Conclusions: LHON is a maternally inherited optic nerve degenerative disorder primarily causing visual impairment. Over 90% of global LHON cases result from mutations at mtDNA loci 11778, 3460, and 14484. The m.12811 T>C mutation has been detected only in a single family and individual patient, potentially presenting with additional clinical symptoms such as paraplegia, ptosis, or hearing loss. While drug therapies may offer some efficacy, no specific curative treatment currently exists for this condition. Management primarily focuses on improving patients' quality of life.

Ocular Imaging

Abstract No.: 205139

A Constellation of Rare Congenital Ocular Anomalies

First Author: Abhishek

Co-Author(s): Shagun KORLA, Shreya NARANG, Aaryan RANA, Jayant SHARMA

Purpose: To report a rare case of a constellation of three congenital anomalies.

Methods: A 23-year-old medical student visited the ophthalmic OPD for a regular eye examination. The student was having a slight headache with no associated symptoms. On ophthalmic examination, the visual acuity was 6/6 in both eyes with intraocular pressure measuring 13mmHg in the right and 15mmHg in the left eye. On slit lamp examination, the Anterior chamber was normal, with the pupil normal in size and reacting to light. On the iris, however small, mold-shaped protuberances were presented against a normal pigmented iris in both eyes. On observing the lens, tiny, stellate-shaped, brown-pigmented opacities were present in the central anterior lens capsule in the right eye, while the left lens was clear. On funduscopy, distinct peripapillary white striated patches with feathered borders approximately one disc diameter in size were present, typically adjacent to the optic disc in both eyes.

Results: The patient was diagnosed with epicapsular star lens in the right eye, with iris mammillations present in both eyes, along with myelinated nerve fibre present adjacent to the optic disc in both eyes.

Conclusions: Epicapsular stars are pigmented, stellate opacities on the anterior lens from persistent tunica vasculosa lentis. Iris mammillations are tiny nodules on darkly pigmented irides. Myelinated retinal nerve fibers are benign congenital anomalies where myelination extends beyond the lamina cribrosa, producing white feathery fundus patches. Altogether, it forms a constellation of rare congenital anomalies.

Abstract No.: 205423

Agreement Between Graders for DR Screening Between Smartphone-Based Retinal Camera and Traditional Fundus Camera in LMIC

First Author: Arshad MEHMOOD

Co-Author(s): Muhammad ABDUL REHMAN SIDDIQUI, Shabbir DANISH, Rida SHAHZA

Purpose: Diabetic retinopathy (DR) is one of the leading causes of blindness worldwide. The gold standard DR screening is stereoscopic fundus photography with desktop cameras. VistaView (Volk Optical Inc, Ohio)

is a smartphone-based retinal camera which offers mydriatic retinal imaging.

Methods: This prospective study took place between December 2021 and June 2022 at a hospital in Karachi, Pakistan. Diabetic patients were imaged following mydriasis using both VistaView and Topcon cameras. All images were graded independently by two graders based on the International Classification of Diabetic Retinopathy (ICDR) criteria. Individual grades were assigned for DR and maculopathy in each image. Agreement between graders for each device was calculated as intraclass correlation coefficient (ICC) and Cohen's weighted kappa (95% CI).

Results: A total of 1,428 images were available from 371 patients with both cameras. A total of 1,231 images were graded. For VistaView, the ICC of DR grades was 78% (95% CI) between the two graders, while that of maculopathy grades was 66% (95% CI). The Cohen's kappa for DR grades of VistaView images was 0.61 (95% CI), while that for maculopathy grades was 0.49 (95% CI). For images from a desktop camera, the ICC of DR grades was 85% (95% CI, 83–87%), while that of maculopathy grades was 79% (95% CI, 75–82%). The Cohen's kappa for DR grades of desktop images was 0.68 (95% CI), while that for maculopathy grades was 0.65 (95% CI).

Conclusions: Agreement levels between graders using both fundus cameras are comparable. VistaView may be utilized for DR screening in teleophthalmology.

Abstract No.: 206553

Aquaporin-4 Modulates Cerebrospinal Fluid Dynamics In and Surrounding the Optic Nerve

First Author: Muneeb FAIQ

Co-Author(s): Kevin CHAN, Anoop SAINULABDEEN, Thajunnisa SAJITHA

Purpose: To quantify the role of aquaporin-4 (AQP4) in regulating cerebrospinal fluid dynamics within the optic nerve using contrast-enhanced MRI and conditional process analysis.

Methods: Adult C57BL/6J mice underwent lumbar intrathecal catheterization for infusion of gadolinium MRI contrast agent (Gd-DTPA) and were divided into 3 groups: Gd-DTPA only (Group 1; n=20), TGN020 (AQP4 inhibitor; i.p.) 45 min before Gd-DTPA (Group 2; n=14), and TGN073 (AQP4 enhancer; i.p.) 45 min before Gd-DTPA (Group 3; n=9). 3D T1-weighted MRI was performed at 7-Tesla (78µm x 78µm x 78µm isotropic, 10-min resolution). Each experiment totaled 120 min and included 3 baseline scans followed by continuous Gd-DTPA infusion (1.6 µL/min for 30 min) and 9 post-contrast scans. Signal intensity area-under-curve was quantified in the posterior/anterior optic nerve subarachnoid space (ONSAS-P/A) and optic nerve parenchyma (ONP-P/A). Mediation moderation

models (PROCESS v4.2, Model 59; 5,000 bootstraps, 95% CI) tested ONSAS-P as predictor and ONP-A as outcome, with ONP-P and ONSAS-A as mediators and group as moderator. Path coefficients were: a1 (ONSAS-P→ONP-P), a2 (ONSAS-P→ONSAS-A), b1 (ONP-P→ONP-A), b2 (ONSAS-A→ONP-A), and c' (direct ONSAS-P→ONP-A).

Results: Compared with no treatment (Group 1), AQP4 inhibition (Group 2) increased posterior→anterior SAS flow ($\Delta a2=+0.7503$, $p<0.001$) while reducing posterior→anterior parenchymal flow ($\Delta b1=-0.8828$, $p<0.01$), anterior SAS→parenchyma flow ($\Delta b2=-0.5318$, $p<0.001$), and posterior ONP-mediated indirect flow ($\Delta Ind1=-0.0563$, $p<0.01$). AQP4 enhancement (Group 3) strengthened posterior SAS→parenchyma flow ($\Delta a1=+0.3337$, $p<0.001$) and posterior→anterior SAS flow ($\Delta a2=+0.3734$, $p<0.001$), reduced anterior SAS→parenchyma flow ($\Delta b2=-0.6714$, $p<0.001$), and augmented direct posterior SAS→anterior parenchyma entry ($\Delta c'=+0.2036$, $p<0.001$). Direct comparison confirmed that TGN073 restored posterior SAS→parenchyma flow relative to TGN020 ($\Delta a1=+0.3050$, $p<0.05$; $\Delta c'=+0.2591$, $p<0.05$) while reducing reliance on posterior→anterior SAS flow ($\Delta a2=-0.3769$, $p<0.01$).

Conclusions: Inhibiting AQP4 may reduce cerebrospinal fluid dynamics in the optic nerve parenchyma and divert more flow to SAS, while enhancing AQP4 may facilitate posterior flow and parenchymal delivery.

Abstract No.: 207089

Associations Between Body Habitus, Exercise Levels and Retinal Microvascular Parameters on Optical Coherence Tomography Angiography in Chinese Elderly Patients

First Author: Hoi Yau Bertha **WONG**

Purpose: To investigate the association between body habitus, exercise level, and the microvascular parameters as measured on Cirrus Angioplex optical coherence tomography angiography (OCT-A) imaging.

Methods: This was a cross-sectional, random, population-based study on consecutive Chinese subjects aged 50 or above. Patients underwent best corrected visual acuity assessment (BCVA), body height and weight measurements, fat percentage, and visceral fat area determination. They were then divided into three groups according to regular exercise levels. Optical coherence tomography-angiography (OCT-A) was performed using scan protocol Angioplex 6x6 on the Carl Zeiss Cirrus 5000 Machine, determining Foveal avascular zone area (FAZ), vessel density (VD) and perfusion density. The right eye was used for analysis. Eyes diagnosed macular problem, glaucoma or other retinal disease also excluded. Physical activity habit was collected by validated questionnaires. Subjects were divided into three group, vigorous exercise, moderate exercise, and no exercise.

Results: A total of 1,029 subjects enrolled, including 372 males aged 62.09 ± 7.46 years, and 657 females aged 60.78 ± 7.15 years. Body Mass Index (BMI) was significantly negatively correlated to average exercise level. Subjects' mean BMI in vigorous exercise, moderate exercise, and no exercise groups were 24.78 ± 3.34 , 27.45 ± 52.96 , and 31.29 ± 52.99 , representatively. Mean FAZ area on OCTA for vigorous exercise, moderate exercise and no exercise groups were 0.26 ± 0.13 , 0.28 ± 0.14 and 0.28 ± 0.13 mm² respectively. Mean VD for the same groups were 16.19 ± 2.23 , 16.46 ± 2.17 and 16.51 ± 2.04 mm/mm², and mean PD for the same groups were 0.39 ± 0.06 , 0.40 ± 0.06 and 0.40 ± 0.05 respectively.

Conclusions: Exercise levels predict BMI and retinal vascularity, reflecting vascular health beyond blood pressure and comorbidities.

Abstract No.: 205969

Associations Between Metabolic Syndrome Components and Ophthalmologic Imaging Parameters Based on the Korea National Health and Nutrition Examination Survey

First Author: Woo Hyun **JUNG**

Co-Author(s): Jin Wook **JEOUNG**, Ki Ho **PARK**

Purpose: This study aimed to investigate the associations between components of metabolic syndrome and optical coherence tomography (OCT) parameters using data from the Korea National Health and Nutrition Examination Survey (KNHANES).

Methods: The OCT data collected from KNHANES were first adjusted for age, sex, and axial length. The risk of reduced retinal nerve layer thickness for each component of metabolic syndrome was then determined using logistic regression analysis.

Results: Hypertension was significantly associated with a higher likelihood of reduced retinal nerve fiber layer (RNFL) thickness (odds ratio [OR], 1.325; $p = 0.002$) and ganglion cell-inner plexiform layer (GCIPL) thickness (OR, 1.752; $p < 0.001$) compared with the normal population. In addition, increased waist circumference was significantly associated with a higher likelihood of reduced GCIPL thickness (OR, 1.334; $p = 0.027$).

Conclusions: Among the components of metabolic syndrome, hypertension and increased waist circumference were associated with structural damage to the retinal nerve layers. Patients with these conditions may therefore be at increased risk of diseases affecting the retinal nerve layers.

Abstract No.: 206852

Clinical Applications of Smartphone-Based Indirect Ophthalmoscopy: A Resident-Led Voyage

First Author: Laiba ASIF

Co-Author(s): Abdullah MAZHRY, Zia MAZHRY

Purpose: To demonstrate the feasibility and clinical utility of smartphone-based indirect ophthalmoscopy as a low-cost alternative to conventional fundus photography in resource-limited settings. This compilation was prepared in a tertiary eye care center with limited access to conventional fundus photography. A Samsung Galaxy S8 smartphone paired with a +20 diopter (D) indirect ophthalmoscopy lens was utilized as an alternative imaging tool. The smartphone's in-built flashlight served as the illumination source, with no external adapters or modifications required. Pupillary dilation was performed in all cases, and imaging was carried out in a darkened environment to optimize retinal visualization. Real-time videos were captured by aligning the smartphone camera with the indirect lens and later compiled to highlight representative cases across outpatient, bedside, and emergency settings.

Methods: Smart phone indirect ophthalmoscopy provided high quality fundus photographs that proved to be equally good as traditional fundus photography.

Results: Smart phone indirect ophthalmoscopy provided high quality fundus photographs that proved to be equally good as traditional fundus photography.

Conclusions: Smartphone indirect ophthalmoscopy is a practical, affordable, and effective tool for retinal imaging, particularly valuable in resident training, bedside evaluations, and resource-limited settings. With minimal equipment and no need for expensive infrastructure, it enables real-time documentation and enhances clinical decision-making in routine ophthalmic practice.

Abstract No.: 205687

Clinical and Multimodal Imaging Features of Focal Choroidal Excavation in Central Serous Chorioretinopathy

First Author: Sumit RANDHIR SINGH

Co-Author(s): Jay CHHABLANI, Nasiaq HASAN, Niroj SAHOO

Purpose: To report the clinical and multimodal imaging features of focal choroidal excavation (FCE) in eyes with central serous chorioretinopathy (CSCR) and compare with CSCR without FCE.

Methods: This was a multicenter, retrospective study. Multimodal imaging was performed at baseline and follow-up visits. Qualitative and quantitative parameters on optical coherence tomography (OCT): location of FCE (subfoveal or extrafoveal), number,

and types (conforming or non-conforming), and CSCR disease activity (active or inactive), were documented. OCT parameters were compared between CSCR-FCE group and their fellow eyes and CSCR eyes without FCE. P-value ≤ 0.05 was considered statistically significant.

Results: Among 1458 CSCR patients, 26 eyes (25 patients) with mean age of 50.8 ± 10.1 years had FCE (prevalence rate: 1.71%). 22 eyes had CSCR in the FCE eye, whereas the remaining four eyes with FCE (2: PPE, and 2: normal) were fellow eyes. At baseline, 13 eyes (59.1%) had conforming FCE, which increased to 17 eyes (77.3%) through the last visit. Prevalence of CNVM was comparable between both groups: CSCR with FCE (3 eyes, 13.6%) compared to 202 eyes in CSCR without FCE group (202 eyes, 14.1%; $p=0.99$). Presence of DLS (45.5% vs 38.5% ; $p=0.05$) and length of DLS ($1585.9 \pm 836.6 \mu\text{m}$ vs $1151.7 \pm 845.9 \mu\text{m}$; $p=0.02$) were significantly higher in the CSCR-FCE group.

Conclusions: Overall prevalence rate of FCE in CSCR is low, with FCE being more common in CSCR compared to their fellow eyes. These appear to remain stable over time; the rate of CNVM formation with CSCR-FCE eyes is not different from CSCR eyes without FCE.

Abstract No.: 201257

Comparison of Wide-field Versus Standard Optical Coherence Tomography in Retinal Imaging

First Author: Jae Rock DO

Co-Author(s): Yong Koo KANG, Dong Hyun KIM, Yoo Min KIM, Dong Ho PARK

Purpose: To compare the clinical performance of the RS-1 and Spectralis optical coherence tomography (OCT)/OCT angiography (OCTA) systems in patients with macular neovascularization (MNV) and in vitrectomized eyes with gas tamponade for retinal detachment (RD).

Methods: Patients with MNV and RD underwent imaging with RS-1 (Nidek Co., Gamagori, Japan) and Spectralis OCT (Heidelberg Engineering, Heidelberg, Germany) during a single examination session using standardized structural OCT and OCTA protocols. Image acquisition time, artifact rate, segmentation accuracy, and the agreement between MNV area on OCTA and indocyanine green angiography (ICGA) were evaluated. In addition, foveal contour delineation was assessed in vitrectomized eyes with gas tamponade for RD.

Results: On structural OCT, RS-1 provided faster acquisition and a lower artifact rate compared with Spectralis. Shadowing was less frequent with RS-1, and mirror artifacts were not observed. In vitrectomized RD eyes with gas tamponade, foveal contour delineation was more reliable with RS-1. On OCTA, RS-1 also achieved faster acquisition, superior segmentation accuracy, and greater agreement of the MNV area with ICGA.

Conclusions: Compared with Spectralis, the RS-1 OCT/OCTA system demonstrated faster acquisition, fewer artifacts, more reliable foveal contour delineation under gas tamponade, and superior accuracy in MNV evaluation. These findings suggest that RS-1 may provide improved clinical utility in both routine retinal imaging and challenging conditions such as post-vitrectomy eyes.

Abstract No.: 202195

Decoding Myopia: Effects on Ganglion Cell-Inner Plexiform and Nerve Fiber Layers

First Author: Shew Fei CHEE

Co-Author(s): Daniel PHANG

Purpose: To compare the ganglion cell inner plexiform layer (GCIPL) and retinal nerve fiber layer (RNFL) thickness profiles between mild, moderate and severe myopic patients by spectral domain optical coherence tomography (SD OCT).

Methods: This was a single-centre cross-sectional study. 60 eyes of 30 myopic patients were studied. All patients underwent a comprehensive ophthalmic evaluation and SD-OCT examination. The patients were grouped based on their spherical equivalent (SE). Low myopia is defined as SE <-3.0 diopter (D), moderate myopia is defined as between -3.0 to -6.0 D, and severe myopia is defined as >-6.0 D.

Results: The RNFL thickness were significantly different among the different myopia groups in all quadrants (average RNFL $p < 0.001$, superior RNFL $p < 0.001$, nasal RNFL $p < 0.001$, inferior RNFL $p < 0.001$, and temporal quadrant $p = 0.020$). Post-hoc test showed that the RNFL thickness were significantly thinner in the severe myopic group as compared to the low myopic group in all quadrants. The average GCIPL and GCIPL thickness in all sectors were significantly different across all myopia groups. Post-hoc analysis demonstrated GCIPL thickness were significantly thinner in the high myopia group compared to the low myopia group in all sectors. Both average RNFL thickness and average GCIPL thickness were correlated significantly with SE and axial length.

Conclusions: This finding suggests that higher levels of myopia are associated with thinner retinal layers, which could have implications for the diagnosis and management of ocular conditions in myopic patients, particularly those with concurrent glaucoma.

Abstract No.: 200193

Diagnostic Utility of IOL Master 700 in Anterior Lenticonus: A Case Report of Alport's Syndrome

First Author: Vishweshwarraiah R DONGRE

Co-Author(s): Siddharam S JANTI, Raghavendra Rao KOLAVALI, Pravalika REBBALA, Hari Kumar S

Purpose: To describe the diagnostic utility of the IOL Master 700 in identifying anterior lenticonus in a young male with systemic manifestations of Alport's syndrome and to highlight the role of anterior segment imaging in diagnosis.

Methods: A 22-year-old male presented with bilateral progressive blurring of vision over two years. His systemic history included chronic renal dysfunction, bilateral sensorineural hearing loss, and a family history suggestive of hereditary nephropathy. A comprehensive ocular examination and multimodal imaging, including slit-lamp photography, anterior segment OCT (AS-OCT), and swept-source OCT biometry (IOL Master 700, Carl Zeiss Meditec), were performed.

Results: Visual acuity was reduced in both eyes with high myopic correction and no significant improvement. Slit-lamp examination revealed the classic oil droplet reflex and anterior bowing of lens due to anterior lenticonus. AS-OCT confirmed anterior bulging of the lens surface. Swept-source OCT imaging with IOL Master 700 clearly delineated the conical protrusion of the anterior lens capsule in both eyes. Slit-lamp, IOL Master 700, and AS-OCT images for both eyes demonstrated symmetrical central anterior lenticonus. Systemic evaluation confirmed renal dysfunction, proteinuria, and bilateral sensorineural hearing loss. Renal biopsy and genetic testing supported a diagnosis of Alport's syndrome.

Conclusions: This case highlights the role of the IOL Master 700 in diagnosing anterior lenticonus, a hallmark ocular finding of Alport's syndrome. The swept-source OCT imaging provides high-resolution visualization of the anterior lens curvature, enabling early and non-invasive diagnosis even in patients with subtle clinical findings. Early ophthalmic identification is critical for guiding systemic evaluation and multidisciplinary management.

Abstract No.: 201791

Ectopic Inner Foveal Layer as Post Pars Plana Vitrectomy Prognostic Predictor in Eyes With Idiopathic Epiretinal Membrane

First Author: Jiyang TANG

Co-Author(s): Xiaoxin LI, Heng MIAO, Yaoyao SUN

Purpose: To analyze the correlation between ectopic foveal inner layer (EIFL) and the EIFL-based epiretinal membrane (ERM) staging system with the 6-month anatomical and functional prognosis post pars plana vitrectomy (PPV) combined with cataract surgery.

Methods: Medical records and optical coherence tomography (OCT) parameters including ERM stage, disorganization of the retinal inner layers (DRIL) severity, central foveal thickness (CFT), EIFL thickness, macular edema (ME), outer nuclear layer thickness, ellipsoid zone disruption and cotton-wool sign of 354 ERM eyes of 339 patients with 6-month post-surgery follow-up were retrospectively analyzed.

Results: Preoperative ERM stage (τ -b=0.196, $P<0.001$), DRIL severity (τ -b=0.248, $P<0.001$), CFT ($R=0.387$, $P<0.001$) and EIFL thickness ($P=0.315$, $P<0.001$) were positively correlated with logMAR best corrected visual acuity (BCVA) at 6 months. ERM stage (τ -b=0.285, $P<0.001$) and DRIL severity (τ -b=0.239, $P<0.001$) were positively correlated with CFT at 6 months. No significant correlation was found between ERM staging ($P=0.054$) with ME resolution at 6 months. More advanced ERM stage ($R=0.494$, $P<0.001$) and DRIL severity ($R=0.379$, $P=0.005$) were significantly correlated with persistent newly onset ME at 6 months.

Conclusions: ERM staging based on EIFL could be a simple and intuitive way to predict functional and anatomical outcomes post-PPV; EIFL thickness were positively correlated with post-operative logMAR BCVA, while advanced ERM stages and DRIL severity were positively correlated with logMAR BCVA, CFT and persistent newly-onset ME at 6 months.

Abstract No.: 200181

Evaluating Progression Thresholds in Varied Stages of Keratoconus: Precision in Corneal Epithelium Measurements for Predicting Disease Progression

First Author: Jinhai **HUANG**

Co-Author(s): Rui **NING**, Yiran **WANG**, Xingtao **ZHOU**

Purpose: This study aims to evaluate the repeatability and reproducibility of corneal epithelium thickness (ET) measurements using a spectral-domain optical coherence tomographer (SD-OCT)/Placido topographer (MS-39, CSO, Florence, Italy) in a keratoconus (KC) population across various stages and to establish progression thresholds for assessing KC advancement.

Methods: In this study, 149 eyes were categorized into four groups: forme fruste keratoconus (FFKC) (29 eyes), mild KC (34 eyes), moderate KC (40 eyes), and severe KC (46 eyes). We utilized the within-subject standard deviation (Sw), test-retest variability (TRT), coefficient of variation (CoV), and intraclass correlation coefficient (ICC) to assess intraoperator repeatability and interoperator reproducibility.

Results: The MS-39 demonstrated acceptable repeatability and reproducibility in KC patients, with ICC values ranging from 0.732 to 0.954. However, patients with more advanced KC stages and progressive peripheralization of measurement points exhibited higher TRTs alongside a thinning trend. This study

proposes cut-off values for mild, moderate, and severe KC at 4.9 μ m, 5.2 μ m, and 7.4 μ m, respectively, for thinnest epithelium thickness (TET). For central epithelium thickness (CET), the recommended cut-off values for mild, moderate, and severe KC are 2.8 μ m, 4.4 μ m, and 5.3 μ m, respectively.

Conclusions: This study revealed a decrease in the precision of the MS-39 when measuring patients with more severe KC and at more peripheral corneal points. Given the significant variance in ET measurements by MS-39 across different KC stages, accurate grading of KC patients is essential to minimize errors in clinical decision-making.

Abstract No.: 203380

Evaluation of a Virtual Reality Headset at a Tertiary Care Ophthalmology Setting

First Author: Rustum **KARANJIA**

Co-Author(s): Catherine **DANG**, Hong An **NGUYEN**, Soumya **PODURY**

Purpose: The purpose of this study was to validate and assess the use of a Virtual Reality Headset for VF testing in a tertiary care setting.

Methods: prospective, interventional study conducted at the University of Ottawa Eye Institute. There are two phases in this study: Phase 1 is the estimated recruitment of 50 normal subjects and 50 affected subjects; and Phase 2 involves recruitment of 100 randomly selected (RS) subjects. For Phase I, normal subjects were recruited as staff and colleagues, while the affected subjects were recruited from clinics and underwent the HFA and VR within the same week.

Results: 135 eyes from 72 subjects (54 eyes from the normal group and 81 eyes from the affected group) were analyzed prospectively. In the normal group HFA and VR results revealed no significant differences in mean PSD (1.52 ± 0.62 dB and 1.63 ± 0.54 dB, $p=0.27$). Interestingly, there was a significant difference in VFI and MD. However, the differences were not clinically meaningful. In the affected group mean VFI and MD were found to be significantly different. The difference in mean PSD values was nonsignificant different. Test duration was longer with the VR system in both groups.

Conclusions: Our data demonstrates that test duration of the VR headset was longer than the HFA in both groups. VFI and MD values were statistically different, while PSD values remained comparable. VR headsets hold promise to increase testing capacity and allow for potential remote monitoring of patients in a tertiary care setting.

Abstract No.: 201380**Fine-Tuning RETFound and VisionFM for Diabetic Retinopathy Staging on Ultra-Widefield Images***First Author: Danqi FANG**Co-Author(s): Carol Y CHEUNG, Hongyang JIANG, Xujia LIU, Ka Ho SZETO*

Purpose: Current AI-based systems for diabetic retinopathy (DR) assessment using conventional fundus photographs are limited by a relatively narrow field-of-view. Ultra-Widefield (UWF) imaging captures up to 200° in a single shot, enabling a more comprehensive retinal evaluation. Foundation models (FMs) have demonstrated strong potential for downstream tasks. This study fine-tuned two foundation models (RETFound and VisionFM) to classify DR into four stages (no/mild, moderate, severe NPDR, PDR) and their performances were compared.

Methods: A total of 14,991 UWF images (3,175 eyes from 1,783 patients with diabetes from two centres) were included. DR labeling was performed by retina specialists according to the International Clinical Diabetic Retinopathy Disease Severity Scale. Two foundation models (RETFound and VisionFM) were fine-tuned and AI algorithms were trained and validated for DR staging, respectively.

Results: In overall performance metrics across four DR stages, the VisionFM-based model demonstrated slightly better performance compared with the RETFound-based model, with an accuracy of 93.16% (92.16–94.16) versus 91.55% (90.52–92.59), sensitivity of 92.07% (90.85–93.20) versus 91.06% (89.77–92.22), and specificity of 97.76% (96.76–98.76) versus 97.32% (96.32–98.32). All between-model differences were statistically significant ($P < 0.001$) with large effect sizes (Cohen's d -1.57 to -3.34). For each DR stage, both models demonstrated good performance, with sensitivities exceeding 85%, specificities and accuracies all surpassing 95%.

Conclusions: Under the FM-based framework, our models achieved good performance in DR staging on UWF images, highlighting its potential for more comprehensive DR screening.

Abstract No.: 206774**From Ischaemia to Intervention: A Closer Look at CRAO***First Author: Prem SAI.T**Co-Author(s): Roshita GARGAIN, Janani KRISHNAN, Krithika M, Padma REKA*

Purpose: CRAO is an ocular emergency that occurs when the central retinal artery becomes blocked, causing ischemic damage to the retina and resulting in vision loss. Presenting a case of CRAO in a young female with no known comorbidities.

Methods: A 35-year-old female with no prior health issues, presented with sudden painless vision loss in her left eye (LE) 18 hours after symptom onset. Visual acuity was 1/60 in the LE and 6/6 in the right eye (RE). Intraocular pressure was normal. RAPD noted in LE. Fundus examination revealed a pale retina and cherry red spot in the macula of the LE, typical of CRAO.

Results: Diagnostic tests showed iron deficiency anemia, and Doppler ultrasound confirmed total occlusion of the left central retinal artery.

Conclusions: Retinal vascular occlusions can signal underlying systemic diseases. Aggressive treatment and a comprehensive systemic workup are necessary for optimal management of CRAO.

Abstract No.: 204078**Macrophage-Like Cell Changes in Diabetic Retinopathy Were Observed Based on Enface-OCT***First Author: Shuyu ZHAO*

Purpose: To observe the changes in the density of macrophage-like cells in diabetic retinopathy by OCTA.

Methods: Retrospective study. Conducted from 1 January 2022 to 1 January 2024, patients with diabetic retinopathy were recruited from Foshan Aier Eye Hospital. All patients underwent a fundus examination, fluorescein angiography (FFA), optical coherence tomography (OCT), and OCTA examination after pupil dilation. Macrophage-like cells (MLCs) were examined using ImageJ on OCTA-enface images. MLCs were quantified using ImageJ on OCTA-enface images.

Results: A total of 53 eyes were included in the study. BCVA in PDR patients was 0.7 ± 0.3 , which was significantly higher than the 0.3 ± 0.2 observed in NPDR patients ($p < 0.001$). Patients in the PDR group experienced a greater increase in mean CST than those in the NPDR group. 4 ± 53.1 vs. 217.5 ± 21.5 , $p < 0.01$, as well as a decrease in FAZ area (0.4 ± 0.1 vs. 0.3 ± 0.1 , $p < 0.001$). MLCs in PDR were 472.5 ± 114.9 vs. 260.7 ± 50.1 in NPDR; both comparisons were statistically significant ($p < 0.001$). MLC density in PDR was 13.2 ± 3.1 vs. 7.2 ± 1.4 in NPDR; both comparisons were statistically significant ($p < 0.001$). Among enrolled DR patients, MLCs were positively correlated with BCVA, CST, and FAZ area (OR = 0.732, 0.881, and 0.732, respectively, $p < 0.01$). Among patients with PDR combined with DME, MLC density showed a positive correlation with CST (OR = 0.911, $p < 0.01$) and negatively correlated with SCP blood flow density (OR = -0.873, $p < 0.01$).

Conclusions: MLCs are involved in the pathologic process of diabetic retinopathy, and the number of MLCs is significantly increased in PDR with DME.

Abstract No.: 200538

Magnification Correction in Fundus Imaging After ICL Implantation and Its Clinical Implications for Image Evaluation

First Author: Xuewen DING

Co-Author(s): Fan LU, Yilei SHAO

Purpose: To evaluate the impact of phakic posterior chamber implantable collamer lens (ICL) implantation on the magnification of swept-source optical coherence tomography (SS-OCT) images, establish an axial length (AL)-based correction model, and validate its clinical value.

Methods: This prospective study included 76 eyes of 39 patients with myopia. SS-OCT scanning laser ophthalmoscopy (SLO) and OCT angiography (OCTA) images were acquired preoperatively and 1 month postoperatively. MATLAB-based image registration algorithms were employed to quantify magnification correction factors in horizontal (Mx) and vertical (My) directions between pre- and post-operative fundus images. These factors, defined as the ratio of post-operative to pre-operative imaging field, quantify the changes in magnification induced by ICL implantation. Stepwise multiple linear regression was performed to develop predictive models. Postoperative OCTA images were geometrically corrected using regression equations. The foveal avascular zone (FAZ) was semi-automatically segmented via a custom MATLAB program, and its area was calculated. One-Way ANOVA was employed to compare the differences in FAZ area among the preoperative group, postoperative uncorrected group, and postoperative corrected group.

Results: Postoperative fundus images showed systemic magnification ($Mx = 0.9689 \pm 0.0269$; $My = 0.9689 \pm 0.0234$), indicating that a 3.11% reduction in magnification was required in both horizontal and vertical dimensions for optimal registration with preoperative images. Multivariate regression identified AL as the core predictor: $Mx = 1.292 - 0.012 \times AL$ ($R^2 = 0.464$, $P < 0.001$), $My = 1.238 - 0.010 \times AL$ ($R^2 = 0.412$, $P < 0.001$). The ANOVA results revealed statistically significant differences in FAZ area measurements across the three groups ($P = 0.026$). Post hoc analysis demonstrated that the postoperative uncorrected FAZ area was significantly larger than the preoperative baseline ($0.32 \pm 0.10 \text{ mm}^2$ vs. $0.28 \pm 0.08 \text{ mm}^2$, $P = 0.014$). In contrast, the postoperative corrected FAZ area showed strong agreement with preoperative measurements ($0.29 \pm 0.09 \text{ mm}^2$ vs. $0.28 \pm 0.08 \text{ mm}^2$, $P = 0.823$). These findings confirm systematic overestimation bias in uncorrected postoperative FAZ measurements.

Conclusions: Individualized AL-based magnification correction is essential to eliminate measurement deviations in en face macular parameters caused by ICL implantation.

Abstract No.: 206264

Morphological Characteristics of Anterior Segment in Patients With Familial Exudative Vitreoretinopathy

First Author: Yarou HU

Purpose: To investigate the morphological characteristics of anterior segment (AS) in eyes with familial exudative vitreoretinopathy (FEVR) and its relevance to retinal traction.

Methods: In this case-control study, 48 eyes with FEVR and 48 healthy eyes matched for gender, age, spherical equivalent (SE), and pupil diameter (PD) were recruited. All participants underwent cycloplegic optometry and AS-optical coherence tomography examination using CASIA 2 to obtain SE and morphometric data.

Results: Compared with matched controls (31% female, mean age 8 years, SE -3.00 D, PD 6 mm), the FEVR group showed significantly decreased white to white ($P=0.02$), anterior chamber depth and width ($P<0.001$), aqueous depth ($P<0.001$), angle recess to angle recess ($P=0.009$), lens diameter ($P=0.03$), anterior lens surface curvature radius ($P=0.002$), decentration ($P=0.004$), anterior chamber angle ($P<0.05$). In contrast, there was an increase in overall corneal thickness ($P<0.05$), iris curvature ($P=0.001$), lens thickness ($P=0.02$), crystalline lens rise ($P<0.001$) and lens vault ($P<0.001$). These metrics also differed significantly between FEVR eyes with and without retinal traction (including retinal folds).

Conclusions: Young patients with FEVR, especially those with retinal traction (indicating severer FEVR), exhibited significantly crowded AS consisting of forward protruding near-spherical lens, shallow anterior chamber, iris bombe and narrow anterior chamber angle, which may predispose patients to severe AS complications, particularly angle-closure glaucoma (ACG). The findings highlight the necessity for longitudinal monitoring of FEVR-AS and development of personalised management strategies to facilitate early intervention and treatment. We also recommend exercising greater caution in diagnosing primary ACG until thorough examinations of peripheral retina.

Abstract No.: 208325

Pterygium-Derived Artifact Simulating an Intraocular Tumor With Ultrawide-Field Imaging

First Author: Danqi FANG

Purpose: To report a rare case of ultrawide-field imaging artifact mimicking a choroidal mass caused by a nasal pterygium, highlighting the importance of recognizing imaging artifacts to avoid misdiagnosis.

Methods: A 56-year-old woman presented with a one-year history of a shadow in the nasal visual field of her left eye. Best-corrected visual acuity was 20/20 in both

eyes. Slit-lamp examination revealed a nasal pterygium. Ultrawide-field imaging showed a solitary, elevated, yellowish-gray lesion in the temporal peripheral fundus, initially suspected to be a choroidal melanoma. Further evaluation included dilated fundus examination with a 3-mirror contact lens, B-scan ultrasonography, and orbital magnetic resonance imaging (MRI).

Results: No intraocular mass was detected on dilated fundus exam, B-scan, or MRI. The lesion seen on ultrawide-field imaging was determined to be an artifact caused by the nasal pterygium. After surgical excision of the pterygium with autologous conjunctival transplantation, the artifactual lesion disappeared on repeat imaging.

Conclusions: Ultrawide-field imaging can produce artifacts that mimic intraocular pathology, such as choroidal tumors. Awareness of such artifacts is essential to prevent unnecessary investigations and misdiagnosis. Multimodal imaging and clinical correlation are recommended when atypical lesions are identified.

Abstract No.: 200421

Split Retinal Nerve Fiber Layer Bundles: A Potential Pitfall in Glaucoma Diagnosis

First Author: Truong Dang Minh **PHAM**

Co-Author(s): Ngoc Phuong Vy **LY**, Thao Huong **NGUYEN**

Purpose: Split retinal nerve fiber layer (RNFL) bundles were described in normal eyes, primarily in young people. This phenomenon is physiologic rather than pathologic. We describe an ocular hypertension (OHT) patient with split RNFL bundles that could lead to glaucoma misdiagnosis.

Methods: Case report.

Results: A 22-year-old female sought a regular eye check-up due to her history of OHT/glaucoma suspect and moderate myopia three years ago. Tafluprost eye drops were indicated. She adhered well to treatment, stabilizing intraocular pressure between 13 and 15mmHg and maintaining 6/6 best-corrected visual acuity. Her sister was diagnosed with bilateral OHT and myopia. Her right and left eye's spherical equivalent was -4.5D and -5.25D and central corneal thickness was 490 and 494 μ m, respectively. The anterior segment was unremarkable, with open anterior chamber angles. The optic disc was tilted bilaterally with optic cup enlargement and normal macula. Optical Coherence Tomography (OCT) revealed bilateral superior peripapillary RNFL thinning compared to normal values. The superior segment had split RNFL bundles in the RNFL thickness maps and a double-hump pattern in the RNFL thickness graph. Her sister also had the same RNFL pattern. OCT macula scans and visual field returned normal. A diagnosis of previous OHT/moderate myopia was made. She was advised to stop Tafluprost and return for follow-ups.

Conclusions: Split RNFL bundles are a variation that can lead to red disease by giving the appearance of local RNFL defects. This configuration should be considered when interpreting OCT results, especially in glaucoma suspects.

Abstract No.: 208324

Symmetry of Optical Coherence Tomography Angiography Optic Nerve Head Metrics in Healthy Subject

First Author: Danqi **FANG**

Co-Author(s): Hao-yu **CHEN**, Carol Y **CHEUNG**, Xiaoting **MAI**, Dawei **YANG**

Purpose: To assess the symmetry of quantitative OCTA ONH metrics in healthy subjects.

Methods: Thirty-three healthy young subjects were enrolled in this prospective study. The ONH of both eyes were imaged four times by an OCTA (DRI OCT Triton, TOPCON) using a 3mm $\times$ 3mm mode with dilated pupils. Images of the radial peripapillary capillary were analyzed by a customized Matlab program, and the following metrics were measured: vessel density, fractal dimension, and vessel diameter index. The most well-centered optic disc from the four repeated scans was then selected for the symmetry analysis using the Pearson correlation coefficient (r), ICC and Bland-Altman plots.

Results: A total of 33 healthy subjects were enrolled in the study. Good to excellent interocular correlation was observed for papillary vessel density (ICC = 0.857), vessel diameter index (ICC = 0.857) and fractal dimension (ICC = 0.906), while circumpapillary vessel density exhibited moderate interocular correlation (ICC = 0.687). Bland-Altman plots revealed an agreement range of -5.26% to 6.21% for circumpapillary vessel density.

Conclusions: The interocular correlations of papillary vessel density, fractal dimension and vessel diameter index were high, but the correlation for circumpapillary vessel density was only moderate. Our data would help to choose proper control and interpret whether the difference between two eyes are within normal range.

Abstract No.: 200602

The Safety of Terahertz Scanning System on Corneas: Preclinical Evidence and Phase I Clinical Trial

First Author: Chang **LIU**

Co-Author(s): Ke **LIN**, Yu-chi **LIU**, Jodhbir **MEHTA**, Mingyi **YU**

Purpose: Terahertz waves are electromagnetic radiation with a fast scanning speed (30ms per scan) to meet medical diagnostic needs. It provides an accurate result for the estimation of corneal thickness. This

study aims to establish the safety profile of the use of the Terahertz scanning system in human corneas.

Methods: The Phase I safety study was conducted in 6 “non-seeing” eyes with normal corneas. All participants underwent clinical evaluations, including UDVA, CDVA, slit lamp examination, external eye photo, pentacam, ASOCT, fundus photo, specular microscopy, in vivo confocal microscopy at baseline, immediately after Terahertz scanning, 1 day, 1 week, and 1 month after Terahertz scanning.

Results: There were no changes in UDVA and CDVA of patients after Terahertz scanning. The corneas remained clear without corneal haze formation and the lens was clear with no opacity. Central corneal thickness was at a consistent level over 1 month after Terahertz scanning, and there were no signs of vitritis, retinitis or optic neuropathy. There was no significant changes in corneal curvature after Terahertz scanning. There were no significant changes in corneal endothelial density after Terahertz scanning. Corneal epithelial cells, corneal nerves, and keratocytes, as well as endothelial assessed by in vivo confocal microscopy, were not affected after Terahertz scanning.

Conclusions: Terahertz scanning is safe on human corneas, and it holds the potential to evaluate corneal hydration and opacity in clinical settings.

Abstract No.: 203619

Ultra-Deep Wide-Field Swept-Source OCT Improves Assessment of Posterior Vitreous Detachment: A Comparative Study

First Author: Zhuangling LIN

Purpose: To compare the ultra-deep mode and the standard mode of swept-source optical coherence tomography (SS-OCT) in assessing posterior vitreous detachment (PVD).

Methods: The retrospective study included 178 eyes from 100 patients diagnosed with epiretinal membrane or macular hole, comprising both affected and fellow eyes. After mydriasis, all eyes underwent two SS-OCT scanning modes (Ultra-Deep Mode: 26mm length, 12mm depth; Standard Mode: 16mm length, 3mm depth) with 18-line radial scans centered on the fovea. PVD staging consistency was compared between the two modes, as well as the visibility of the posterior vitreous cortex (PVC) and Weiss ring in complete PVD.

Results: The inter-mode consistency was high in PVD staging ($\kappa=0.981$, $P<0.001$), with 100.0% agreement in diagnosing complete PVD. Among the 107 eyes diagnosed with complete PVD, detached PVC was observed in 105 eyes (98.13%) using the Ultra-Deep Mode compared to 51 eyes (47.66%) using Standard Mode ($P<0.001$). The Ultra-Deep Mode allowed visualization of PVC in more quadrants ($P<0.001$). Weiss ring was detected in 4 eyes (3.7%) in the Ultra-Deep Mode and 17 eyes (15.9%) in the

Standard Mode ($P=0.003$). In the cases of complete PVD, both modes revealed a higher prevalence of detached PVC in the inferior quadrant compared to the superior quadrant (Standard Mode: 44.9% vs. 14.0%, $P<0.001$; Ultra-Deep Mode: 98.1% vs. 44.7%, $P<0.001$).

Conclusions: The Ultra-Deep Mode (scan length: 26 mm, scan depth: 12 mm) improves diagnostic certainty of complete PVD by enhancing visualization of both detached PVC and Weiss rings.

Abstract No.: 206576

Ultrasound Biomicroscopy Pars Plana Fungal Foci in Postoperative Endophthalmitis

First Author: Erika Jean SALVAME

Purpose: To describe an occurrence of persistent post-cataract surgery endophthalmitis presenting with foci of fungal deposit at the pars plana seen by ultrasound biomicroscopy and endoscopic vitrectomy.

Methods: This is a case report from a tertiary hospital in a developing country.

Results: A 55-year-old male underwent complicated phacoemulsification. 1 week postop, VA decreased to hand movement (HM) with hypopyon. No improvement on intravitreal antibiotics prompted pars plana vitrectomy. Vision improved to 20/80, but by 1 month post-operation, VA decreased to HM. B-scan revealed vitritis. Pre-operative ultrasound biomicroscopy revealed a hyperechoic nodule at the pars plana extending to the adjacent detached retina. Patient underwent intraocular lens explantation, and retinal detachment surgery. Intra-operative endoscopic evaluation revealed cream feathery mounds at the pars plana. Microbiological workup revealed spores and pseudohyphae suspicious of candida species. Intravitreal and systemic anti-fungal treatment was initiated.

Conclusions: Fungal endophthalmitis is a potentially devastating postoperative complication. Its clinical course is nonspecific and can be confounded by initial improvement and low grade prolonged inflammation. This case highlights the importance of multimodal platforms of imaging in identifying foci of infections. Adjunct intraoperative visualization platforms may also aid in better yield of samples for diagnostic evaluation.

Abstract No.: 200377

Utility of Preoperative Swept Source Optical Coherence Tomography in Diabetic Vitrectomy

First Author: Arshad MEHMOOD

Co-Author(s): Muhammad ABDUL REHMAN SIDDIQUI, Altamash Shahriyar GHAZANFAR

Purpose: To determine benefit of preoperative swept source optical coherence tomography (SS-OCT) to

detect occult retinal pathologies in patients with advanced diabetic eye disease.

Methods: Fundus photos and SS-OCT were performed preoperatively in all patients scheduled for diabetic vitrectomy between January 2017 to August 2022. Fundus photos and SS-OCT scans were reviewed by two retina specialists. We used modified BIO-score on fundus photos to evaluate fundus clarity. This modified BIO-score was based on Nussenblatt scale of vitreous haze (5). According to this score a 5+ vitreous haze is the one in which no fundus can be seen while a 0 score was given to no vitreous haze and clear view of fundus. Findings on fundus photos were compared with findings on SS-OCT

Results: 38 eyes of 35 patients were included. Cataract of variable severity was present in 22 eyes. In our sample, 84.2% of cases had a BIO score of 3 or more and 31.6% had a BIO score of 4 or 5. The most common diagnosis on fundus photos was vitreous haemorrhage in 23 cases. While the most common diagnosis on SS-OCT was TRD in 21 cases. Only 3 cases had no view on SS-OCT.

Conclusions: SS-OCT may be beneficial in preoperative management of diabetic vitrectomy especially in cases of vitreous hemorrhage. SS-OCT should be considered as an adjunct to clinical examination for preoperative evaluation of retina when the fundus view is hazy such as in presence of vitreous hemorrhage

Abstract No.: 204746

When Bilateral Retinal Detachment Is Not Straightforward: Lessons From Multimodal Imaging

First Author: Swati **SHARMA**

Co-Author(s): Abhishek **KUMAR**, Ramandeep **SINGH**, Vishnu **TODI**

Purpose: To present a rare case of acute retinal necrosis causing panuveitis with retinal detachment: a diagnostic dilemma.

Methods: A 54-year-old male presented with complaints of sudden onset progressive diminution of vision in the left eye, followed by the right eye, after 4 months of being treated elsewhere as a case of panuveitis. Outside documents revealed treatment with suboptimal doses of oral steroids and methotrexate. Over time, he developed retinal detachment in his left eye, followed by his right eye, and was referred to a higher center with a diagnosis of bilateral exudative retinal detachment. Visual acuity in both eyes was hand motions. Intraocular pressure was 11mmHg OD and 10mmHg OS. The anterior segment showed pigmented keratic precipitates on the corneal endothelium. There was no significant past history. Systemic workup was WNL. The anterior chamber had no cells, and a few pigments were present on the anterior lens capsule; retrolental cells were also

present. On fundus examination, both eyes had retinal detachment with a sheet of vitreous condensation above the disc in the left eye; the peripheral retina had scarring and pigmentary changes. On indentation, no break was found in either eye.

Results: FAF of both eyes had tongue-shaped, well-defined hypoautofluorescent lesions with hyperautofluorescent borders with scalloped edges. SD-OCT revealed macular detachment. FFA revealed hyper- and hypofluorescent lesions in the periphery, suggestive of scarring. In the right eye, inferotemporal choroidal nonperfusion areas. Disc hyperfluorescence was seen in both eyes.

Conclusions: On the basis of tongue-shaped hypoautofluorescent lesions along with FFA showing CNP areas, a diagnosis of retinal detachment following acute retinal necrosis was made.

Abstract No.: 202096

Wide-Field Anterior Segment Shape Assessment With Anterior Segment Optical Coherence Tomography: A Comparison Between Keratoconus and Normal Eyes

First Author: Yuki **ARAI**

Co-Author(s): Takahiro **HIRAOKA**, Gaku **KIUCHI**, Tetsuro **OSHIKA**

Purpose: Scleral lenses and specialty soft contact lenses are increasingly reported as effective options for visual rehabilitation. Lens fitting is mainly influenced by scleral and peripheral corneal morphology, rather than the central cornea. However, peripheral shape characteristics in keratoconus (KC) eyes remain insufficiently investigated. We compared anterior segment morphology between KC and normal eyes.

Methods: We analyzed 23 normal eyes of 23 subjects (mean age, 37.2±17.8 years) and 16 KC eyes of 16 subjects (mean age, 37.8±17.2 years) with no history of ocular surgery. Anterior segment optical coherence tomography (CASIA2) was performed to obtain elevation maps. Mean sagittal height (Sag) values were derived using least-squares elliptical fitting at diameters of 3, 5, 7, 9, 11, and 13 mm. Sag differences (Δ Sag) between adjacent diameters (3–5, 5–7, 7–9, 9–11, 11–13 mm) were calculated and compared between groups.

Results: Δ Sag values at 3–5 mm, 5–7 mm, and 7–9 mm were significantly greater in KC than in normal eyes (265 ± 11.4 vs 344 ± 56.4 μ m, $p < 0.001$; 413 ± 18.7 vs 502 ± 76.9 μ m, $p < 0.001$; 569 ± 29.0 vs 629 ± 60.6 μ m, $p = 0.002$). No significant differences were observed at 9–11 mm (719 ± 41.8 vs 742 ± 57.5 μ m, $p = 0.185$) or 11–13 mm (795 ± 54.8 vs 794 ± 55.8 μ m, $p = 0.953$).

Conclusions: Within the central 9 mm, KC eyes showed greater morphological change compared with normal eyes. In contrast, no significant difference was found from the limbal cornea to the anterior scleral area,

suggesting similar peripheral configuration between groups.

Ocular Oncology and Pathology

Abstract No.: 200275

A Baso-Squamous Carcinoma of the Eyelids: An Extremely Rare Case

First Author: Raveesh BINDAL

Co-Author(s): Vishal SHARMA

Purpose: Co-existing squamous and basal cell carcinoma of eyelids- a 'Baso-squamous carcinoma', an extremely rare case.

Methods: A 60 year's 60-year-old male presented with complaints of redness and itching in the left lower lid, involving the fundus, for the past 2 years, associated with a history of a hyperpigmented nodular crusting in the same site, which was repeatedly scratched off by the patient himself. The BCVA at the time of presentation was found to be 0.00 logMAR in both eyes. Anterior segment findings were normal in both eyes. On incisional biopsy and histopathology, a diagnosis of nodular basal cell carcinoma was made. Wide local excision with dacryocystectomy was planned. On histopathology after wide local excision with dacryocystectomy, squamous cell carcinoma was seen with few dyskeratotic cells with perineural invasion. A diagnosis of collision tumour of the left eyelid was made and was confirmed using immunohistochemistry. PET scan showed no metastasis.

Results: Left eye baso-squamous carcinoma.

Conclusions: A baso-squamous carcinoma is an extremely rare and aggressive subtype of primary eyelid carcinoma, exhibiting features of both BCC and SCC, which may lead to misdiagnosis and inappropriate treatment. Hence, an aggressive approach is important for a prompt diagnosis.

Abstract No.: 200935

A Case Report of Leukocoria in a Ten-Year-Old Child

First Author: Purnima RAJKARNIKAR STHAPIT

Co-Author(s): Rachni GURUNG, Sadichhya SHRESTHA

Purpose: To describe a case of a child, who was first diagnosed as Coats disease, but whose results later turned out to be those of retinoblastoma, despite not having the typical symptoms of retinoblastoma.

Methods: A 10-year-old female presented with unilateral, gradual, progressive loss of vision and leukocoria for two months. Examination showed a fixed

dilated pupil with ectropion uvea and a dull yellowish glow in the pupil. Fundus examination showed total retinal detachment, subretinal exudates, and dilated tortuous vessels overlying it. CT scan showed diffuse hyperdense exudates and no calcifications. But in view of non-perception of light, unilateral disease, and a distant possibility of being a retinoblastoma, enucleation was done.

Results: Histopathology confirmed it to be a well-differentiated retinoblastoma.

Conclusions: Atypical retinoblastoma can have a varied presentation and hence it should always be kept as a differential diagnosis in a child of any age group presenting as leukocoria because misdiagnoses can sometimes be fatal in a case of retinoblastoma.

Abstract No.: 207163

A Case of Optic Disc Melanocytoma With Pigment Dispersion

First Author: Dengxue WANG

Co-Author(s): Guangjun XU

Purpose: To explore clinical features, multimodal imaging, and follow-up of optic disc melanocytoma (ODM) with pigment dispersion for accurate diagnosis.

Methods: Retrospective analysis of one ODM patient was done. Ocular exams (visual acuity, IOP: Intraocular Pressure, slit-lamp, fundus, visual field) and multimodal imaging (CFP: Color Fundus Photography, OCT: Optical Coherence Tomography, OCTA: Optical Coherence Tomography Angiography, FFA: Fluorescein Fundus Angiography, ocular ultrasound/CDFI: Color Doppler Flow Imaging) were performed, with 2-year follow-up.

Results: A 34-year-old male had left optic disc mass (incidental finding, no relevant history). Both eyes had uncorrected VA 5.0; IOP: 16mmHg (right), 17mmHg (left). Left fundus showed 2-disc-diameter brown lesion (covering optic disc, 3D elevation, feathery edge, vitreous pigment dispersion); left visual field had enlarged blind spot + arcuate defect. Multimodal imaging: CFP showed lesion/pigment; OCT had pre-disc hyperreflectivity with shadow; OCTA had lesion hyperreflectivity (near RPE) + minimal flow; FFA had early lesion fluorescence block + late annular hyperfluorescence; ultrasound had hyperechoic elevation + CDFI flow. 2-year follow-up: stable VA/IOP, no lesion change/malignancy.

Conclusions: Multimodal imaging (CFP+OCT+OCTA+FFA) is key for ODM diagnosis, differentiating uveal melanoma, and monitoring, despite ODM's benign nature with malignant risk.

Abstract No.: 202667**A Fading Tumour, a Failing Retina: Challenges in Retinoblastoma Management***First Author: Dayna YONG**Co-Author(s): Gangadhara SUNDAR, George THOMAS*

Purpose: A case of unilateral Group E retinoblastoma with good response to intra-arterial chemotherapy (IAC) complicated by retinal detachment (RD).

Methods: -

Results: A 5-year-old child was referred with a 1month history of altered light reflex and advised enucleation versus IAC, with potential side effects. Right eye had no perception to light (NPL) with relative afferent pupillary defect. Anterior segment was normal; posterior segment view had a large endophytic lesion with superficial hemorrhage along with diffuse vitreous haze precluding visualization of the optic nerve head and rest of retina. Left eye was normal. Neuroimaging showed a large intraocular lesion without orbital/brain involvement. Tests were negative for metastatic disease. Diagnosis was right Group E Retinoblastoma and patient underwent 2 cycles of IAC [Mephalan (5mg), Carboplatin (30mg) and Topotecan (0.4mg)]. On follow-up, the tumor regressed, but vitreous hemorrhage persisted despite a flat retina on ultrasound. Following third cycle of IAC, intravitreal Topotecan (90mcg/0.05ml) was administered with usual precaution. A month later an open funnel total RD with retinal folds developed despite a regressing lesion.

Conclusions: RD during retinoblastoma treatment may be rhegmatogenous or exudative, but was hard to determine in our patient due to poor view, especially post-intravitreal therapy. If exudative, resolution of fluid could be obtained. Due to poor prognosis (NPL), enucleation was advised.

Abstract No.: 202770**Achieving Complete Remission of Ocular Surface Squamous Neoplasia (OSSN) by Surgery Alone***First Author: Chun Loong TAN**Co-Author(s): Azlyn Aj, Mimiwati Z, Nur Musfirah Mahmud, Neshalene RATNA KRISHNAN*

Purpose: To report a case of OSSN successfully treated surgically without the use of topical chemotherapy.

Methods: Case report.

Results: An 83-year-old Chinese female presented with a painless growth on the right eye (RE) for 1 month. The right visual acuity is 6/12. There was no relative afferent pupillary defect. Examination showed the presence of a pedunculated conjunctival mass from the inferior nasal conjunctiva extending to two-thirds of the cornea. The mass measured 9.2 mm x 8 mm and was surrounded by engorged conjunctival vessels.

The right eyelid was erythematous. Extraocular muscle movements were full, and the anterior and posterior segments were unremarkable. Magnetic resonance imaging (MRI) orbit revealed a lobulated exophytic soft tissue lesion arising from the inferior conjunctiva of the right eye, extending to the anterior cornea, measuring 0.9 x 1.4 x 1.2 cm, with invasion of the right inferior tarsal plate but no extension beyond the orbital sclera or medial rectus muscle. Blood investigations and tumor markers were normal. The patient underwent RE-wide excision biopsy, and the histopathology report confirmed OSSN. Treatment with topical Mitomycin-C (MMC) was initiated for 2 days; however, the patient developed a total corneal epithelial defect, thus the treatment was immediately discontinued. A Bandage contact lens was inserted, and the patient was treated with topical levofloxacin and lubricating eye drops. The corneal epithelial defect healed completely within 2 months, with no signs of local recurrence after 2 years of follow-up.

Conclusions: Early diagnosis and surgical wide excision in OSSN may be able to prevent recurrence without the use of the conventional dose of MMC.

Abstract No.: 206435**Choroidal Melanoma – A Rarity***First Author: Abhishek**Co-Author(s): Shagun KORLA, Shreya NARANG, Jayant SHARMA*

Purpose: To report a rare case of choroidal melanoma in an elderly male

Methods: An 86-year-old male presented with painful loss of vision in right eye with right sided headache since 3 months with no history of nausea or vomiting. Ophthalmic examination showed no perception of light and projection of rays inaccurate in right eye with intraocular pressure measuring 42 mmHg by non contact tonometer. On slit lamp examination, circumciliary congestion was present, anterior chamber was flat, pupil was slightly dilated and non reacting with cataractous lens behind preventing the view of posterior segment. B-scan of the right eye showed collar button shaped lesion with solid consistency along with serous retinal detachment in the right eye. Contrast enhanced magnetic resonance imaging of brain showed a well defined lesion in the lateral half of posterior chamber of right globe along with retinal detachment and vitreous hemorrhage in the right eye.

Results: The patient was diagnosed with right eye large choroidal melanoma with no systemic metastasis. The patient was planned for enucleation of the right eye however was not cleared for the surgery due to underlying cardiac issues and was managed conservatively.

Conclusions: The choroid melanomas although rare occur more frequently in comparison to iris and ciliary

body melanoma and is the most common occurring intraocular malignancy amongst the adults. Melanoma tend to usually arise from sixth decade of age with increasing incidence with progressive age. It is a rare malignancy with incidence of 6 cases per million population.

Abstract No.: 203943

Ciliochoroidal Schwannoma Presenting As Neovascular Glaucoma

First Author: Abhishek KUMAR

Co-Author(s): Naintara CHAUHAN, Bhavna CHAWLA, Swati SHARMA

Purpose: To present a rare differential of choroidal mass presenting as neovascular glaucoma.

Methods: A female in her early 20s presented to the clinic with pain and slowly progressive diminution of vision in her left eye for around 14 months. BCVA in right eye was 6/6, and BCVA in left eye was positive for perception of light, and projection of rays was inaccurate in two quadrants with a stony, hard eyeball. On anterior segment evaluation, anterior chamber was irregularly shallow, more shallow towards the temporal area; the iris was atrophied with florid neovascularization of the iris with localized posterior synechiae. The pupil was poorly dilating, and RAPD was present. On gonioscopic examination, angles were closed around 270 degrees. Intraocular pressure on applanation was 42 mmHg. On fundus examination, total retinal detachment was seen; further details could not be examined in view of the poorly dilating pupil.

Results: USG B scan of left eye depicted a 12X10 mm heterogenous temporal choroidal mass with mild to moderate amplitude spikes with retinal detachment; kappa sign was not present. Ultrasonic biomicroscopy depicted a heterogenous mass arising from ciliary body. CEMRI had T1 isointense and T2 hypointense with a heterogenous enhancing pattern suggestive of a choroidal melanoma. Fine needle aspiration was done, which was acellular, and eventually enucleation was done, and histopathology showed S100 and SOX1-positive ciliochoroidal schwannoma.

Conclusions: Intraocular tumors, though rare, can be a cause of NVG and should be kept in mind. Ultrasonography B/A scan, ultrasound biomicroscopy and CEMRI in diagnosing in tricky situations like these.

Abstract No.: 202953

Clinical Prognostic Characteristics of Ocular Mucoepidermoid Carcinoma: A Retrospective Study

First Author: Runzi YANG

Co-Author(s): Jing LI, Rui LIU, Jianmin MA, Tingting REN, Nan WANG, Liangyuan XU

Purpose: This study evaluated the baseline features, clinical symptoms, pathological features, and prognostic factors of patients with ocular mucoepidermoid carcinoma.

Methods: This is a retrospective clinical study. A total of 27 patients with ocular mucoepidermoid carcinoma diagnosed by pathology were included, and their medical history data were collected.

Results: The mean age of onset of ocular mucoepidermoid carcinoma was 57.56 ± 18.99 years with no gender bias. The clinical manifestations were not specific, mainly mass, swelling, visual impairment and so on. The most common sources of tumors are the lacrimal gland, conjunctiva, and eyelid. MEC consists of different proportions of mucous cells, intermediate cells and epidermoid cells. The incidence of peripheral infiltration is high, and the most common invasion is peri-nerve, intraorbital structure, extraocular muscle and local lymphatic vessels. Surgical excision and combined radiotherapy are the most common treatment options. The overall survival rate was 92.6%, and one patient died of the disease. The recurrence rate of orbital mucoepidermoid carcinoma was high, and the three-year relapse-free survival rate was 59.0%. Univariate analysis of the prognostic factors of patients showed that the presence or absence of peripheral tissue invasion had an important impact on prognosis.

Conclusions: Ocular mucoepidermoid carcinoma has a high recurrence rate and a low mortality rate. Current treatments are associated with high survival rates. Patients with peripheral tissue invasion have a higher probability of recurrence and metastasis, requiring long-term follow-up and close observation.

Abstract No.: 203375

Clinical and Paraclinical Features of Ocular Adnexal Extranodal Marginal Zone B-cell Lymphoma

First Author: Lieu LE

Co-Author(s): Nam PHUNG, Hang TRAN

Purpose: Extranodal marginal zone B-cell lymphoma (EMZL) of the ocular adnexa is a rare non-Hodgkin lymphoma that can mimic benign orbital lesions. This study aimed to describe its clinical and paraclinical features.

Methods: A retrospective and prospective review was performed on 16 patients with ocular

adnexal EMZL diagnosed by histopathology and immunohistochemistry between January and October 2023. Clinical presentation, laboratory tests, imaging, and immunohistochemistry were analyzed.

Results: The mean age was 59.5 years; 68.8% were 51–70 years, with a male-to-female ratio of 1.7:1. A palpable orbital mass was the most common finding (87.5%), followed by proptosis (62.5%), ptosis (25%), and conjunctival hyperemia (18.8%). Systemic features included B symptoms (18.8%) and weight loss (25%). The main sites involved were orbital soft tissue (62.5%) and conjunctiva (50%); lacrimal gland and eyelid were less frequent. Right eye lesions predominated (62.5%), while bilateral disease occurred in 18.8%. PET-CT detected FDG uptake in 25% of cases, whereas 37.5% showed lesions without uptake. β 2-microglobulin and LDH levels were low. Immunohistochemistry showed positivity for CD20, BCL2, and Ki67, and negativity for CD3, CD5, BCL6, Cyclin D1, CD43, and CD23.

Conclusions: Ocular adnexal EMZL usually presents in late middle age with orbital masses. Diagnosis depends on histopathology and immunohistochemistry, characterized by CD20 and BCL2 positivity. PET-CT has limited sensitivity. Recognizing these features may support earlier diagnosis and management.

Abstract No.: 202577

Clinico-Demographic Profile and Survival of Retinoblastoma Patients in North Indian Population

First Author: Asha **DEVI**

Co-Author(s): Sanjay **BOSAK**, Priyanka

Purpose: To determine the clinico-demographic characteristics, survival rate and risk factors for children with retinoblastoma in Northern India.

Methods: In this retrospective observational case series, 86 children were reviewed over a period of 5 years. Socio-demographic characteristics, clinico-radiological features, histopathologic variables, treatment outcomes and survival rate were analyzed.

Results: A total of 86 patients (102 eyes) with retinoblastoma were studied. There were 64 male and 22 females. Age ranges from 3 months to 6 years (mean age 2.89 ± 0.93 years). Majority belonged to rural background (70.93%) and lower socioeconomic status (83.72%). 81.40% patients had unilateral involvement and 18.60 % had bilateral involvement. Mean duration of presentation was 5.35 months. The commonest mode of presentation was proptosis with orbital invasion (49.02 eyes) followed by leukocoria (44.12 % eyes) and squint (6.86 % eyes). 17.65% eyes had large fungating orbital mass. Histopathological high-risk features were present in 41.18 % eyes. 11.63 % patient had lymph node metastasis and 5.81% of patients had distant metastasis. Patients were managed by primary enucleation (39.53%), neoadjuvant chemotherapy

(62.79%) while exenteration was performed in 13.95% cases. Two patients died during treatment. The 3-year survival was 45.71% for unilateral cases and 37.50% for bilateral cases (Kaplan Meir method).

Conclusions: Commonest mode of presentation of retinoblastoma in Northern India is proptosis. Delayed presentation associated with poor prognosis and is due to ignorance and lack of awareness.

Abstract No.: 202694

Combined Lamellar Scleral Incision and Endoscopic Vitrectomy for Removal of a Giant Choroidal Melanoma: A Case Report

First Author: Shuai **SHENG**

Purpose: Choroidal melanoma, the most common adult intraocular malignancy, poses significant threats to vision and life due to its high metastatic potential and mortality. This study evaluates a combined surgical approach for a giant choroidal melanoma.

Methods: A 53-year-old female patient (Li) presented in December 2023 with a 2-month history of a left intraocular mass. Examination (including ultrasonography and MRI) revealed localized thickening in the temporal globe, suggestive of choroidal melanoma. The tumor (approximately 10mm x 10mm, encapsulated) was completely removed using a combined lamellar scleral incision and endoscopic vitrectomy.

Results: Histopathology confirmed choroidal melanoma. At 2 months postoperatively, best-corrected visual acuity (BCVA) was 1.0, indicating successful tumor removal with vision preservation.

Conclusions: This combined lamellar scleral incision and endoscopic vitrectomy approach proved effective for removing a giant choroidal melanoma while maximizing visual preservation. Compared to traditional methods with limitations such as significant trauma and incomplete tumor removal, this minimally invasive technique ensured tumor clearance with retinal integrity, offering a promising new surgical strategy.

Abstract No.: 205051

Conjunctival Myxoid Stromal Tumor (CSMT): Clinico-Pathological Profiles of a Rare Entity

First Author: Kaustubh **MULAY**

Co-Author(s): Santosh **HONAVAR**, Fairouz **PUTHYAPURAYIL**

Purpose: Conjunctival myxoid stromal tumors (CSMT) are rare conjunctival tumors arising from the primitive mesenchyme. The aim of this study was to elucidate the clinical features, light microscopic, and immunohistochemical findings of CSMT.

Methods: We retrieved 21 cases of orbital CSMT diagnosed between 2016 and 2025. Clinical findings,

histopathological features and immunohistochemical findings were evaluated.

Results: Age at presentation varied from 4 to 74 years (Mean = 48.7). Both children and adults were affected. A slight predilection for males was observed (M:F = 12:9). Most presented with a sub-conjunctival mass in the bulbar region that was often suspected to be a cyst. Histopathologically, CSMT is characterized by singly dispersed spindle to round cells, often displaying some degenerative nuclear atypia, within a myxomatous to collagenous stroma. Lesional cells were positive for CD34 and vimentin. None of the patients had a cardiac myxoma or had a recurrence.

Conclusions: CSMT is a rare mesenchymal proliferation with an indolent behaviour. Given its association with Carney complex, it is important that both pathologists and clinicians be aware of this entity and patients be screened systemically.

Abstract No.: 202808

Diagnosis and Treatment of Neonatal Retinoblastoma: A Case Series Analysis

First Author: Guoming **ZHANG**

Purpose: To analyze the clinical features, treatment, and prognosis of retinoblastoma in infants under one year of age.

Methods: We retrospectively analyzed 5 cases (7 eyes) of retinoblastoma diagnosed in infants younger than one year at Shenzhen Eye Hospital from 2020 to 2024. The cohort consisted of 2 males and 3 females, with age at diagnosis ranging from 1 to 11 months; 3 cases were unilateral and 2 were bilateral. Based on the International Intraocular Retinoblastoma Classification (IIRC), 2 eyes were staged as Group A, 2 as Group B, 1 as Group C, and 2 as Group D. All five patients underwent fundus imaging using the RetCam system. Systemic intravenous chemotherapy was performed using the vincristine, etoposide, and carboplatin, while focal therapy was treated with laser photocoagulation. The mean follow-up time was 24.8 months.

Results: Among the five patients, four received 3–6 cycles of systemic intravenous chemotherapy, while one patient underwent only focal treatment. Of the seven eyes, six were treated with laser photocoagulation. During the follow-up period, tumor recurrence occurred in three eyes, and one eye developed a new lesion. At the final follow-up, all seven eyes demonstrated either tumor regression or stable disease. No enucleations were performed, resulting in a 100% eye preservation rate.

Conclusions: Fundus screening in neonates facilitates the early detection of retinoblastoma. High rates of eye preservation can be achieved following systemic intravenous chemotherapy combined with focal treatment. Regular follow-up is essential for these patients.

Abstract No.: 205048

Endocrine Mucin-Producing Sweat Gland Carcinoma of the Eyelid: Reappraisal of Patient Demographics, Tumour Immunophenotypes and Prognosis

First Author: Kaustubh **MULAY**

Co-Author(s): Santosh **HONAVAR**, Vikas **MENON**, Fairouz **PUTHYAPURAYIL**

Purpose: Endocrine mucin-producing sweat gland carcinoma (EMPSGC) is a rare, low-grade adnexal neoplasm with predilection for the periorbital skin of older women. Histologically and immunophenotypically, EMPSGC is analogous to solid papillary carcinoma of the breast and a precursor of neuroendocrine-type mucinous carcinoma. We aim to elucidate the clinicopathologic features, immunohistochemical findings and prognostic significance of the neuroendocrine differentiation of EMPSGC and its associated carcinoma.

Methods: This was a retrospective analysis of 23 biopsy-proven cases of EMPSGC diagnosed at our Institute between 2014 and 2025. Information collected included patient demographics, clinical presentation, type of surgical intervention, light microscopic features, IHC findings, recurrences, and the presence of an invasive mucinous component.

Results: Results established an overall Male predominance (60.8%) and average presenting age of 64.4 years (Range 45–82). EMPSGC lesions were associated with adjacent mucinous carcinoma in 39.1% of cases. The recurrence rate for neuroendocrine-type MSC was 8.7%, less than the reported 30% for non-neuroendocrine MSC. There were no cases of metastasis.

Conclusions: EMPSGC and neuroendocrine-type Mucinous carcinoma are distinct entities with more indolent behavior than previously reported, supporting a favorable prognosis for patients.

Abstract No.: 208462

Endoscopic Transorbital Approach for the Management of Subperiosteal Orbital Hemorrhage

First Author: Qinying **HUANG**

Co-Author(s): Weili **ZHANG**

Purpose: Subperiosteal orbital hemorrhage (SOH) is mostly caused by facial or orbital trauma. However, nontraumatic SOH (NSOH) is a rare condition which is reportedly associated with systematic diseases, high cranial venous pressure or vascular malformations. Here, we present a patient who has been taking warfarin for long time suffering from NSOH after vomiting.

Methods: We presented a 54-year-old women who was suffering from sudden pain, upper lid swelling and

difficult opening in her left eye after severe vomiting. She had a history of cerebral infarction, atrial fibrillation and implantation of a prosthetic mechanical mitral heart valves. Thus, she has been taking warfarin for many years to prevent thromboembolic events. Her left upper eyelid could not be elevated at all, with marked tenderness of the eyelid, elevated intraorbital pressure and proptosis as well as restricted ocular motility upward or outward. Both direct and indirect light reflexes in left eye were disappeared. Unfortunately, she developed complete vision loss in her left eye. Image examination supported the diagnosis of NSOH.

Results: She underwent surgery to remove the hematoma via endoscopic transorbital approach (ETA) after modulating the coagulation function. Her visual acuity (VA) was improved to counting fingers, and other symptoms had disappeared after one month.

Conclusions: Conservative treatment is enough for most patients diagnosed of NSOH. When the patient's VA is heavily declined, surgery is necessary. The coagulation function and systemic diseases should also be considered at the same time to prevent severe complications. ETA is a reliable technique to remove the hematoma.

Abstract No.: 205118

Epidemiology of Ophthalmic Lymphoma in Chinese: A 14-year Population-Based Study

First Author: Allie LEE

Purpose: Ophthalmic lymphoma is a rare yet potentially sight- and life-threatening condition. However, population-based studies investigating the epidemiology of ophthalmic lymphoma in Chinese remain scarce. This study aims to investigate and update the incidence rates, histological subtypes and time trends of ophthalmic lymphoma in Chinese.

Methods: Patients diagnosed with primary ophthalmic lymphoma under the ICD-9 site codes 190.0-190.9 from 2005 to 2018 were retrieved from the database of Hong Kong Cancer Registry, the only facility in the territory collecting and validating cancer data from a 7.3 million population.

Results: A total of 295 primary ophthalmic lymphoma were included in the study. The overall age-standardized average annual incidence rate was 1.89 per 1,000,000 population. The incidence rate increased with age ($p < 0.001$). In the elderly group (80-84 years old), a higher incidence rate was observed in male than female. The most common histological type was extra-nodal marginal zone B cell lymphoma (69.2%), followed by diffuse large B cell lymphoma (11.9%) and follicular lymphoma (4.1%). The most common site was the orbit. Over the years, the incidence rate of ophthalmic lymphoma showed an increasing trend, with an annual percent change of 2%.

Conclusions: In Chinese population, the incidence of ophthalmic lymphoma was low but showed an increasing trend. Extra-nodal marginal zone B cell lymphoma was the most common histological type.

Abstract No.: 209601

Epigenetic Repression of ITIH5 by EZH2 Enhances EMT and Malignancy in Conjunctival Melanoma: A Reinforcing Circuit Linking Histone Methylation and Epithelial Plasticity

First Author: Jie CHEN

Co-Author(s): Renbing JIA, Shiqiong XU

Purpose: Disruption of histone modification balance is widely recognized as a defining feature of the epigenetic silencing of tumor suppressor genes. Nevertheless, the precise relationship between histone modification dynamics and the epithelial-mesenchymal transition (EMT) during tumor evolution remains obscure.

Methods: In this study, we delineate a self-reinforcing circuit connecting histone methylation to EMT that drives the progression of conjunctival melanoma (CoM).

Results: Our findings reveal that aberrant elevation of EZH2 expression promotes the accumulation of trimethylated histone H3 at lysine 27 (H3K27me3) in CoM cells, a modification that correlates closely with increased tumor malignancy. Pharmacologic or genetic inhibition of EZH2 markedly attenuates CoM growth and dissemination in both cell-based and animal models. Integrative multi-omics profiling further identified Inter- α -trypsin inhibitor heavy chain 5 (ITIH5) as a principal downstream target of EZH2. Mechanistic investigation showed that EZH2 directly enriches the H3K27me3 mark on the ITIH5 promoter region, resulting in transcriptional silencing. Loss of ITIH5 expression, in turn, enhances EMT activation and facilitates metastasis.

Conclusions: Collectively, these findings uncover a pivotal epigenetic feedback loop linking histone methylation to EMT and illuminate the broader framework of epigenetic-metabolic reprogramming that fuels repression of tumor suppressor pathways and tumor metastasis.

Abstract No.: 208309

Global Retinoblastoma Survival and Globe Preservation: A Systematic Review and Meta-Analysis of Associations With Socioeconomic and Health-Care Factors

First Author: Emily Suhan WONG

Co-Author(s): Lijia CHEN, Richard CHOY, Wai Kit CHU, Chi Pui PANG, Yuzhou ZHANG

Purpose: Despite advancements in globe-preserving treatments, improvements in retinoblastoma outcomes remain uneven across income levels and regions. This study aimed to assess global trends in retinoblastoma survival and globe preservation over the past four decades and to examine associated socioeconomic and health-care factors underlying these disparities.

Methods: A systematic review and meta-analysis were conducted across nine databases (PubMed, Embase, ScienceDirect, Web of Science, OpenGrey, Global Burden of Disease, Global Health Data Exchange, Global Index Medicus, and the International Agency for the Prevention of Blindness) for studies published between Jan 1, 1981, and Oct 8, 2021. Eligible studies reported overall survival and/or globe salvage in retinoblastoma. Data were stratified by decade (1980–89, 1990–99, 2000–09, 2010–20). Socioeconomic and health-care indicators were extracted from the World Bank, WHO, and IAPB databases. Mixed-effects meta-analysis and multivariable regressions were used to evaluate heterogeneity and associations. The study was registered with PROSPERO (CRD42020221556).

Results: Of 14,621 screened articles, 314 studies from 80 regions (38,130 patients) were included. Between 1980 and 2020, overall survival improved from 79% (95% CI, 74–84) to 88% (83–93; $p = 0.017$), and globe salvage from 22% (14–32) to 44% (36–52; $p = 0.0003$). Outcomes correlated positively with income level, education, and health-care accessibility, and inversely with Gini index and rural population percentage. Persistent survival gaps were noted in sub-Saharan Africa and Southeast/Southwest Asia.

Conclusions: Global retinoblastoma outcomes have improved substantially over the past 40 years; however, striking disparities remain. Enhanced health-care financing, access, and education are critical to narrowing the survival gap in low- and middle-income countries.

Abstract No.: 208206

Growth Hormone-Releasing Hormone Receptor Antagonist MIA-602 Suppresses Retinoblastoma via Downregulating MEK-ERK Signaling

First Author: Linbin ZHOU

Co-Author(s): Wai Kit CHU, Jiahui LI, Chi Pui PANG, Chee Yung THAM, Cheuk YAM

Purpose: Our previous works have shown that MIA-602, a growth hormone-releasing hormone receptor (GHRH-R) antagonist, can specifically exert pro-apoptotic effects on retinoblastoma (RB) cells in vitro, but its in vivo effects and the underlying mechanisms remain not fully understood. In this study, we aimed to investigate the in vivo anti-tumor effects of MIA-602 and the underlying mechanisms.

Methods: Cell counting kit-8 assays, colony formation assays, and flow cytometry analyses were utilized to determine the effects of MIA-602 or an ERK inhibitor on RB cell viability, proliferation, and apoptosis, respectively. Western blotting was used to measure MEK and ERK phosphorylation. An orthotopic cell line-derived xenograft (CDX) tumor model was established to test the anti-tumor effects of MIA-602 via TUNEL assays and immunostaining.

Results: MIA-602 substantially decreased the cell viability and colony formation, and increased the proportion of sub-G1 population of Y79 and WERI-Rb1 cells ($n=3-4$, $p<0.05$). Notably, intravitreal injection of MIA-602 promoted xenografted RB tumor apoptosis and hindered tumor growth ($n=6-7$, $p<0.05$). Conversely, GHRH-R agonist MR-409 markedly increased the proliferation of both cell lines ($n=3-4$, $p<0.05$). Mechanistically, MIA-602 decreased the phosphorylation of ERK and its upstream regulator MEK in both cell lines and the CDX tumor model, while MR-409 enhanced MEK and ERK phosphorylation in both cell lines. A selective ERK inhibitor suppressed ERK phosphorylation and abolished the pro-proliferative effects of MR-409 on both cell lines ($n=3-4$, $p<0.05$).

Conclusions: GHRH-R antagonist MIA-602 promotes apoptosis of RB cells via downregulating MEK-ERK signaling.

Abstract No.: 205897

Hemi-Retinal Vein Occlusion Following Transpupillary Thermotherapy for Small Choroidal Melanoma

First Author: Tavish GUPTA

Co-Author(s): Rohan CHAWLA, Neiwete LOMI, Nawazish Fatma SHAIKH

Purpose: To describe the clinical course and complications occurring during the management of a small choroidal melanoma abutting the optic disc that developed a hemi retinal vein occlusion (HRVO) after transpupillary thermotherapy (TTT).

Methods: A 38-year-old male presented with the complaint of floaters in the right eye. On examination, a pigmented choroidal mass was seen superior to the disc, around 2.2 mm thick, with 6.3 mm base. It had surrounding subretinal fluid and was diagnosed as a small posterior choroidal melanoma. He underwent two TTT sessions. Two months later he presented with gradual diminution of vision, and was found to have superficial haemorrhages, dilated tortuous and sclerosed vessels in ST quadrant and fibrosis at the site of choroidal mass with neovascularisation. Fluorescein angiography revealed regressed hypo-fluorescent lesions, blocked fluorescence from superficial haemorrhages, late hyper-fluorescence from neovascularisation and vast hypo-fluorescent areas of non-perfusion. HRVO was diagnosed and combination therapy with intravitreal anti VEGF injections (three doses) and sectoral pan retinal photocoagulation was started.

Results: TTT achieved complete tumor regression. HRVO produced superior hemisphere ischemia, NVD, and NVE without macular edema. Anti VEGF rapidly reduced neovascularization; staged laser consolidated ischemic retina. By 12 months, best corrected visual acuity improved to 6/9, neovascularisation resolved, and the choroidal scar remained flat with no recurrence.

Conclusions: TTT is an effective sight sparing option for small peripapillary choroidal melanomas, but retinal vascular occlusions must be anticipated as a complication, especially when major vessels traverse the treatment zone. Prompt recognition of HRVO and aggressive dual therapy can preserve vision.

Abstract No.: 206495

Her Eyes Had a Lot to Tell: Ocular Manifestations of Phakomatosis Pigmentovascularis

First Author: Shaifali **CHAHAR**

Co-Author(s): Santosh **HONAVAR**

Purpose: To describe an extremely rare entity where recognition of cutaneous changes guided the diagnosis of a vision-threatening ocular lesion, underscoring the importance of comprehensive clinical vigilance in rare syndromes.

Methods: A 24-year-old female with dermatological lesions presented with progressive, painless diminution of vision in the left eye for one month. Comprehensive ocular and systemic examination was performed, including multimodal imaging for ocular involvement. The lesion was managed with intravitreal anti-VEGF injection, and outcomes were monitored.

Results: Cutaneous examination revealed erythematous-to-violaceous cutaneous lesions with facial and limb involvement, along with ocular melanocytosis. These findings pointed towards

diagnosis of phakomatosis pigmentovascularis (PPV). Dilated fundus evaluation showed a pigmented juxtapapillary choroidal lesion with subretinal fluid. Multimodal imaging confirmed the lesion, and targeted anti-VEGF therapy led to complete resolution of subretinal fluid with stabilization of vision.

Conclusions: PPV is an exceptionally rare syndrome with highly variable ocular manifestations, which may go unnoticed unless the cutaneous lesions are recognized and a comprehensive examination is done by an ophthalmologist. Importantly, associations with uveal melanoma make recognition of these “clinical clues” vital for timely and life-saving intervention. In this case, careful attention to skin findings not only enabled diagnosis but also directed ocular evaluation, highlighting how multidisciplinary correlation can uncover rare but critical conditions. Even as a single case, this visually striking example demonstrates why ophthalmologists must be attuned to systemic cutaneous markers that herald ocular disease.

Abstract No.: 203987

Intraocular Lymphoma Masquerading as Endogenous Endophthalmitis: A Case Report Challenging the Diagnostic Utility of Aqueous Cytokine Ratios

First Author: Qiaozhu **ZENG**

Co-Author(s): Heng **MIAO**

Purpose: To report a case of intraocular lymphoma misdiagnosed as endogenous endophthalmitis in a middle-aged female presenting with blurred vision and scotoma.

Methods: The patient initially underwent diagnostic vitrectomy, intravitreal antibiotic injection (ceftazidime), and gas tamponade at an external hospital based on elevated intraocular cytokines (IL-6: 98.5 pg/mL, IL-8: 102.6 pg/mL, IL-10: 23.5 pg/mL; IL-10/IL-6 ratio: 0.2) and positive aqueous mNGS for *Cutibacterium acnes*. She underwent vitrectomy, intravitreal ceftazidime injection, and gas tamponade. Postoperative vitreous fluid analysis showed further elevated IL-6 (409.6 pg/mL) and IL-10 (320.0 pg/mL). Referral examination revealed raised gray-white retinal lesions with hemorrhages and vascular infiltration. Subsequent vitrectomy with electrocoagulation, retinal biopsy, endolaser, and silicone oil tamponade was performed. Histopathological examination confirmed the diagnosis of lymphoma.

Results: Histopathological analysis of the retinal biopsy confirmed the diagnosis of intraocular lymphoma. Postoperative management with intravitreal methotrexate and systemic rituximab led to gradual stabilization of the condition.

Conclusions: This case demonstrates that intraocular lymphoma, even of B-cell origin, may not always present with an IL-10/IL-6 ratio greater than 1. Retinal

biopsy remains the gold standard for definitive diagnosis, and targeted therapy can achieve disease control.

Abstract No.: 202655

Intraocular Seeding After Carbon Ion Therapy for Choroidal Melanoma

First Author: Seito HIRAOKA

Co-Author(s): Takahiro HIRAOKA, Sujin HOSHI, Tetsuro OSHIKA, Kuniharu TASAKI

Purpose: Carbon ion therapy is a highly effective local treatment for choroidal melanoma, providing excellent tumor control while preserving the eye. However, rare complications such as intraocular seeding have not been well described. We report a case of intraocular tumor dissemination following carbon ion therapy, aiming to raise awareness of this potential post-treatment complication and emphasize the importance of vigilant follow-up.

Methods: A 73-year-old male with a history of vitrectomy for retinal detachment was referred for evaluation of a choroidal mass. MRI revealed an 8-mm lesion in the posterior globe, and IMP scintigraphy showed increased uptake, consistent with choroidal melanoma. The patient underwent carbon ion therapy. Ophthalmic examinations were performed periodically to monitor tumor response and ocular status.

Results: Eight months post-treatment, the patient experienced new-onset floaters and photophobia. Ophthalmic examination revealed dense vitreous opacities with numerous pigmented deposits suggestive of intraocular seeding. Enucleation was performed. Histopathological analysis confirmed tumor infiltration of the retina and penetration into the vitreous cavity. No systemic metastasis was detected. This case illustrates that intraocular dissemination can occur despite tumor shrinkage after radiotherapy, highlighting a potential route for tumor spread through the vitreous cavity.

Conclusions: Intraocular seeding after carbon ion therapy, although rare, should be considered a possible complication in choroidal melanoma management. Regular and thorough post-treatment ophthalmic monitoring is essential for early detection. Prompt intervention, including enucleation when necessary, may help prevent further ocular and systemic complications. Awareness of this potential outcome is important for clinicians managing patients with choroidal melanoma treated with advanced radiotherapy techniques.

Abstract No.: 206995

Intraocular Surgery in Children With Pretreated Retinoblastoma: Long-Term Results

First Author: Denis VOLODIN

Co-Author(s): Ivan OSOKIN, Vera YAROVAYA, Andrey YAROVY

Purpose: To evaluate long-term anatomical and functional results and local and systemic safety of intraocular surgery (IOS) in children with pretreated retinoblastoma (Rb).

Methods: IOS was performed in 34 patients (35 eyes) with pretreated Rb. The mean patients' age was 68 months (28-180 mo.). IOS was conducted from 6 to 140 months (median – 20 mo.) after completion of organ-preserving treatment. Best-corrected visual acuity (BCVA) before IOS varied from light perception to 0.2 (median 0.01). Cataract surgery (CS) was performed in 33 patients (34 eyes) using phacoaspiration (n=31) or lensvitrectomy (n=3) technique. Vitreoretinal surgery (VRS) with melphalan irrigation was conducted in 12 patients (12 eyes). Indications for VRS were subtotal/total dense vitreous hemorrhage (n=10) and subtotal retinal detachment with tractions (n=2). In 11 patients VRS was combined with CS.

Results: Transparency of optical media and tumor control was restored in all patients. In the long-term follow-up (6-104 mo., median – 32) secondary cataract developed in 34% of patients. There were no complications after CS without VRS, while after VRS or combined IOS 5 eyes presented with phthisis bulbi. BCVA after IOS made up from 0.005 to 0.5 (median 0.1) and statistically significantly increased in comparison with pre-operative values (p=0.0001). Overall, 92% of the eyes were retained (n=32). 3- and 5-years' rate of recurrence-free survival made up 97%. The median follow-up after IOS was 57 months (6-120 mo.).

Conclusions: Intraocular surgery proved to be a highly effective and safety method to restore fundus and tumor control in children with intraocular complications of organ-preserving Rb treatment with recurrence-free survival rate of 97%.

Abstract No.: 206922

Intravitreal Anti-VEGF and Dexamethasone Therapy in Patients With Uveal Melanoma After Gamma-Knife Stereotactic Radiosurgery

First Author: Ekaterina MALAKSHINOVA

Co-Author(s): Vera YAROVAYA, Andrey YAROVY

Purpose: To present the results of anti-VEGF and ID in patients with ME after SRS of UM.

Methods: Anti-VEGF and ID was performed in 21 patients (21 eyes) with ME, which developed after radiation therapy with SRGK of UM. Among them, 5

(24%) patients were men, 15 (72%) were women. The average age of patients was 39 years (from 14 to 63 years). The average visual acuity (VA) before treatment was 0.21 (range from 0.002 to 0.7). According to optical coherence tomography, the average value of central macular thickness (CMT) at the time of diagnosis of ME was 330 ± 86 microns, the average value of volume cube (VC) – 12 ± 2 . The average amount of intravitreal injections was 3 (from 1 to 10).

Results: The average VA after anti-VEGF was 0.4. Based on the data of changes in VA, 14% patients had stabilization of the process, 57% showed improvement. According to optical coherence tomography, the average CMT value after anti-VEGF was 251 ± 95 microns ($p < 0.001$), and the average VC value was 8 ± 4 ($p < 0.001$).

Conclusions: The first experience of intravitreal anti-VEGF and ID has shown its effectiveness in reducing the height of CMT and improving or stabilizing visual acuity, which makes reasonable their use in cases with post-radiation ME.

Abstract No.: 200673

Iris Tumor & Associated Glaucoma: A Diagnostic and Therapeutic Challenge

First Author: Adnan **ABDUL MAJEED**

Purpose: This case highlights the importance of early recognition, accurate diagnosis, and tailored management strategies in Uveal malignancies

Methods: case report

Results: A 20 year-old female presented with a gradually enlarging pigmented lesion in the left iris, associated with mild photophobia and visual loss. Slit-lamp examination revealed a well-circumscribed, pigmented nodular mass in the inferior quadrant of the iris with multiple small pigmentary seeding on anterior surface. Intraocular pressure was raised in the left eye and there was absolute cup in left eye. Ultrasound biomicroscopy demonstrated a lesion extending 5 clock hours, with moderate internal reflectivity.

Conclusions: Iris melanoma, though uncommon, should be considered in the differential diagnosis of iris masses. Early diagnosis, aided by advanced imaging and cytology, enables organ-preserving surgical intervention. This case underscores the critical role of ophthalmologists and oncologists in the collaborative management of ocular melanomas.

Abstract No.: 202439

Local Resection via Partial Lamellar Sclerouvectomy for Ciliary Body Tumors

First Author: Xiaolu **YANG**

Purpose: This study aims to report our experience in managing this rare condition, with a focus on large tumors involving more than 5 clock hours. We also evaluate surgical outcomes and complications

associated with local resection via partial lamellar sclerouvectomy (PLSU) in four cases of ciliary body tumors treated in China.

Methods: This study reviewed four cases of ciliary body tumors managed by PLSU at Shanghai General Hospital from October 2019 to April 2023. Tumor features, histopathologic results, postoperative complications, visual acuity, and surgical outcomes were assessed at a mean follow-up of 20.8 months.

Results: Four patients with a mean age of 31.8 years were enrolled in this study. Histopathological examination revealed adenoma of the non-pigmented ciliary epithelium, schwannoma, and multiple iris and ciliary pigment epithelial cysts. The mean largest basal tumor diameter was 6.00 mm (range: 2.00–10.00), and the mean tumor thickness was 3.50 mm (range: 2.00–5.00). Preoperative complications included cataract in three eyes (75%), lens dislocation in two eyes (50%), and secondary glaucoma in one eye (25%). Transient ocular hypotony occurred in one patient, with no other postoperative complications observed. At a mean follow-up of 20.8 months, best-corrected visual acuity improved in three eyes and remained stable in one eye. No tumor recurrence was observed in any eye.

Conclusions: PLSU is an effective and safe technique for the local resection of ciliary body tumors. With thorough preoperative evaluation and meticulous surgical technique, procedure-related complications can be effectively managed.

Abstract No.: 202836

Management of Recurrent Orbital Solitary Fibrous Tumour in an Elderly Male: A Multimodal Therapeutic Approach

First Author: Piyush **BAJAJ**

Co-Author(s): Nikita **NUPUR**

Purpose: To highlight the diagnostic challenges, clinical progression, and multimodal management of a recurrent orbital solitary fibrous tumour (SFT) in an elderly male, with emphasis on the role of vigilant follow-up in preventing delayed detection of recurrence.

Methods: A 65-year-old male presented with progressive proptosis and right orbital swelling for 3 months. Two years earlier, he had undergone orbitotomy with mass biopsy and lid reconstruction elsewhere, where histopathology suggested a spindle cell neoplasm/solitary fibrous tumour. The patient was subsequently lost to follow-up. On current presentation, best-corrected visual acuity was perception of light negative in the right eye and 6/18 in the left eye; intraocular pressure in the right eye was not recordable. Imaging (MRI orbit/brain with contrast, ultrasound abdomen, CT chest) and immunohistochemistry confirmed recurrent orbital SFT. The patient underwent repeat orbitotomy with

superficial mass excision biopsy and lid reconstruction, followed by adjuvant radiotherapy.

Results: Histopathology with immunohistochemistry reconfirmed recurrent orbital SFT. Surgical excision and lid reconstruction were completed successfully, and adjuvant radiotherapy was initiated to mitigate the risk of further recurrence after a medical oncologist opinion.

Conclusions: Orbital solitary fibrous tumour is a rare entity that carries the potential for recurrence and, rarely, metastasis. Loss to follow-up after primary surgery may delay recognition of regrowth and worsen prognosis. MRI and immunohistochemistry remain indispensable for diagnosis. Surgical re-excision, when feasible, combined with adjuvant radiotherapy, represents an effective multimodal therapeutic strategy for recurrent disease. Vigilant, long-term surveillance is critical in optimizing outcomes.

Abstract No.: 201720

Methotrexate-Associated Lymphoproliferative Disorder Presenting as an Orbital Mass in Rheumatoid Arthritis: A Rare Case Report

First Author: Fumiko **MURAO**

Co-Author(s): Takafumi **MISAKI**, Yoshinori **MITAMURA**, Ryoji **YANAI**

Purpose: Methotrexate-associated lymphoproliferative disorder (MTX-LPD) is a subtype of iatrogenic immunodeficiency-associated lymphoproliferative disorders caused by long-term administration of methotrexate (MTX). Although MTX-LPD can occur in various organs, orbital involvement is extremely rare. We present a case of orbital MTX-LPD in a patient with rheumatoid arthritis.

Methods: A 71-year-old woman with rheumatoid arthritis under long-term MTX therapy presented with a 2-week history of left upper eyelid swelling and vertical diplopia. Ophthalmic examination, orbital magnetic resonance imaging (MRI), and biopsy were performed. Laboratory blood tests and systemic evaluation with chest computed tomography (CT) were also conducted.

Results: MRI revealed a well-circumscribed, homogeneous mass, approximately 3 cm in diameter, in the lateral left orbit, displacing the globe nasally. Orbital biopsy confirmed diffuse large B-cell lymphoma (DLBCL). Chest CT showed multiple ground-glass opacities in both lungs. Based on these findings, MTX-LPD was strongly suspected, and MTX was discontinued. One month after withdrawal, eyelid swelling and diplopia resolved completely.

Conclusions: Orbital involvement of MTX-LPD is rare but should be considered in patients under long-term MTX therapy presenting with eyelid swelling or diplopia. Prompt recognition and withdrawal of MTX

can lead to resolution of symptoms, highlighting the importance of early diagnosis and management.

Abstract No.: 201408

Miliary Pattern With Malignant Twist

First Author: Chin Ling **TAN**

Co-Author(s): Wendy See **YEN NEE**

Purpose: This report describes the nuances in differentiating miliary TB from malignant causes on CXR along with key clinical features.

Methods: Case report

Results: A 67-year-old male, ex- chronic smoker, previously healthy presented with 6 month's right eye loss of vision with pain and redness for one month, associated with constitutional symptoms. Right visual acuity was light perception with RAPD positive and neovascular glaucoma. There was vitreous hemorrhage with no fundus view. B-scan demonstrated a dome-shaped choroidal lesion with moderate internal reflectivity. Left eye visual acuity was 6/24 with yellowish choroidal lesion with subretinal yellowish deposits at superotemporal fundus and hyperpigmented scars inferiorly. Systemic examinations revealed bilateral cervical lymphadenopathies. Mantoux test was 18mm with CXR showing miliary pattern of diffuse reticulonodular interstitial opacities and enlarged right hilum. He was initially suspected to have ocular tuberculosis due to regional endemicity. However, further history revealed a positive family history of malignancy. Carcinoembryonic antigen was significantly raised above 2800ng/mL. CT scan of thorax, abdomen and pelvis demonstrated necrotic lung mass with multiple distant metastases. Lung biopsy confirmed adenocarcinoma with EGFR mutation positive, twisting the diagnosis to primary pulmonary adenocarcinoma with multiple distant metastases including the choroid. Patient succumbed to his disease 5 weeks from initial presentation before the induction of chemotherapy.

Conclusions: Bilateral choroidal metastasis is rare. Although uncommon, pulmonary adenocarcinoma is an important differential of miliary CXR pattern. The significant overlap of infectious and malignancy etiologies highlights the need for high clinical suspicion to prevent inevitable morbidity and mortality.

Abstract No.: 205675**Multidisciplinary Approach in Recurrent Orbital Leiomyosarcoma: Aggressive Surgical Management and Adjuvant Therapy Outcomes***First Author: Anindita WICITRA**Co-Author(s): Kartika BROHET, Rizky DJAMAL, Handoko YOSSARSONGKO*

Purpose: Primary orbital leiomyosarcoma is a rare malignant neoplasm of mesenchymal origin. It predominantly occurs in the older population and has been reported in various ocular and periocular sites. This report describes a case of recurrent orbital leiomyosarcoma, therapeutic challenges, and management outcomes.

Methods: Case report.

Results: A 69-year-old woman presented with progressive, painless left eye proptosis over several months. She had a history of palatal mass excision at another hospital. Ophthalmic examination revealed reduced visual acuity, restricted ocular motility, and a palpable mass at the lower eyelid extending into the left maxilla. Fundoscopy showed optic disc edema with blurred margins, consistent with compressive optic neuropathy. CT scan of the paranasal sinuses demonstrated a solid lesion involving the left nasal cavity, maxillary, ethmoid, and frontal sinuses, with destruction of the inferomedial orbital rim, orbital extension, and infiltration of the inferior and medial rectus muscles, as well as adhesion to adjacent masticatory muscles. The patient underwent left orbital exenteration. Histopathology revealed spindle cell proliferation, while immunohistochemistry was vimentin and desmin positive, S-100 negative, confirming leiomyosarcoma. As proton beam therapy was unavailable, external beam radiotherapy was initiated. However, local recurrence in the left maxilla occurred during treatment, necessitating debulking. The tumor was unresponsive to subsequent radiation therapy, and further progression with temporal lobe infiltration was confirmed on brain CT. Her condition deteriorated, and she passed away two months later.

Conclusions: Due to its rarity, diagnosis often requires a combination of imaging, histopathology, and immunohistochemistry. The standard management approach consists of orbital exenteration and adjuvant radiotherapy.

Abstract No.: 205919**Orbital Anatomical Variations Between the Southern China and the Kashi Populations Based on 3D-CT Analysis***First Author: Meng WANG*

Purpose: This study aims to characterize regional variations in orbital morphology between populations from Southern China and Kashi through

three-dimensional computed tomography (CT) measurements, providing anatomical references for clinical practice.

Methods: In this observational cross-sectional study, CT scans of 80 patients (160 eyes) from Zhongshan Ophthalmic Center and The First People's Hospital of Kashi were analyzed using Mimics Research software. 25 orbital parameters were measured, including orbital volume, orbital fat volume, extraocular muscle volume, and various orbital dimensions.

Results: The orbital height was significantly greater in the Southern group compared to the Kashi group (35.99 ± 2.13 mm vs. 34.49 ± 2.89 mm; $P < 0.001$), and the orbital index (OI) was also significantly higher in the Southern group (95.55 ± 6.81 vs. 91.91 ± 5.12 ; $P < 0.001$). The Kashi participants exhibited significantly greater medial orbital depth (41.62 ± 2.67 mm vs. 40.70 ± 2.57 mm; $P = 0.028$) and smaller exophthalmos (15.66 ± 2.13 mm vs. 16.50 ± 2.31 mm; $P = 0.018$). Additionally, the Kashi group displayed significantly shorter sphenoid trigone length (11.25 ± 3.14 mm vs. 12.64 ± 3.19 mm; $P = 0.006$) and narrower sphenoid trigone width (7.44mm, IQR: 3.12 vs. 8.96mm, IQR: 2.65; $P = 0.001$).

Conclusions: This study provided a comprehensive comparison of orbital anatomy between populations from Southern China and Kashi, confirming that the Kashi group exhibits smaller orbital height, OI, exophthalmos, and sphenoid trigone dimensions, but greater medial orbital depth, which are essential anatomical features for planning decompression surgeries, orbital fracture reconstructions, and diagnosing conditions.

Abstract No.: 202385**Orbital Natural Killer/T-Cell Lymphoma***First Author: Jing LI**Co-Author(s): Jianmin MA*

Purpose: To evaluate the clinical features, pathological findings, treatment, and prognosis of patients with orbital natural killer/T-cell lymphoma (NKTCL).

Methods: This retrospective study collected clinical data from 11 patients diagnosed with orbital NKTCL by pathological examination at Beijing Tongren Hospital, Capital Medical University, between November 2005 and March 2024. The patients were followed up to assess their prognosis.

Results: The median age of patients with orbital NKTCL was 51 years, with a slight male predominance. All cases were unilateral, with clinical presentations of eyelid or periorbital swelling, and other symptoms including decreased vision (90.9%), conjunctival congestion (90.9%), ocular motility disorders (81.8%), proptosis (63.6%), and ptosis (36.4%). All patients had surrounding tissue involvement, with the most common sites being the eyelid (11 cases), eyeball wall (7

cases), and lacrimal gland (5 cases). Additionally, 63.6% of patients had concurrent soft tissue involvement of the nasal region, while 36.4% had isolated orbital NKTCL. Pathological examination revealed diffuse proliferation and infiltration of atypical lymphocytes, occasionally with necrosis. All patients underwent ocular surgery, 7 received postoperative chemotherapy, and one received concurrent local radiotherapy. Follow-up (median duration: 120 months) revealed poor prognosis, with 5 patients lost to follow-up, 5 deaths, and only one survival without recurrence.

Conclusions: Orbital NKTCL is highly aggressive, rapidly progressive, and has a poor prognosis. When anti-inflammatory and corticosteroid therapies prove ineffective, early biopsy for histopathological confirmation is strongly recommended. Upon diagnosis, prompt chemotherapy and radiotherapy should be initiated to improve the patient's prognosis.

Abstract No.: 200236

Orbital Rhabdomyosarcoma in the Pediatric Population: A Prospective, Observational Study From Mid-West Nepal

First Author: Pradeep BASTOLA

Purpose: This study was aimed to find out the demographic characteristics, clinical characteristics and prevalence of rhabdomyosarcoma in children presenting to a tertiary level hospital of terrain Nepal, over a period of nine years. The study also aimed to explore the current understanding of rhabdomyosarcoma management.

Methods: This prospective, observational study was carried out in a tertiary hospital of Mid-Western part of Nepal from November 2011 to April 2019. Histopathologically confirmed cases of rhabdomyosarcomas were included in the study. Demographics, clinical characteristics and other relevant findings were entered in a specified proforma for the study and analyzed by Statistical Package for Social Services 24. Point estimate at 95% Confidence Interval was calculated along with frequency and percentage for binary data.

Results: Among 1,180 suspected children, eight (0.68%) (0.29-1.3 at 95% CI) study subjects were diagnosed to have unilateral orbital rhabdomyosarcoma. Males six (75%) outnumbered the females. The mean age of presentation was seven, 7+/-1.8 (Range: 6-8) years. Embryonal variant of rhabdomyosarcoma (6, 75%) was the commonest type, followed by the alveolar type (2, 25%). Proptosis was the commonest presenting feature and was present in all (8, 100%) study subjects.

Conclusions: The prevalence of rhabdomyosarcoma was higher in the current study when compared with similar international studies. The embryonal variant of rhabdomyosarcoma was the commonest type

encountered. Male predilection for rhabdomyosarcoma was high when compared to the females.

Abstract No.: 204685

PRR11 as a Newly Identified Oncogenic Driver in Retinoblastoma

First Author: Yu HE

Co-Author(s): Bo GONG

Purpose: Retinoblastoma (RB) is the most common pediatric intraocular malignancy and remains life-threatening without early treatment. Current therapies lack effective molecular targets beyond RB1 gene mutations. This study aimed to identify novel oncogenic drivers and therapeutic targets in RB.

Methods: Transcriptomic analyses of four RB-related datasets (GSE125903, GSE110811, GSE97508, and GSE24673) from the Gene Expression Omnibus (GEO) database were performed to screen candidate genes. Single-cell transcriptomics was used to determine cell type-specific expression patterns. Functional validation of candidate genes was conducted in vitro and in vivo. Coimmunoprecipitation mass spectrometry (co-IP/MS) was employed to identify protein interactions, and proteomic analysis was used to explore downstream signaling pathways.

Results: Proline Rich 11 (PRR11) was identified as a significantly overexpressed gene in RB. Single-cell transcriptomics revealed heterogeneous expression, with high levels in tumor-associated populations such as cone precursor-like cells and MKI67+ photoreceptorless-degenerated cells. Functional experiments demonstrated that PRR11 promotes RB cell proliferation and tumor growth. Co-IP/MS revealed that the deubiquitinase OTUB1 interacts with and stabilizes PRR11, sustaining its high expression. Proteomic analysis showed that PRR11 suppresses Dickkopf WNT signaling pathway inhibitor 3 (DKK3), leading to aberrant activation of Wnt/ β -catenin signaling, upregulation of cyclin D1, and accelerated S/G2M cell cycle progression.

Conclusions: This study establishes PRR11 as an oncogenic driver in RB and uncovers the OTUB1-PRR11-DKK3 axis as a regulatory mechanism of Wnt/ β -catenin signaling in RB tumorigenesis. Targeting PRR11 and its downstream pathways may provide a novel therapeutic strategy for RB treatment.

Abstract No.: 201173

Paradoxical Masquerade of Granulomatous Panuveitis as Retinoblastoma

First Author: Darren Anthony KHOW

Co-Author(s): Bryan Vincent MESINA

Purpose: To report the case of a patient presenting with a painful blind eye suggestive of retinoblastoma, but on histology, only showed chronic inflammation.

Methods: Presented in this report is the case of an eight-year-old female who came in for blurring of vision, leukocoria, eye redness, and pain of the right eye, with findings of band keratopathy, shallow chambers, a cataractous lens, and marked anterior chamber activity, with an initial diagnosis of chronic panuveitis.

Results: Over the course of her consults, she eventually presented with buphthalmos, prompting cranial imaging which showed suspicious intraocular calcifications, leading to a diagnosis of retinoblastoma. Neoadjuvant chemotherapy was initiated, and enucleation was done. After enucleation of a blind, painful eye, histopathology showed no signs of retinoblastoma, confirmed by slide review, now leading back to a diagnosis of chronic panuveitis.

Conclusions: Uveitis and retinoblastoma are two very distinct entities, and while there may be instances where significant overlap of signs and symptoms may be present, it is crucial to differentiate the two as management is drastically different for both disease entities.

Abstract No.: 203231

Primary Localized Conjunctival Amyloidosis: A Rare Clinical Case Report

First Author: Ariunbat LKHAGVASUREN

Co-Author(s): Amarsanaa DELGERJAV, Selenge ENKHBAYAR, Tumenjargal ERDENEBAATAR, Bayasgalan PUREVDORI

Purpose: Localized conjunctival amyloidosis typically presents as recurrent or persistent conjunctival masses, resulting in ocular irritation, cosmetic deformity, or visual disturbance. Because of its rarity and nonspecific presentation, misdiagnosis or delayed diagnosis is common. Here, we present a rare case of primary localized conjunctival amyloidosis (PLCA) in a Mongolian patient.

Methods: A 64-year-old Mongolian male presented with progressive bilateral eyelid swelling and ptosis of both upper and lower eyelids, accompanied by ocular irritation, foreign body sensation, and gradually worsening visual acuity since 2015. A nodule first noted in the right lower eyelid had progressively enlarged. His past medical history was unremarkable, except for right eye trauma from a whip injury in 2004. On examination, best-corrected visual acuity was 6/7.5 in both eyes, intraocular pressure was 18 mmHg bilaterally, and slit-lamp evaluation revealed bilateral conjunctival nodules with a pinkish-yellow, papilliform appearance; fundoscopy showed normal optic discs and macula.

Results: Management The patient underwent excisional biopsy of the lesions under local anesthesia. Cryotherapy was applied to the lesion base to reduce recurrence risk. Histopathological analysis of excised

tissue confirmed amyloid deposition, consistent with primary localized conjunctival amyloidosis. Systemic Work-up Further investigations, including blood tests and imaging studies, ruled out systemic amyloidosis, particularly in the kidneys, heart, and liver. The final diagnosis was primary localized conjunctival amyloidosis (PLCA).

Conclusions: Primary localized conjunctival amyloidosis is a rare ocular condition that may mimic other conjunctival lesions. Excisional biopsy with adjunctive cryotherapy is an effective treatment, and systemic evaluation is essential to exclude generalized disease.

Abstract No.: 204162

Primary Orbital Low-Grade Myofibroblastic Sarcoma: A Case Report and Literature Review

First Author: Zhao YUN

Purpose: Low-grade myofibroblastic sarcoma (LGMS) is an exceedingly rare malignant mesenchymal spindle-shaped cell tumour. It mostly occurs in the head and neck, extremities and other body parts.

Methods: LGMS rarely involves the orbit or ocular adnexa. We report a case of a 43-year-old woman with a history of progressive proptosis of the left eye and painful swelling for one year. The special features of orbital computed tomography in this case have not been reported in the previous literature. Imaging of the orbit showed a large irregular soft tissue mass with calcified plaques inside. The patient underwent a lateral orbitotomy, and the tumour was completely excised. The histopathological diagnosis was orbital low-grade myofibroblastic sarcoma. The patient refused adjuvant therapy. Fortunately, no recurrence was found in the follow-up period of 8 months.

Results: Orbital LGMS appears to have unique clinical features, and the best treatment has not yet been established.

Conclusions: As in a previous study, surgical resection and combined adjuvant therapy can improve the prognosis. Regular long-term follow-up after surgery is mandatory.

Abstract No.: 205056

Primary Orbital Yolk Sac Tumor (Endodermal Sinus Tumor): A Rare Entity

First Author: Kaustubh MULAY

Co-Author(s): Megha BANKA, Santosh HONAVAR

Purpose: Yolk sac tumor is an infrequent, malignant germ cell tumor that typically originates in the gonads. Primary, extra-gonadal involvement is uncommon and orbital location as primary site is extremely rare. We aim to describe the clinical presentation, imaging features, histopathological characteristics, and management of orbital YST.

Methods: We report on a yolk-sac tumor in a 17-month-old child.

Results: The female child presented with gradually increasing protrusion of the left eye since 1-year with episodes of waxing and waning in size. Imaging studies showed a well-defined, lobulated, intra-conal mass with solid and cystic components. Light microscopic examination and subsequent immunostaining confirmed the diagnosis of a yolk sac tumor. Systemic evaluation was normal.

Conclusions: Diagnosing orbital yolk sac tumor and distinguishing it from other orbital lesions, including those of congenital, benign, or malignant origin, is critical for its prompt treatment.

Abstract No.: 202428

Profile of Retinoblastoma Survivors in Nepal

First Author: Ben LIMBU

Purpose: Retinoblastoma is rare disease but potentially fatal if left untreated. This study aimed to evaluate demographic profile, treatment and complications in survivors of retinoblastoma in tertiary eye care center in 2019

Methods: This is multicentric hospital based cross sectional study conducted from January 2019 to December 2019 after ethical clearance from National Health Research Council. All post-treatment cases of retinoblastoma who had completed at least 1-year follow-up examination in any of our retinoblastoma (RB) center in 2019 were included whereas newly diagnosed and ongoing treatment cases and those failed to consent were excluded. Data based on demographic profile, ethnic and geographical distribution of RB survivors was collected and entered into Microsoft Excel 2016. Statistical analysis was performed using Statistical Package for Social Sciences version 20

Results: A total of 37 RB survivors that included 24(64.9%) female and 13(35.1%) male. Of the total, 34 (91.8%) survivors had unilateral (Right Eye 18, Left Eye 16) involvement whereas 3(8.1%) bilateral involvement. The mean age at diagnosis and study time was 38.65 ± 37.43 months (3-214 months) and 93.46 ± 65.58 months (16-252 months) respectively. Primary enucleation was commonest mode of treatment (64.9%). Majority of survivors belonged to upper caste group 20(54.1%) and mostly from Bagmati 15(40.5%) followed by province-2 (21.6%)

Conclusions: Descriptive study showed that most of survivors had undergone enucleation due to delayed presentation with poor prognosis. Early diagnosis and appropriate treatment modality are prerequisite for salvaging life of child, sight and eyeball

Abstract No.: 206887

Relapsed Acute Lymphoblastic Leukaemia With the Solitary Feature of Bilateral Eyes Masquerade Uveitis

First Author: Yi Hao YAP

Co-Author(s): Zjen Pang MOI, Wendy Yen Nee SEE, Lik Wei TIONG

Purpose: Reporting a rare case of relapsed leukemia presenting with the solitary feature of bilateral eyes' severe anterior uveitis.

Methods: Case report.

Results: We present a case of a 12-year-old boy who presented with bilateral gradual blurring of vision and dry eye symptoms. Examination revealed severe anterior uveitis, with 1+ vitreous haze without posterior pole involvement. He has been diagnosed with T-cell Acute Lymphoblastic Leukemia (ALL) 9 months ago and underwent chemotherapy followed by a bone marrow transplant (BMT) 2 months ago. Eye screening prior to chemotherapy and BMT was normal. Initial investigation showed an elevated ESR, and aqueous sampling was HSV PCR positive. Other infective work-up results were negative. The initial repeated peripheral blood film (PBF) showed no blast cells. Despite the administration of intravenous Acyclovir and topical steroids, no significant improvement was observed. A repeated anterior chamber (AC) tap for cytology and PBF revealed blast cells, revising his diagnosis as a relapse of ALL. Leukaemic retinopathy developed after 4 weeks of presentation. His clinical condition declined, and he was subsequently put on palliative home care.

Conclusions: Relapse typically occurs 6 months post-transplant. The earliest reported relapse was 1 day post-transplant. A relapse within 6 months post-transplant indicates a poor prognosis. Given the rarity of anterior segment infiltration in ALL (0.5-2.5%), and it might not have systemic involvement (2.2%). This case highlights that an AC tap for cytology even in the presence of initial negative PBF is indicated. Early identification and intervention are crucial, requiring a multidisciplinary approach to ensure comprehensive care.

Abstract No.: 202172

Retinoblastoma vs. Medulloepithelioma- a Rare Case of Painful Blind Eye in a Child

First Author: Neeraja T G

Co-Author(s): Shruthi Tara V

Purpose: Presenting a rare case of painful blind eye in a child posing a diagnostic dilemma and the importance of histopathology and clinical correlation.

Methods: A 11-year-old boy presented with a painful, blind right eye. He had previously undergone lens extraction elsewhere (in 2014) for a complicated cataract, followed by vitrectomy and silicon oil injection

(in 2015) for total retinal detachment. On presentation he had no perception of light. Anterior segment evaluation revealed anterior and ciliary staphyloma with circum-corneal congestion. He underwent enucleation with orbital implant and the specimen was subjected for histopathological evaluation. Although the tumour initially mimicked retinoblastoma due to the presence of rosettes, deeper sections confirmed its origin from the ciliary body. The presence of intra-tumoral mucin-filled cystic spaces, highlighted by Alcian Blue positivity along with hyaline cartilage helped establish the diagnosis and distinguish it from retinal tumors.

Results: A young boy with a painful blind eye and history of white reflex and multiple intra ocular surgeries warranted a suspicion of intraocular malignancy. Histopathology confirmed a ciliary body medulloepithelioma of teratoid type with extra-scleral extension, characterized by rosette-like structures and intra-tumoral mucin-filled cystic spaces, Alcian Blue positive, helping distinguish it from retinoblastoma.

Conclusions: Despite being the second most common intra-ocular malignancy in children, Medulloepithelioma, due to its varied clinical presentation, is often missed initially. This poster highlights differentiating features between retinoblastoma and medulloepithelioma and the importance of special stains which can change the treatment protocol. It is emphasized to correlate clinically and is prudent to enucleate than eviscerate in doubtful scenarios.

Abstract No.: 208429

Risk of Subclinical Radiation-Induced Retinopathy Following High-Dose Irradiation in Chinese Patients With Nasopharyngeal Carcinoma: A Case-Control Study

First Author: Mary **HO**

Co-Author(s): Noel **CHAN**, Gabriel **LI**, Andrew **MAK**, Bryan Hon Ming **WONG**

Purpose: The aim of this study was to evaluate functional and structural changes in vascular parameters following high-dose intensity-modulated radiation therapy (IMRT) for nasopharyngeal carcinoma (NPC).

Methods: This is a cross-sectional case-control study. Comparisons were made between clinical and OCT-angiography imaging findings of subjects who received IMRT of dose >54 Gy from 2010–2016, and demographically matched controls.

Results: Thirty-six eyes of 18 subjects were recruited, with a mean age of 59.0 ± 13.4 years, at a mean of 6.9 years following radiotherapy; the OCTA parameters were compared to 68 eyes from 34 healthy controls. Of the recruited cases, 10 (55.6%) received 70 Gy in 35 fractions, while the rest received 69.96 Gy in

33 fractions. None developed clinically observable radiation retinopathy. However, irradiated eyes exhibited significantly lower vessel density (VD), larger foveal avascular zone (FAZ) area, reduced fractal dimension (FD), and decreased vessel diameter index (VDI) when compared to the controls. The visual acuity (VA) and OCT-A parameters including non-perfused area, VD, FD and VDI showed a correlation relationship either the maximum dose (Dmax), and mean dose (Dmean) irradiation to eyeball.

Conclusions: This study revealed a significant, radiation exposure dose related reduction in all microvascular parameters and reduced visual acuity, likely due to the vascular damage caused by radiation despite lack of evidence of clinically observable radiation retinopathy.

Abstract No.: 203028

SOX4 as a Key Oncogene Driving Tumor Invasion in Retinoblastoma

First Author: Yaoming **LIU**

Co-Author(s): Rong **LU**, Jiahe **NIE**, Junjie **TANG**, Zhihui **ZHANG**

Purpose: This study aims to explore the role of SRY-related HMG box transcription factor 4 (SOX4) in promoting invasion in retinoblastoma (RB), and to elucidate the underlying oncogenic pathways.

Methods: SOX4 expression in human retina, intraocular RB, and extraocular RB samples was evaluated using bulk RNA sequencing (RNA-seq) and single-cell RNA sequencing (scRNA-seq), with further evaluation in RB cell lines (Y79, WERI-RB1). SiRNA-mediated knockdown was performed in RB cell lines, followed by functional assays including CCK-8, EdU, colony formation, and transwell assays. An orthotopic xenograft model with SOX4 knockdown was utilized to assess tumor invasion. RNA-seq was performed on SOX4 knockdown (si-SOX4) and control (si-NC) Y79 cells to explore downstream signaling pathways.

Results: RNA-seq and scRNA-seq data revealed that SOX4, E2F3, and DEK were significantly upregulated in RB tissues compared to normal retina. Notably, SOX4 expression was particularly elevated in extraocular RB tissues, especially in MKI67+ photoreceptorless decreased cells. Knockdown of SOX4 in RB cell lines caused decreased proliferation, colony formation, migration, and reversal of EMT markers (N-cadherin, E-cadherin, vimentin). In vivo, SOX4 knockdown resulted in fewer cases of anterior chamber involvement and eyeball wall invasion in an orthotopic xenograft model. RNA-seq analysis revealed that SOX4 knockdown altered the Wnt/ β -catenin and cyclin D1 signaling pathways.

Conclusions: SOX4 plays a critical role in driving local invasion in RB, and targeting SOX4 may provide new insights into the molecular mechanisms of RB invasion,

potentially leading to improved therapeutic strategies for RB treatment.

Abstract No.: 201162

Solitary Fibrous Tumours of Conjunctiva, Intra-Ocular, and Orbit: Clinico-Pathological Spectrum and Its Management Based on Risk-Stratification

First Author: Raghuraj HEGDE

Co-Author(s): Shruthi KRISHNA, Prithvi VISHWANATH

Purpose: To analyse the clinicopathological spectrum of Solitary Fibrous Tumour (SFT) with ocular & orbital involvement. This study shows risk stratification-based management.

Methods: SFTs are rare spindle cell tumours with very few reports of ophthalmic involvement. Four cases were reviewed: conjunctival, intra-ocular, orbital, & recurrent SFT. Clinical features, histopathology, immunohistochemistry & treatment were assessed. Risk stratification guided surgical & adjuvant therapy was done. Management was based on existing literature on this very rare neoplasm.

Results: All cases showed varied sites & behaviour. STAT6 positivity confirmed the diagnosis. Conjunctival SFT (low Ki67 index) was completely excised and no further treatment was given. Intra-ocular SFT (high Ki-67 index), required adjuvant radiotherapy. Orbital SFT needed extensive resection followed by radiotherapy (intermediate Ki-67 index). The recurrent SFT had high-risk features (High Ki67 Index), which were managed with repeat debulking and adjuvant radiotherapy. There has been no recurrence in all patients with a minimum of 6 months post-surgery follow up.

Conclusions: SFTs show varied locations and have diverse clinic-pathological features. Accurate diagnosis & risk-based management strategies are crucial to minimise recurrence.

Abstract No.: 202454

Sometimes It Is a Zebra: An Unusual Presentation, Progression and Management of OSSN

First Author: Lai Yu Tony NG

Co-Author(s): Kin Ting Andrew KUK, Pricila Tien Yan WANG

Purpose: Ocular surface squamous neoplasia (OSSN) describes a continuum of ocular surface tumors involving the conjunctiva and/ or cornea, ranging from non-invasive conjunctival intraepithelial neoplasia (CIN) to invasive squamous cell carcinoma (SCC). It is the most common malignancy of the conjunctiva or cornea. Risk factors include older age, ultraviolet light exposure, smoking, a pale complexion, immunodeficiency such as Human Immunodeficiency Virus (HIV) infection, etc. Herein, we present a case of

an unusual presentation and progression of CIN in a 56-year-old man, initially manifesting as spontaneous corneal perforation without conjunctival lesions. 4 months after corneal patch graft repair, he developed new conjunctival lesions. Histopathological examination confirmed CIN. He was later managed successfully with combined medical therapy and a two-staged tumor excision and lid reconstruction, with no recurrence on latest follow-up. We also conduct a literature review on the presentation and latest management of OSSN.

Methods: N/A

Results: N/A

Conclusions: N/A

Abstract No.: 204148

Stevens-Johnson Syndrome Complicated With Chronic Dacryocystitis: A Case Report

First Author: Wei HAN

Purpose: The patient is a 61-year-old female whose chief complaint is bilateral purulent discharge for over 20 years. The patient reported that at the age of 9, after receiving a measles vaccination, she developed a fever. She was treated with «metamizole sodium» at a local clinic and suddenly lost consciousness, with widespread skin erythema and erosion. She regained consciousness after treatment and was diagnosed with Stevens-Johnson Syndrome. Since then, she experienced «corneal transplantation», «cataract extraction», and «lamellar keratoplasty and partial eyelid suture» of the left eye. Recently, she visited our hospital due to bilateral purulent discharge.

Methods: Vision: Light perception (+), conjunctival congestion and edema, grayish-white corneal opacity, peripheral corneal neovascularization. Lacrimal duct irrigation: The Needle can reach the bone wall, with upward and downward reflux, and a large amount of purulent secretions returned. We decided to perform excision of the lacrimal sac and lacrimal canaliculus for her.

Results: There was no bleeding or significant swelling after the operation, and the incision healed well. The patient did not experience excessive tearing, and the amount of secretions significantly decreased. This makes it possible to proceed with corneal transplantation or artificial cornea surgery to eliminate potential risks.

Conclusions: Lacrimal sac excision is a destructive surgery with a very limited application range. However, for patients with dacryocystitis combined with dry eye syndrome and severe corneal lesions, it is the last resort. Lacrimal sac excision resolves the purulent discharge problem, and avoids aggravating dry eye symptoms. It is a more appropriate solution in such cases.

Abstract No.: 205746**Subtenon Injections Therapy for Exudative and Hemorrhagic Complications of Retinoblastoma Local Treatment***First Author: Andrey YAROVY**Co-Author(s): Amina CHOCHAEVA, Denis VOLODIN, Vera YAROVAYA*

Purpose: To present results of a novel active approach to conservative treatment of exudative and hemorrhagic complications of local treatment of retinoblastoma (Rb) with subtenon injection therapy (STIT).

Methods: Exudative and/or hemorrhagic complications occurred in 92 eyes after laser, cryo, brachytherapy, intra-arterial chemotherapy, and/or radiosurgery for resistant or recurrent Rb. STIT was fulfilled in 54 eyes with more severe complications. A 22-gauge catheter was temporarily implanted into the subtenon space under ophthalmoscopic control using an intra-catheter light pipe. Six injections of medicines were daily fulfilled within 10-12 days. Results of treatment were compared to similar group of 38 eyes of conventional therapy (CT).

Results: Complete resolution of subretinal fluid, edema, exudates, and hemorrhages was achieved in 41 eyes (76%) within 2-4 months after STIT. In 5 eyes the procedure was repeated. Three eyes were enucleated because of the persistence and severity of complications. Comparison with CT group showed statistically higher number of resolutions of complications ($p=0.008$) and higher eye preservation rate in STIT group ($p<0.0001$).

Conclusions: Subtenon injection therapy is a safe and effective approach to the treatment of exudative and hemorrhagic complications of Rb local management and has distinct advantages over conventional therapy.

Abstract No.: 202910**Targeting MCM6 Enhances Melphalan Chemosensitivity in Retinoblastoma***First Author: Junjie TANG**Co-Author(s): Rong LU, Meng WANG*

Purpose: Retinoblastoma, a pediatric ocular malignancy, is commonly treated with intravitreal melphalan chemotherapy. However, drug resistance has become a major obstacle to effective treatment. This study aims to identify key regulators involved in retinoblastoma progression and melphalan chemoresistance, with the goal of developing strategies to overcome this resistance.

Methods: Single-cell transcriptomics was employed to analyze gene expression patterns in retinoblastoma cells. Functional assays were conducted, including knockdown of minichromosome maintenance complex component 6 (MCM6), followed by assessment of

cell growth, cell-cycle progression, and DNA damage levels. In vivo experiments were also carried out to evaluate the combined effect of MCM6 inhibition and melphalan on intraocular tumor growth.

Results: MCM6 was found to be highly expressed in retinoblastoma cells. Its expression was particularly elevated in tumors from patients who failed melphalan treatment and was closely associated with a gene network related to cell proliferation. Knockdown of MCM6 significantly suppressed retinoblastoma cell growth, arrested cell cycle progression, and enhanced the sensitivity of these cells to melphalan by increasing DNA damage. In vivo, the combination of MCM6 inhibition and melphalan treatment synergistically inhibited intraocular tumor growth.

Conclusions: MCM6 plays a critical role in regulating both the proliferation of retinoblastoma cells. Inhibiting MCM6 represents a promising therapeutic strategy to enhance the efficacy of melphalan-based chemotherapy for retinoblastoma.

Abstract No.: 204825**The Association Between Mitotic Activity and Ki-67 Expression With Clinical and Histopathological Prognostic Factors of Conjunctival Melanoma***First Author: Agung NUGROHO**Co-Author(s): Neni ANGGRINI, Aria KEKALIH, Evelina KODRAT, Mutmainah MAHYUDDIN, Virna Dwi OKTARIANA, Anggun Rama YUDANTHA*

Purpose: Conjunctival melanoma is a rare but potentially aggressive conjunctival malignancy. Local recurrence of conjunctival melanoma reaches 40% with a high mortality rate (18%). Mitotic activity and Ki-67 immunohistochemistry (IHC) staining expression as proliferation markers can predict melanoma prognosis. This study aims to assess the association between mitotic activity and Ki-67 expression with clinical and histopathological prognostic factors in conjunctival melanoma, specifically tumor location, local invasion, lymph node involvement, tumor recurrence, distant metastasis, cell type, lymphovascular invasion, and pagetoid spread.

Methods: This study was conducted using data from medical records and paraffin blocks of conjunctival melanoma patients at Cipto Mangunkusumo Hospital from January 2013- December 2023. Samples were reviewed, hematoxylin-eosin (HE) stained, and IHC stained using Ki-67 antibody. The mitotic count and Ki-67 expression results were then cross-checked with established prognostic factors. Then, statistical analysis was performed to determine the association between them.

Results: Thirty four research samples met the inclusion criteria were then analyzed. There was no statistically significant association between mitotic activity and Ki-

67 expression with the clinical and histopathological prognostic factors tested ($p > 0.05$). Most conjunctival melanoma patients in this study had high mitotic activity (85.3%); this finding exceeds the percentage proportion in previous studies although does not show relation to worse prognostic factors.

Conclusions: In conjunctival melanoma patients, there was no statistically significant association between mitotic activity and Ki-67 expression with poor clinical and histopathological prognostic factors. A high proportion of patients with high mitotic count may affect the outcome of this study.

Abstract No.: 202398

The Diagnostic Challenge: Identifying Orbital Neuroblastoma in a Pediatric Patient

First Author: Phillip Jairus **SAYO**

Co-Author(s): Yvette Marie **SANTIAGO-GATMAITAN**

Purpose: To present a case of metastatic neuroblastoma in a child following an alleged head trauma, emphasizing the diagnostic challenge and importance of early diagnosis.

Methods: Case report.

Results: A one-year-old previously healthy Filipino girl presented with left periorbital hematoma following presumed head trauma after an unwitnessed fall. Over weeks, there was persistence of hematoma with new-onset proptosis and changes in sensorium initially assessed as left spheno-orbital fracture with epidural hematoma. Further worsening of status prompted admission and referral to Ophthalmology. Examination showed bilateral periorbital ecchymosis, non movable mass at the left temporal area, proptosis of left eye with restricted ocular motility, mandibular lymphadenopathy, and an abdominal distention. Orbitocranial MRI revealed vividly enhancing extra-axial mass with destruction of the left lateral wall and intracranial extensions, and a smaller extraconal mass on the right orbit. Abdominal CT scan showed a large left suprarenal mass. Emergency orbital biopsy done showed round cell tumor. Despite the absence of immunohistochemical staining, clinical and radiologic findings were suggestive of an advanced metastatic orbital neuroblastoma. Her condition further deteriorated with systemic complications. This case features the diagnostic challenge of differentiating trauma-related injuries from underlying malignancies in children.

Conclusions: This case highlights the importance of suspecting underlying malignancies in children with orbital or cranial masses, especially when recovery deviates from typical trauma. Early diagnosis, thorough evaluation, and a multidisciplinary approach are crucial for effective management and improved prognosis in complex pediatric cases.

Abstract No.: 200407

Tiny Eyes, Big Battles – Rare Case of Retinoblastoma in a Four-Month-Old Child

First Author: Trupti **SUTE**

Co-Author(s): Kavita **DHABARDE**

Purpose: To present a rare case of retinoblastoma in a 4-month-old child.

Methods: Retinoblastoma is the most common ocular malignancy of childhood. Although retinoblastoma primarily affects younger children, it is very rare below 1 year of age. A 4-month-old girl presented with leukocoria in her right eye for 2 months. Posterior segment examination revealed retinal detachment and abnormal, tortuous retinal vessels along with vitreous seedings in the right eye. B-mode ultrasound showed the right eye having a well-defined, solid endophytic mass present on the posterior pole, with a few foci of calcification.

Results: Due to poor visual prognosis and high clinical suspicion of malignancy (retinoblastoma), enucleation was performed under general anaesthesia. The enucleated eyeball was sent for histopathological analysis, which confirmed the diagnosis of retinoblastoma without optic nerve involvement. A high index of suspicion of retinoblastoma in an infant having leukocoria and timely management of the condition by enucleation has saved the child. A prosthesis was implanted for the stimulation of the development of the orbit in the child.

Conclusions: This case is a unique case as retinoblastoma at the age of 4 months is a very rare condition. Hence, we wish to report this case due to its rare presentation and to create awareness about the presence of retinoblastoma in infancy.

Abstract No.: 206315

Topical Mitomycin C for Pre-Invasive Ocular Surface Squamous Neoplasia in a Patient With Xeroderma Pigmentosum: A Case Report

First Author: Hatem **ALI**

Purpose: To highlight the successful non-surgical management of a pre-invasive ocular surface squamous neoplasia (OSSN) lesion in a xeroderma pigmentosum (XP) patient, using pulse topical mitomycin C (MMC) therapy guided by anterior segment optical coherence tomography (AS-OCT).

Methods: Single-patient interventional case report. A 38-year-old woman with xeroderma pigmentosum presented with a nasal epibulbar mass spanning 3–6 clock hours with corneal extension. Diagnosis and monitoring used slit-lamp and AS-OCT, demonstrating hyper-reflective epithelial thickening with an abrupt transition and stromal shadowing. Compounded mitomycin-C 0.02% eye drops were prescribed in pulse

cycles (2 weeks on/1 week off) with preservative-free lubrication. Slit Lamp photo was captured for documentation at each visit.

Results: At baseline, AS-OCT confirmed epithelial hyperreflectivity with an abrupt transition from normal to abnormal tissue, consistent with pre-invasive OSSN. After initiation of pulse topical MMC 0.02%, the lesion demonstrated progressive reduction in thickness and vascularity on slit-lamp evaluation. Sequential slit-lamp photographs documented steady regression across treatment cycles. By five months, complete clinical resolution was achieved with improvement of visual acuity from counting fingers at 30–50 cm to 0.13.

Conclusions: AS-OCT is the gold standard for diagnosing OSSN, while topical MMC offers safe and effective treatment for pre-invasive cases. Because OSSN can mimic benign lesions, full ocular examination and awareness of risk factors such as xeroderma pigmentosum are critical for early detection and management.

Abstract No.: 206732

Tracing the Green Footprint: Chloroma in Relapsed ALL

First Author: Shreya **BHADANI**

Co-Author(s): Manisha **CHOUDHARY**, Manmath **DAS**, Matuli **DAS**, Shrutakirti **PARIDA**, Aanchal **SINGHAL**

Purpose: To highlight chloroma as a rare extramedullary presentation in relapsed acute lymphoblastic leukemia (ALL) in a young male

Methods: A 17-year-old male with history of ALL and central nervous system relapse presented with 3-month history of progressive, painless diminution of vision in both eyes with drooping of right upper lid. He had a prior episode of right-sided Bell's palsy 8 months back. Best-corrected visual acuity was no perception of light in right eye (RE) and 6/9, N12 in left eye (LE). Extraocular movements were grossly restricted in RE and mildly in LE. RE showed complete ptosis, periorbital edema, conjunctival congestion, mucopurulent discharge, superficial punctate keratitis, iris neovascularization, fixed dilated pupil, and total cataract. LE had lagophthalmos with exposure keratopathy, conjunctival congestion, fixed dilated pupil, and clear lens. Dilated fundus examination in LE showed infiltrative neuropathy. RE fundus was not visible. RE B-Scan demonstrated vitreous seedings with retinal detachment.

Results: Final diagnosis of bilateral infiltrative orbitopathy (chloroma) with cataract and retinal detachment in RE was established. MRI revealed bilateral bulky optic nerves with disc edema. Patient was managed with topical antibiotics, lubricants, prednisolone acetate and aggressive chemotherapy.

Conclusions: Relapsed T- cell ALL with ocular involvement is rare and generally associated with

poor visual and systemic outcomes. Occurrence of chloroma in association with ALL has very rarely been reported till date. This case highlights the broad spectrum of leukemic ocular manifestation including orbitopathy, optic nerve infiltration, and anterior segment pathology, thus emphasizes the critical role of early ophthalmic evaluation and multidisciplinary management in systemic leukemia.

Abstract No.: 208221

Unilateral Ocular Surface Disease – Case Report of a Rare Skin Carcinoma

First Author: Posey Po Yin **WONG**

Co-Author(s): Ka Wai **KAM**, Kenneth Ka Hei **LAI**, Alvin Lermann **YOUNG**

Purpose: We report a rare case of unilateral chronic blepharokeratoconjunctivitis with madarosis in the right eye of an 80-year-old lady. We would like to raise awareness of malignant eyelid lesions presenting as benign conditions.

Methods: We reported a rare case in our hospital with detailed history taking, ophthalmic examination, and map biopsy over the tarsus and conjunctiva.

Results: Histopathology of biopsy revealed tumor cells in temporal forniceal conjunctiva compatible with xtramammary Paget's disease. Underlying malignancy was ruled out by PET-scan. The patient and her relatives opted for conservative management in view of the nature of the disease.

Conclusions: Blepharitis and keratoconjunctivitis recalcitrant to typical topical treatment should be investigated for malignancy. Timely histopathological biopsy aids in early diagnosis and differentiation the type of carcinoma with different prognosis. Screening of underlying malignancy is essential in extramammary Paget's disease.

Abstract No.: 205710

Unmasking Primary Vitreoretinal Lymphoma: A Case Series Highlighting Clinical and Imaging Clues

First Author: Su Chern **LIM**

Co-Author(s): Roslin **AZNI**, Mae-lynn **CATHERINE BASTION**, Ayesha **MOHD ZAIN**, Daphne **TEH**

Purpose: To highlight the clinical, fundus, and multimodal imaging features of primary vitreoretinal lymphoma (PVRL).

Methods: A retrospective review of three cases of PVRL with distinct clinical manifestations.

Results: PVRL is a rare, high-grade lymphoma that frequently masquerades as chronic uveitis, making diagnosis challenging. Three cases are presented to illustrate its varied clinical and imaging features. The first, a 54-year-old woman with progressive bilateral blurring of vision and vitritis, demonstrated multiple

yellowish subretinal deposits along the superotemporal arcade and superonasal region of the right eye. Optical coherence tomography (OCT) revealed subretinal deposits while fundus fluorescein angiography (FFA) showed corresponding staining hyperfluorescence. Vitreous cytology confirmed lymphoma cells. The second, a 77-year-old man with progressive unilateral vision loss and bilateral vitritis, exhibited yellowish leopard-spot chorioretinal infiltrates, subretinal hyperreflective material on OCT, and vitreous opacities on B-scan ultrasonography. Vitreous cytology confirmed diffuse large B-cell lymphoma. The third, a 72-year-old man initially treated as acute retinal necrosis with rhegmatogenous retinal detachment, presented with vitritis, multiple chorioretinal infiltrates, intraretinal hemorrhage and retinal arteritis. OCT revealed retinal pigment epithelium (RPE) nodularity consistent with infiltrates, and brain magnetic resonance imaging (MRI) demonstrated primary central nervous system lymphoma.

Conclusions: PVRL exhibits heterogeneous clinical and imaging manifestations, including vitritis, chorioretinal infiltrate and retinal vasculitis, and RPE nodularity on OCT. Multimodal imaging—particularly OCT, FFA, and fundus autofluorescence—provides crucial diagnostic information. Greater awareness of these features is essential to avoid misdiagnosis, ensure timely treatment, and improve visual and systemic outcomes.

Abstract No.: 201723

When Eye Leads the Way: Choroidal Metastasis Unmasking Primary Bronchogenic Carcinoma

First Author: R Ram **SUDARSHAN**

Co-Author(s): Syed Mohideen **ABDUL KHADER**

Purpose: A 50-year-old female presented with complaints of floaters in the left eye for two weeks. Visual acuity in both eyes was 6/6. Anterior segment examination was unremarkable. Fundus examination revealed yellowish elevated choroidal mass (~4x4 mm) along the superonasal arcade of the right eye and inferotemporal arcade of the left eye, with overlying RPE alteration and surrounding subretinal fluid.

Methods: FFA showed initial hypofluorescence and late-phase heterogeneous hyperfluorescence. B-scan ultrasonography demonstrated choroidal masses with high internal reflectivity. OCT revealed dome-shaped elevation of the neurosensory retina and RPE with adjacent subretinal fluid. Based on these findings, choroidal metastasis from an unknown primary was suspected.

Results: Radio imaging (CT scans of chest, abdomen, chest and orbit) revealed a large mass in the left lower lobe of lung – bronchogenic carcinoma with metastases to the liver, choroid, and vertebrae.

Conclusions: This case emphasizes the need for prompt systemic evaluation in patients presenting with atypical bilateral choroidal lesions.

Ophthalmic Epidemiology and Prevention of Blindness

Abstract No.: 202276

Assessing Willingness to Pay for Specialized Ophthalmic Clinics for Families of Individuals With Intellectual Disabilities in Taiwan

First Author: Chiun Ho **HOU**

Purpose: Individuals with intellectual disabilities (IDs) often have increased needs for vision care but face substantial barriers to receiving comprehensive examinations. Access to specialized ophthalmology clinics tailored to their unique needs remains limited. This study aims to evaluate the willingness to pay (WTP) among family caregivers for specialized ophthalmology services.

Methods: From August 15 to October 5, 2023, we conducted a face-to-face survey of primary family caregivers of individuals with IDs across two local authorities in Taiwan. A stratified random sampling approach was used for a representative probability sample, yielding 657 completed responses (response rate: 82.6%). WTP was assessed using the contingent valuation method based on a hypothetical specialized ophthalmology clinic scenario, which was developed through prior qualitative research. Data were analyzed using two-part regression models.

Results: WTP for specialized ophthalmology services varied significantly across income groups. WTP ranged from US\$3.2 to US\$7.3 in the lowest-income group, and ranged from US\$17.1 to US\$21.6 in the highest-income group ($p < 0.001$). Higher household income, greater self-reported financial satisfaction, and increased concern for the ocular health of family members with IDs were identified as significant predictors of higher WTP.

Conclusions: Caregivers' WTP remains relatively low compared with the minimum operational costs required to sustain specialized ophthalmology clinics under Taiwan's National Health Insurance system. These findings highlight the necessity of increased public funding to ensure the financial viability of such services and to reduce disparities in vision care between individuals with and without IDs.

Abstract No.: 200966**Beyond the Numbers: What Disability Certificates Reveal About Avoidable Blindness in North India***First Author: Kusha**Co-Author(s): Arti SAREEN*

Purpose: To analyze the causes of visual disability among applicants at a district hospital in Himachal Pradesh and assess the proportion of avoidable versus unavoidable causes, with the aim of informing public health strategies.

Methods: A retrospective observational study was conducted on 100 applicants issued visual disability certificates at Zonal Hospital, Shimla between April 2023 and March 2024. Data were extracted from the UDID portal, including age, gender, visual acuity, and percentage of disability. Causes of visual disability were categorized and classified as avoidable (preventable or treatable) or unavoidable.

Results: The mean age of applicants was 41.9 years, with a male-to-female ratio of 1.85:1. Most applicants (33%) were in the 40–60 age group. The majority (84%) were categorized as having low vision (40–80% disability), while 15% were blind (90–100% disability). The leading causes were pathological myopia (26%), amblyopia (20%), and ocular trauma (15%). Notably, 61% of the causes were identified as avoidable.

Conclusions: A significant proportion of visual disability cases were preventable or treatable, emphasizing the urgent need for enhanced screening programs, early intervention, and public awareness. Strengthening primary eye care, improving school vision screening, trauma management, and increasing access to eye banking and glaucoma detection can reduce the burden of avoidable blindness.

Abstract No.: 200385**Changes in the Treatment Plans of Glaucoma Patients in a Real-World Setting: Implications for Blindness Prevention in a Resource-Constrained Developing Country***First Author: Farah AKHTAR**Co-Author(s): Mahmood ALI, Yousaf JAMAL MAHSOOD, Muhammad SADIQ*

Purpose: Glaucoma is a major cause of irreversible blindness, with the highest burden in low- and middle-income countries. This study assessed glaucoma treatment modifications regarding when, why, and how the changes are advised in the glaucoma prescriptions. The secondary outcome was to identify what percentage of patients are controlled or otherwise on the existing therapy.

Methods: In this cross-sectional study, 868 patients (1,600 eyes) with glaucoma were evaluated over 6 months at a tertiary eye hospital. History, examination

findings, and topical therapy details were recorded. Optical Coherence Tomography and visual field testing were performed at least twice to detect progression. Treatment changes were classified as: unchanged (same regimen), changed (replacement with another agent), added (additional agent introduced), or deleted (drug removed). Reasons for change—including inadequate IOP control, adverse effects, affordability, or dosing issues—were documented. Data were analyzed using SPSS v24; $p < 0.05$ was considered significant.

Results: Open-angle glaucoma was present in 78.3% of cases; 70.6% had moderate-to-severe optic nerve damage. Treatment remained unchanged in 71.2%, was added in 10.9%, changed in 9.7%, and deleted in 8.2%. Target IOP ≤ 14 mmHg was achieved in 56.9% of eyes. Affordability, adverse effects, and disease progression significantly influenced treatment decisions ($p < 0.05$).

Conclusions: Most patients maintained stability on existing regimens, and over half achieved IOP targets associated with reduced blindness risk. Structured glaucoma care, even in resource-limited settings, can meaningfully prevent visual disability.

Abstract No.: 200936**Common Etiologies of Ophthalmic Diagnoses in the Eye Emergency Room of a Tertiary Eye Referral Center in Thailand***First Author: Atiya LIMSRISAKULWONG**Co-Author(s): Mingkwan LUMYONGSATIEN*

Purpose: To determine the etiology of ophthalmic emergency conditions, patient characteristics, and clinical outcomes in a tertiary eye center in Thailand.

Methods: The medical records of patients referred to the emergency room with eye conditions between June 2023 and November 2024 were retrospectively reviewed. Demographic data, diagnoses, eye examinations, and treatment outcomes were analyzed.

Results: A total of 290 patients (60.7% male; mean age 47.6 ± 17.5 years) were included. The most common diagnoses were corneal ulcer (21%), followed by retinal detachment (16.9%), intraocular foreign body (10.3%), endophthalmitis (9.7%), and acute angle closure glaucoma (4.8%). The majority of the cases (97%) presented were urgent conditions, and 88.6% received treatment within 24 hours of diagnosis. Traumatic conditions accounted for 42% of cases. Clinical outcomes post-treatment showed improvement in 85.9% of patients. Factors associated with trauma, after being adjusted for confounds, included younger age (odds ratio [OR], 0.967; 95% CI, 0.950 to 0.984) and male gender (OR, 4.316; 95% CI, 2.393 to 7.784).

Conclusions: The most common causes of ophthalmic conditions presented to the emergency room at a tertiary eye care in Thailand were corneal ulcer, retinal detachment, and intraocular foreign body. Training programs, healthcare personnel support, and policy

development are crucial in managing and preventing these common conditions.

Abstract No.: 204450

Community Children Eye Program (CCEP): An Innovative Approach to Opportunistic Pediatric Eye Screening During Immunization Services

First Author: Samata SHARMA

Co-Author(s): Ben LIMBU

Purpose: Childhood blindness is a major public health concern in developing countries, where access to specialized pediatric eye care is limited. The Community Children Eye Program (CCEP) was designed as a community-based model to integrate early eye screening into routine immunization services, utilizing non-ophthalmic health workers with standardized tools.

Methods: Key components of the CCEP included a national workshop to develop a curriculum, training of trainers, capacity building of immunization staff, implementation of screening at immunization centers, and regular monitoring. During routine immunization visits, non-ophthalmic health workers used a simple torchlight to screen for strabismus, nystagmus, ptosis, leukocoria, risk of retinopathy of prematurity (ROP), and external ocular abnormalities. Children with suspected conditions were referred to the tertiary eye center for confirmation and treatment.

Results: Over the first 4 months, 5312 children received vaccines, of whom 3535 (67%) underwent eye screening (mean age: 6.9 months; range 0.3–60). A total of 110 referrals were made; 58 (52.7%) attended hospital follow-up. Referral indications included strabismus (9%), nystagmus (0.9%), ptosis (4.5%), risk of ROP (39.1%), and other causes (46%). Among the 58 children evaluated, 25 were normal while 33 had ocular abnormalities; 73% of affected children were female and 27% male.

Conclusions: The CCEP demonstrates the feasibility of integrating pediatric eye screening into immunization programs in resource-limited settings. Early findings highlight its potential to detect ocular diseases in preverbal children, facilitate timely referral, and help reduce avoidable childhood blindness.

Abstract No.: 201219

Emerging Gender Gaps in Cataract Surgical Uptake: A 13-Year Patient-Level Equity Analysis in Rural Sarawak

First Author: Norasyikin MUSTAFA

Co-Author(s): Mohamad Aziz SALOWI, Siti Nurhuda SHARUDIN, Wang SHIR YEN, Wan Radziah WAN NAWANG

Purpose: Cataract is the leading cause of global blindness, with women making up about two-thirds of those affected. The World Health Organisation (WHO) emphasises that equitable access to first-eye cataract surgery is a key indicator of universal eye health. In Malaysia, a national outreach programme has been targeting underserved areas, including Bau, Sarawak, since 2013. This study investigates gender equity in first-eye cataract surgery in Bau over 13 years.

Methods: A retrospective analysis of Malaysian National Eye Database (NED) records was conducted for Bau residents undergoing cataract surgery from 2013 to 2025. Only first-eye surgeries (n=500) were analysed. Variables included gender, age, laterality, and pre-operative visual acuity. Statistical analyses assessed gender differences in surgical uptake, visual thresholds, and trends over time.

Results: Females accounted for 49.6% of first-eye surgeries, with a median age of 70 compared to 69 for males (p=0.119). More females (37.7%) presented with vision worse than 3/60 than males (34%, p=0.657). At surgery, 16.2% had bilateral vision worse than 6/60, with females comprising 58.8% (p=0.071). Over 13 years, surgical uptake declined in both genders, but the decline was steeper and borderline significant among females (−1.93/year, 95% CI −3.99 to 0.13, p=0.064) compared to males (−1.31/year, 95% CI −4.00 to 1.36, p=0.302).

Conclusions: This study highlights a potential emerging gender gap in cataract surgical uptake in rural areas. Under WHO equity standards, such a decline warrants gender responsive planning to prevent widening disparities in access.

Abstract No.: 202414

Epidemiology of Age-Related Macular Disease: A UK Biobank Study

First Author: Ryan Tak Chun WONG

Co-Author(s): Philip Yawen GUO, Edison Chak-fung HO, Alexander Ka Ngai LAM

Purpose: To investigate the epidemiology of age-related macular degeneration (AMD) in UKBiobank cohort.

Methods: This retrospective cohort study analysed data from 502,250 UKBiobank participants aged 37–73 years-old (54.4% female). AMD prevalence was calculated from diagnoses recorded at the initial

assessment center visit (2006-2010). Incidence rate was calculated as the number of new AMD cases arise from participants free-of-disease at baseline, per 10,000-person-years of follow-up period. Follow-up was censored at the date of AMD diagnosis, death, loss to follow-up, and the end of the study period (10/31/2022). Prevalence and incidence were examined across subgroups defined by age, sex, ethnicity (White, Asian, Mixed, Black), and spherical equivalent.

Results: At baseline, 11,112 participants with AMD (61% female) and 55,344 healthy controls (52% female) were identified. The overall prevalence of AMD was 3.93% and was higher in females (4.64%). The overall incidence rate was 1.43 per 10,000 person-years. Subgroup analyses revealed that AMD prevalence was highest in White, followed by Mixed, Black, and Asian (3.95%, 3.62%, 3.57%, and 3.40% respectively). In contrast, the incidence rate was highest in Black, followed by Mixed, Asian, and White (1.61, 1.57, 1.46, 1.42/10,000-person-year respectively).

Conclusions: We identified intrinsic variations of AMD prevalence and incidents among different subgroups. Females and White exhibited the highest prevalence; however, incidence was highest among Black. These findings highlight inherent disparities in AMD risk and underscore the need for future targeted research.

Abstract No.: 205934

Epidemiology of Common Respiratory Viruses of Acute Conjunctivitis in Hong Kong

First Author: Allie LEE

Purpose: Common respiratory viruses have been shown to possess ocular tropism and be the aetiology of conjunctivitis. To formulate effective infection control measures, it is important to understand the prevalence of these viruses. However, epidemiological data of common respiratory viruses in conjunctivitis is limited. We aim to determine the prevalence and distribution of common respiratory viruses in acute conjunctivitis in Hong Kong.

Methods: Subjects clinically diagnosed with acute conjunctivitis were recruited from ophthalmology clinics and outpatient clinics 1st January 2022 to 31st August 2024. Conjunctival swabs were obtained from the affected eye and analysis was performed via a qualitative multiple nested polymerase chain reaction (PCR) to detect common respiratory viral targets, including adenovirus, coronavirus, influenza A&B, parainfluenza virus, respiratory syncytial virus, rhinovirus, and human metapneumovirus. Viral nucleic acid was extracted and undergo a PCR assay and agarose gel electrophoresis.

Results: A total of 115 subjects were recruited and 16 of them were of insufficient quantity. 99 samples underwent multiple nested PCR. In the majority of samples, single virus was detected (51.5%). Only

12.1% showed dual viral agent and no viral agent was detected in the remaining samples. The most common respiratory viral agent detected was influenza B virus (27.3%), followed by adenovirus (23.2%) and influenza A virus (8.1%).

Conclusions: Infection by common respiratory viruses was commonly seen in acute conjunctivitis in Hong Kong. The most frequently seen viruses were influenza B virus and adenovirus.

Abstract No.: 205144

Exercise Programme for Visually Impaired Older Individuals Living in Care and Attention Home

First Author: Chun Chun Jane YEUNG

Purpose: Introduce a pilot exercise programme for visually impaired older individuals living in a care and attention home. Analyse the feasibility of implementing the programme and outcome assessment.

Methods: Descriptive. Pilot weekly one-hour exercise programme for visually impaired older individuals (>60 years old) residents in a care and attention home. All subjects were offered participation in the exercise programme. They were given a preliminary assessment to assess the suitability of enrolment e.g. ability to walk independently or with minimal assistance.

Results: Description of the exercise programme, assessment (subjective & objective) of physical health (muscle strength, flexibility, agility and coordination) after a one-year exercise programme. Difficulties encountered, modification of standard exercise programme and outcome assessment will be presented.

Conclusions: It is labour intensive (a low instructor to subject ratio is desired) but it is feasible to promote exercise in visually impaired older individuals living in care & attention home. Initial positive results and feedbacks from participants.

Abstract No.: 201167

Expanding Access to Eye Care: A Decade of the KLIP Mobile Screening Programme in Malaysia

First Author: Siti Husna HUSSEIN

Co-Author(s): Maimunah ABDUL MUNA'AIM, Azlina MOKHTAR

Purpose: To describe the outcomes and impact of the 'Klinik Pakar Mata Bergerak' (KLIP Mobile), a specialised eye screening programme in the rural community in Negeri Sembilan. This initiative was delivered through collaboration between Universiti Sains Islam Malaysia, the Negeri Sembilan Health Department, and the Negeri Sembilan State Secretariat.

Methods: This retrospective study analysed data from 5,494 participants screened during mobile eye screenings conducted between 2016 and 2025 across seven districts in Negeri Sembilan. The ocular examination included visual acuity test, refraction, slit-lamp examination, and fundus photography. Demographic profiles, ocular diagnoses, and referral patterns were evaluated.

Results: Among the 5,494 participants, diabetic retinopathy was the most prevalent (1791; 32.6%) followed by cataract (1202; 21.9%), refractive error (1103; 20.1%), glaucoma (159; 2.9%), and pterygium (136; 2.5%). Overall, 1,133 participants (20.6%) were referred to ophthalmologists and 839 (15.3%) to optometrists. Cataract was the leading cause of referral, with 742 patients requiring surgery. By facilitating early detection and referrals, the programme improved access to treatment for the communities, particularly for cataract and proliferative diabetic retinopathy which require further ocular interventions such as cataract surgery or laser therapy.

Conclusions: The KLIP Mobile Programme demonstrates the impact of sustained university–government partnerships in expanding access to eye care especially to rural communities. Its success highlights the value of mobile eye services as practical and sustainable models for community ophthalmology, aligning with WHO's Integrated People-Centred Eye Care framework.

Abstract No.: 201478

Financing and Provision of Refractive Services in Indonesia: A Mixed Methods Study of Policy, Utilisation and Data Analysis From 2,400,000 National Health Insurance Beneficiaries

First Author: Felicia **WIDYAPUTRI**

Co-Author(s): Ester **FEBE**, Krisna **JATI**, Ardhina **NUGRAHAENI**, Rima **PUTRI**, Muhammad **SASONGKO**

Purpose: Uncorrected refractive error (RE) is the leading cause of visual impairment across all age groups in Indonesia. While the national health insurance system (JKN) covers refractive services, its implementation has not been thoroughly evaluated. This study aimed to analyse the financing, service provision, and estimated healthcare costs associated with RE.

Methods: A mixed-methods approach was used, combining quantitative analysis of JKN secondary data on RE service coverage with qualitative insights from policy reviews, in-depth interviews, and focus group discussions with patients. Direct observations at two selected eye care centres were conducted to estimate the actual costs of refractive care and assess resource gaps.

Results: Despite 95% of Indonesia's population being insured through JKN, utilisation of refractive services remained low (only 1.82% of JKN members), particularly among low-income groups where RE prevalence was the highest. Only 80% of patients obtained prescribed spectacles due to capped subsidies tied to JKN insurance class, leaving significant out-of-pocket costs. The direct costs of refractive care frequently exceeded JKN's coverage limits, and patients incurred substantial indirect expenses such as transportation and lost income.

Conclusions: The current gaps in JKN's refractive care coverage hinder equitable access to essential services and place undue financial burdens on vulnerable populations. Without targeted policy improvements to address these challenges, the increasing prevalence of uncorrected RE will continue to impose avoidable health, economic, and social burdens. This study highlights the urgent need for comprehensive policy revisions to ensure sustainable and equitable access to refractive care in Indonesia.

Abstract No.: 205562

Global Burdens and Causes of Blindness and Vision Loss in Children and Adolescents

First Author: Yu **ZHANG**

Purpose: To estimate the global, regional, and national burdens of blindness and vision loss among children and adolescents from 1990 to 2021, categorized by age, severity, and cause, and to project the burdens through 2030.

Methods: Based on the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) 2021, the burden of blindness and vision loss was evaluated by case numbers, rates per 100,000 population, and average annual percentage changes (AAPC) in prevalence and years lived with disability (YLD) rates. Burden trends from 1990 to 2021 were analyzed using a Joinpoint regression model, and the Bayesian age-period-cohort (BAPC) model projected the disease burden through 2030.

Results: Globally, there was no significant change in prevalence rate for blindness and vision loss from 1990 to 2021, but YLD rate significantly decreased (AAPC of -0.17). The prevalence and YLD rates declined in refraction disorders and other vision loss from 1990 to 2021, but rose in near vision loss. The prevalence and YLD rates of refraction disorders show the most significant increase in East Asia. The BAPC model forecasts a rise in global blindness and vision loss prevalence and YLD from 2021 to 2030 (1.63% and 0.03%, respectively), though refraction disorders and other vision loss are expected to decline.

Conclusions: Over the past three decades, global efforts have reduced the burden of blindness and vision loss among children and adolescents. Despite

the overall decrease in refraction disorders, East Asia remains a challenge.

Abstract No.: 202103

Global, Regional, and National Burden of Blindness Due to Diabetic Retinopathy, 1990–2021

First Author: Yuan **LIU**

Co-Author(s): Ziye **CHEN**, Tao **LI**, Yuan **MA**, Yang **MENG**

Purpose: This study aimed to analyze the patterns and trends in the burden of blindness due to diabetic retinopathy (DR) from 1990 to 2021 at the global, regional, and national levels.

Methods: We conducted a population-based analysis using the latest data from the Global Burden of Disease Study 2021. We examined the prevalence and number of cases of DR-related blindness stratified by type of diabetes, sex, age, and sociodemographic index (SDI) level. The trends in the blindness burden were quantified via the average annual percentage changes. A decomposition analysis was performed to identify key drivers of the changing burden. A Bayesian age-period-cohort model was used to predict the future burden of DR-related blindness from 2022 to 2035.

Results: Globally, the number of people blind due to DR increased by 326.0% from 1990 to 2021, with the age-standardized prevalence rate (ASPR) increasing from 7.59 to 15.28 per 100,000 population. Regionally, Tropical Latin America had the highest ASPR in 2021, whereas South Asia and East Asia had the greatest number of prevalent cases. Nationally, India and China had the highest number of prevalent cases in 2021, whereas Marshall Islands reported the highest ASPR. In 2021, the middle SDI group had the greatest number of patients who became blind due to DR. Predictions suggest the burden will continue to rise through 2035.

Conclusions: The global burden of DR-related blindness has increased significantly over the past three decades, with notable disparities across regions, countries, and SDI groups.

Abstract No.: 203597

Global, Regional, and National Epidemiology of Vision Impairment Due to Diabetic Retinopathy Among Working-Age Population, 1990-2021

First Author: Yang **MENG**

Co-Author(s): Ziye **CHEN**, Tao **LI**, Yuan **LIU**, Yuan **MA**

Purpose: To evaluate the global, regional, and national trends of vision impairment associated with diabetic retinopathy (DR) in the working-age population (20-65 years) from 1990 to 2021.

Methods: This was a population-based analysis using data from the Global Burden of Disease Study 2021. Vision impairment was defined as low vision (Snellen

visual acuity of $< 6/18$ to $\geq 3/60$) and blindness (Snellen visual acuity of $< 3/60$ or central visual field $< 10^\circ$). The burden of DR-related vision impairment, that is, prevalence and years lived with disability (YLD), was analyzed by sex, age, location, and sociodemographic index (SDI). A Bayesian age-period-cohort analysis was employed to forecast the future burden up to 2035.

Results: From 1990 to 2021, the global prevalence rate and YLD rate of DR-related vision impairment increased significantly. In 2021, 2.85 million prevalent cases and 250 117 YLDs were reported, representing 2.8-fold and 3.0-fold increases compared to 1990, respectively. South Asia and China were identified as the most severely burdened region and country in 2021, respectively. Throughout 1990-2021, females consistently bore a greater burden than males. In terms of SDI, the burden was predominantly concentrated in middle-SDI countries. Predictive analysis suggests a continued increase in the number of patients and YLDs by 2035.

Conclusions: Globally, there has been a substantial increase in the burden of DR-related vision impairment among working-age individuals, with disparities observed in terms of sex, location, and SDI. Given the projected worsening of this burden, targeted interventions are needed to address this global health challenge.

Abstract No.: 207834

Glucose-Lowering Medications and Risk of Ophthalmic Diseases in Type 2 Diabetes

First Author: Xianwen **SHANG**

Co-Author(s): Shuo **WANG**

Purpose: To evaluate associations between glucose-lowering medications and incident ophthalmic diseases in type 2 diabetes (T2D) patients.

Methods: We analyzed 17,033 T2D patients (aged 40-72) without baseline cardiovascular disease or cancer from the UK Biobank. Glucose-lowering medication (insulin, metformin, glipizide, glimepiride, metformin plus rosiglitazone, rosiglitazone, pioglitazone) use was defined through verbal interviews. Incident ophthalmic diseases were ascertained using inpatient records up to January 2021. Multivariable Cox regression adjusted for sociodemographic and clinical confounders.

Results: During a median follow-up of 11.4 years, we identified 2,546 incident cataract cases, 327 age-related macular degeneration [AMD] cases, 392 glaucoma cases, and 896 diabetic retinopathy (DR) cases. After adjustment for age, sex, ethnicity, education, income, Townsend deprivation index, BMI, smoking, diet score, sleep duration, physical activity, HbA1c, and diabetes duration: insulin use was associated with higher risks of cataract (HR 1.19; 95% CI 1.05–1.36) and DR (HR 1.72; 95% CI 1.46–2.04). Metformin and glipizide were associated with increased cataract risk before but not

after adjustment for HbA1c and diabetes duration (metformin: HR 1.16, 95% CI 1.07–1.26 → 0.95, 95% CI 0.85–1.06; glipizide: HR 1.24, 95% CI 1.13–1.36 → 1.07, 95% CI 0.95–1.20). Similarly, initial associations of metformin, glipizide, glimepiride, and pioglitazone with higher DR risk attenuated to non-significance after adjustment for HbA1c and diabetes duration.

Conclusions: Insulin use was independently associated with higher cataract and DR risks. Other glucose-lowering medications showed no significant associations with ophthalmic diseases after accounting for glycemic control and diabetes duration.

Abstract No.: 202929

Longitudinal Changes in General and Central Obesity and Risk of Diabetic Retinopathy in Newly Diagnosed Type 2 Diabetes

First Author: Sooyeon **CHOE**

Co-Author(s): Ahnul **HA**, Young Kook **KIM**

Purpose: To investigate the associations between obesity (general, central) and diabetic retinopathy (DR) in patients with newly diagnosed diabetic mellitus (DM) and to examine changes in DR risk associated with fluctuations in general and central obesity status.

Methods: In this nationwide population (50-million-person)-based cohort study using the Korean National Health Insurance Service (NHIS) database (2002–2022), we identified patients newly diagnosed with type 2 DM between 2010 and 2015. We investigated associations between DR risk and both general obesity ($\text{BMI} \geq 25 \text{ kg/m}^2$) and central obesity (waist circumference $[\text{WC}] \geq 90/85 \text{ cm}$ for males/females) using Cox proportional hazards models.

Results: Among 408,126 newly diagnosed diabetes patients, 33.2% ($n=135,315$) developed DR during the 8.6 ± 3.5 -year follow-up. Both general and central obesity were independently, dose-dependently associated with increased DR risk (adjusted hazard ratio [aHR]: 1.081 [95% CI: 1.069–1.093] and 1.096 [1.084–1.108], respectively). Compared with the reference BMI group ($18.5\text{--}23 \text{ kg/m}^2$), risk progressively increased across BMI categories, highest at $\text{BMI} \geq 30 \text{ kg/m}^2$ (aHR: 1.176 [1.150–1.202]). Similarly, risk increased across WC categories, peaking at $\text{WC} \geq 100/95 \text{ cm}$ (aHR: 1.078 [1.055–1.102]). In longitudinal analyses, post-diabetes-diagnosis new obesity increased DR risk (aHR: 1.090 [1.060–1.120] for general; 1.091 [1.069–1.113] for central obesity), while obesity resolution, relative to persistence, was associated with significant risk reduction (aHR: 0.965 [0.943–0.987] for general; 0.937 [0.919–0.956] for central obesity).

Conclusions: General and central obesity were identified to be risk factors for DR in patients with DM. The changes in obesity status can alter DR risks after initial DM diagnosis. These findings emphasize the benefits of obesity management for patients with DM.

Abstract No.: 201348

Myopia Control in Children: Parental Knowledge and Practices Across Urban and Suburban Communities in Central Malaysia

First Author: Maimunah **ABDUL MUNA'AIM**

Co-Author(s): Siti Husna **HUSSEIN**, Azlina **MOKHTAR**

Purpose: Myopia is increasingly prevalent in children, with early onset associated with faster progression and vision-threatening complications. Studies in developing countries suggest that parental awareness and practices on early interventions may differ between urban and sub urban communities. This study aims to assess differences in parental knowledge and practices on myopia control between urban and suburban populations in central Malaysia, in order to identify gaps that may influence early detection and prevention strategies.

Methods: A cross-sectional survey was conducted among parents of children aged 6–12 years using a validated questionnaire assessing demographics, visual habits, levels of concern, awareness of complications, and knowledge of myopia control interventions. Residential location was categorised as urban or suburban.

Results: A total of 218 parents participated: 165 urban and 53 suburban. Mean daily near-work hours were similar (urban 2.5; suburban 2.4). Urban parents reported higher concern about myopia progression (4.45 vs 3.91/10). Awareness of targeted interventions was low (urban 6.1%, suburban 2%), and urban parents were more likely to identify at least one control method (84.9% vs 64.2%; $P = 0.006$). Over 82% of children in both groups used myopia control strategies, often without parents recognising them as formal interventions. Outdoor activity levels were low in both groups.

Conclusions: Although myopia control practices are common, awareness of specific interventions remains poor, particularly in rural regions. Targeted education campaigns may enhance awareness and facilitate evidence-based early intervention

Abstract No.: 202620

Ocular Comorbidities, Quality of Life, and Caregiver Burden in Children With Facial Clefts: Interim Findings From a Prospective Observational Study

First Author: Shweta **DHIMAN**

Co-Author(s): Shibani **DAS**, Subrat **JENA**, Raj **KENIA**, Santosh **MAHAPATRA**

Purpose: To evaluate the prevalence of ocular comorbidities in children with facial clefts and to assess associated impacts on pediatric quality of life (QoL) and caregiver burden.

Methods: This ongoing prospective observational study enrolls children under five years with cleft lip and/or palate undergoing surgical care at a tertiary cleft center, with ophthalmic evaluation performed at an affiliated eye hospital. Each child underwent a complete ocular examination including adnexal, anterior and posterior segment assessment, and refraction. Health-related QoL was assessed for children aged 2–5 years using the validated PedsQL™ Parent Proxy questionnaire, and caregiver burden was measured using the Zarit Burden Interview–12 (ZBI-12). Data were analyzed descriptively and compared across subgroups. Ethical approval was obtained.

Results: As of August 2025, 40 children (mean age 2.8 years; M:F ≈ 1.2:1) have been evaluated. Ocular comorbidities included nasolacrimal duct obstruction, refractive error, strabismus, and fundus changes, with a prevalence of ~20%. Children with ocular involvement had lower mean PedsQL scores than those without. Caregiver stress was common, with over half reporting mild-to-moderate burden on ZBI-12, most often mothers as primary caregivers.

Conclusions: Interim findings highlight a substantial prevalence of ocular anomalies and measurable psychosocial impact in children with facial clefts. Integrating ophthalmic screening and caregiver support into cleft care programs may improve both visual and quality-of-life outcomes. Final results with expanded enrollment are awaited.

Abstract No.: 204691

Ocular Hazards of the Oil Palm Industry: Preventable Blindness in Plantation Workers

First Author: Chiu Ling LIM

Co-Author(s): Nurliza KHALIDDIN, Leroy Young King TAN

Purpose: To describe the clinical profile, presentation, and management of hospitalized patients with oil palm-related eye injuries between January and September 2025 in Hospital Sultan Ismail, Johor.

Methods: A descriptive retrospective study of all patients admitted with oil palm-related ocular injuries during the study period. Demographic data, clinical features, management, and outcomes were reviewed.

Results: Six patients were identified, all male palm-oil plantation workers. Median age was 39.5 years (range 25–50). Most injuries occurred during harvesting and pruning, predominantly due to direct trauma from oil palm fronds or entry of fibrous debris into the eye. Three presented with corneal ulcers showing features of fungal keratitis, two with corneal lacerations, and one with perforated corneal ulcer. Presenting vision ranged from counting fingers to perception of light. Corneal ulcers were treated with intensive topical fortified antibiotics and antifungals; two required penetrating keratoplasty. Corneal lacerations were

managed with urgent corneal toilet and suturing. Despite aggressive treatment, four patients had poor vision. Mean hospital stay was 9 days. Final visual acuity ranges from 6/12 to hand movement.

Conclusions: Oil palm-related ocular trauma is an important occupational hazard in Malaysia and often results in severe visual impairment. Preventive measures, including mandatory protective eyewear and stronger workplace safety enforcement, are essential to reduce its incidence and impact.

Abstract No.: 205521

PhenoAge Acceleration Is a Potential Causal Driver of Early AMD Pathogenesis

First Author: Weichen YUAN

Co-Author(s): Xinyuan ZHANG

Purpose: This study aims to investigate the genetic association between epigenetic clock acceleration and the risk of early AMD using Mendelian randomization (MR).

Methods: Genetic instruments for four epigenetic clock acceleration measures and early AMD were obtained from publicly available genome-wide association studies. The inverse-variance weighted (IVW) fixed-effects model was used as the primary analytical method to identify the genetic causality. Robustness of the results was assessed through multiple sensitivity analyses.

Results: IVW analysis revealed a significant positive association between PhenoAge acceleration and an increased risk of early AMD. Sensitivity analyses supported the robustness of the causality. In contrast, no statistically significant associations were observed between the other three epigenetic clocks acceleration and the risk of early AMD (all $p > 0.05$).

Conclusions: The findings suggest that PhenoAge acceleration may be a potential causal driver of early AMD. This discovery is of great significance, as it reveals that the specific biological features of aging characterized by PhenoAge, particularly pathophysiological processes such as metabolic-inflammatory imbalance, may play a key role in the pathogenesis of early AMD.

Abstract No.: 204181

Possibilities in Integrating Artificial Intelligence (AI) Into the Referral Pathway: Improving Access to Ophthalmology Outpatient Care

First Author: Whitney Felicia CHAN

Co-Author(s): John BUCHAN, Kendrick SHIH

Purpose: To evaluate the quality and origin of referral letters for public ophthalmology specialist outpatient clinic (SOPC) appointments, assess the time and human resources involved in triage, and explore

opportunities—including the integration of AI—to improve the efficiency, accuracy of the referral pathway.

Methods: This retrospective study reviewed referral letters submitted to the Lo Fong Shiu Po Eye Centre at Grantham Hospital in 2025. A random sample of routine and semi-urgent (P2) cases was analysed. Referral origin, content completeness, clinical detail, legibility, and format were assessed. Additional data on the time and staff required to triage each letter were collected through clinical attachment.

Results: Of the 200 referrals, 49% were from general practitioners, 33% from ophthalmologists, and 18% from other hospital-based clinicians, reflecting diverse referral pathways. Clinical completeness was highly variable. Visual acuity was missing in 42% of P2 and 45% of routine cases, and where documented, around 60% of referrals did not include BCVA. Nearly half of all referrals lacked ocular examination findings. Symptom duration was provided in 78% of P2 cases but only 35% of routine referrals. Ophthalmologists were significantly less likely than GPs to record systemic history ($p < 0.0001$), though GPs are more likely to show incomplete ophthalmic history ($p = 0.0067$). Preliminary diagnoses appeared in 43% of P2 and 63% of routine referrals, with ophthalmologists more likely to include one than GPs ($p < 0.0001$). Operational observations revealed a fully manual triage system. 17% of letters were handwritten, mainly from private practices, causing legibility issues that complicated triage. Nurses dedicated roughly one hour per day and ophthalmologists 15 minutes reviewing referrals, underscoring the inefficiency of the current model.

Conclusions: Referral letters for SOPC in Hong Kong vary in quality and often miss key clinical details, hindering triage and delaying patient management. Standardised electronic templates and better training for primary care can improve triage accuracy and patient access. AI integration to evaluate referrals and prioritise urgent cases could further enhance efficiency, reduce waiting times, and improve specialist care delivery.

Abstract No.: 205776

Prevalence and Causes of Blindness and Vision Impairment Among People 50 Years and Older in Nepal: A National Rapid Assessment of Avoidable Blindness Survey

First Author: Sailesh Kumar MISHRA

Co-Author(s): Bhart Bahadur CHAND, Parikshit GOGATE, Namrata KARN, Chet Raj PANT, Yuddha Dhoj SARKOTA, Ranjan SHAH

Purpose: To determine the prevalence and causes of blindness and vision impairment among people 50 years and older in Nepal.

Methods: We conducted seven provincial-level Rapid Assessment of Avoidable Blindness (RAAB) cross-sectional, population-based surveys between 2018–2021. Provincial prevalence estimates were weighted to give nationally representative estimates. Sampling, enumeration, and examination of the population 50 years and older was done at the province level following standard RAAB protocol.

Results: Across seven surveys, we enrolled 33,228 individuals, of whom 32,565 were examined (response rate 98%). Females ($n = 17,935$) made up 55% of the sample. The age-sex-province weighted national prevalence of blindness (better eye presenting visual acuity $<3/60$) was 1.1% (95% confidence interval [CI] 1.0–1.2%), and any vision impairment $<6/12$ was 20.7% (95% CI 19.9–21.5%). The prevalence of blindness was higher in women than in men (1.3% [95% CI 1.1–1.5%] vs 0.9% [95% CI 0.7–1.0%]). Age-sex weighted blindness prevalence was highest in Lumbini Province (1.8% [95% CI 1.3–2.2%]) and lowest in Bagmati Province (0.7% [95% CI 0.4–0.9%]) and Sudurpaschim Province (0.7% [95% CI 0.4–0.9%]). Cataract (65.2%) was the leading cause of blindness in our sample, followed by corneal opacity (6.4%), glaucoma (5.8%) and age-related macular degeneration (5.3%). Other posterior segment diseases accounted for 8.4% of cases. Cataract was also the leading cause of severe vision impairment (83.9%) and moderate vision impairment (66.8%), while refractive error was the leading cause of mild vision impairment (66.5%).

Conclusions: The prevalence of blindness was higher among women than men and varied by province. The Lumbini and Madesh Provinces in the Terai (plains) region had a higher prevalence of blindness than elsewhere. Cataract was the leading cause of blindness, severe vision impairment, and moderate vision impairment, while refractive error was the leading cause of mild vision impairment.

Abstract No.: 204902

Prevalence of Epiretinal Membrane in Eyes From a Population-Based Study Cohort of Octogenarians Living in Singapore

First Author: Wei Kiong NGO

Co-Author(s): Bryan Chin Hou ANG, John CHAMBERS, Kelvin Zheng Hao LI, Tock Han LIM, On Behalf Of Helios Study Team

Purpose: Primary epiretinal membrane (ERM) formation is an age-associated process resulting in fibrocellular membrane development that distorts fovea and impairs central vision. We aimed to describe the prevalence and characteristics of ERM in eyes from a cohort of octogenarians in Singapore.

Methods: Data were drawn from the Health for Life in Singapore (HELIOS) cohort – approximately 10,000 residents aged 30–84 years - who underwent standardized ocular assessments (including visual

acuity (VA) and spectral-domain OCT). Participants aged ≥ 80 years with gradable B-scan OCT were included, and ERMs were classified per Govetto Stages 1–4 based on foveal pit morphology, retinal layer definition, ectopic inner foveal layers, and tractional distortion. ERM stage was then correlated with measured VA.

Results: Of the 57 HELIOS participants aged ≥ 80 years, 19 without OCT scans and one eye with ungradable images were excluded, leaving 75 eyes from 38 individuals (mean age 81.7 ± 1.3 years; range 80.0–84.8 years) for analysis. Epiretinal membrane was detected in 32 eyes (42.7%), predominantly Stage 1 (87.5%, $n = 28$), with Stage 2 in 9.4% ($n = 3$) and Stage 4 in 3.1% ($n = 1$); mean VA was 73.8 letters in Stage 1 eyes versus 58.7 letters in Stage 2 or greater eyes ($p = 0.015$).

Conclusions: Among Singaporean octogenarians, ERMs affected 42.7% of eyes, most were Stage 1 lesions with minimal visual impairment. Progression beyond Stage 1 was significantly associated with decreased visual acuity. These results underscore the clinical importance of early detection and monitoring of age-related vitreoretinal interface changes.

Abstract No.: 207833

Protective and Adverse Effects of 15 Dietary Supplements on Ophthalmic Complications in Type 2 Diabetes

First Author: Xianwen **SHANG**

Co-Author(s): Shuo **WANG**

Purpose: To evaluate associations between 15 common dietary supplements and incident ophthalmic diseases in type 2 diabetes (T2D) patients.

Methods: We analyzed 16,638 T2D patients (aged 40–72) free of cardiovascular disease and cancer from the UK Biobank. Supplement use was self-reported via a standardized questionnaire. Incident ophthalmic diseases (cataract, age-related macular degeneration [AMD], glaucoma, diabetic retinopathy [DR]) were identified through inpatient records until January 2021. Multivariable Cox proportional hazards models adjusted for sociodemographic, lifestyle, and clinical factors.

Results: During a median follow-up of 11.4 years, we identified 2,833 incident cataract cases, 387 AMD cases, 415 glaucoma cases, and 1,120 diabetic retinopathy cases. After multivariable adjustment for age, sex, Townsend deprivation index, ethnicity, education, income, BMI, diet, smoking, sleep, physical activity, HbA1c, diabetes duration, and glucose-lowering medication count, Cod liver oil supplementation was associated with reduced cataract risk (HR 0.67; 95% CI 0.56–0.79) and diabetic retinopathy risk (HR 0.56; 0.40–0.78). Folate supplementation was associated with increased cataract risk (HR 1.23; 1.004–1.52). Vitamin D supplementation was associated with elevated glaucoma risk (HR 1.60; 1.06–2.41). No significant

associations were observed for vitamin A, B-complex vitamins, vitamin C, vitamin E, multivitamins, calcium, zinc, iron, selenium, fish oil, or glucosamine with any ophthalmic outcome.

Conclusions: Cod liver oil supplementation may protect against cataract and DR in T2D patients, while folate and vitamin D supplementation could elevate risks for cataract and glaucoma, respectively. Other supplements showed no significant associations with ophthalmic outcomes.

Abstract No.: 200625

Reliability and Validity of Thai Version of the National Eye Institute for Visual Functioning Questionnaire – 25 (T-NEI-VFQ-25) Among Thai Ocular Surface Disease Patients

First Author: Pakornkit **PHRUEKSAUDOMCHAI**

Co-Author(s): Peewara **CHORMANEE**, Sorn

KUNTIYARATANA, Marin **PATTANAPATTANA**, Khaomook **SINGHAPANTU**

Purpose: Aimed to evaluate reliability and validity of T-NEI-VFQ-25 among Thai ocular surface disease patients.

Methods: The study was performed by Translation of NEI-VFQ-25 from English version to Thai version. Ophthalmologists, General practitioner, Optometrist, Optician, Eye technician, Eye nurse and Linguists had been using focus group analysis. Content validity of the translated survey was assessed by 15 examiners. Validity indexes, Item Objective Congruence (IOC) and Content Validity Index (CVI); Item level CVI & scale level CVI were evaluated. The reliability was evaluated by Cronbach's Alpha coefficient.

Results: A total of 249 participants with consent completed the T-NEI-VFQ-25 by an online database survey. The indices of item-objective congruence (IOC) ranged from 0.80 to 1.0 for each question, with a mean of IOC 0.94. Item-level Content Validity Index scores (I-CVI) ranged from 0.93 to 1.00 for each question, with a mean of CVI of 0.98. The results showed all items included in the analysis were considered valid, as the coefficient was > 0.3 . Internal consistency reliability (calculation of all the questions taken together), the Cronbach's α of the instrument was ≥ 0.7

Conclusions: The Thai version of The National Eye Institute for Visual Functioning Questionnaire – 25 has high validity and reliability and can be applied to the Thai population to evaluate conditions related to vision quality, especially in patients with ocular surface disease.

Abstract No.: 206832

Risk Factors for Diabetic Retinopathy During Pregnancy in Preexisting Diabetes

First Author: Jinyue **DAI**

Co-Author(s): Xuran **DONG**, Jintao **LI**, Ying **WANG**, Yuan **WEI**, Tianchen **WU**, Ke **ZHANG**

Purpose: Diabetic retinopathy (DR) is a serious ocular complication. This study aimed to investigate risk factors for incident DR during pregnancy in women with preexisting diabetes, focusing on the impact of chronic hypertension (CH) on the timing of DR onset to optimize screening strategies.

Methods: This retrospective cohort study included 158 singleton pregnancies with preexisting diabetes. Clinical data on demographics, obstetric history, comorbidities (including CH), lab tests (e.g., HbA1c), and fundus examinations were collected. Patients were grouped based on DR development during pregnancy (31 cases vs 127 controls). Univariate and multivariate Cox proportional hazards models identified independent risk factors. Kaplan-Meier curves and log-rank tests compared group differences. A trimester-stratified survival analysis (early: 0-14; mid: 14-28; late: >28 weeks) was performed.

Results: Multivariate Cox analysis identified CH as a strong independent risk factor for DR (HR=3.18, 95% CI: 1.09-9.34, P=0.035). Older maternal age was a protective factor (HR=0.88, 95% CI: 0.78-0.99, P=0.049). Stratified analysis revealed that DR risk was concentrated in the mid-trimester, where patients with CH had significantly higher cumulative DR incidence (P<0.001). The Cox model met the proportional hazards assumption (P>0.05) and showed good discrimination (Concordance-index=0.77).

Conclusions: The risk of incident DR during pregnancy in women with preexisting diabetes peaks in the mid-trimester. CH is an independent risk factor, while older age appears protective. Intensified fundus screening during the mid-trimester is recommended for diabetic pregnancies with CH. A risk-stratified, time-window-based screening strategy may enable earlier DR detection and management, improving long-term ocular outcomes.

Abstract No.: 205641

Seeing Through Divides: Geographic, Socioeconomic, and State-Level Disparities in Optic Neuritis Patients at a South Indian Tertiary Center

First Author: P.sangavi **SAMRITHA SELVI**

Co-Author(s): Virna.m.shah

Purpose: Optic neuritis (ON) is an acute inflammatory condition of the optic nerve. Most literatures originates from Western populations, with limited data addressing socioeconomic and demographic variations in Indian. This study aimed to assess state-level, urban-rural and

socioeconomic differences in ON presentation at a tertiary eye care center in South India.

Methods: A retrospective review of 109 ON cases was conducted between May 01, 2024, and June 30, 2025. The mean age was 44.2 ± 15.1 years, with females (52.3%) and males (47.7%). Unilateral ON occurred in 77.1% of patients and bilateral disease in 22.9%. Patients were stratified by state (Tamil Nadu vs Kerala), Urban/rural background and socioeconomic status based on a paid/free care. Demographic and clinical variables were analyzed descriptively.

Results: Among 109 cases, 55% were from rural areas and 45% from urban settings. By state, 72.5% were from Tamil Nadu, 25.7% from Kerala, and 1.8% from Karnataka. 18.3% of patients received free care, while 81.7% were paying. The mean time to outpatient presentation was 7 days, with no significant urban-rural difference ($p = 0.38$); urban patients presented at 14.0 ± 20.5 days versus 13.4 ± 15.0 days for rural patients. Kerala cases showed a rural predominance (69%), while Tamil Nadu displayed near-equal urban-rural representation. Papillitis (46%) and recurrent ON (35%).

Conclusions: Significant disparities exist in ON presentation by region and socioeconomic status within South India. With MOGAD (17.4%) predominance and NMOSD being (6.4%) of the total population. MOGAD AND NMOSD are showing urban predominance. These findings highlight the need for increased awareness and targeted outreach among rural and lower SES populations. Empower Vision Through Proactive Optic Neuritis Detection.

Abstract No.: 201597

The U-Shaped Relationship Between Serum Selenium Levels and Diabetic Retinopathy

First Author: Xiaofeng **HAO**

Co-Author(s): Xi **CHEN**, Mei **SUN**

Purpose: Numerous studies have established a clear link between serum selenium levels and various health outcomes. However, to date, only studies have found an association between serum selenium levels and diabetic retinopathy (DR). The exact link between them is unclear. We are adding data from different patient populations.

Methods: Data from 645 adults, collected through the National Health and Nutrition Examination Survey (NHANES) between 2011 and 2016, were analyzed. The association between serum selenium levels and the incidence of DR was assessed using binary logistic regression. Subgroup analysis, smoothed curve-fitting analysis, and propensity score weighting were used to investigate the association further.

Results: According to the multivariate analysis, there was no statistically significant linear association between serum selenium levels and the probability of developing DR ($P > 0.05$). Segmented regression

analysis, however, showed that the chance of getting DR was considerably lower when selenium levels hit the threshold of 106.8 $\mu\text{g/L}$ (OR = 0.88, P = 0.0107).

Conclusions: A U-shaped curve represents the link between serum selenium levels and DR. The incidence of DR is elevated in individuals with serum selenium levels that are either higher or lower than the optimal range.

Abstract No.: 205174

Unseen and Overlooked: Cataract Burden in Marginalized Communities Near Kathmandu

First Author: Sabita **PALIKHE**

Co-Author(s): Samkyta **BISTA**

Purpose: To highlight the hidden burden of cataract blindness in marginalized communities located close to Nepal's Capital city and to share the Experience of delivering free, self-funded cataract surgical services to these underserved populations.

Methods: Two free surgical Camps were organized by Drishti Eye Foundation in nearby marginalized populations: One in a Chepang Community (~50 km from Kathmandu) and another in the Tamang Community of Galchi. Comprehensive eye examinations were conducted, and patients with operable cataract underwent manual small incision cataract surgery with intraocular lens implantation. Demographic information, preoperative and postoperative visual acuity, and surgical Outcome were recorded.

Results: A total of 165 cataract surgeries were performed free of cost (Chepang :63, Tamang :102). Patients ranged from young adults to the elderly, with the majority aged > 60 years. Both Male and Female patients were represented, with a slight male predominance. Most patients presented with severe VI or blindness (Pre Operative Vision < 3/69 in the Better eye in the Majority). Postoperatively, there was marked improvement in VA with most patients achieving good functional vision. The Visual outcomes were significant and immediately life-changing for the participants.

Conclusions: Even in communities located close to Nepal's Capital city, significant cataract blindness persists, reflecting ongoing disparities in access to care. Self-funded community-based outreach remains a vital strategy to restore sight in these marginalized populations. Such initiatives demonstrate that the impact of cataract blindness extends beyond remote rural areas and underline the urgent need for sustainable, equitable eye care delivery models in Nepal.

Abstract No.: 203946

Unveiling the Burden of Diabetic Retinopathy: Insights From a One-Year Community-Based Screening Program in West Java, Indonesia

First Author: Grace **SETIAWAN**

Co-Author(s): Mayang **RINI**

Purpose: To identify characteristic and risk factors of diabetic retinopathy in primary health care center in Bandung Districts, West Java, Indonesia.

Methods: This was a cross-sectional study during the period of March 2021 until June 2022 of 1080 participants. Demographic and clinical characteristics, visual acuity, and several risk factors such as blood glucose level, blood pressure, body mass index, waist circumference, HbA1C, and cigarette usage were documented.

Results: Among 1080 participant with DM, 28.89% (25.16 – 33.12% [95% CI]) were classified to have DR. A total of 32.69% (28.14 – 36.71 [95% CI]) participants with RD had vision threatening diabetic retinopathy (VTDR). The prevalence of DR in this study was higher in women (77.23%) with mean age of 57.26 ± 9.17 and duration of DM of 3.5-years (56.01%), blood glucose level < 200 mg/dL (63.79%), high systolic blood pressure (52.03%), high diastolic blood pressure (39.07%), normal BMI (55.5%), high waist circumference (43.7%), and high HbA1C (3.42%). A total of 1041 (96.39%) participant had antidiabetic drugs, and 9.63% of them were currently smoking.

Conclusions: Diabetic retinopathy was identified in 28.89% of screened patients with diabetes mellitus, with nearly one-third of these cases classified as vision-threatening. DR prevalence was higher among women, older individuals, and those with longer diabetes duration, elevated blood pressure, high waist circumference, and poor glycemic control. These findings highlight the importance of targeted screening and risk factor management in primary care settings.

Abstract No.: 206450

Use of Chinese Medicine in Patients With Ocular Diseases in Hong Kong

First Author: Jiahui **LI**

Co-Author(s): Wai Kit **CHU**, Bo Man **HO**, Zhichao **HU**, Ivan **KONG**, Linbin **ZHOU**

Purpose: To evaluate the usage situation and knowledge of patients with ocular diseases in Hong Kong and collect their opinions on the use of Chinese medicine (CM).

Methods: This survey was conducted in patients with ophthalmic diseases at the Hong Kong Eye Hospital. Ethics was approved by the University Survey and Behavioural Research Ethics Committee and the Hospital Authority Central Institutional Review Board. All subjects answered a survey of 35 questions related

to their disease diagnosis and management, and their willingness and ability to access healthcare-related resources. Outcome measures included sociodemographic characteristics, usage of CM methods and opinions on the use of CM.

Results: A total of 501 patients answered the survey, with 33.7% male and 66.3% female. Average and median ages are 61.07 (IQR18) and 59.99 (IQR 18) years respectively. 15% (n=76) patients had received CM to treat their eye diseases. A similar sex ratio was detected in these 2 groups (male: female 23.7%:76.3% compared to 35.8%:64.2%). Similar education levels were detected in these 2 groups (primary: secondary: tertiary or above education 6.6%:48.7%:27.6% who had received CM, compared to 13.4%:52.0%:19.3% who had not). Most patients who received CM were diagnosed with glaucoma (39.5%), and 19.7% with retinal diseases. For those who received CM, most of them take oral medication (50%, n=61). 69% (n=40) of them were satisfied with the treatment outcome after receiving CM.

Conclusions: Oral medication is the most popular form of CM. And the majority of patients treated with CM are satisfied with the treatment outcome.

Abstract No.: 206633

Vision Atlas: An Interactive Platform/ Global Resource for Visualizing and Monitoring Avoidable Vision Loss

First Author: Anthea **BURNETT**

Co-Author(s): Michael **MORTON**, Jude **STERN**, Mayinuer **YUSUFU**

Purpose: To accelerate progress toward eliminating avoidable sight loss by 2030, the Vision Atlas was redeveloped to consolidate timely, reliable and accessible data on sight loss, eye health service delivery, commitments to eye health, and the social impact of eye health — providing policymakers, advocates, and researchers with a comprehensive resource.

Methods: The Vision Atlas integrates epidemiological estimates from the Vision Loss Expert Group, national and regional surveys, country-level studies on eye health systems using indicators derived from WHO tools, and global studies on the developmental impact of eye health. As an interactive tool, it enables customizable visualizations—dynamic charts, maps, and graphs—that allow users to explore and use eye health data based on their specific needs.

Results: With verified data from over 65 sources, this publicly accessible online platform (<https://visionatlas.iapb.org/>) was launched in 2025. It provides comprehensive eye health data at global, regional and national levels, covering over 180 countries, and enables country comparisons. In addition to customisable data presentation, the platform also

provides Data Stories, which present key topics using clear, visual narratives that make complex information in an accessible format. As a living, evolving resource, the Vision Atlas continuously integrates new surveys, studies, and global reports to provide the most up-to-date and actionable evidence.

Conclusions: The Vision Atlas serves as a global public good, translating complex datasets into an accessible, actionable, and visually engaging platform that empowers stakeholders to identify priority areas, monitor progress, and advocate for universal eye health.

Ophthalmic Trauma

Abstract No.: 203989

A Case of Stress Vasoreactivity Chorioretinopathy

First Author: Yuxin **LI**

Co-Author(s): Yuntao **HU**

Purpose: To report a case of vision loss due to macular subretinal fluid (SRF) accumulation without direct blunt ocular trauma, presumed to be stress vasoreactivity chorioretinopathy (SVC) based on multimodal imaging.

Methods: A 48-year-old male presented with bilateral blurry vision after a head injury from a traffic accident, denying direct ocular trauma. Ophthalmic examinations including OCT, indocyanine green angiography (ICGA), and OCT angiography (OCTA) were performed. The patient received intravenous alprostadil to improve vascular dilation.

Results: Initial best-corrected visual acuity (BCVA) was 0.02 OD and 0.03 OS, with OCT showing macular SRF in both eyes. A local hospital diagnosed bilateral optic nerve injury and prescribed neurotrophic treatment. At referral, BCVA was 0.2 OD and 0.06 OS, with persistent SRF. ICGA revealed patchy late-phase hypofluorescence. After alprostadil therapy, SRF resolved within three days. Two weeks later, BCVA improved to 0.9 OD and 0.8 OS, with improved ICGA findings. OCTA showed increased choroidal vessel and stroma volume in the macular and peripapillary regions, along with progressive choroidal thickening.

Conclusions: Subfoveal SRF accumulation was the main cause of vision loss in this case. Findings suggest that SVC, through choroidal hypoperfusion and retinal pigment epithelium dysfunction, can lead to SRF accumulation. Multimodal imaging is essential for diagnosis and monitoring.

Abstract No.: 203959**A Large 50 Millimeter Intraorbital Wooden Foreign Body After Fall From Tree Which Developed Fungal Eyelid Infection***First Author: Mohammad IDRIS*

Purpose: To report a rare case of large 50 millimeter intraorbital wooden foreign body after fall from tree with fungal infection in the eyelid.

Methods: All investigations including Ct scan Orbit and sinuses and culture from eyelid wound was taken. Under general anesthesia, the wound was explored.

Results: This child of age 5 years with history of fall from tree one month back. After non healing of wound not responding to antibiotics, the child developed fungal infection with wound in lower eyelid. A longitudinal oblique hypodense FB in the pre maxillary area extending superiorly into preseptal space into the orbit with fracture in maxilla and medial wall. Patient was started on antifungal drugs and was operated to retrieve the foreign body which was 50mm with multiple pieces of leaves removed. One week after FB removal Child improved and eyelid wound healed with no fornix adhesions.

Conclusions: This is a rare case of large 50 millimeter intraorbital wooden foreign body which developed fungal infection in the eyelid. History and investigations in such cases can save the eye from serious intraorbital infections like fungus.

Abstract No.: 204913**A Subtle Entry, a Fatal Outcome: Case Report of Transorbital Penetrating Brain Injury***First Author: Willy YAHYA**Co-Author(s): Ni Made LAKSMI UTARI, Putu YULIAWATI*

Purpose: Transorbital penetrating brain injury is a rare, life-threatening trauma with often subtle presentation. This case highlights the importance of systematic evaluation and multidisciplinary management.

Methods: A 54-year-old male presented to Ngoerah Hospital, Bali, Indonesia, with decreased consciousness (E2V2M5) and a small laceration on the lower medial left eyelid after a fall involving a penetrating wooden branch. Ocular findings included proptosis, anisocoria with a dilated pupil, lens opacity, vitreous hemorrhage, and restricted motility. Computed tomography scan revealed a hypoattenuating foreign body extending from the orbit to the intracranial region. A multidisciplinary team, which included the ophthalmology and neurosurgery departments, planned an urgent craniotomy with debridement, dural repair, and foreign body extraction. Intravenous ceftriaxone and metronidazole were given for infection prophylaxis.

Results: Partial removal of the wooden foreign body was achieved through anterior orbitotomy and

subcranial craniotomy, limited by the fragment's brittleness and intracranial location. On postoperative day 4, the patient developed sudden wound bleeding with blood aspiration, leading to respiratory failure and death.

Conclusions: Even in the absence of obvious ocular entry wounds, a thorough primary survey is essential to identify life-threatening complications of orbital trauma. Early diagnosis and coordinated multidisciplinary management are critical in this case.

Abstract No.: 201325**Analyzing the Long-Term Visual Outcomes of Patients With Ocular Trauma***First Author: Mosaab MOHAMED ELMAHDI**Co-Author(s): Gong YU*

Purpose: To systematically review and synthesize existing evidence on visual acuity, quality of life, and complication rates in patients who sustained ocular trauma, with follow-up periods of one year or longer.

Methods: A comprehensive literature search was conducted in PubMed, Embase, and Cochrane Library for studies published between January 2000 and June 2025. Inclusion criteria comprised cohort and case-control studies reporting visual outcomes at ≥ 12 months post-injury. Data on best-corrected visual acuity (BCVA), anatomical restoration, secondary interventions, and patient-reported outcomes were extracted. Study quality was assessed using the Newcastle-Ottawa Scale, and a narrative synthesis was performed due to heterogeneity in outcome measures.

Results: Twenty-three studies encompassing 3,157 patients met inclusion criteria. Mean follow-up ranged from 12 to 96 months. At last follow-up, 42% of eyes achieved BCVA of 20/40 or better, whereas 28% remained $\leq 20/200$. Globe rupture and posterior segment involvement were significant predictors of poor visual recovery ($p < 0.01$). Secondary interventions—vitrectomy (54%) and corneal grafting (18%)—improved anatomic outcomes but did not consistently translate into functional gains. Quality-of-life assessments revealed persistent photophobia, reading difficulty, and psychological distress in 36% of survivors.

Conclusions: Long-term visual prognosis after ocular trauma remains guarded, particularly in severe injuries involving the posterior segment. Although surgical advances enhance structural repair, functional recovery and patient-reported quality of life lag behind anatomical success. Standardized outcome measures and prospective multicenter studies are needed to optimize rehabilitation strategies.

Abstract No.: 202877

Application of Functional Intraocular Lenses in Retinal Surgery

First Author: Bo QIN

Co-Author(s): Dongcheng LIU, Yijie LU

Purpose: Discuss how to tailor surgical planning for functional intraocular lenses in retinal surgery based on patient conditions within the context of the refractive cataract era.

Methods: This paper examines the application of functional intraocular lenses in retinal surgery through several clinical case studies.

Results: ① For stable retinal patients requiring simultaneous cataract surgery, such as those with epiretinal membrane (ERM), lamellar macular hole (MH), stable diabetic retinopathy (DR), branch retinal vein occlusion (BRVO), or vitreous hemorrhage (with good macular morphology), and middle-aged or elderly retinal patients with working distance and accommodation needs, co-implantation of a functional intraocular lens (IOL) may be considered. ② When implanting a monofocal IOL, assess the patient's macular function. For patients with retinal disease where the macula is not significantly affected or where good postoperative visual acuity is anticipated, monofocal IOL implantation may be selected. ③ Evaluate the status of the suspensory ligament and elastic lens capsule (ELP). Postoperative refractive deviation typically does not exceed 0.5D. Functional IOL implantation may be selected, with tension rings used when necessary. ④ Extended depth-of-focus (EDOF) IOLs avoid interference from diffraction rings, do not affect combined anterior-posterior segment procedures, and prevent postoperative optical interference.

Conclusions: The use of functional intraocular lenses in retinal surgery requires personalized design, taking into account the patient's refractive status. Through monovision design or hybrid intraocular lens design, full-range vision can be achieved, expanding the potential indications for functional intraocular lenses in retinal surgery.

Abstract No.: 202695

Application of Perfluoropropane (C3F8) Gas Combined With Subretinal Tenecteplase in Staged Surgery for Complex Ocular Trauma

First Author: Shuai SHENG

Purpose: Complex open-globe injuries are ophthalmic emergencies with poor prognosis and high blindness rates. Primary repair aims to restore globe integrity for secondary intervention. This report evaluates a staged approach using C3F8 gas and subretinal tenecteplase.

Methods: A 54-year-old male presented with vision loss after an electric hammer injury. Primary repair included

laceration closure, anterior chamber washout, and intravitreal injection of 1.2 ml C3F8 gas. Subsequent secondary surgery involved pars plana vitrectomy with laser photocoagulation and subretinal injection of tenecteplase to address subretinal hemorrhage. A third surgery (November 1, 2023) repaired complex retinal detachment with silicone oil injection.

Results: Two months post-final surgery, best-corrected visual acuity (BCVA) was 0.5, indicating favorable recovery.

Conclusions: Intravitreal C3F8 injection during primary repair effectively managed early hypotony, reduced hemorrhage, prevented corneal blood staining and extensive retinal detachment, and inhibited post-traumatic proliferation, facilitating secondary surgery. Subretinal tenecteplase administered during the secondary procedure promoted clot dissolution within one week. This combined approach using C3F8 and tenecteplase in staged surgery improves outcomes and reduces blindness risk in complex ocular trauma.

Abstract No.: 206959

Axe-Related Ocular Adnexal Trauma In A Young Male Patient

First Author: Herdina RAMADHANI

Co-Author(s): Dyah Ayu Eliza LESTARI, Heru PRASETIYONO

Purpose: Ocular and adnexal trauma predominantly affect young population and may result in visual morbidity. Approximately 55 million cases of ocular trauma occur every year, and significant proportion of this occurs in the workplace. We present a case of ocular adnexal trauma resulting from an axe.

Methods: A case of 21-year-old male patient brought to the emergency department with redness, blood and pain in left eye following workplace accident. As the patient bent down, his left eye accidentally touched the sharp-edge an axe. He didn't wear any eye protection equipment. Examination in left eye revealed VA was 20/20. Anterior segment evaluation showed superior eyelid laceration in 1/3 lateral partial thickness involving lid margin, laceration in the lateral canthus, extensive conjunctival laceration in lateral half of the eye, and subconjunctival hemorrhage in inferior. Seidel test was negative. Funduscopy within normal limit. The patient underwent surgical repair. Postoperatively, the symptoms improved and well-healed wounds.

Results: The ocular adnexa play an important role in the protection of the globe as a mechanical defense mechanism. A mechanical trauma causing injury to the ocular adnexal structures can lead to ocular morbidity. Work-related eye trauma is one of the leading causes of ocular morbidity among workers, particularly in the industrial and construction sectors. These incidents cause temporary or permanent visual impairment, impact worker productivity and the economic burden.

This is predominantly avoidable by the utilization of protective eyewear.

Conclusions: Provision of appropriate eyewear protection and education for workers is required to minimize the incidence of ocular adnexal trauma in workplace.

Abstract No.: 204156

Blinded by a Nail, Saved by a Lens: A Remarkable Visual Comeback

First Author: Dyah Ayu Cintantya Pradipta Citrani
RAMADHANI

Co-Author(s): Sagung Gede INDRAWATI, Amanda Nur Shinta PERTIWI

Purpose: To demonstrate the significant role of RGP contact lenses in restoring visual acuity in a patient with an irregular post-traumatic cornea combined with aphakia.

Methods: A 27-year-old male presented four months after penetrating ocular trauma to his left eye from a self-extracted nail, having undergone emergency corneal laceration repair. Initial visual acuity was hand movement. Slit-lamp examination revealed central corneal scarring with irregular astigmatism and corneal flattening; no intraocular lens (IOL) or lens remnants were present. Visual acuity with aphakic glasses only improved to 0.1 (20/200). Following initial assessment, a custom-designed RGP contact lens was fitted. Lens fitting was evaluated using static, dynamic assessment, and fluorescein under cobalt blue illumination with a yellow filter. Best-corrected visual acuity (BCVA) was recorded after RGP lens fitting.

Results: Optimal RGP contact lens fitting significantly improved the patient's BCVA to 0.8 (20/25) with minimal discomfort. Fitting assessment showed the lens centered over the pupillary zone, slightly low-riding but without conjunctival touch, and exhibited smooth movement upon blinking. Fluorescein evaluation revealed central pooling due to the flattened cornea, minimal inferonasal touch consistent with the laceration scar, and adequate peripheral clearance and edge lift for tear exchange and good centration. The patient reported marked improvement in visual function and quality of life.

Conclusions: RGP contact lenses offer an effective solution for visual rehabilitation in patients with post-traumatic irregular corneas and aphakia. Proper lens fitting significantly improves visual acuity and patient satisfaction, confirming RGPs as a crucial modality for complex corneal conditions

Abstract No.: 204275

Case Study: Removal of Intraorbital Bullet Through Endoscopic Surgery

First Author: Yuan Yuh LEONG

Co-Author(s): Sunny SHEN

Purpose: We present a case report that describes the use of image-guided nasal-endoscopic surgery for the safe removal of a metallic orbital foreign body in close proximity to the optic nerve.

Methods: A 35-year-old overseas male patient presented to Singapore National Eye Centre with a history of bilateral gunshot injuries sustained 8 months prior. He had no light perception in the right eye and 6/36 vision in the left (previously amblyopic). Computer tomography(CT) imaging showed a metallic foreign body (0.5 × 0.4 × 0.4 cm) in the left orbit, abutting the mid-orbital segment of the optic nerve. Due to its location, a combined approach with the Otorhinolaryngology team using nasal-endoscopic surgery was preferred. Functional endoscopic sinus surgery (FESS) was first performed to expose and open the lamina papyracea. The CT image guidance system (IGS) was then used to localize the foreign body. Careful dissection through the extraconal fat using a ball probe allowed safe identification and retrieval of the object.

Results: The foreign body was removed without complications. Forensic analysis identified a 2.5 mm lead pellet with trace amounts of arsenic and phosphorus. The patient recovered well without new deficits.

Conclusions: This case highlights the value of CT-guided nasal-endoscopic techniques in managing orbital foreign bodies close to the optic nerve.

Abstract No.: 202919

Directional Differentiation of Human Embryonic Stem Cell-Derived Conjunctival Epithelial Cells and Its Application

First Author: Xiangyue HU

Purpose: Conjunctival diseases and trauma can result in conjunctival scarring, restricting eye movement, and potentially leading to ocular surface failure, significantly impacting patients' vision. Currently, conjunctival reconstruction surgery serves as the primary treatment method; however, it is hampered by challenges such as donor scarcity, graft limitations, and incomplete functional restoration. Hence, there is a pressing need for a novel alternative cell source for conjunctival reconstruction. This study investigates the viability of utilizing human embryonic stem cells to produce mature conjunctival epithelial cells, presenting a fresh approach to addressing conjunctival disorders.

Methods: Enhancing stemness and proliferation of cultured hESCs through audible acoustic waves. Directed differentiation of hESC-derived conjunctival

epithelial cells (iCjECs). Application of hESC-derived conjunctival cell-derived exosomes (iCjECs-exo) for ocular surface injury repair.

Results: Enhancing stemness and proliferation of cultured hESCs through audible acoustic waves. Directed differentiation of hESC-derived conjunctival epithelial cells (iCjECs). Application of hESC-derived conjunctival cell-derived exosomes (iCjECs-exo) for ocular surface injury repair.

Conclusions: This study introduces a straightforward, effective, and precisely defined method for the directed differentiation of hESCs into conjunctival cells that express mature conjunctival epithelial and goblet cell markers. Additionally, we have devised an in vitro culture approach for hESCs treated with audible acoustic waves to ensure a high-quality cell source for stem cell differentiation. Furthermore, the study investigates the role of exosomes derived from differentiated conjunctival cells, offering a novel perspective for the clinical utilization of hESC-derived conjunctival epithelial cells.

Abstract No.: 203908

Don't Let Your Eyesight Be Gone in a Flash: A Firecracker Injury

First Author: *Ridhima BANSAL*

Co-Author(s): *Shagun KORLA, G.c RAJPUT*

Purpose: In India, firecracker injuries are common during the festival of 'Deepavali' where traditionally, firecrackers form an essential part of the celebrations. As per the National Programme for Control of Blindness (NPCB), the prevalence of blindness in India was 1.1% in 2001–2002 and 1% in 2006–2007. Eye injuries are estimated to account for 18% of all firework injuries. Ocular trauma from fireworks can cause ocular injuries ranging from a minor trauma to a globe rupture, with a severe vision loss in over 15% of the individuals.

Methods: A 51-year-old male presented to MMU Emergency. DOP: Day after Diwali. C/O sudden painful diminution of vision with redness and swelling of eyelids in the left eye after sustaining a firecracker injury in the same eye. He was given primary treatment at the Regional Hospital, Rajgarh, and was referred to our hospital for further management.

Results: Left eye. VA: H.M.C.F. IOP (NCT): 32 mmHg. Lids and adnexa: Edema and erythema. Pupil: Mid dilated, sluggish reacting. Anterior segment: Image and video 1. Posterior segment: Media grade 4 (only the optic disc was visible). B-scan- multiple medium intensity Dot echoes suggestive of vitreous hemorrhage and linear medium to high intensity membranous echoes suggestive of complete PVD. Retina looks attached (video 2)

Conclusions: Left eye closed globe injury type 1, Grade 4 pupil positive zone I (according to Betts classification). Management. Restoration of intact epithelium Control

of acute inflammatory reaction. Support of the reparative process. Prevention of complications.

Abstract No.: 207314

Endoscopic Cyst Excision With Laser Photocoagulation: A Unique Approach to the Management of Recurrent Iris Cysts

First Author: *Vivek DAVE*

Purpose: To describe an effective technique of managing recurrent iris cysts with endoscopic cyst excision coupled with laser photocoagulation.

Methods: This retrospective consecutive non-comparative interventional case series included 4 cases of recurrent iris cysts previously managed by conventional techniques, but showed recurrence. Presenting complaints and detailed history were noted. All patients underwent endoscopic cyst excision with laser photocoagulation of the attachment of the cyst to the root of the iris and ciliary body. The outcome in terms of vision, corneal clarity, recurrence of the cyst, and total follow-up was noted.

Results: We describe 4 cases managed with endoscopic cyst excision with laser photocoagulation. None of the cases showed any recurrence. The cornea showed acceptable clarity at the last follow-up visit. The follow-up period was 1.5 years, four years, two years, and one year, respectively, with no recurrence. Case 3 developed glaucoma in the follow-up, requiring filtering glaucoma surgery.

Conclusions: An endoscopic approach and laser photocoagulation allow for a complete cyst excision with a prolonged recurrence free period in recurrent iris cysts. This could be a reasonably good approach to successfully manage a condition that is otherwise known to be recurrent.

Abstract No.: 209606

Endoscopic Removal of Complex Intraorbital Foreign Bodies

First Author: *Xinyu LI*

Co-Author(s): *Hongfei LIAO, Linjuan WU, Wencan WU, Guangming ZHOU*

Purpose: To evaluate the feasibility and effectiveness of endoscopic transnasal removal of complex intraorbital foreign bodies.

Methods: This study included a total of 39 patients with intraorbital foreign bodies who underwent endoscope-assisted removal. All patients underwent a comprehensive ophthalmic examination before surgery, including uncorrected visual acuity, best-corrected visual acuity (BCVA), ocular motility and ptosis assessment, optical coherence tomography (OCT), and visual field testing. Computed tomography (CT) was used as the main imaging method to determine the size and location of the foreign bodies and their spatial

relationship with key orbital structures. All surgeries were performed under the guidance of a surgical navigation system. Patients were followed regularly at 1 week, 1, 3, 6, and 12 months postoperatively. Follow-up included assessments of visual acuity, anterior and posterior segment conditions, intraocular pressure, and recording of postoperative complications.

Results: The surgical procedure went smoothly, the foreign bodies were completely removed, and no complications such as neurovascular damage occurred. Postoperatively, the patients experienced relief from eye movement pain, and their vision was effectively improved. A total of 39 patients were included, of which 38 patients (97.4%) were male and 1 patient (2.6%) was female (average age: 44.2 years; range: 9–79 years). Removal was successfully achieved in 35 cases (success rate 89.7%). Thirty-eight patients (97.4%) exhibited symptoms within 48 hours after injury, while 1 patient (2.6%) developed symptoms 7 years post-injury. The best-corrected visual acuity (BCVA) improved after surgery in all patients. The mean preoperative BCVA was 6/30 (95% confidence interval [CI] 6/60–6/20) and the mean postoperative BCVA was 6/10 (95% CI 6/12–6/7.5). Inorganic foreign bodies included metal (n=21), glass (n=3), pencil lead (n=1), and stone (n=1). The metal foreign bodies were magnetic objects (n=13), shotgun pellets (n=1), and other non-magnetic metal fragments (n=7). Organic foreign bodies included wood and motor oil. The primary ocular conditions were orbital cellulitis (n=3), traumatic optic neuropathy (n=7), globe injury (n=17), and extraocular muscle rupture (n=2).

Conclusions: Endoscopy is a feasible option for handling complex intraorbital foreign bodies. The transnasal route can directly reach the location of the foreign body, enabling precise exploratory surgery with clear observation and accurate operation, allowing for the detection of very small foreign bodies. The transorbital route allows for subperiosteal manipulation, avoiding the interference of intraorbital fat herniation associated with traditional open orbital surgery. Once reaching the lesion, surgery can be performed within the orbit with minimal damage.

Abstract No.: 207280

Epidemiological Profile of Orbital Fracture in Orbital Trauma at a Level 2 Trauma Centre

First Author: Sangeetha T

Co-Author(s): Inchara N, Nishitha N

Purpose: Orbital fractures, often from blunt trauma, commonly affect the fragile orbital floor and medial wall. Symptoms may include periorbital swelling, diplopia, enophthalmos, infraorbital hypesthesia, and limited eye movement, depending on fracture severity and soft tissue involvement. We aim to assess the demographics, surgical management, and

complications of orbital and orbitozygomaticomaxillary complex (OZMC) fractures at Level 2 Trauma Centre.

Methods: A retrospective review was conducted on 96 patients with orbital fractures treated between January 2024 and July 2025. Data collected included demographics, etiology, fracture type, treatment, and complications.

Results: The majority of patients were males aged 40–59. Road traffic accidents were the most common cause, followed by falls. Alcohol use was significantly associated with assault-related fractures ($P=0.001$). OZMC fractures were most frequent, followed by pure orbital fractures; 47% had concomitant facial fractures. Observation and open reduction with internal fixation were the treatments.

Conclusions: High rates of orbital and OZMC fractures in Kolar, likely due to its location on a national highway, highlight the importance of thorough primary care assessment in emergency settings. CT is the best tool for diagnosing orbital fractures, while MRI is better for spotting soft tissue entrapment, especially in children. Early diagnosis is important, as delays can cause lasting functional and cosmetic problems.

Abstract No.: 202869

Hot Glue, Cold Reality: Paediatric Chemical Eye Injury

First Author: Yi Lin CHUA

Co-Author(s): Penny Poi Wah LOTT, Deivanai SUBBIAH, Cheun-seng WONG

Purpose: To report a case of ocular chemical injury in a 5-year-old boy.

Methods: Case report.

Results: A 5-year-old boy with no prior medical history was referred following accidental exposure of his right eye to hot Epoxy glue from a glue gun. He presented with right eye redness and pain 6 hours post trauma. Immediate first aid with 7 liters of normal saline irrigation was performed. Upon arrival, the ocular surface pH was 8, improving to 7 after additional irrigation. Examination was limited due to poor cooperation but revealed conjunctival injection with marked inferior chemosis and total corneal opacity with no iris details visible. No retained foreign body was seen. The left eye was normal. Intraocular pressures were digitally normal in both eyes, and there was no reverse relative afferent pupillary defect. Visual acuity could not be assessed. Based on the Dua classification, the injury was classified as Grade 6, indicating severe ocular surface damage. The child was admitted for close monitoring and intensive anti-inflammatory medical therapy while awaiting surgery. On Day 9 post-injury, he underwent amniotic membrane transplantation (AMT) with symblepharon ring insertion under general anaesthesia to promote healing. Intraoperatively, there was a total cornea

epithelial defect and 360 degree conjunctiva chemosis. The ocular surface was opaque, and iris and pupil details were not visible. No symblepharon was detected.

Conclusions: This case highlights the severity of paediatric ocular chemical burns and emphasizes the importance of immediate irrigation, appropriate medical therapy, and timely surgical intervention to optimize visual outcomes.

Abstract No.: 208042

Implantation of Toric Implantable Collamer Lens (TICL) in Adult Pseudophakic Eye After Traumatic Cataract Surgery During Childhood

First Author: Jingming LI

Co-Author(s): Yongkang ZHANG, Yue BIAN, Ma JIXIAN, Yi ZHUO

Purpose: To report a case of implantation of Toric Implantable Collamer Lens (TICL) in adult pseudophakic eye after traumatic cataract surgery during childhood.

Methods: A 29-year-old female patient who underwent traumatic cataract surgery and implantation of an intraocular lens during her childhood later developed myopia and astigmatism in both eyes. The UCVA was 20/63 for the right eye and 20/500 for the left eye. The right cornea was clear with a quiet anterior chamber. The right pupil was posteriorly synechia at 4-7 o'clock with downward displacement and irregular shape. The intraocular lens was positioned well with a posterior capsule defect in the right eye. The optometry was as follow: OD-2.25DS/-3.25DC×155→20/25; OS-7.25DS/-0.25DC× 50→20/20.

Results: The right eye was given implantation of ICL and left eye was implanted with TICL. The UCVA were 20/30 for the right eye and 20/16 for the left eye postoperatively. The surgery video would be provided if necessary.

Conclusions: Implantation of TICL for correction of refractive error after cataract surgery could be a choice for patients with pseudophakic eyes.

Abstract No.: 200353

Intense Pulsed Light Treatment of Ocular Surface Alkali Burn: A Case Report

First Author: Wangyi FANG

Co-Author(s): Tong QIAO

Purpose: To report a novel application of intense pulsed light (IPL) therapy for managing meibomian gland damage and ocular surface sequelae in a rare case of ocular alkali burn.

Methods: A clinical case report is presented detailing the course of IPL treatment for a patient suffering structural and functional meibomian gland impairment following an ocular surface alkali burn. The patient

received a standardized periocular IPL protocol administered weekly over four consecutive sessions.

Results: Following the IPL treatment course, multimodal ocular surface imaging demonstrated marked improvements: a reduction in corneal opacity, a significant decrease in conjunctival vessel density, and structural restoration of previously shortened meibomian glands.

Conclusions: This case suggested that IPL may facilitate the repair of alkali-damaged meibomian glands, contributing to improved ocular surface structure and function. IPL may be a promising therapeutic option for ocular surface reconstruction after alkali burns.

Abstract No.: 208560

Intravitreal Conbercept for Management of Macular Hemorrhage Secondary to Blunt Ocular Trauma

First Author: Nana XU

Purpose: To evaluate the efficacy of intravitreal conbercept (IVC) in the treatment of macular hemorrhage secondary to blunt ocular trauma.

Methods: This retrospective, single-arm interventional study evaluated the efficacy of intravitreal conbercept (IVC) for macular hemorrhage secondary to blunt ocular trauma. Consecutive patients with traumatic sub-internal limiting membrane hemorrhage (SILMH) or submacular hemorrhage (SMH) involving the fovea, presenting between 2021 and 2023, were included. Eligible cases had bleeding ≥ 2 weeks and > 1 optic disc diameter. All received IVC and were followed for ≥ 24 weeks. Data on hemorrhage resolution time, best-corrected visual acuity (BCVA), and comorbidities were collected. Statistical analysis used repeated-measures ANOVA and Fisher's exact test.

Results: Eight patients (8 eyes) with mean age of 29.13 years were included. Mean time to hemorrhage resolution with recovery of the normal foveal contour was 29.75 days (range: 21-35 days). Significant improvement in BCVA from presentation (1.17 ± 0.47 , logMAR) to 2 weeks post-IVC (0.71 ± 0.24 , logMAR) was observed ($P < 0.05$), which was further improved up to the last assessment time point at week 24 post-IVC (0.17 ± 0.14 , logMAR; $P < 0.01$). All the SILMH patients had no visual deteriorate complaints, however, one of the SMH patients experienced little and localized central scotomas because of choroidal rupture hidden beneath hemorrhage.

Conclusions: IVC is an effective resolution in the management of SILMH and SMH due to blunt ocular trauma, especially for the patients with bleeding lasted for more than two weeks.

Abstract No.: 205312**Laser Pointer Maculopathy: A Preventable Threat from Excessive Power in Laser Pointers***First Author: Sathiyaraj BALAKRISHNAN*

Purpose: To raise awareness of laser maculopathy, its clinical impact, while educate the society to prevent permanent vision loss.

Methods: Case study. A 14-year-old boy presented with a central scotoma in his right eye, two days after a direct exposure to a laser pointer by himself for more than 30 seconds and no discomfort immediately after the incident. The laser is used at school laboratory as pointer which is class 3B with a wavelength of 650nm. Visual acuity of the right and left eye was 6/18 and 6/6, respectively. Fundus revealed pale spots in the right fovea. OCT shows Loss of the foveal depression with hyperreflectivity and disruption of the ellipsoid zone at the fovea and subtle irregularity of RPE. Fundal autofluorescence showed high uptake.

Results: Tissue damage occurs through three mechanisms; ionization, thermal and photochemical. The type of laser used, wavelength, exposure time and spot size are determinants of the tissue injury. If exposure exceeds 10 seconds, destruction is due to photochemical, resulting in cell death and permanent vision loss. Prognosis At 6 week oct showed thinning and loss of photoreceptor integrity at fovea and no visual regain and no choroidal neovascularization.

Conclusions: Inappropriately used class 3 or 4 lasers can cause permanent blindness, even with brief exposures. We advised the school staff and students regarding the laser injuries and letter written to health ministry and government to limit the commercial availabilities of high-power laser devices.

Abstract No.: 200635**Management of Traumatic Tractional Corectopia With Cataractous Lens: A Case Report***First Author: Keerti WALI**Co-Author(s): Vallabha K, Vaishnavi PATIL*

Purpose: To report management of a case of traumatic tractional corectopia.

Methods: A 42-year-old man presented with sudden onset, gradually progressive vision deterioration in his right eye, secondary to trauma by metal wire ten years ago. Examination revealed superior iris plastered to the inferior angle of anterior chamber (confirmed on Gonioscopy) leading to 0.5 mm extremely eccentric pupil with adjacent limbal scar.

Results: Peripheral iris adhesion was released surgically along with mini- sphincterotomies. Intraoperatively, cataractous lens with inferior zonular dialysis was noted. A safer approach of Manual small incision

cataract surgery (MSICS) with in the bag rigid resulted 20/40 vision and central pupil.

Conclusions: MSICS is a simple, cost-effective alternative to the standard approach of Nd-YAG laser pupilloplasty, microdissection of iris adhesion and cataract extraction by Phacoemulsification with Capsular tension ring and acrylic intraocular lens insertion.

Abstract No.: 202372**Managing Corneal Perforations During COVID-19: Real-World Strategies From a Tertiary Centre in India***First Author: Karan BHATIA**Co-Author(s): Madhu BHADARIA, Prasanna Venaktesh RAMESH, Nikunj TANK*

Purpose: To assess the effectiveness of corneal perforation management strategies during COVID-19 in a resource-limited setting.

Methods: Retrospective study of 112 eyes (Mar 2020–Jun 2021) with ≥ 3 months follow-up. A stepwise protocol prioritised globe preservation using temporising measures and alternatives to fresh donor tissue. Primary outcome: Anatomical integrity at 3 months. Secondary outcome: Potential for future visual rehabilitation via keratoplasty.

Results: Ninety-five eyes had perforated corneal ulcers; 17 had impending perforation. Fungal etiology dominated (62%). Tissue adhesive with BCL (n=35), Therapeutic Penetrating Keratoplasty (TPK) with preserved tissue (n=31), Modified Gunderson flap (n=20), and evisceration (n=11) were performed. Anatomical integrity was achieved in 89.3%. Only 5 eyes had undergone keratoplasty; 85 remained waitlisted.

Conclusions: Adaptive, resource-sensitive strategies enabled anatomical salvage during COVID-19. Innovative methods preserved eyes with potential for future vision.

Abstract No.: 201386**Misdiagnosis Analysis of 3 Cases With Ocular Trauma in Preschool Children***First Author: Liu RUI*

Purpose: To analyze the diagnosis and treatment process of 3 Preschool children with ocular trauma, in order to avoid misdiagnosis and delayed treatment of retinoblastoma.

Methods: Retrospective analysis of 3 cases, in which all these Preschool Children experienced misdiagnosis, and Clinical characteristics and prognosis of the RB were summarized.

Results: Three preschool children with an average age of 66.5 months (48-72 months) had a medical history

of ocular trauma. They were previously diagnosed with «Traumatic anterior chamber hemorrhage, Vitreous hemorrhage, Endophthalmitis or intraocular foreign body». Traveling through several hospitals, all 3 cases finally underwent enucleation surgery and pathological examination. No local or systemic metastases were found during 24.4 months (16-34 months) follow-up.

Conclusions: The misdiagnosis of RB in preschool children should be avoided. Early correct diagnosis and timely appropriate treatment is beneficial for improving the survival rate.

Abstract No.: 200151

Multistage Visual Rehabilitation After Severe Ocular Trauma: A Clinical Case Report

First Author: Ekaterina **SUDAKOVA**

Co-Author(s): Dmitrii **SHKVORCHENKO**, Nikolay **SOBOLEV**, Viktoriia **TEPLOVODSKAIA**

Purpose: To demonstrate the efficacy of a staged surgical approach in managing severe ocular trauma with aniridia and posttraumatic glaucoma through a clinical case.

Methods: We present a case of a 69-year-old female with severe right eye trauma following a motor vehicle accident, complicated by complete aniridia, aphakia, hemophthalmos, and secondary glaucoma. Initial examination revealed: best corrected visual acuity (BCVA): correct light projection, intraocular pressure (IOP): 30 mmHg. Treatment involved three stages: 1) Primary vitrectomy achieved BCVA of 20/70 with persistent ocular hypertension (32 mmHg); 2) Ahmed valve implantation normalized IOP to 10-11 mmHg and stabilized BCVA at 20/50; 3) Final-stage iris-lens diaphragm implantation resulted in BCVA of 20/30 and IOP of 14 mmHg by postoperative day 3

Results: One-year follow-up demonstrated stable visual function and hydrodynamic parameters. The patient was completely satisfied with the functional and cosmetic result.

Conclusions: The results demonstrate the efficacy of sequential vitreoretinal, antiglaucoma, and optical-reconstructive surgical interventions for complex combined post-traumatic lesions. Ahmed valve implantation represents a pathogenetically justified method for secondary posttraumatic glaucoma with aniridia, enabling stable hydrodynamic parameters. This staged surgical approach warrants further investigation and clinical implementation to optimize treatment for patients with severe combined post-traumatic complications.

Abstract No.: 202784

Occult Indirect Optic Nerve Injury

First Author: Xuchuan **WANG**

Purpose: Introduce the characteristics and pathogenesis of occult indirect optic nerve injury through a detailed case.

Methods: A male patient was admitted to the emergency department 5 hours after being struck by a steel bar on the left superciliary arch and inner canthus. He had skin lacerations on the left facial and eyelid regions. Visual acuity was 1.0 in the right eye and 0.6 in the left eye. The left pupil was moderately dilated (approximately 5 mm) with a sluggish light reflex, and relative afferent pupillary defect (RAPD) was positive. The optic disc had clear margins and normal color, with a cup-to-disc ratio of 0.3. No obvious abnormalities were found in the right eye. However, on the third day, the patient complained of a shadow in the visual field. Visual Evoked Potential (VEP) showed preserved F-VEP but prolonged P100 latency in P-VEP. High-dose glucocorticoid pulse therapy (1 g/day methylprednisolone) was then initiated.

Results: At discharge two weeks after injury, the uncorrected visual acuity of the left eye remained 1.0, but visual field examination revealed a tubular visual field in the affected eye. The patient's injury site was the left superciliary arch, with no obvious visual loss in the early stage. However, the affected eye presented with mydriasis, sluggish light reflex, abnormal VEP, and concentric narrowing of the visual field, consistent with occult indirect optic nerve injury.

Conclusions: This condition is easily overlooked in the early stage, leading to delayed treatment and permanent visual damage to the patient.

Abstract No.: 201106

Ocular Morbidity From Trauma

First Author: Shah Md Rajibul **ISLAM**

Co-Author(s): Shah Md Bulbul **ISLAM**, Omar **JAFARULLAH**, Golam **RABBANI**

Purpose: To outline the seriousness of ocular trauma.

Methods: This cross sectional observational study was done from the imaging room (B Scan USG) of all the patients with ocular trauma that had been advised for a BScan USG. It was done from July 2022 up to June 2023. Age and sex was noted, causative agent was identified, BScan USG findings were noted.

Results: Out of 2653 patients, 82% were male. Mean age was 29 ± 10.4 (06 - 72) years. 68% were open globe injury and 32% were closed globe. High speed projectile was the highest 30% followed by blunt trauma 20%, Sharp kitchen objects 18%, RTA 10%, toy 12%, Stationary 5%, Fight 3% and Vegetative trauma 2%. Traumatic cataract resulted in 42% followed by vitreous hemorrhage 38%, endophthalmitis 18%,

retinal detachment and lens dislocation 12% and hyphema 10%.

Conclusions: A large number ocular trauma can be avoided if proper safety equipment is used and precautions taken. Large number of ocular morbidity occurs in young males every year resulting in socio-economic burden. We as clinicians should advocate strong legislation to prevent work related ocular injury.

Abstract No.: 205486

Orbito-Facial Fractures With Concomitant Rupture of Globe: Etiology, Injury Pattern, and Prognostic Factors

First Author: Rajendra MAURYA
Co-Author(s): Asha EVI, Priyanka

Purpose: We investigate the etiology, clinico-radiological pattern, and prognostic factors of patients having orbito-facial fractures with simultaneous globe rupture.

Methods: A retrospective review of patients having orbito-facial fractures with concomitant globe rupture was done to determine age, sex, time & place of injury, cause of injury, type and site of bony fracture, number of orbital wall fractures, zone of globe injury, ocular trauma score (OTS), surgical procedures, and final outcome. The correlation between OTS and final visual acuity was assessed.

Results: A total of 62 patients with eye ball rupture complicated by orbito-facial fractures were assessed. The majority of the patients were male (77.42%) between 21 and 30 years. The cause of injury included road traffic accidents (43.54%), physical assault (20.97%), fall from height (11.29%), and recreational activities (8.10%). The commonest orbital wall fracture was combined medial wall & floor fracture (35.48%), followed by combined lateral wall and floor fracture (32.26%), and isolated medial wall and floor fracture in 24.9% & 20.97% respectively. The majority of patients had > 2 orbital wall fractures. However .645% patients had pan orbito-facial fracture. The majority of globe ruptures resulted in zone II (51.61%) and zone III (33.87%) injury. An intra-orbital foreign body was seen in 19.35 % eyes. Surgical intervention was done in 87.10% cases. The OTS correlated with final visual acuity ($p < 0.001$).

Conclusions: Orbito-facial fractures with simultaneous globe rupture are a vision-threatening condition. This study highlights that zone of injury, OTS, number of orbital wall fractures, and RAPD are the most important prognostic factors. Visual outcome is proportionate to the number of orbital wall fractures.

Abstract No.: 202965

Outcomes of Canalicular Tear Repair Using Self-Retaining Monocanalicular Stent

First Author: Riffat RASHID
Co-Author(s): Farzana AFZAL, Syeed Mehabub Ul KADIR, Sadia SULTANA

Purpose: To evaluate the surgical outcomes of canalicular laceration repair with self-retaining monocanalicular stent.

Methods: This prospective study of 27 patients was carried out in the Department of Oculoplasty, from January 2023 to December 2024. Patient with upper and lower canalicular lacerations and undergone repair with self-retaining monocanalicular stent were included in this study. Patients presented late one week after trauma, associated nasal and orbital fracture, signs of local infections and uncompliant patients were excluded from the study. The main feature assessed were healing of wound, postoperative cosmetic appearance and complications. The stent was removed after 3 months. Patients were followed up for six months.

Results: Total patients were 27. Male were 18(67%) and female 9(33%). The mean age was 17.74 years with age range from 2 to 85 years. Right eyes were operated 15(55.56%) and left eyes 12(44.44%). Upper canaliculus repaired 1(3.70%), lower canaliculus 24(88.89%) and both canaliculus 2(7.41%). Associated lacerated lid injury were present in 11(40.74%) patients. 2(7.41%) patient reported early extrusion of stent. Anatomical and functional successes were 96.30% respectively. Only 1(3.70%) patient had persistent epiphora with canalicular block.

Conclusions: Traumatic canalicular laceration repair should be done under operating microscope to provide best possible cosmetic and functional outcome with reduced post-operative complications. Canalicular laceration repair with self-retaining monocanalicular silicon stent showed high success rate.

Abstract No.: 204362

Photoreceptor Damage and Inner Retinal Damage Caused by Metallic Intraocular Foreign Body

First Author: Xiaoting MAI
Co-Author(s): Peixin ZHANG

Purpose: This study aimed to evaluate the retinal damage in metallic IOFB injured patients and to investigate the effect of iron particles on retina by experimental animal models.

Methods: Medical records of trauma patients with IOFBs in the emergency department from 2008-2020 were reviewed to evaluate the characteristics of optical coherence tomography (OCT) images. Retinal damage

was assessed with the application of iron particles in rats.

Results: From the OCT analysis, photoreceptor damage and inner retinal damage were identified in the metallic IOFB patients. In rats, the photoreceptor damage was observed with the application of iron submicro/micro-particles, and the inner retinal damage with iron nanoparticles.

Conclusions: Metallic IOFBs can cause photoreceptor damage and inner retinal damage. The size effect of metal particles is an important condition for the damage.

Abstract No.: 204461

Rare Case: Orbital Foreign Body Caused by Industrial Lubricant Grease Gun – Challenges in Diagnosis and Treatment of Orbital Tissue Inflammation

First Author: Nguyen **NAM**

Co-Author(s): Ton **HAI**, Bien **VAN**

Purpose: Grease-gun injury of the orbit is a rare condition. Since 1964, we have found only 13 cases reported in English worldwide. In this report, we describe a severe case of orbital cellulitis caused by an accident with grease-gun.

Methods: Case report.

Results: A 17-year-old male patient presented severe vision loss in the right eye, lids edema, sutured conjunctival laceration, and restricted eye movement in all directions caused by a grease-gun injury. The patient was diagnosed as orbital foreign body of grease, orbital cellulitis, and in risk of sepsis. He was treated with intravenous antibiotics and Methylprednisolone, underwent orbitotomy surgery to remove 5 millimeter of grease from the right orbit. After one week of treatment, the patient's best corrected visual acuity improved dramatically from counting fingers at 0.5 meters to 10/10 vision, and almost full recovery of eye movement.

Conclusions: Grease-gun injury could leave a deceptive orbital foreign body of grease. Timely diagnosis and appropriate treatment are crucial to save the patients.

Abstract No.: 201027

ScRNA-Seq Reveals Diverse Proliferative Vitreoretinopathy Cell Composition and Metabolic Properties Across Different Regions

First Author: Wenjie **YIN**

Co-Author(s): Qinghuai **LIU**, Xiyang **MAO**, Zixuan **NIU**, Songtao **YUAN**

Purpose: Proliferative vitreoretinopathy (PVR) represents a common and challenging complication leading to blindness following ocular injury. The

–epithelial-mesenchymal transition (EMT) of retinal pigment epithelium (RPE) has been traditionally recognized as the primary mechanism driving the pathogenesis of PVR. However, pharmacological interventions targeting RPE EMT have failed to meet the clinical treatment requirements of PVR. Therefore, a comprehensive elucidation of cellular and molecular mechanisms of PVR is urgently required.

Methods: Different retinal regions of PVR membranes were surgically excised and respectively subjected to single-cell RNA sequencing and immunofluorescence staining to delineate the cellular compositions and cell-specific molecular pathways associated with PVR subtypes. Subtype-specific PVR mouse models were established to investigate the pathological mechanisms and potential treatment strategies for PVR in distinct anatomical regions.

Results: We demonstrated that PVR exhibited distinct cytopathological characteristics depending on their retinal location. Specifically, epiretinal PVR predominantly comprised macrophages, whereas PMEL+ RPE-derived cells were exclusively observed in subretinal membranes. Both pathological phenotypes were unified by retinal hypoxia, yet they diverged in their downstream hypoxic pathway selection. Targeting HIF1 α -regulated glycolysis selectively reduced epiretinal PVR formation, while inhibiting reactive oxygen species production specifically abrogated subretinal PVR. Furthermore, the application of hyperoxia chamber in a mouse model of dispase-induced persistent retinal injury effectively eradicated PVR across all retinal regions and restored retinal morphology.

Conclusions: These findings establish hypoxia-induced regional heterogeneity as a pathological mechanism in PVR progression and advocate for anatomically targeted therapeutic strategies.

Abstract No.: 206602

Single-Stage Ocular Surface Reconstruction for Recurrent Symblepharon Following Molten Aluminum Thermal Injury: A Case Report

First Author: Shipra **SINGH**

Co-Author(s): Shikha **JAIN**, Ashok **PATHAK**

Purpose: To report the successful management of severe bilateral ocular thermal injury from molten aluminum exposure through single staged surgical reconstruction and evaluate long-term anatomical and functional outcomes.

Methods: A 19-year-old male presented with severe right eye symblepharon following molten aluminum thermal injury five years prior. The patient had undergone multiple surgeries elsewhere between 2020-2023 with recurrent symblepharon formation. At presentation, the right eye showed a massive

symblepharon with cicatricial tissue covering a subtotal corneal surface and best corrected visual acuity of perception of light, while the left eye had inferonasal corneal scarring with Best corrected visual acuity of 6/9. A single-stage comprehensive surgical reconstruction was performed on the right eye, including symblepharon release, lower lid and inferior fornix reconstruction with mucus membrane grafting, fornix deepening sutures, and temporary tarsorrhaphy. Post-operative management included systemic and topical corticosteroids with serial clinical monitoring.

Results: Post-operative follow-up demonstrated successful graft integration with intact mucous membrane grafts at day 28 and maintained reconstruction at five months. Adequate lid closure was achieved with no significant ectropion or dry eye. Anterior segment optical coherence tomography was planned to assess scarring depth for consideration of limbal stem cell grafting and automated lamellar keratoplasty if required.

Conclusions: Severe bilateral thermal injury from molten aluminum can be successfully managed through staged surgical reconstruction achieving satisfactory anatomical rehabilitation and potential for visual recovery.

Abstract No.: 207238

Steel Versus Sight: Penetrating Trauma by Scissors in a Pediatric Patient

First Author: George Raden Mas **SAID**

Co-Author(s): Shanti **BOESOIRIE**, Mohammad Rinaldi **DAHLAN**, Niluh Ayu Putu **DEWI**, Angga **KARTIWA**

Purpose: Penetrating ocular trauma in children is an ophthalmic emergency with potential for devastating visual outcomes. This case highlights the successful management of an unusual orbital injury with full visual recovery caused by scissors penetrating the orbit.

Methods: A 12-year-old boy presented three hours after an accidental right orbital injury with scissors. Visual acuity was 1.0 bilaterally. Plain radiographs revealed a metallic foreign body lodged in the orbital floor without bony discontinuity or intraocular involvement. The patient underwent urgent surgical exploration, foreign body removal, and debridement. During the surgery, the doctors found bleeding under the conjunctiva, a 20 × 3 mm cut in the lower conjunctiva, and a 3 × 4 mm scratch on the cornea. No globe rupture or intraocular foreign body was identified, and all rectus and oblique muscles were intact. Postoperatively, the patient received topical antibiotics, systemic corticosteroids, and analgesia. On postoperative day 14, uncorrected visual acuity was 1.0 with full ocular motility, no diplopia, and intact stereopsis (60 arcsec).

Results: Ocular trauma is a major cause of visual morbidity in children. Penetrating injuries, though less frequent, can cause severe damage. This case is notable for the mechanism and location of injury with minimal ocular compromise. Prompt surgical intervention was key to the favorable outcome. This case reinforces findings in recent pediatric trauma studies showing that timely care can preserve vision even in high-risk injuries.

Conclusions: This case demonstrates that even severe-appearing orbital injuries in children can result in excellent outcomes with timely, coordinated care.

Abstract No.: 202699

Subretinal Injection of Indocyanine Green Using a 25-Gauge Heavy Water Needle During Vitrectomy: A Case Report

First Author: Shuai **SHENG**

Purpose: To report a case of inadvertent subretinal injection of indocyanine green (ICG) using a 25-gauge heavy water needle during epiretinal membrane (ERM) surgery and analyze the associated risks and complications.

Methods: ERM is a common retinal condition treated with vitrectomy. ICG staining is often used to visualize the internal limiting membrane (ILM). However, subretinal ICG can cause complications. Case report of a 76-year-old female undergoing vitrectomy for ERM. Excessive injection pressure while applying ICG with a 25-gauge heavy water needle caused ICG to breach the retina superotemporal to the macula, entering the subretinal space.

Results: The iatrogenic break self-sealed intraoperatively; residual subretinal ICG could not be aspirated. At 1 week post-op, BCVA was 0.5; ICG persisted without complete absorption; OCT showed retinal pigment epithelial (RPE) edema. At 6 months, BCVA was 0.8, with focal retinal atrophy at the injection site.

Conclusions: The narrower lumen of a 25-gauge heavy water needle carries a potential risk of creating iatrogenic breaks under excessive injection pressure. Subretinal ICG is difficult to absorb acutely, potentially causing RPE edema (indicating retinal toxicity) and leading to focal retinal atrophy in later stages. This reinforces evidence of ICG retinal toxicity. Careful dye application with minimized injection pressure is crucial. Close postoperative monitoring of vision, fundus status, and complications is essential.

Abstract No.: 201494

To Report an Unusual Case of Isolated Traumatic Partial Transection of the Lateral Rectus Muscle Caused by a Cat Scratch

First Author: Chun Loong TAN

Co-Author(s): Neshalene RATNA KRISHNAN, Leroy Yk TAN, Azlyn Aj, Mimiwati Z, Nur Musfirah Mahmud

Purpose: To report an unusual case of isolated traumatic partial transection of the lateral rectus muscle without globe damage caused by a cat scratch.

Methods: Case report.

Results: A 59-year-old male presented with a 1-mm conjunctival laceration and prolapse of striated muscle tissue on the temporal aspect of the right eye after being scratched by a neighbour's cat claw. He experienced bleeding and ocular pain but no diplopia. On examination, visual acuity was 6/9 in both eyes with no relative afferent pupillary defect. Extraocular movements were full in the right eye. The conjunctival laceration was located 7 mm from the temporal limbus, with prolapsed pinkish striated tissue. Surgical exploration revealed a 35-mm long, one-quarter width partial transection of the inferior aspect of the lateral rectus muscle. The macerated muscle end could not be resutured and was excised. The laceration did not involve the sclera or cornea, and the rest of the ocular examination was unremarkable. Postoperatively, the patient received topical and systemic antibiotics. At 1-month follow-up, the wound had healed well, with no diplopia, and a Hess chart confirmed full temporal movement of the right eye.

Conclusions: Cat-related ocular trauma is not trivial, as claws can cause deep injuries beyond superficial lacerations. This case highlights that partial transection of the lateral rectus may still preserve functional reserve, allowing recovery without diplopia. Prompt recognition and surgical management are essential to prevent missed deep injuries and optimize visual and motility outcomes.

Abstract No.: 204765

Trend of Firecracker Eye Emergency (TOFEE) - A Tertiary Eye Care Centre Study

First Author: Purendra BHASIN

Purpose: To evaluate the demographics, distribution, types, and outcomes of ocular trauma sustained due to firecracker injuries during one year at a tertiary ophthalmic centre.

Methods: A retrospective observational study was conducted on 47 eyes of 42 patients with firecracker injuries. Data were assessed for patient demographics, time lapsed, type and extent of trauma, visual disability score, and follow-up over 2-12 months. Pareto charting was used to analyze frequency and cumulative percentages.

Results: Firecracker injuries were 50 times more common during Diwali week compared to the rest of the year. Of the patients, 88% were male, 66.67% were under 20 years, and 36.70% were bystanders. Closed globe injuries accounted for 88%, with surgical intervention required in 39%. Ocular adnexal involvement occurred in 33.33%, and anterior segment injuries in 69.73%. At final follow-up, 60% of eyes achieved visual acuity >6/9, while 15% had severe visual loss (<3/60) and one eye required evisceration.

Conclusions: Firecracker injuries during Diwali pose a significant risk, particularly to young males and bystanders. Most injuries are preventable. Public awareness, stricter safety regulations, and the use of protective measures are essential to reduce the incidence and severity of such ocular trauma during festivals.

Abstract No.: 206754

Unilateral Terson Syndrome in a Child With Head Injury and Traumatic Globe Luxation in the Contralateral Eye

First Author: Tavishi SINGHAL

Co-Author(s): Rahul SAINI, Nitika BERI, Pramod Kumar SAHU

Purpose: We report a case of a 3year old child who presented with head injury incurred by an iron rod over the right eye.

Methods: The child underwent a CT scan of the brain and orbit, which revealed a lateral wall and orbital roof fracture with brain parenchymal herniation and proptosis of the right eye. The left eye wasn't directly impacted by the iron rod, but on fundus evaluation revealed multiple intraretinal haemorrhages, whereas the brain imaging showed sub-arachnoid and subdural hemorrhage in the fronto-parietal regions, which led us to our diagnosis of Terson syndrome.

Results: A young three year-old girl presented with a head injury and right eye globe luxation with proptosis. The child was intubated so visual acuity assessment was not possible. On ophthalmic examination, both pupils were mid dilated non reacting to light indicating increased Intracranial Pressure. The fundus examination in the luxated globe showed retinal whitening and a cherry red spot indicating central retinal artery occlusion secondary to central retinal artery compression. The other eye which seemingly appeared normal had multiple intraretinal hemorrhages over the posterior pole and mid periphery with foveal sparing. The patient was intubated with a poor GCS and was planned for orbital decompression and repositioning after systemic stabilisation whereas the left eye was being managed conservatively with regular fundus evaluation. Unfortunately the patient passed away the next day due to the head injury.

Conclusions: Terson syndrome is an uncommon condition in the pediatric population, and unilateral Terson is even more so. Do consider fundus examination.

Abstract No.: 205459

Unusual Pen Nib Orbital Foreign Body: Successful Transcutaneous Removal With Excellent Functional Recovery

First Author: Sheetal **SHARMA**

Co-Author(s): Ramlal **SHARMA**

Purpose: Orbital foreign bodies lodgment in the medial side of the orbital floor is rare. In this case we are highlighting how a simple pen nib can actually get embedded in the orbital floor causing serious orbital trauma and its prompt and successful surgical management.

Methods: A 15-year-old boy got accidental periocular trauma with a pen after a playful sibling rivalry and presented with pain, periorbital edema and mildly restricted ocular motility. Metallic foreign body was confirmed with X-Ray. Globe and vision were preserved. Transcutaneous approach was selected for its removal backing up with ENT and Maxillofacial surgeons. Foreign body was retrieved in toto, and wound was closed.

Results: The patient's postoperative recovery was uneventful. Ocular movements got fully restored and vision was normal too. The incision healed well with excellent cosmesis.

Conclusions: This case is very rare in the literature and highlights that a simple pen can result in nib inoculation in the orbit which can become a major cause of ocular morbidity. Prompt imaging, timely surgical intervention and careful choice of approach are important determinants to prevent complications and thus achieving optimal visual and cosmetic outcomes. And lastly, we want to give a take home message through this case is that as pens are common tools in schools and households, awareness campaigns and school-level safety guidelines can play a vital role in preventing such injuries and thus reducing the burden of avoidable ocular trauma in children.

Orbital and Oculoplastic Surgery

Abstract No.: 203930

3D-Printed Titanium Patient-Specific Implant-Assisted Orbital Wall Reconstruction With Simultaneous Large-Angle Exotropia Correction As Salvage Therapy for Medial Rectus Injury After Sinus Surgery

First Author: Niratchaya **THANAKIJ**

Co-Author(s): Pimkwan **JARU-AMPORNAN**, Pittaya **PHAMONVAECHAVAN**, Piangporn **SAKSIRIWUTTO**

Purpose: To present a novel single-stage salvage approach combining 3D-printed titanium patient-specific implant (PSI)-assisted orbital wall reconstruction with simultaneous large-angle exotropia correction in a patient with medial rectus (MR) transection following sinus surgery.

Methods: A 33-year-old woman with a history of nasopharyngeal carcinoma developed MR transection, medial orbital wall fracture, and retrobulbar hemorrhage after endoscopic sinus surgery. She subsequently presented with large-angle exotropia (65 prism diopters), hypertropia, enophthalmos, ptosis, and adduction restriction despite multiple prior muscle procedures. Preoperative CT and endoscopy guided surgical planning. Under general anesthesia, the oculoplastic team removed a malpositioned silicone sheet and reconstructed the medial orbital wall using a customized titanium PSI, restoring orbital contour and providing a stable anchoring site. The strabismus team simultaneously performed lateral rectus disinsertion with periosteal fixation and reattached the MR stump directly to the PSI at its anatomical insertion.

Results: At 1 month, the patient achieved orthotropia in primary gaze with resolution of diplopia and improvement of enophthalmos (2.0 mm → 0.5 mm). Extraocular movement remained limited, but the patient was asymptomatic in daily activities. Secondary ptosis correction was planned.

Conclusions: This is the first reported case of PSI-assisted orbital wall reconstruction combined with simultaneous large-angle exotropia correction for MR transection after sinus surgery. The interdisciplinary single-stage approach enabled precise anatomical restoration, stable muscle fixation, and immediate ocular realignment, reducing surgical stages and accelerating functional recovery.

Abstract No.: 206116

A Case Report: Orbital Apex Syndrome Secondary to Chronic Invasive Fungal Rhinosinusitis and Its Diagnostic Challenges

First Author: Diane Frances PERALTA

Co-Author(s): Marie Joan LOY, Yvette Marie SANTIAGO-GATMAITAN

Purpose: Chronic Invasive Fungal Rhinosinusitis (CIFRS) is an indolent infection with slow destructive process that mostly affects immunocompromised patients.

Methods: This is a case of a 65-year-old female with a history of kidney transplantation, diabetes mellitus, and immunosuppressant use. She presented with sudden painless vision loss of the right eye. The patient eventually developed ophthalmoplegia and on review of systems, noted a five-month history of right-sided headache. Magnetic resonance imaging was requested which revealed a right-sided ill-defined nasopharyngeal mass. On admission, biopsy was done which revealed bacterial and fungal elements. Antibiotics and isavuconazole were then started. The patient was then managed with endoscopic tumoral debulking and amphotericin B since with progression of right-sided ptosis and ophthalmoplegia. Histopathology showed reactive inflammatory tissue, hence a short course of intravenous high-dose steroids was given. Overall health declined and patient eventually expired.

Results: CIFRS presents with vague, localized symptoms progressing silently in immunosuppressed hosts. Extension of the mass to the orbital apex led to the vision loss and ophthalmoplegia of the patient. On review of earlier imaging, polysinus disease was noted with right-sided hyperattenuating paranasal sinus opacification, which is nonspecific, but may raise suspicion for fungal involvement. Histopathology and culture remains essential for diagnosis.

Conclusions: This case highlights the importance of maintaining high clinical suspicion for CIFRS in immunocompromised patients with vague, localized symptoms such as headache. Prompt recognition and tissue diagnosis are critical for early intervention.

Abstract No.: 202142

A Case of Intraorbital Migration of Hyaluronic Acid Following Bacterial Infection After Filler Injection

First Author: Honami FUSE

Co-Author(s): Takahiro HIRAOKA, Tetsuro OSHIKA, Kuniharu TASAKI

Purpose: To describe a rare case of intraorbital migration of hyaluronic acid (HA) after bacterial infection following facial filler injection, and to discuss its clinical implications.

Methods: A 45-year-old woman with a history of bilateral cheek HA filler injection presented with

swelling and pain in the left infraorbital region four months later. She was diagnosed with delayed bacterial infection and treated with antibiotics. Although symptoms initially improved, ocular motility disturbance developed 10 days after treatment. Orbital MRI revealed a lesion hypointense on T1-weighted images and moderately hyperintense on T2-weighted images, consistent with HA migration.

Results: At referral to our hospital, a mild visual field defect and ocular motility limitation were observed. Conservative management led to regression of HA and improvement in both visual field and motility.

Conclusions: Intraorbital HA migration is extremely rare, in contrast to vision loss caused by intra-arterial embolization of fillers. In this case, infection likely disrupted the orbital septum, enabling HA migration. Because HA is isoattenuating to soft tissue on CT, MRI is more effective for evaluation. Within the orbit, HA may undergo relatively rapid hydrolysis, suggesting that conservative management can be a feasible treatment option. Clinicians should be aware that even minimally invasive filler injections can occasionally lead to serious ocular complications.

Abstract No.: 206386

A Case of Sjogren's Syndrome With Rosai-Dorfman Disease Masquerading as a Lacrimal Gland Mass: A Rare Extra-Nodal Presentation

First Author: Rongkai TAN

Co-Author(s): Zainol BINTI HARUN, Chui Yain CHEN, Chenshen LAM, Naseem Vanessa MANSURALI, Ying Fun NG

Purpose: This report describes a rare case of right lacrimal gland mass secondary to extra-nodal Rosai-Dorfman disease coexisting with underlying Sjogren's syndrome.

Methods: Case report.

Results: A 51-year-old lady with underlying severe dry eye disease presented with right upper eyelid swelling for 6 months. Snellen chart visual acuities were 6/12 in the right eye and 6/9 in the left eye. External examination demonstrated an ill-defined mass over the superotemporal lacrimal gland area on palpation, measuring 20mm x 10mm. It was firm in nature, non-mobile, and non-tender on palpation. CT orbits showed diffusely enlarged right lacrimal gland and an enhancing parotid nodule. There were corneal punctate epithelial erosions and severe tear deficiency over both eyes, with normal intraocular pressures. Bilateral eyes posterior segment examination were unremarkable. She underwent right orbitotomy with excision biopsy of the mass. Her blood test was strongly positive for Sjogren's syndrome. Histopathological examination of the mass revealed dense infiltrates of chronic inflammatory cells and histiocytes, with reactive lymphoid follicles. Immunohistochemistry

testing revealed histiocytes with strong and diffuse positive staining for Rosai-Dorfman disease. Therefore, she was diagnosed with right lacrimal gland extra-nodal Rosai-Dorfman disease with Sjogren's syndrome. No recurrence was observed post-excision.

Conclusions: Coexistence of extra-nodal Rosai-Dorfman disease (RDD) with Sjogren's Syndrome is rare; however, one has to be aware of its associations with other inflammatory conditions like hypertrophic pachymeningitis and panuveitis. While RDD is generally a benign and self-limiting condition, its occurrence alongside an autoimmune disorder like Sjögren's syndrome may require different management strategies, with corticosteroids showing to be of benefit.

Abstract No.: 200951

A Case of Sparganosis Mansonii Parasitic Infection of Tenon's Capsule

First Author: Cheng LI

Purpose: Sparganosis mansonii is a parasitic infection caused by the plerocercoid larva of *Spirometra mansonii*, a tapeworm commonly found in amphibians and reptiles. Humans become accidental hosts through ingestion of contaminated water or undercooked intermediate hosts, with larvae capable of migrating to subcutaneous tissues, the eyes, or the central nervous system.

Methods: This case describes a rare presentation of ocular sparganosis in a middle-aged man with no known exposure to traditional risk factors. The live *Spirometra mansonii* larva, discovered within the Tenon's capsule and measuring 22 cm, underscores the diagnostic challenge and the importance of considering parasitic infections in atypical orbital masses.

Results: This case highlights the diagnostic challenges of ocular sparganosis, particularly when clinical signs are subtle and conventional tests are inconclusive. The localization of the parasite within the Tenon's capsule without deeper orbital involvement is unprecedented and may account for the mild presentation.

Conclusions: Clinicians should consider parasitic infections in the differential diagnosis of atypical subconjunctival or orbital masses, especially in endemic regions. Public health education regarding the risks of exposure to untreated water sources remains critical in preventing such infections.

Abstract No.: 204498

A Race Against Time: Managing Blepharoplasty-Induced Orbital Compartment Syndrome With Emergency Canthotomy

First Author: Ruchita SONTAKKE

Co-Author(s): Paromita DUTTA, Tanvi GAONKER

Purpose: To highlight a rare but potentially blinding complication of cosmetic blepharoplasty -orbital compartment syndrome and emphasize the importance of early recognition and immediate bedside canthotomy/cantholysis as sight-saving interventions.

Methods: We describe the clinical course of a 58-year-old man who developed acute orbital compartment syndrome immediately after bilateral lower eyelid blepharoplasty. Clinical findings, emergency management with lateral canthotomy and cantholysis, and postoperative outcomes were documented.

Results: The patient presented with bilateral sudden orbital pain, tense eyelid swelling, proptosis, and diminution of vision immediately following blepharoplasty. A clinical suspicion of orbital compartment syndrome was made, and an emergency lateral canthotomy with cantholysis was performed in both the eyes resulting in rapid reduction of orbital tension and gradual visual recovery. At follow-up, visual acuity improved to baseline, and postoperative photographs demonstrated complete resolution of ptosis and eyelid swelling.

Conclusions: Early recognition of orbital compartment syndrome following eyelid surgery is vision-saving. Prompt bedside intervention with lateral canthotomy and cantholysis can fully restore function even in severe presentations, highlighting the need for high clinical suspicion and immediate action. Surgeons must recognize warning signs and be prepared to perform emergency canthotomy and cantholysis to prevent irreversible vision loss.

Abstract No.: 205569

A Rare Case Report of Supernumerary Puncta and a Punctal Cyst

First Author: Shui King TSOI

Co-Author(s): Andre MA, Hunter Kwok Lai YUEN

Purpose: Supernumerary puncta are rare, typically asymptomatic congenital anomalies that are often discovered as incidental findings. This case report describes the unusual presentation of an acquired punctal cyst with a coincidental discovery of contralateral supernumerary puncta.

Methods: A case report.

Results: A 29-year-old female presented with a several-week history of a painless swelling on her right medial lower eyelid. Slit lamp examination revealed a translucent, cystic lesion near the right inferior

punctum, consistent with an acquired punctal cyst. Examination on the contralateral eye revealed an incidental, asymptomatic double puncta over the left inferior eyelid. The right inferior punctum and the left inferior supernumerary puncta were found patent with syringing. The right inferior punctal cyst was successfully managed with picking using a 30-gauge needle while no surgical intervention was necessary for the supernumerary puncta.

Conclusions: While often asymptomatic, supernumerary puncta can sometimes cause symptoms like epiphora and dry eye. It serves to illustrate the importance of a comprehensive bilateral adnexal examination to appreciate potentially easily missed supernumerary lacrimal puncta.

Abstract No.: 207233

A Rare Case of Liposarcoma Over the Left Upper Eyelid

First Author: Ryan LEE

Co-Author(s): Kelvin Kam Lung CHONG, Kenneth Ka Hei LAI, Alvin Lerrmann YOUNG

Purpose: Liposarcoma is the most common soft-tissue sarcoma in adults, with the orbit being the rarest primary origin. It poses challenges in management due to its high risk of recurrence and infiltration.

Methods: This report highlights a case of liposarcoma over left upper eyelid.

Results: A 64-year-old female presented with a progressively enlarging mass over left upper eyelid for over ten years. Multiple surgeries were done with pathological reports indicating atypical lipomatous tumor. The mass increased rapidly in size since July 2022, with extensive involvement over left upper, lower, and lateral eyelids, causing mechanical complete ptosis. Orbitotomy and upper lid maximal debulking (levator sparing) was performed on 15 July 2022. The orbit was debulked up to superior orbital rim and lateral periosteum. Pathological report showed circumferential resection margin involvement. Subsequent MRI showed residual tumor over left upper eyelid and enhancing tissues over lower eyelid and lacrimal gland. Tumor abutted periosteum without bony invasion of lateral orbital wall. No intraconal or globe involvement was noted. Patient underwent orbital exenteration with partial removal of orbital bone on 31 Oct 2022, followed by reconstruction with right anterolateral thigh flap. Pathological report confirmed well-differentiated liposarcoma with low-grade dedifferentiation (positive for MDM2 amplification) and focal perineural invasion. Tumor cells focally touch the superomedial and inferotemporal margins. A small 4mm fibroosseous lesion was identified within the bone.

Conclusions: This case highlights the challenges in managing liposarcoma, in view of its recurrence and

infiltrative nature. Long-term follow-up is essential for providing comprehensive care and monitoring for recurrence.

Abstract No.: 200692

A Rare Case of Pachydermoperiostosis (PDP) and Its Ocular Manifestations

First Author: Adnan ABDUL MAJEED

Purpose: To bring awareness about the rare but important disease related to eye; Pachydermoperiostosis.

Methods: case report

Results: ABSTRACT A case of 56 years old Pakistani male visited OPD with complaint of thickening of both eyelids, ptosis and left lower lid ectropion caused by rare condition named pachydermoperiostosis (PDP). PDP is a rare autosomal dominant condition but autosomal recessive families probably can also occur. It is manifested by clubbing of digits, hyperhidrosis of palm and feet, peri-ostosis, acro-osteolysis and pachydermia. Ocular features include blepharoptosis, floppy eyelids, eyelid and palpebral conjunctival hypertrophy, mechanical ectropion, meibomian gland dysfunction, tear film abnormalities, punctate epithelial erosions and ocular surface disease

Conclusions: Pachydermoperiostosis is a rare disease. It can present with ocular manifestations along with other systemic features. As in this case, patient presented with ptosis and mechanical ectropion but on further systemic evaluation, it was found that he had clubbing, periosteosis and pachyderma. Although rare, but such cases should be kept in mind while evaluating and managing the patients with ptosis, ectropion and eyelid thickening.

Abstract No.: 205508

A Silent Culprit: Intraorbital Tumor Secondary to B-Cell Lymphoma

First Author: Naseem Vanessa MANSURALI

Co-Author(s): Zainol BIN HARUN, Boon Chye GAN, Rongkai TAN

Purpose: This report describes a case of a left orbital tumor secondary to B-cell lymphoma.

Methods: Case report

Results: A 77-year-old lady was referred for worsening left eye proptosis, chemosis, and tearing, post-endoscopic sinus surgery. On examination, her vision was 6/7.5 in the right eye and 6/15 in the left eye. External examination revealed left eye severe chemosis, proptosis with hypertropia, and a superiorly displaced globe. Hertel exophthalmometer showed an asymmetry of 5mm between the two eyes. Left eye inferior gaze was limited, with full extraocular movement in other gazes. Apart from the left eye having marked chemosis, the anterior chamber and

posterior segment findings were unremarkable in both eyes. A CT scan of the orbit demonstrated a soft tissue lesion situated at the left orbit, maxillary sinus, and nasolacrimal sac. Left orbital exploration via a swinging eyelid approach showed a diffuse soft tissue orbital tumor. Orbital tumor debulking was done alongside left functional endoscopic sinus surgery to debulk the maxillary sinus component. Histopathological examination revealed a diffuse large B-cell lymphoma with germinal centre B cell-like phenotype.

Postoperatively, her vision improved to 6/12 over the left eye, proptosis and chemosis resolved, and syringing done showed a patent left nasolacrimal duct. The patient was referred to the hematologist for further management.

Conclusions: B-cell lymphoma-associated intraorbital tumors may present with non-specific orbital symptoms that mimic other benign or malignant ocular lesions. This case highlights the importance of early recognition and prompt tissue diagnosis for timely management, thereby preserving vision and improving the overall survival rate.

Abstract No.: 205222

A Ten-year Retrospective Review of the Effects of Orbital Radiation Therapy on Dysthyroid Optic Neuropathy

First Author: Thorfan **KASETSINSOMBAT**

Co-Author(s): Rungkiat **CHANGWAIWIT**, Wimrak **ONCHAN**, Damrong **WIWATWONGWANA**

Purpose: Dysthyroid optic neuropathy (DON) is a vision-threatening complication of thyroid eye disease (TED). While corticosteroids and orbital decompression remain standard treatments, orbital radiation therapy (RT) has emerged as a promising adjunctive treatment. This study aimed to evaluate visual outcomes and associated clinical parameters following orbital RT in DON patients over a ten-year period.

Methods: A retrospective review was conducted of patients with DON treated with orbital RT at Chiang Mai University Hospital between January 2013 and December 2023. The primary outcome was improvement in visual acuity, defined as a gain of ≥ 2 Snellen lines assessed at 2 weeks, 1 month, 3 months, 6 months, 1 year, and 2 years post-treatment. Secondary outcomes included changes in relative afferent pupillary defect (RAPD), color vision (Ishihara plates), ocular motility, VISA inflammation score and proptosis.

Results: The medical records of 51 eyes from 34 patients were reviewed. The mean age of patients was 61.6 years; 64.7% were female. Visual acuity improved in 41.1% of eyes at 2 weeks and up to 94% at 2 years. RAPD improved in 85.6% at 6 months. Color vision improved by 4.78 plates, ocular motility improved by 18.96%, VISA inflammation score reduced from 2.65

to 0.85 over 6 months and proptosis decreased by 2.0 mm over the same period.

Conclusions: An orbital radiation therapy demonstrated favorable improvements in visual function and associated clinical parameters in DON patients. It may be an effective adjunctive treatment, particularly in early disease management of DON.

Abstract No.: 201296

Advanced Surgical Management of Symblepharon in Pediatric Stevens-Johnson Syndrome

First Author: Metika **IRZA**

Co-Author(s): Sarah **RAMADHANTI**, Hendriati

Purpose: To present challenging management of rare paediatric case of severe bilateral symblepharon secondary to Stevens-Johnson Syndrome (SJS), highlighting the complex surgical approach of conjunctival resection and fornix reconstruction with amniotic membrane transplantation in ocular surface and fornix.

Methods: A 6-year-old girl presented with bilateral Grade IVC3+ symblepharon and inability to open her eyes for four months after SJS induced by medications. Dense fibrovascular adhesions obliterated the conjunctival fornixes and extended over the corneal surface. Surgical management included meticulous symblepharon release, excision of fibrovascular tissue, and reconstruction of the fornix conjunctiva. Multilayer amniotic membrane grafts then applied to the cornea and fornix, secured with sutures, and supported with bandage contact lens.

Results: Sequential surgeries in both eyes successfully removed fibrotic conjunctival adhesions and restored fornix depth. Amniotic membrane provided a biological scaffold for epithelial healing and prevented adhesion. Intraoperative complications of the left eye showed fibrovascular tissue was spread from superior fornix conjunctiva to cornea. Anterior chamber and iris was difficult to identified but symblepharon was successfully released. Surprisingly, the cornea of the right eye was covered with fibrovascular tissue but symblepharon at conjunctival fornix was easier to released. Postoperative outcomes on both eyes showed improved ocular surface integrity, reserved motility, and decreased photophobia.

Conclusions: Conjunctival resection and fornix reconstruction with amniotic membrane transplantation is an effective technique for advanced symblepharon secondary to SJS. Careful removal of fibrovascular adhesions followed by biological resurfacing offers anatomical restoration and functional improvement of ocular motility in paediatric patients with severe ocular surface damage.

Abstract No.: 204859

Advanced Two-Stage Protocol for Severe Cicatricial Ectropion: Strategic Triamcinolone Pre-conditioning and Tailored Auricular Reconstruction

First Author: Irma Suwandi **SADIKIN**

Co-Author(s): Hisar **DANIEL**, Yunia **IRAWATI**, Andi Marsa **NADHIRA**

Purpose: Cicatricial ectropion represents a challenging eyelid malposition caused by anterior lamella scarring from trauma, burns, or surgery. Grade IV cicatricial ectropion requires complex reconstructive approaches to restore normal eyelid function and appearance. To report the successful management of severe cicatricial ectropion using pre-surgical triamcinolone acetone injections followed by full-thickness auricular skin grafting.

Methods: An 18-year-old male presented with grade IV cicatricial ectropion of both upper and lower eyelids of the right eye, three months following chemical injury. The patient complained of eyelid eversion, decreased vision (6/24), epiphora, and ocular discomfort. Examination revealed cicatricial ectropion of the superior and inferior palpebrae with corneal haziness and punctate keratitis. Pre-operative treatment consisted of triamcinolone acetone injections (0.1 cc at cicatrix point) using the infiltration technique with a 1 cc syringe, administered monthly for three consecutive months. Surgical reconstruction involved full-thickness auricular skin grafts sized according to the scar dimensions (larger graft for upper eyelid) with cantotomy and canthopexy performed. The wound was dressed with pressure bandages for 10 days post-operatively.

Results: The surgical procedure was completed successfully with minimal bleeding. At three-month follow-up, excellent functional and cosmetic outcomes were achieved with complete resolution of ectropion, no lagophthalmos or entropion, well-integrated grafts, and improved visual acuity to 6/15 uncorrected. No cicatricial recurrence was observed in either upper or lower eyelids.

Conclusions: Pre-operative triamcinolone acetone injection combined with full-thickness auricular skin grafting provides an effective treatment approach for severe cicatricial ectropion, achieving both functional restoration and aesthetic improvement with minimal complications.

Abstract No.: 202245

An 'Accidental' Dacryocystography

First Author: Kirsten **WONG**

Co-Author(s): Maryanne **ROMERO**, Gangadhara **SUNDAR**

Purpose: Dacryocystography (DCG) allows assessment of the lacrimal drainage system's morphology and

function, and evaluation of the location and presence of any obstruction or stenoses. This can be done via digital-subtraction (DS)-DCG, computed tomography (CT)-DCG or magnetic resonance (MR)-DCG, with use of contrast media. Although not generally used in the setting of acute trauma, its role has been described in the evaluation in post-traumatic secondary obstructions. We present a case of ophthalmic trauma, where there was unintended entry of radio-opaque material into the lacrimal drainage system providing visualization similar to a CT-DCG.

Methods: A case report of a 58-year-old male presenting to the Emergency Department after sustaining injury from a "less-than-lethal projectile" containing blue dye.

Results: He suffered a deep left medial canthal laceration which involved the inferior canaliculus. Plain un-contrasted CT scan of the orbits revealed hyperdense material tracking from the medial canthus into both upper and lower canaliculi and down the nasolacrimal duct, indicating no significant disruption to lacrimal drainage. He underwent uncomplicated left lower canaliculus laceration repair with bicanaliculus intubation, after which he was reviewed at 6 weeks post-operatively, where patency of the lacrimal system was confirmed by nasal endoscopy. The tube was removed at 12 weeks post injury.

Conclusions: This was an interesting case where a patient presenting with trauma from a 'less-than-lethal projectile' containing a dye that acted like contrast material usually used in CT-DCG. Although not essential for pre-operative planning, it gave us an idea of the extent of injury and about the function of his lacrimal drainage system.

Abstract No.: 204549

An Unwelcomed Guest of Southeast Asia – Orbital Cysticercosis

First Author: Avishi **AGRAWAL**

Co-Author(s): Pankaj **GUPTA**, Kavita **POONIA**, Manu **SAINI**, Usha **SINGH**

Purpose: Cysticercosis is endemic in South East Asian countries like India, Nepal, Myanmar, Indonesia, provinces of China and neighbours. A more common presentation is in the form of neurocysticercosis or involvement of subcutaneous tissues, while ocular involvement remains uncommon, with intraocular manifestation being more prevalent than extraocular. Our aim is to highlight the clinical spectrum and diagnostic challenges of orbital cysticercosis manifesting as orbital cellulitis which is an uncommon presentation.

Methods: We present a case series of 2 cases from India which presented with unilateral orbital cellulitis. Detailed ocular examination, and imaging modalities

such as CT orbit and USG helped us reach to the diagnosis of orbital cysticercosis.

Results: Imaging was suggestive of scolex in the extraconal space involving superior rectus and medial rectus in the first case, while in case 2 intraconal involvement of inferior rectus close to the orbital nerve was seen. Both were started with oral albendazole 15 mg/kg/day and a tapering course of oral corticosteroids. Both the patients responded well to the medical management.

Conclusions: Orbital cysticercosis although uncommon should be considered as a differential of unilateral orbital cellulitis especially in endemic regions. Early diagnosis using HRCT and initiation of medical therapy remains the mainstay with surgery reserved for the resistant cases.

Abstract No.: 200850

Association of Long Non-Coding RNA Gene H19 Polymorphisms and Susceptibility to Graves' Ophthalmopathy

First Author: Hung-chih **CHEN**

Co-Author(s): Pei-jane **BAIR**

Purpose: The aim of the current study is to investigate potential associations among Long Non-coding RNA (LncRNA) H19 single nucleotide polymorphism (SNP) and Graves' ophthalmopathy susceptibility.

Methods: Five loci of LncRNA H19 SNPs (rs217727, rs2107425, rs2839698, rs3024270, and rs3741219) were genotyped by using TaqMan allelic discrimination in 139 Graves' disease patients and 55 Graves' ophthalmopathy patients.

Results: We found that heterozygotes (A/G) for rs3741219 of H19 gene was associated with an increased risk of Graves' ophthalmopathy ($p < 0.05$; OR = 1.704; 95% CI, 1.009-2.876) as compared with homozygotes for the major allele (A/A). Subjects who carried at least one polymorphic allele (homozygote or heterozygote for the minor allele) were more susceptible to Graves' ophthalmopathy ($p < 0.05$; OR = 1.992; 95% CI, 1.048-3.8788) than those homozygous for the major allele.

Conclusions: The H19 rs3741219 SNPs polymorphism is significantly associated with Graves' ophthalmopathy, and LncRNA H19 SNPs may be involved in the development of Graves' ophthalmopathy.

Abstract No.: 200901

Biomechanical Analysis of Orbital Development: A Finite Element Analysis by an Experimentally Validated Model

First Author: Mingyang **WANG**

Co-Author(s): Dongmei **LI**

Purpose: Constructing orbital finite element models capable of simulating the development process and analyzing the biomechanical mechanism.

Methods: Four normal orbits from one-month-old New Zealand white rabbits were used in this study. Toshiba Aquilion Prime was used to determine the computed tomography scan and direct orbital pressure manometry using an improved manometer based on the TSD104 pressure sensor transducer. The finite element analysis was conducted using the ANSYS Workbench platform.

Results: The biomechanics of each orbital wall improved to varying degrees as the rabbit orbit grew and developed. The von Mises stress in both rabbits initially concentrated at the lower edge of the posterior orbital wall, expanded to the entire orbit, and ultimately became more significant in the biomechanics of the region that consisted of the posterior orbital and superior orbital walls. During the expansion phase, the biomechanics of both rabbits gradually developed from the nasal side to the occipital side for radial displacement. It is evident that the finite element model are a good fit for simulating the physiological development of the rabbit orbit. The maximum radial displacement and maximum von Mises stress appeared two plateau periods during the development of the orbit, at 50–60 days and 80–90 days.

Conclusions: This study establishes a theoretical foundation for the creation of a biomechanical model of human orbital development by offering the first finite element model to simulate orbital development and analyze the biomechanical mechanism of orbital pressure on orbital development.

Abstract No.: 203723

Can Corneal Ulcers Be the Underlying Cause of Dacryocystitis?

First Author: Ravi **RANJAN**

Co-Author(s): Rohan **RAJ**, Kumari **RUPAM**

Purpose: To investigate the prevalence of Dacryocystitis in patients with infective corneal ulcers.

Methods: Included 58 patients with infective corneal ulcer in one eye and no H/O any lacrimal pathology. The presence or absence of Dacryocystitis was determined by lacrimal syringing. Corneal ulcers were diagnosed and treated based on clinical manifestations, corneal scraping, microscopic examinations, and bacterial/fungal cultures. Dacryocystitis was treated with medication and DCR.

Results: Out of 58 Patients with corneal ulcers, 5 patients developed Dacryocystitis. One case of Dacryocystitis was recovered with medication. The four patients needed DCR surgery. Data Interpretation found that Patients with corneal ulcers are over 65 times more likely to develop Dacryocystitis than the general population.

Conclusions: The study indicates that Dacryocystitis is closely associated with infective corneal ulcers. In clinical practice and based on existing literature, it is known that corneal ulcers threaten vision. Management of lacrimal disorders is generally successful but requires careful attention. Understanding the relationship between these two conditions is crucial for day-to-day practice.

Abstract No.: 203440

Case Report: Delayed Intraorbital Lipid Encapsulation Following Complex Ocular Trauma from a High-Pressure Hydraulic Oil Hose Rupture

First Author: Zhixin **GUAN**

Co-Author(s): Jiang **GUANGWEI**, Li **SHOUQING**, Liu **SHU**

Purpose: Diagnosis and Surgical Challenges of Delayed Intraorbital Subcutaneous Fat Droplet Encapsulation Following Ocular Trauma.

Methods: A rare case of ocular trauma is reported, detailing the diagnostic and therapeutic process along with a 1.5-year follow-up experience.

Results: A 54-year-old male sustained left ocular and facial trauma from a ruptured hydraulic oil hose on May 11, 2023. Initial examination revealed questionable light perception, periorbital swelling, eyelid lacerations, total hyphema, corneal edema, a fixed 5-mm pupil, and non-visible fundus. Ocular ultrasound and CT showed periocular emphysema and heterogeneous hypoechoic areas. The patient underwent immediate eyelid repair and subsequent vitrectomy. He represented on November 15 with persistent eyelid swelling. Imaging suggested lipid deposition. Surgical exploration revealed multiple cystic masses containing oil-like fluid. Histopathology confirmed non-epithelialized cysts with chronic inflammation and foreign-body reaction.

Conclusions: The hydraulic oil gun operates via high-speed injection, whereby fine lipid droplets—carrying substantial kinetic energy—may penetrate the subcutaneous tissue of the eyelid alongside a small amount of gas. These intraorbital lipid droplets can become encapsulated by fibrous tissue, forming cystic masses that cause persistent eyelid irritation. Due to the similar imaging characteristics between lipid materials and gas, early definitive diagnosis through imaging alone is challenging. Thus, correlation with trauma history and clinical evolution is essential. Surgical intervention is required to remove the oil and necrotic tissue; however, complete excision is often

difficult to achieve in a single procedure, and multiple surgeries may be necessary depending on the patient's condition.

Abstract No.: 200126

Case Series Report: Intraorbital Metal Shot Injuries

First Author: Son **BUI**

Co-Author(s): Giang **BUI THI HUONG**

Purpose: To describe the clinical characteristics and imaging features of patients with intraorbital metal shot injuries.

Methods: A case series study on 06 eyes of 06 patients diagnosed with intraorbital metal shot injuries was examined and treated at the Eye Trauma Department in Vietnam National Eye Hospital from March 2025 to April 2025.

Results: Of the 06 patients reviewed in the study, 100% were male. The mean age at presentation was 16 (range 9 - 38). Domestic accidents were the most common cause of trauma (84%). 50% of cases were related to the use of a slingshot. All of the patients presented within 1 week of injury. The entrances were skin (33%) and conjunctiva (67%). The major clinical characteristics were eyelid and conjunctival congestion and edema (100%), retinal injuries (84%), vitreous hemorrhage (67%), and proptosis (50%). Optic nerve injuries occurred in 01 case (16%). 50% patients had no light perception VA. Computerized tomography (CT) features showed sphere-shaped objects with high density (4000 HU) and different sizes (ranging from 6 to 9mm). Related orbital injuries were orbital fractures, soft tissue infiltrations, orbital hemorrhage or bubble air...

Conclusions: Intraorbital metal shot injuries have various and complicated clinical manifestations and can lead to severe complications that need early diagnosis and prompt treatment. CT scan plays an important role in diagnosis, treatment, and prognosis.

Abstract No.: 205006

Case Series of Rhino-Orbital Mucormycosis Presenting as Orbital Apex Syndrome

First Author: Chiu Ling **LIM**

Co-Author(s): Azyln Azwa **JASMAN**, Nurliza **KHALIDDIN**, Andrew **LOW**, Nik Nazihah **NIK AZIS**, Poh Fong **SHE**

Purpose: To report three cases of rhino-orbital mucormycosis infection in immunocompromised patients

Methods: Case Series

Results: Case 1: A 6-year-old girl with B-cell Acute Lymphoblastic Leukaemia (B-ALL) presented with fever and left eyelid swelling for one week. Examination of the left eye(LE) revealed no perception of light, orbital apex syndrome, conjunctiva injection and chemosis.

LE fundus showed inferior hemiretinal artery occlusion with choroidal abscess. Case 2: A 64-year-old lady with diabetic ketoacidosis presented with fever and left facial numbness. LE vision was counting finger. She had LE orbital apex syndrome with loss of sensation over the forehead. In addition, she had cornea ulcer and endogenous endophthalmitis. Case 3: A 67-year-old diabetic gentleman presented with LE blurring of vision, left facial swelling, pain and numbness. Examination revealed LE orbital apex syndrome, 5th and 7th cranial nerve palsies, hand movement vision and exposure keratopathy. The fundus view was hazy but appeared flat. All patients presented with orbital apex syndrome and underwent functional endoscopic sinus surgery (FESS). A maxillary sinus mass was found in case 1, while septal eschars were observed in cases 2 and 3 and debridement was performed. Histopathology showed necrotic tissue with fungal hyphae, and *Rhizopus* species were cultured in cases 1 and 2. All patients received intravenous Amphotericin B. In addition, case 2 received intravitreal and retrobulbar Amphotericin B plus oral posaconazole. Unfortunately, all patients succumbed to the illness within three weeks of diagnosis.

Conclusions: Rhino-orbital mucormycosis is a life-threatening fungal infection that requires early diagnosis and immediate treatment to improve patient outcomes.

Abstract No.: 202852

Causes of Tearing in Patients With Chemotherapy: Meibomian Gland Dysfunction Versus Lacrimal Drainage Obstruction

First Author: Hyungyu **LEE**

Co-Author(s): Sehyun **BAEK**, Hwa **LEE**

Purpose: To determine the causes of tearing in patients with a history of chemotherapy, we evaluated their meibomian glands and lacrimal drainage system.

Methods: We retrospectively analyzed 34 eyes of 17 patients (mean age, 62.4±14.8 years) treated with chemotherapy for 13.8±7.6 months. Regimens included TS-1 (58.8%), docetaxel (23.5%), paclitaxel (11.8%), and 5-fluorouracil (5.9%). Evaluations comprised TBUT, FDDT, punctal examination, syringing and probing, dacryoscintigraphy, and LipiView® meibography; epiphora onset was timed from chemotherapy initiation.

Results: Epiphora began 9.1–10.9 months after therapy; 52.9% reported tearing within 3 months and 64.7% within 6 months. Mean TBUT was 5.4±2.6 s. FDDT was ≤grade 1 in 29.4% (mean 1.91±0.87). Puncta were normal in 70.6%, stenotic in 26.5%, and obstructed in 2.9%. Syringing showed total regurgitation in 29.4%, partial in 55.9%, and none in 14.7%. Probing revealed soft stops in 11.8% and hard stops in 88.2%. Dacryoscintigraphy was normal in

17.6%, demonstrated post-sac delay/obstruction in 23.5%, and pre-sac delay/obstruction in 58.8%. Mean meiboscores were 2.15±0.86 (upper) and 2.53±0.79 (lower), with a significant upper–lower difference ($P=0.004$).

Conclusions: LDS obstruction or delayed transit is a principal driver of chemotherapy-associated epiphora. Given the high prevalence of meibomian gland loss, reflex tearing from MGD must also be considered to guide comprehensive, effective management.

Abstract No.: 201318

Challenging Recurrence: Lower Eyelid Basal Cell Carcinoma Reconstruction With Mustardé Rotational Flap

First Author: Navpreet **KAUR**

Co-Author(s): Arti **SAREEN**, Dr.Ram Lal **SHARMA**, Kalpana **SHARMA**

Purpose: To describe the diagnosis, management, and reconstructive outcome of a recurrent lower eyelid basal cell carcinoma (BCC) treated with wide excision and Mustardé rotational flap in a previously irradiated patient.

Methods: A 71-year-old female with a history of radiotherapy for right lower eyelid basal cell carcinoma presented with a recurrent ulcerative lesion involving the lower eyelid and adjacent cheek. Preoperative evaluation included slit-lamp examination, fundus evaluation, systemic investigations, and computed tomography of the orbit and paranasal sinuses to assess local extension and exclude bony involvement. Under general anesthesia, a wide local excision of the lesion was performed with 4 mm tumor-free margins, followed by reconstruction using a Mustardé cheek rotational flap in the same sitting. A temporal curvilinear incision was made, beginning in the lateral canthus and extended inferiorly to the preauricular fold. The Mustardé flap was elevated in the subcutaneous plane, rotated medially to cover the defect and secured using non-absorbable interrupted sutures. A temporary tarsorrhaphy was performed to support flap integration and protect the cornea.

Results: The excised lesion measured 4.5 × 3.4 × 0.9 cm with clear margins. Postoperatively, the flap demonstrated excellent viability and wound apposition without evidence of infection or flap necrosis. Functional eyelid closure was preserved, and cosmesis was satisfactory. No early postoperative complications were noted.

Conclusions: The Mustardé rotational flap provides an effective method for reconstructing multicentric large lower eyelid defects after BCC excision. It offers excellent functional and cosmetic outcomes in a single-stage procedure.

Abstract No.: 206873

Chloroma vs. Eosinophilic Granuloma: A Diagnostic Challenge in Pediatric Bone Lesions

*First Author: Christian Patrick **ANTONIO***

*Co-Author(s): Gary John **MERCADO**, Camille **SISON***

Purpose: Chloromas, also known as granulocytic or myeloid sarcomas, are rare extramedullary tumors of immature myeloid cells that can mimic other lesions such as eosinophilic granuloma. Their subtle clinical and radiologic features make diagnosis challenging, emphasizing the need for high clinical suspicion and immunophenotyping.

Methods: Case Summary: A 3-year-old male presented with a progressively enlarging left orbital mass two months after minor head trauma. The mass displaced the globe inferiorly. CT imaging showed a heterogeneously enhancing extraconal mass with osteolysis of the superior orbital rim and periorbital extension, initially suggesting a granulomatous histiocytic lesion. MRI a month later revealed new lesions in the bilateral frontal bones with dural and scalp involvement. Skeletal survey identified multiple lytic lesions in long bones and feet, further supporting a provisional diagnosis of eosinophilic granuloma. An anterior orbitotomy and biopsy of the orbital mass however, revealed a white, rubbery lesion inconsistent with Langerhans cell histiocytosis. Additional workup, including histopathology, bone marrow aspiration with flow cytometry, and 24-hour urine vanillylmandelic acid was performed to reach a definitive diagnosis. Prophylactic vincristine was started while awaiting biopsy results to manage symptoms.

Results: The bone marrow aspiration histopathology revealed round cell neoplasm that favor myelophthisis. Flow cytometry was negative for overt acute leukemic blast cell populations, however immunohistochemistry staining revealed positive CD34, CD117, CD68, and Ki67 40% proliferative index, which supports the diagnosis of Chloroma.

Conclusions: Granulomatous bone lesions in children pose significant diagnostic challenges due to overlapping presentations. Prompt diagnosis is essential for treatment

Abstract No.: 208050

Choroidal Thickness Changes in Immunoglobulin G4-Related Ophthalmic Disease: A Territory-Wide Study

*First Author: Jeffrey Kai Chun **MAK***

*Co-Author(s): Carmen Kar Mun **CHAN**, Andy Chi On **CHENG**, Joyce Kar Yee **CHIN**, Kelvin Kam Lung **CHONG**, Andrew Kin Ting **KUK**, Chi On **KWONG**, Kenneth Ka Hei **LAI**, Wendy Pui Fan **LAM**, Polin **LEOW**, Kenneth Kai Wang **LI**, Chi Pui **PANG**, Clement Chee Yung **THAM**, Ngai **YANG**, Nelson Kwok Foo **YIP**, Wilson Wai Kuen **YIP**, Alvin Lerrmann **YOUNG**, Hunter Kwok Lai **YUEN***

Purpose: To evaluate the changes and clinical implications of choroidal thickness in IgG4-ROD patients.

Methods: This cross-sectional matched case-control comparison study included patients managed by hospitals covering the entire publicly funded ophthalmology service in Hong Kong, and 2 private eye centers. Choroidal thickness was measured using the swept-source optic coherence tomography angiography. IgG4-ROD disease parameters include age of disease onset, severity of IgG4-ROD, number of extraocular organ involved, and the pre-treatment serum IgG4 level.

Results: Forty-six worst-affected eyes from 46 Chinese patients with IgG4-related disease (36 IgG4-ROD) were analyzed. Choroidal thickness measurements were significantly thinner in IgG4-ROD when compared to healthy subjects, but comparable to the eyes of Immunoglobulin G4-related disease (IgG4-RD) patients. The choroidal thickness measurements at Outer superior, Inner superior, and Inner inferior were negatively correlated with the age of IgG4-ROD onset. The choroidal thickness measurements at the Inner inferior and Outer inferior were negatively correlated with the number of extraocular organ involvement.

Conclusions: Our study found that the choroidal thickness measurements in IgG4-ROD eyes were thinner than the healthy subject's eyes, but comparable to the eyes of IgG4-RD patients. Several hypotheses are proposed to explain the choroidal thickness changes in IgG4-ROD patients. The mechanism of choroidal thickness changes in IgG4-ROD patients should be further explored.

Abstract No.: 200423**Clinical Manifestations and Treatment Modalities of Dysthyroid Optic Neuropathy in Patients With Thyroid Eye Disease in a Tertiary Eye Center in Thailand***First Author: Tanunya PIMMA**Co-Author(s): Mingkwan LUMYONGSATIEN, Paphitchaya TEMPHATTHARACHOK, Sunsern WATTANAPHANICH***Purpose:** To investigate the clinical characteristics, treatment modalities, and visual outcomes in patients with dysthyroid optic neuropathy (DON).**Methods:** Medical records of DON patients treated at a single tertiary eye center between 2018 and 2024 were retrospectively reviewed. Collected data included clinical characteristics, visual acuity (VA), Clinical Activity Score (CAS), and proptosis at baseline and after treatment. Treatment modalities were categorized into four groups: (1) intravenous methylprednisolone (IVMP), (2) orbital decompression (OD), (3) radiation therapy (RT), and (4) immunosuppressive therapy (IMT).**Results:** A total of 40 patients (48 eyes) were included. 27.5% were male. The mean age was 56.3 ± 11.9 years, and the mean CAS was 2.88 ± 1.45 . Most patients (87.5%) had abnormal thyroid status, and 92.5% presented with decreased vision. All received IVMP; of these, 24 underwent OD, 11 received RT, and 12 received IMT. A favorable response was observed in 57.5% of patients treated with IVMP alone. Older age (OR: 1.07, 95% CI: 1.01–1.13, $p < 0.05$) and poorer baseline VA (OR: 4.76, 95% CI: 1.64–13.8, $p < 0.001$) were significant predictors of treatment failure in the IVMP group. The average number of treatment modalities administered per patient was 2.0 ± 0.95 . Mean VA (logMAR) significantly improved from 1.29 ± 0.70 to 0.32 ± 0.39 (mean difference: 0.97 ± 0.79 ; 95% CI: 0.74–1.20, $p < 0.001$).**Conclusions:** Approximately 60% of Thai patients with DON responded to IVMP, and most required two or more treatment modalities. These findings highlight the need for additional therapies and a multidisciplinary approach, along with risk stratification to optimize visual outcomes.**Abstract No.: 200314****Clinical Outcomes of Maximal Levator Resection Versus Frontalis Sling in Patients With Congenital Ptosis***First Author: Chayanat OUIJALERN**Co-Author(s): Mingkwan LUMYONGSATEIN***Purpose:** To compare the clinical outcomes of maximal levator resection (MLR) versus frontalis sling (FS) procedures in the management of severe congenital ptosis with poor levator function.**Methods:** This retrospective study included 50 patients with severe congenital ptosis and poor levator function who underwent surgical correction at Mettapracharak Hospital (July 2014–July 2023). Patients were divided into two groups: Group 1 (29 patients) underwent MLR, and Group 2 (21 patients) received FS. Outcomes were assessed based on margin reflex distance 1 (MRD1), palpebral fissure height, levator function, lagophthalmos, postoperative complications, and recurrence rates.**Results:** Preoperatively, mean levator function was comparable ($P=0.24$). At 12 months postoperatively, mean MRD1 values were similar between the groups (MLR: 2.62 ± 0.94 mm; FS: 2.64 ± 1.19 mm; $p=0.94$). Group 1 demonstrated significantly higher rates of lagophthalmos (69.0% vs. 38.1%, $p=0.044$); conversely, abnormal eyelid contour was more common in Group 2 (19.0% vs. 3.4%). Exposure keratopathy was more prevalent in Group 1 (41.4%) than Group 2 (23.8%). Recurrence rates were similar between groups.**Conclusions:** Maximal levator resection is a viable alternative to the frontalis sling procedure for treating severe congenital ptosis with poor levator function, offering comparable functional outcomes and avoiding graft-related complications. However, increased postoperative lagophthalmos in MLR underscores the need for careful patient selection and vigilant follow-up.**Abstract No.: 204783****Clinical Profile of Extraocular and Adnexal Presentation of Micobacterium Tuberculosis***First Author: Mukti MITRA**Co-Author(s): Golam HAIDER, Riffat RASHID, Sadia SULTANA***Purpose:** To describe the Clinical profile of extraocular and adnexal presentation of Micobacterium tuberculosis and to evaluate their outcome of management.**Methods:** In this prospective interventional case series, 38 patients (Aged 8 years to 52 years) of poor socioeconomic background presented with orbital and adnexal tuberculosis from January 2010 to December 2024. Among them 10 patients presented with proptosis and 13 patients had non-healing ulcer of lid and adnexa, 15 patients with abscess in the eyelid and periocular region.**Results:** Total patients were 38. Male were 18(47.36%) and female 20(52.64%). Orbital tuberculosis was in 10 (26%), lid and adnexal tuberculosis 28 (74%). Abscess in levator and superior rectus complex was found in one patient presented with acute ptosis. Histopathology revealed caseating granulomatous inflammation consistent with tuberculosis. Patients were treated with anti-tubercular drugs for nine months to one year. Clinical presentations improved gradually after

starting of anti-tubercular drug. One patient showed recurrence. Systemic tuberculosis was found in one patient, presented with acute proptosis with lung abscess, later died from disseminated tuberculosis.

Conclusions: Clinical presentation of orbital and adnexal tuberculosis is wide spectrum. Diagnosis is sometimes delayed. It is rarely associated with systemic tuberculosis specially in endemic zone and overcrowded areas. So high index suspicion is very vital to save life.

Abstract No.: 204122

Combined Gold Weight Implantation and Lateral Tarsal Strip for Paralytic Ectropion With Exposure Keratopathy: A Case Report

First Author: Brenda HAYATULHAYA

Purpose: To present a case of paralytic ectropion complicated by exposure keratopathy and a recurrent corneal ulcer, which was successfully managed with a combination of gold weight implantation and lateral tarsal strip procedure.

Methods: A case report focuses on a patient with paralytic ectropion and lagophthalmos that led to corneal ulceration. Clinical evaluation included ocular surface examination, eyelid position assessment, and corneal staining. Surgical intervention consisted of upper eyelid gold weight implantation to improve eyelid closure and lateral tarsal strip procedure to correct lower eyelid laxity. Postoperative outcomes were assessed based on eyelid function, corneal surface healing, and recurrence of exposure-related complications.

Results: Following surgery, there was a significant improvement in eyelid closure and apposition. The gold weight implant enabled adequate passive eyelid closure, while the lateral tarsal strip addressed horizontal lid laxity, restoring proper alignment between the eyelid and globe. The corneal ulcer healed completely during the follow-up period, and no recurrence of exposure keratopathy was observed. Cosmetic outcome was also satisfactory, with minimal implant visibility and good patient tolerance.

Conclusions: The combined approach of gold weight implantation and lateral tarsal strip procedure provides effective anatomical and functional rehabilitation in paralytic ectropion with exposure keratopathy. This technique ensures corneal protection, promotes ulcer healing, and prevents further ocular surface complications, making it a reliable treatment option for facial nerve palsy-related eyelid dysfunction.

Abstract No.: 201039

Comparison of Lower Eyelid Complications Among Surgical Approaches for Orbital and Zygomaticomaxillary Fractures: A Network Meta-Analysis

First Author: Yu-yen CHEN

Purpose: This network meta-analysis aimed to evaluate and compare the risks of lower eyelid complications—ectropion, entropion, scleral show, and postoperative scarring—associated with four surgical approaches (subciliary, subtarsal, infraorbital, and transconjunctival) for orbital and zygomaticomaxillary fracture repair.

Methods: A systematic search of PubMed, Embase, and Cochrane databases identified relevant studies published between January 1, 1990, and August 10, 2025. Twenty-seven eligible studies involving 2,790 patients were included. Direct pairwise meta-analyses and network meta-analyses were conducted to compare complication risks among the approaches. Sensitivity analyses were performed to assess the influence of individual studies, and inconsistency tests were applied to evaluate model robustness.

Results: The subciliary approach was associated with the highest risk of ectropion and scleral show. The transconjunctival approach had the lowest risk of ectropion and scarring but the highest risk of entropion. The subtarsal approach had the lowest risk of scleral show, while the infraorbital approach had the highest risk of postoperative scarring. Sensitivity analyses confirmed consistent rankings, and no significant inconsistency was detected.

Conclusions: This study provides updated, comprehensive evidence to guide the choice of surgical approach for orbital and zygomaticomaxillary fracture repair. Surgeons should balance operative exposure, cosmetic outcomes, and complication risk, and communicate these trade-offs clearly with patients to optimize decision-making.

Abstract No.: 200224

Complications Following Dermal Fat Grafting in Upper Sunken Eyelid Correction

First Author: Dieu Huong DUONG

Co-Author(s): Thu Hien NGUYEN THI

Purpose: To highlight and review potential complications following dermal fat grafting in upper eyelid blepharoplasty through analysis and management of two clinical cases.

Methods: We retrospectively reviewed two female patients who presented with significant complications after upper eyelid blepharoplasty combined with dermal fat grafting performed at another clinic. Complications included eyelid crease asymmetry, hypertrophic fat grafting, redundant skin, multiple

eyelid folds, skin adhesions, and ptosis. Both patients underwent detailed evaluation and tailored surgical revision at our clinic, involving reconstruction of eyelid creases, excision of hypertrophic fat, correction of redundant tissue, and ptosis repair.

Results: Postoperative assessments at 1 week and 1 month demonstrated marked improvement in eyelid crease symmetry, eyelid closure, and ptosis correction. The eyelid contours remained stable at 1-month follow-up, and both patients expressed satisfaction with their improved functional and aesthetic outcomes.

Conclusions: Dermal fat grafting in upper sunken eyelid correction, despite its popularity, carries risks of significant complications if inadequately performed. Awareness of potential adverse outcomes, careful preoperative assessment, precise surgical techniques, and prompt management are critical to achieving optimal cosmetic and functional results.

Abstract No.: 207348

Correlating the Implant Diameter With Custom Ocular Prosthesis Weight Following Evisceration: A Prospective Randomized Control Trial

First Author: Tarjani Vivek **DAVE**

Co-Author(s): Sanjana M

Purpose: This prospective randomized controlled interventional study aimed to evaluate the relationship between orbital implant size and prosthetic outcomes following evisceration, focusing on aesthetic and volumetric results with 16 mm, 18 mm, and 20 mm implants.

Methods: Conducted at a single center, the study enrolled consecutive patients aged over five years who underwent evisceration between July 17, 2017, and July 17, 2018. Implant sizes were randomly assigned, and patients were followed postoperatively for up to one year. Primary outcomes included correlations between implant diameter and prosthetic weight/thickness. Secondary outcomes assessed complications (e.g., extrusion, migration) and volumetric issues like ptosis, enophthalmos, superior sulcus deformity, and lower eyelid laxity.

Results: Of the 90 patients enrolled, 58 completed one-year follow-up. The mean age was 25.1 ± 13 years. Common indications for evisceration included phthisis bulbi (65.5%), disfigured blind eye (18.9%), and staphyloma (15.6%). Implant sizes were distributed as 16 mm (27.7%), 18 mm (41.1%), and 20 mm (31.1%). Complications included implant extrusion (2.2%) and migration (4.4%). Volumetric issues observed were lower lid laxity (62.2%), enophthalmos (40%), ptosis (16.6%), and superior sulcus deformity (35.5%). No correlation was found between implant size and prosthesis weight or thickness. However, 20 mm implants yielded significantly better volumetric

outcomes than 16 mm ($p=0.001$) and 18 mm ($p=0.01$) implants.

Conclusions: While implant size did not influence prosthesis weight or thickness, the 20 mm implant provided superior cosmetic and volumetric outcomes. Long-term follow-up showed worsening outcomes in smaller implant groups.

Abstract No.: 207228

Decoding Necrotizing Fasciitis in Sweet's Syndrome: When Flesh Turns Foe

First Author: Tarjani Vivek **DAVE**

Co-Author(s): Sumer **DOCTORR**, Prerna **SINHA**

Purpose: To describe the clinical presentation, diagnostic challenges, and management outcomes of periocular necrotizing Sweet's syndrome (NSS), a rare variant of Sweet's syndrome that clinically simulates necrotizing fasciitis (NF).

Methods: We retrospectively reviewed three patients presenting with acute periocular inflammation, pain, and necrosis, initially suspected to have NF. Clinical features, hematologic associations, surgical findings, and microbiological and histopathological evaluations were analyzed. All patients underwent limited debridement for diagnostic confirmation. Collagen sheet grafts were used for wound coverage, and outcomes were documented.

Results: One patient had isolated classical Sweet's syndrome, while two were subsequently diagnosed with hematologic disease. All three demonstrated features consistent with NSS. Initial surgical exploration with microbiological cultures excluded infection, and biopsy confirmed neutrophilic dermatosis consistent with Sweet's syndrome. Collagen sheet grafting promoted rapid re-epithelialization in two patients, yielding cosmetically favorable results. In one patient with full-thickness eyelid margin necrosis, collagen coverage alone was inadequate, leading to an acquired eyelid coloboma. Importantly, none of the patients required extensive surgical excision as would be indicated in NF, and all improved with systemic corticosteroid therapy.

Conclusions: Periocular NSS is a rare but critical differential diagnosis of NF, as therapeutic approaches differ dramatically. While NF mandates urgent aggressive debridement, NSS responds to corticosteroids and conservative surgery. Accurate recognition, histopathological confirmation, and judicious use of collagen grafting can preserve eyelid structure and function while avoiding unnecessary mutilating procedures.

Abstract No.: 201283

Deep-Learning Method for the Diagnosis and Classification of Orbital Blowout Fracture Based on Computed Tomography

First Author: Hyun Jin **SHIN**

Purpose: The aim of this study is to develop deep-learning models for detecting and classifying blowout fracture (BOF) using orbital computed tomography (CT) image data.

Methods: This retrospective study investigated 1264 orbital CT images from 233 patients. These images were classified as either normal or BOF, and then categorized based on fracture site: (1) medial, (2) inferior, and (3) inferomedial. The fractures in the same set of BOF images was then divided according to when they occurred: (1) new and (2) old. Deep-learning models were then developed using Neuro-T, a medical artificial intelligence builder software, and evaluated according to the following metrics: (1) accuracy, (2) precision, (3) sensitivity, (4) F1 score, and (5) area under the receiver operating characteristic curve (AUC).

Results: This study analyzed 1,264 facial CT from 233 patients with multiple CT slices taken from each patient in various coronal views (mean age: 37.5 17.9 years; 79.8% male—186 subjects). Based on these data, 3 deep-learning models were developed for 1) BOF detection (accuracy 99.5%, PPV 99.2%, sensitivity 99.6%, F1 score 99.4%, AUC 0.9999), 2) BOF location (medial, inferior, or inferomedial; accuracy 97.4%, PPV 92.7%, sensitivity 89.0%, F1 score 90.8%), and 3) BOF timing (accuracy 96.8%, PPV 90.1%, sensitivity 89.7%, F1 score 89.9%). In addition, the BOF detection model had an AUC of 0.9999.

Conclusions: Deep-learning models developed with Neuro-T (Neurocle Inc, Seoul, Republic of Korea) can reliably diagnose and classify BOF in CT, distinguishing acute from old fractures and aiding clinical decision-making.

Abstract No.: 200453

Development and Clinical Validation of Personalized Finite Element Analysis for Dysthyroid Optic Neuropathy

First Author: Pengsen **WU**

Co-Author(s): Guiqin **LIU**

Purpose: This study aims to develop and validate a finite element analysis (FEA) model of dysthyroid optic neuropathy (DON) to compare the biomechanical behavior between patients undergoing conventional or augmented orbital decompression surgery, with potential clinical implications for surgical planning.

Methods: The elastic moduli of orbital tissues were quantified using atomic force microscopy. FEA models were established using MRI data from patients with myopathic TED. Pre-disease, pre-operative, and

postoperative FEA models were developed for both the conventional orbital decompression group and the augmented group, in which the posteromedial floor and the orbital process of the palatine bone were additionally removed to analyze the stress distribution and displacement of the optic nerve, eyeball, and orbital wall. A retrospective clinical analysis was performed to validate the biomechanical analysis results.

Results: The FEA results reveal that DON patients experience higher stress on the optic nerve, eyeball, and orbital wall than healthy individuals, mainly concentrated at the orbital apex. Post-operation, the stress on the optic nerve was significantly reduced in both groups. In addition, postoperative stress on the optic nerve was significantly lower in the augmented group than the conventional group. The clinical results demonstrate that patients in the augmented group experienced significantly faster and more pronounced improvements in visual acuity and visual field.

Conclusions: The FEA shows that augmented orbital decompression surgery can alleviate stress more effectively, especially for the optic nerve, which was validated by clinical analysis. This developed FEA model of DON may facilitate determining the appropriate surgical procedure for orbital decompression.

Abstract No.: 206006

Does Dacryocystitis Influence Dacryocystorhinostomy Outcomes? A Histology-Based Analysis

First Author: Sasikant **LEELAWONGS**

Co-Author(s): Nichthida **TANGNUNTACHAI**, Thanatporn **THREETONG**

Purpose: To compare the histological findings of the lacrimal sac between patients presented with dacryocystitis and epiphora and their anatomical and functional outcomes after dacryocystorhinostomy.

Methods: A retrospective cohort of the patients with nasolacrimal duct obstruction (NLDO) undergoing dacryocystorhinostomy (DCR) with lacrimal sac biopsy and histopathological examination (March 2024 – March 2025). Patients were stratified into three groups: acute dacryocystitis, chronic dacryocystitis, and isolated epiphora. Histopathological findings of inflammation and fibrosis were compared across groups and correlated with anatomical and functional success rates.

Results: The study included 28 eyes from 24 patients (mean age: 65.3 years; 95.8% female), stratified into acute dacryocystitis (n=3), chronic dacryocystitis (n=5), and isolated epiphora (n=30). The baseline characteristics were non-significant across groups. Histopathology revealed a predominance of chronic inflammation in all groups (66.7%, 60% and 65%, respectively; P=0.55). Fibrosis was consistently

observed in both subepithelial and deep stromal layers across all groups ($P=0.22$). All acute dacryocystitis notably contained amorphous stromal material suggestive of incomplete healing. At 6 months, the anatomical success rate was 100% in the acute and chronic dacryocystitis groups and 85% in the isolated epiphora group. Functional success was 100% in the acute and chronic groups and 95% in the isolated epiphora group. Neither anatomical nor functional success rates differed significantly among the three groups.

Conclusions: Anatomical and functional success rates did not differ significantly among the patients with acute dacryocystitis, chronic dacryocystitis and isolated epiphora. This outcome is consistent with comparable histopathological findings, which are characterized by chronic inflammation and fibrosis involving both subepithelial and deep stromal layers of the lacrimal sac.

Abstract No.: 206387

Ear To Eye: Auricular Cartilage Graft in Post-Blepharoplasty Ectropion

First Author: Ahdini Zulfiana **ABIDIN**

Co-Author(s): Darmayanti **SISWOYO**

Purpose: To report a surgical management of lower eyelid ectropion as post-blepharoplasty complication. The procedure involves strengthening the inferior tarsal plate using ear cartilages to restore the eyelid position.

Methods: A 43 years old female visited the outpatient clinic with red watery eyes after blepharoplasty in aesthetic clinic four months ago. Three months later, she had upper face lift and secretome injection at the same clinic hoping it would resolve. Physical examination revealed bilateral lower eyelid ectropion and lagophthalmos due to overexcised skin. Surgical correction was undertaken to address eyelid malposition and repair the ectropion. Skin graft was not performed due to reason of longer cosmetic improvement, during surgery we found that the skin was sufficient to return the position of eyelid margin. We harvested ear cartilages, sutured to the inferior tarsal plate, and fixated at the inferior orbital rim to support lid margin position. Lateral tarsal strip was done to tighten and stabilize lateral canthal tendon.

Results: Post-operative follow-up demonstrated significant improvement and function with restoration of normal eyelid apposition to the globe and stable eyelid contour. Improvement in cosmetic and resolved symptoms were reported by the patient.

Conclusions: This case highlights the importance of appropriate management of ectropion as post-blepharoplasty complications. The use of autologous cartilage grafts with lateral tarsal strip technique provides effective structural support and restores eyelid function.

Abstract No.: 202061

Ectopic Lacrimal Gland Combined With Cyst in the Nasal Conjunctiva

First Author: Zhaole **LI**

Co-Author(s): Zeyi **LI**, Cangeng **XU**

Purpose: To describe the clinical manifestation and pathological features of ectopic lacrimal gland combined with the cyst in the nasal bulbar conjunctiva.

Methods: A 43-year-old woman presented with a tumor in the nasal bulbar conjunctiva in her left eye that has exhibited for three years. A yellowish tumor measuring approximately 7×5 mm was observed. invaded the corneal limbus in the nasal conjunctiva, which was solidly elevated, bumpy, welldefined, and exhibited angiogenesis. Below the tumor, there was a translucent, thinwalled cyst. Both tumors were resected by microscopic surgical excision.

Results: Pathological Diagnosis illustrated that The hyperplastic lacrimal gland of the conjunctiva exhibited papillary hyperplasia in focal ducts. The cyst wall consisted of a bilayer columnar epithelial cells. The lacrimal duct cyst wall was composed of stratified columnar epithelial cell. The clinical features of the conjunctival ectopic lacrimal gland differed from those of the normal lacrimal gland. Furthermore, the ectopic lacrimal contained an excretory duct that formed a cyst.

Conclusions: The combination of an ectopic lacrimal gland and a lacrimal ductal cyst in the nasal conjunctiva is rare. Thus, pathological diagnosis is necessary to confirm the diagnosis.

Abstract No.: 200177

Effective of Management and Outcome of Orbital Cellulitis With Periorbital Abscess in Pediatric: A Case Report

First Author: Yin **SOPHEAKBOTH**

Co-Author(s): Khov **PHARA**

Purpose: To report a case of orbital cellulitis and orbital abscess, which had rapidly developed over a period of 3 days after mild blunt trauma to frontal area.

Methods: A 12-year-old present with redness, severe pain and swelling over the right eye which had progressed rapidly over a period of 3 days after mild blunt trauma at frontal region. No medical and surgical history. VA OD 6/34, OS 6/6, IOP 18 /14. A Warm, hard fluctuant swelling over the right temporal frontal periorbital region associated with erythema and edema of the upper and lower eyelids. progress swelling to the left eye lid, proptosis&displaced downwards ,EOM restricted, RAPD (-), chemosis , injection, corneal clear, AC form and normal fundus. Blood test, eye US and CT scan brain and orbit were requested.

Results: US and CT scan showed a well-defined peripherally enhancing hypodense soft tissue. Fluid

collection measures up to 78x62x20mm in frontal superior right orbit and temporal-lateral orbit. Blood test showed high WBC. Hospitalization and with urgent incision and drainage of abscesses, result of gram stains and culture for antibiotic susceptible. Postoperatively, the patient was treated with intravenous ceftazidime because we detect Gram negative Bacilli and Metronidazole for 13 days along with topical Maxidrol and ibuprofen, paracetamol for pain and temperature controlled.

Conclusions: Early management and incision drainage guide by CT scan, to decrease the bacterial load and eliminate the focus, accelerating the healing process. Early detective of gram stains/culture revealed Gram negative Bacilli treated with intravenous ceftazidime, and dressing change every day.

Abstract No.: 205263

Efficacy and Future Directions of Targeted Neoadjuvant Therapy Combined With Orbital Decompression in Thyroid Eye Disease

First Author: Rong LU

Purpose: Thyroid eye disease (TED) is an autoimmune orbital inflammatory disorder linked to thyroid dysfunction, presenting with periorbital edema, proptosis, diplopia, and visual impairment. Conventional staged management has limited efficacy and high complication risks. This study aimed to propose a novel paradigm: TED-targeted neoadjuvant therapy (systemic biologics administered preoperatively to modulate the perioperative immune microenvironment and optimize outcomes).

Methods: A prospective single-center study included 20 consecutive patients with active, sight-threatening TED (EUGOGO Grade 6) who underwent endoscopic transnasal orbital decompression. The neoadjuvant cohort (n=20) received intravenous tocilizumab (8 mg/kg) preoperatively, with surgery performed ≤ 7 days post-infusion. The control cohort (n=20) comprised propensity-matched historical patients who underwent surgery alone. Outcome measures included intraoperative (mucosal edema [0-3 scale], blood loss, operative duration), postoperative (visual acuity [LogMAR], pattern-reversal VEP, Clinical Activity Score [CAS], proptosis reduction) indicators, and perioperative complication rates (safety).

Results: The neoadjuvant group demonstrated significantly reduced mucosal edema, decreased mean intraoperative blood loss, and shorter mean operative time compared to controls. Significant differences favoring the neoadjuvant group were observed in: (1) Visual improvement rate; (2) Magnitude of visual acuity gain; (3) Time to visual recovery, Clinical Activity Score (CAS) reduction was also significantly greater in the neoadjuvant group. No statistically significant difference in postoperative complication rates was observed between the two groups.

Conclusions: TED-targeted neoadjuvant therapy significantly optimizes intraoperative conditions and reduces procedural risks, accelerates postoperative visual function restoration and tissue recovery, and provides a clinically translatable «medical-surgical» integrated strategy for high-risk patients with active-phase TED.

Abstract No.: 200896

Efficacy of Tocilizumab in Refractory Graves' Orbitopathy From Real-World Clinical Practice: An Observational Study

First Author: Mingyang WANG

Co-Author(s): Dongmei LI, Honglei LIU, Tianyu ZHENG

Purpose: To evaluate the effectiveness of Tocilizumab in treating Thyroid eye disease (TED) that is resistant to conventional therapy.

Methods: This observational study at a tertiary care center included 79 Chinese TED patients, 15 of whom were pediatric patients, with 52 of these patients having moderate to severe active TED (all adult patients having steroid-resistant TED). Intravenous infusion of TCZ 8 mg/kg was given every 28 days for 4 months. Changes in visual acuity (VA), intraocular pressure (IOP), proptosis, clinical activity score (CAS), and thyrotropin receptor antibody (TRAb) levels throughout TCZ therapy were assessed at baseline (T0), the fifth month (T4), and follow-up (T5). Additionally, improvements in CAS by at least 2 points and CAS < 4 points at T4 and T5 were evaluated.

Results: Significant improvements were found in VA, IOP, proptosis, CAS, and TRAb levels in the adult group, and proptosis in the pediatric group at T5 ($P < .05$). Additionally, significant improvements were identified in TRAb levels and CAS (active TED at T0) in the pediatric group at T4 ($P < .05$). In the adult and pediatric group with active TED at T5, 71.4% and 60% experienced a decrease in CAS by ≥ 2 points, respectively; 89.3% and 60% achieved the response criterion of low activity disease (CAS < 4 points), respectively.

Conclusions: TCZ emerged as a valuable therapeutic option for Chinese patients with active, corticosteroid-resistant, moderate to severe TED.

Abstract No.: 207389

Euthyroid Orbitopathy: An Uncommon Presentation With Significant Management Implications

First Author: Inchara NAGARAJ

Co-Author(s): Narendran B S, Anunitha RAYAPURAJU

Purpose: To describe the clinical course and therapeutic response of thyroid eye disease (TED) in a euthyroid patient, highlighting diagnostic challenges and management strategies.

Methods: A 51-year-old male presented with right-sided eyelid edema, redness, and watering for three months. He had a history of short-term thyroxine therapy, discontinued two years earlier. On examination, proptosis measured 23 mm with Hertel's exophthalmometry. The Clinical Activity Score (CAS) was 3–4, with mild abduction restriction but no evidence of optic neuropathy. Magnetic resonance imaging (MRI) demonstrated bulky, homogeneously enhancing extraocular muscles, predominantly involving the recti.

Results: The patient was started on weekly intravenous methylprednisolone (500 mg) for six weeks, showing symptomatic improvement after four doses. Noncompliance led to recurrence with bilateral ocular symptoms. Steroid therapy was reinitiated in combination with mycophenolate mofetil (1 g twice daily), resulting in significant improvement and a reduction of CAS to 2.

Conclusions: Thyroid eye disease in euthyroid patients is rare and presents diagnostic and therapeutic challenges due to the absence of systemic thyroid dysfunction. This case underscores the importance of early recognition, sustained compliance, and combined therapy with corticosteroids and steroid-sparing agents such as mycophenolate mofetil to achieve disease control and prevent long-term morbidity.

Abstract No.: 206312

Evisceration Surprises: Lessons From Ten Years of Occult Intraocular Masses Detected After Evisceration

First Author: Kirthi **KOKA**

Co-Author(s): Md Shahid **ALAM**, Sonam **POONAM NISAR**, Priyanka **SAINI**

Purpose: To highlight the occurrence of unsuspected intraocular masses detected post-evisceration and to underscore the importance of thorough preoperative evaluation and imaging.

Methods: Retrospective analysis of histopathologically diagnosed unsuspected intraocular masses post-evisceration at a tertiary eye centre over the last ten years.

Results: Nine unsuspected intraocular masses were detected in 1,647 patients with a mean age of 37.67 ± 20.72 years post-evisceration. Initial diagnosis included a painful blind eye (4), panophthalmitis (2), phthisis bulbi (2), and perforated corneal ulcer(1). Preoperative ultrasound revealed retinal detachment (3), positive «T sign» (3), possible retinal detachment (2) and intraocular foreign body(1). Intraocular mass was not detected in any of the cases on ultrasound. Histopathological examination revealed adenocarcinoma, melanoma, retinoblastoma, squamous cell carcinoma, IgG4-related inflammatory disease, spindle cell lipoma, and hemangioblastoma

in one patient each, respectively. Adenomatous hyperplasia of the ciliary body was seen in two patients. Management strategies included exenteration (3), intraoperative conversion to enucleation (2), palliative care (1) and observation (3).

Conclusions: A thorough clinical evaluation and appropriate imaging should be performed prior to all cases undergoing evisceration to avoid inadvertent evisceration of occult masses. Enucleation should be the treatment of choice when malignancy cannot be excluded. Intraoperative vigilance and routine histopathology ensures timely detection and management, reducing the risk of recurrence and metastasis.

Abstract No.: 200147

Factors Affecting Etiology and En-DCR Outcomes in Nasolacrimal Duct Obstruction: A Retrospective Cohort Study

First Author: Xinyue **YU**

Co-Author(s): Wei **CHI**, Xuanwei **LIANG**

Purpose: Evaluate clinical data from patients with nasolacrimal duct obstruction (NLDO) to identify potential pathogenic causes and key factors that may influence the effectiveness of En-DCR (Endoscopic Dacryocystorhinostomy).

Methods: We conducted the study, including 1,140 NLDO eyes of 1,008 patients who underwent En-DCR. The symptoms and signs of the patients at admission, their previous diagnosis and treatment, and the results of NLDO-related examinations were recorded. Surgical outcomes were assessed by telephone follow-up at least 1 year after surgery, and multivariable analysis was used to identify risk factors associated with surgical outcomes.

Results: Among 1,008 participants, 362 (35.9%) snored or had sleep apnea, 211 (20.9%) had gastroesophageal reflux disease (GERD), and 195 (19.3%) had a family history of epiphora. Most of the 851 female patients were menopausal (80.5%). Additionally, 228 (26.8%) had a history of gynecologic disease, and 98 (11.5%) had undergone gynecologic surgery. The overall success rate for En-DCR was 95.6%. Independent key factors influencing outcomes included regurgitation on pressure over the lacrimal sac (ROPLAS) sign (OR = 0.25, 95% CI: 0.13-0.48, $p < 0.001$), and minimum diameter of lacrimal sac in dacryocystography (OR = 8.71, 95% CI: 2.57-29.57, $p < 0.001$).

Conclusions: Co-occurrence of NLDO with paranasal sinusitis and nasal polyps, chronic conjunctivitis, dry eye, gastroesophageal reflux disease, a family history of epistaxis, sleep apnea, or snoring is common. Furthermore, the ROPLAS sign and the minimum diameter of dacryocystography is ≤ 3 mm are the two most important influences of En-DCR outcomes.

Abstract No.: 201646

First Report of Orbital Abscess Caused by Emerging Zoonotic *Dirofilaria asiatica* sp. nov. in Thailand With Molecular Surveillance Supporting *Aedes albopictus* as a Potential Vector

First Author: Watsaporn PORNWATANACHAROEN
Co-Author(s): Pimkwan JARU-AMPORNAN, Kridtin JARUTATSANANGKON, Utarat KAEWUMPORN, Kanok PREATIVATANYOU, Patsharaporn T. SARASOMBATH

Purpose: This report presents the first unusual case of orbital abscess caused by the emerging zoonotic parasite *Dirofilaria asiatica* sp. nov. in Thailand, with molecular evidence of parasite presence in the patient's residence. Samples from the patient's household, pet cat, and local mosquitoes were analyzed for parasite DNA sequencing to confirm the findings.

Methods: An 80-year-old woman from Chonburi Province, Thailand, presented with a two-week history of right periorbital swelling and a palpable mass. Clinical evaluation and orbitotomy isolated a single parasite worm, characterized histologically and molecularly. A non-invasive home survey collected saliva from household members, the pet cat and local mosquitoes, for molecular detection and parasite DNA sequencing.

Results: Clinical suspicion of orbital cellulitis was confirmed by contrast-enhanced CT, revealing a rim-enhancing inferolateral orbital lesion. Orbitotomy exposed an encapsulated mass containing a live roundworm about 11 cm long. Histopathology showed nematode tissue with eosinophilic inflammation. PCR targeting the filarial cytochrome c oxidase subunit I gene and DNA sequencing identified *D. asiatica* sp. nov. (GenBank accession no. PP442028). The patient recovered after surgical excision. A home survey detected *D. asiatica* DNA in one *Aedes albopictus* mosquito from the household.

Conclusions: This case adds to the limited reports of *D. asiatica* infection in Thailand, highlighting its emerging role as a zoonotic parasite with ocular tropism. Combining molecular diagnostics with environmental surveys enhances diagnostic accuracy and understanding of transmission. Surgical excision remains the preferred treatment, while mosquito surveillance and vector control are essential preventive measures in endemic areas.

Abstract No.: 206941

Help, My Baby Has Only One Eye!

First Author: Natasha Jia Ying TAY
Co-Author(s): Farah ABU BAKAR, Hanida HANAFI, Rona Asnida NASARUDDIN

Purpose: To report a rare case of congenital optic nerve glioma (ONG) and to describe its multidisciplinary management.

Methods: Case report.

Results: Optic nerve gliomas (ONG) are usually benign in the pediatric population and can occur sporadically or may be associated with neurofibromatosis type 1. ONGs originate from pre-cortical optic pathways and are essentially slow-growing. We report a case of a newborn baby girl who was referred to Ophthalmology team at 4 hours of life for left eye swelling. Ocular examination revealed a soft, non-tender, 2x2cm swelling arising from the medial canthal region, displacing the globe supero-laterally. Magnetic Resonance Imaging (MRI) brain/orbit showed a left extraconal soft tissue tumour likely arising from superior oblique muscle with extension into anterior cranial fossa and ethmoidal sinus. Orbital tumour debulking was done at 1 year of life and histopathology examination (HPE) revealed low grade optic nerve glioma. The patient subsequently underwent eight cycles of Vincristine chemotherapy planned by the pediatric oncology team, followed by combined surgical excision by ophthalmology and neurosurgical team.

Conclusions: Congenital optic nerve gliomas are extremely rare and require a collaborative approach to management. This case emphasizes the importance of a multidisciplinary approach among ophthalmologists, pediatricians, radiologists, histopathologists and neurosurgeons for appropriate management and mitigation of disease progression.

Abstract No.: 206814

IgG4-Related Ophthalmic Disease With Atypical Histopathology: A Case Report of Necrotizing Vasculitis and CD8-Positive T-cell Predominance in a Patient With Multiple Autoimmune Comorbidities

First Author: Alejandra VALENZUELA
Co-Author(s): Joseph ARNOLD

Purpose: To highlight diagnostic challenges in IgG4-ROD with autoimmune comorbidities and atypical histopathology.

Methods: This is a case report of a patient with IgG4-Related Ophthalmic Disease with atypical histopathological presentation.

Results: A 54-year-old female presented with a one-year history of progressive bilateral eyelid swelling and bilateral lacrimal gland enlargement. Her medical history included autoimmune hepatitis, hypertension, hyperlipidemia, chronic kidney disease (CKD), type II diabetes mellitus with nephropathy, and Hashimoto's thyroiditis post-thyroidectomy. She reported unchanged vision, absent diplopia, but severe bilateral orbital pain and mechanical difficulty opening her eyelids, impairing her daily activities. Massively enlarged, hard lacrimal glands prompted MRI orbits and laboratory tests (ANCA, ACE, IgG4, LDH, SPEP).

Examination revealed marked bilateral superotemporal orbital masses, with palpable lacrimal glands (4 x 2.5 cm right, 3.5 x 2.5 cm left), inducing mechanical upper lid ptosis and proptosis. Orbital MRI confirmed bilateral lacrimal gland involvement with diffuse eyelid soft tissue thickening, enhancing with gadolinium. Serum IgG4 was elevated (220 mg/dL; reference <140 mg/dL), with normal CBC, ESR, and CRP. Suspecting IgG4-RD, a left anterior orbitotomy provided tissue diagnosis, revealing necrotizing vasculitis, dense CD8-positive T-cell infiltrate, and >50 IgG4-positive plasma cells per high-power field (IgG4/IgG ratio >40%), consistent with IgG4-ROD.

Conclusions: IgG4-RD should be considered in chronic dacryoadenitis with upper eyelid swelling in the context of an autoimmune history. Atypical histopathological features like necrotizing vasculitis and CD8-positive T-cell predominance highlight its heterogeneity. Histopathological confirmation and multidisciplinary management are essential, especially in complex cases, to optimize outcomes and minimize complications. Further studies are needed to understand atypical immune infiltrates and their therapeutic implications.

Abstract No.: 206573

Internal Carotid Artery – Inferior Petrosal Sinus Fistula in a Filipino Male: A Case Report

First Author: Nadine Leigh **CHU**

Co-Author(s): Marco **TUMALAD**

Purpose: To present a rare case of delayed-onset dural arteriovenous fistula following head trauma, emphasizing diagnostic challenges and the pivotal role of multimodal imaging in evaluation and diagnosis.

Methods: This case report details the patient's history, clinical findings, and multimodal imaging, including optical coherence tomography of the optic nerve head, magnetic resonance imaging with magnetic resonance angiography, and a six-vessel cerebral angiogram.

Results: A 53-year-old male presented with a 4-year history of progressive, non-pulsatile left eye proptosis, painless blurring of vision, eye redness, and heaviness, with onset 30 years after prior head trauma. Ocular examination revealed axial proptosis, dilated tortuous episcleral vessels, significant vision loss, and an elevated intraocular pressure relative to the fellow eye. Fundoscopy showed bilateral optic nerve cupping with notable retinal nerve fiber layer thinning on the left. MRI/MRA demonstrated suspicious dilatation of the left superior ophthalmic vein. A six-vessel digital subtraction angiogram confirmed a dural arteriovenous fistula between the left internal carotid artery and the inferior petrosal sinus, with predominantly antegrade drainage into the internal jugular vein.

Conclusions: Dural arteriovenous fistulas with predominantly antegrade venous drainage often follow an indolent course, lacking the overt clinical

signs typically associated with high-flow arteriovenous fistulas. This subtle presentation may obscure the underlying pathology, delaying diagnosis and increasing the risk of irreversible visual loss. Early recognition through a high index of suspicion and appropriate use of multimodal imaging is essential for timely intervention and preservation of vision.

Abstract No.: 207525

Intralesional Bleomycin for Orbital Venolymphatic Malformation

First Author: Kit May **CHOW**

Co-Author(s): Kala **SUMUGAM**

Purpose: To describe the usage of intralesional bleomycin injection after numerous failed sclerotherapy.

Methods: Retrospective case series.

Results: The first case is a 7 year old girl who presented with intralesional haemorrhage of left VLM. She was given three doses of sclerotherapy, but her VLM recurred 3 years later. She was then given three doses of intralesional bleomycin injection and her lesion reduced in size. The second case is a 37 year old pregnant lady who presented with painful worsening proptosis over the left eye. CT and MRI showed left retrobulbar VLM. As she was 29 week pregnant during presentation, she was given 1 month of oral steroids. Post-partum she was given two doses of sclerotherapy but subsequently defaulted follow up. Three years later, she presented again with a recurrence of VLM with optic nerve compression. After two doses of intralesional bleomycin injection, her lesion reduced in size and optic nerve function improved. The last case is a 56 year old man who presented with right painful proptosis due to intralesional bleed of right intraconal VLM. The patient was given intralesional bleomycin injection twice, and repeat MRI showed a smaller mass with lesser degree of proptosis.

Conclusions: Intralesional bleomycin injection is an effective treatment modality for VLM.

Abstract No.: 200899

Intraocular Pressure Changes After Combined Orbital Decompression and Glucocorticoid Treatment for Thyroid Eye Disease

First Author: Mingyang **WANG**

Co-Author(s): Dongmei **LI**

Purpose: To evaluate the change in the intraocular pressure (IOP) in subjects with Thyroid eye disease (TED) after orbital decompression (OD) with glucocorticoids (GCs).

Methods: Ninety-nine orbits of 76 patients with TED were retrospectively reviewed, with either OD (Group A), OD with intravenous glucocorticoids (i.v.GC) (Group B) or parabolbar GC (Group C) administration. The main

outcome measures included pre-and post-operative IOP in the primary and upward gazes.

Results: Mean postoperative IOPs in the primary gaze were lower than the preoperative values for groups A and C ($P < 0.05$). The IOPs during the upward gaze were higher than those in the primary gaze before and after OD (all groups, $P < 0.05$). The mean postoperative and preoperative IOPs during upward gaze were similar in all groups except group C ($P = 0.001$). The mean decrease in IOP in the primary gaze was 1.57 ± 6.00 mm Hg and 2.22 ± 2.62 mm Hg in groups A and C, respectively ($P < 0.05$). Only in group C, the mean IOPs during upward gaze decrease by 5.29 ± 4.89 mm Hg (active TED before OD), and the mean gaze-related IOP decreased from 7.75 ± 6.02 to 2.57 ± 4.21 mm Hg ($P < 0.05$).

Conclusions: A pbGC treatment before OD can effectively reduce the primary and upward gaze IOPs and lead to a greater postoperative reduction in the upward gaze IOP to approximate that in the primary gaze. A pbGC treatment may be preferred for patients with TED in the active or congestive phase before OD considering the IOP.

Abstract No.: 201757

It's ComplicaTED: A Case Report of a 12-Year-Old Female With Thyroid Eye Disease

First Author: Camille Victoria **SISON**

Co-Author(s): Kimberly Amanda **COMIA**, Elaine Marie **OMAHIA**, Ma.Regina Paula **VALENCIA**

Purpose: The purpose of this study is to present a case of a 12 year-old female with Thyroid Eye Disease.

Methods: This is a case report of a 12 year-old female, Filipino, who presented with a one year history of "bulging eyes" with blurring of vision, both eyes.

Results: On initial consultation, visual acuity was 6/12 in both, improving to 6/6 with correction. Color vision and intraocular pressures were normal. Clinical Activity Score (CAS) was 2/7 (1 - gaze-evoked orbital pain, 1 - eyelid swelling). Thyroid function tests showed hyperthyroidism, and thyroid receptor antibodies were elevated. Orbital CT scan with contrast showed no evidence of proptosis and no enlargement of the extraocular muscles. The patient was subsequently referred to Pediatric Ophthalmology, ENT, and Pediatric Endocrinology services for co-management. Ocular lubricants, selenium supplementation, methimazole, and propranolol were prescribed. Supportive measures, such as avoidance of smoke exposure were also advised. In the course of monitoring, she had increased proptosis, and decrease in visual acuity, apart from the gaze-evoked orbital pain, and eyelid swelling, resulting in a CAS score of 4/10. This prompted close monitoring, and pediatric clearance for intravenous methylprednisone.

Conclusions: This case presents an uncommon case of Thyroid Eye Disease in the pediatric population, and highlights the need for multidisciplinary care between ophthalmologists and other specialties in order to maintain stability in eye and hormone health.

Abstract No.: 206145

Lipogenic Activity of IL-1 β -Producing, IL-17A-Primed Myeloid Cells via PU.1 in the Pathogenesis of Active Thyroid Eye Disease

First Author: Sijie **FANG**

Co-Author(s): Kelvin **CHONG**, Wai Kit **CHU**, Yinwei **LI**, Terry **SMITH**, Jing **SUN**, Huifang **ZHOU**

Purpose: Macrophage dysfunction likely contributes to the pathogenesis of thyroid eye disease (TED), a disabling and sight-altering autoimmune disease. Interactivity between macrophages and metabolic disturbances occurring within the orbit remains unexplored. Here, we investigate how metabolic reprogramming determines macrophage fate mapping in TED.

Methods: In this case-control study, orbital connective tissues (OCTs) and primary M1-like macrophages (M1 Macs) were collected from patients with either active or stable TED and healthy controls. Flow cytometry, immunofluorescence, transcriptomics, qRT-PCR, Western blotting, metabolomics and chromatin immunoprecipitation-sequencing were utilized to characterize orbit-infiltrating M1 Mac subsets. Effects of interleukin (IL)-17A on lipid metabolism, de novo lipogenesis (DNL), and inflammasome pathway usage were determined in M1 Macs.

Results: OCTs from active TED exhibited enhanced fatty acid synthesis and upregulated IL-17A signaling. Orbit-infiltrating M1 Macs co-expressing IL-1 β and IL-12, IL-23 or fatty acid synthase (FASN) were predominant in active TED. IL-17A promoted FASN and IL-1 β expression at both mRNA and protein levels in these cells, activating fatty acid synthesis and the inflammasome pathway. Moreover, IL-17A stimulated palmitic acid (PA) production through DNL, dependent on glucose and citrate, and PA induced IL-1 β production. IL-17A-primed IL-1 β production could be attenuated by FASN inhibition. PU.1, a transcription factor upregulated by IL-17A, and PA underpinned the activation of inflammasome-related genes in TED-derived M1 Macs.

Conclusions: These results demonstrate robust lipogenic activity and IL-1 β synthesis provoked by IL-17A in TED-derived M1 Macs. These findings provide a molecular rationale for therapeutically blocking DNL in TED.

Abstract No.: 202660**Management of Exposure Keratopathy in Crouzon Syndrome: A Case Report***First Author: Samata SHARMA*

Purpose: To demonstrate the management outcome of exposure keratopathy in a child with Crouzon syndrome in a resource-limited setting.

Methods: A 6-year-old male with Crouzon syndrome and a positive paternal history presented with bilateral eye protrusion since birth. He had a history of multiple failed left eye lateral tarsorrhaphies done elsewhere. On examination: bilateral exophthalmos, alternate exotropia, left eye chemosis, and diffuse superficial punctate keratopathy were noted. Unaided visual acuity was 6/9 in right eye (OD) and 6/12 in left eye (OS). Ocular motility was full, pupils were round, regular and reactive; posterior segments were normal. Hertel's exophthalmometry showed 96 mm base, OD 22 mm, OS 26 mm. Under general anesthesia, a left eye three-wall orbital decompression (medial, lateral, and floor) was performed using a locally available, low-cost handheld burr, along with medial tarsorrhaphy.

Results: At 7-month follow-up, exophthalmos was significantly reduced and the exposure keratopathy resolved. Eyelid closure improved, leading to better tear distribution and resolution of dry eye symptoms. Visual acuity in OS improved to 6/9. Ocular motility and posterior segment remained normal. Hertel's readings improved to 17 mm in left eye.

Conclusions: Managing complex cases like exposure keratopathy in Crouzon syndrome is particularly challenging in resource-limited settings due to limited subspecialty training, lack of advanced technology, and unavailability of modern surgical equipment. Despite these limitations, the child had a significantly favorable management outcome, including vision restoration, orbital volume expansion, reduction of proptosis, and complete resolution of exposure keratopathy.

Abstract No.: 202128**Management of Trichiasis in Cicatricial Ocular Surface Disease: Cryotherapy Compared With Anterior Lamellar Resection***First Author: I-chan LIN*

Purpose: To compare the clinical outcomes of cryotherapy versus anterior lamellar resection in the treatment of trichiasis without entropion.

Methods: A total of 28 patients (33 eyelids) were included, of which 16 patients (18 eyelids) underwent cryotherapy and 12 patients (15 eyelids) were treated with anterior lamellar resection. Stevens-Johnson Syndrome was the most common underlying disease in both groups. The baseline demographic and clinical characteristics, including age, duration of disease, median trichiasis grade, and success rate,

and complications were comparable between the two groups.

Results: At two weeks, approximately 50% of the eyelids treated with cryotherapy achieved a trichiasis-free status. However, recurrences were frequent and were managed with repeat cryotherapy, mucous membrane grafting, or manual epilation. At a mean follow-up of 20 months, the overall success rate in the cryotherapy group was around 70%, though many patients required multiple interventions. Anterior lamellar resection, on the other hand, resulted in a 83% success rate at two weeks, and 78% success rate on 20-months follow up.

Conclusions: Anterior lamellar resection was found to be more effective and durable than cryotherapy for the management of cicatricial trichiasis. Cryotherapy offered temporary relief but required repeated procedures and carried a higher risk of recurrence, whereas anterior lamellar resection provided higher success rate than cryotherapy.

Abstract No.: 203338**Medical Adhesive-Related Skin Injury on the Eyelid of the Fellow Eye – a Case Report***First Author: Ian WONG**Co-Author(s): Vanessa Ka Yu CHEUNG, Ryan WONG*

Purpose: To report a rare case of medical adhesive-related skin injury on the eyelid, and discuss the management and measures to prevent this.

Methods: A rare case with medical adhesive-related skin injury was described. The patient underwent vitrectomy for the left eye, while during recovery after the uneventful surgery, the right upper and lower lid epidermis suffered extensive injury during drape removal. The immediate management, and outcome after 12 weeks were presented to highlight the importance of proper management following the injury to optimise recovery. Key high-risk features were also discussed.

Results: This case illustrated how important it is to identify high risk patients before the surgery, such that preventive measures could be implemented. As these are iatrogenic conditions, potential medico-legal issues may arise and could happen to any patients undergoing ophthalmic surgery. Also the importance of immediate proper treatment, and ways to prevent this were discussed.

Conclusions: When handled properly in high risk patients medical adhesive-related skin injury on ophthalmic patients undergoing surgery could be avoided. When occurred proper management can produce optimal clinical outcome.

Abstract No.: 209012

Modified Levator Muscle Complex Suspension for Treating Pediatric Blepharoptosis With Poor Bell's Phenomenon

First Author: Ming LIN

Purpose: To evaluate the surgical outcomes in pediatric patients with congenital blepharoptosis and poor Bell's phenomenon (BP) treated with modified levator muscle complex suspension.

Methods: A retrospective review was conducted on the surgical outcomes of 42 pediatric patients with congenital blepharoptosis and poor Bell's phenomenon (BP) who underwent modified levator muscle complex suspension. The major surgical outcomes evaluated included marginal reflex distance 1 (MRD1), palpebral fissure height (PFH), and the incidence of postoperative lagophthalmos.

Results: The mean follow-up duration was 10.28 ± 9.89 months (range: 3-32 months). At the final visit, surgical success was achieved in 54 of 62 eyelids (87.1%), with 46 eyelids (74.2%) showing excellent results, 8 eyelids (12.9%) showing good results, and 8 eyelids (12.9%) showing poor results. The postoperative palpebral fissure height (PFH) of affected eyes significantly improved from 3.58 ± 1.31 mm before surgery to 7.97 ± 1.47 mm after surgery ($p < 0.001$). The mean marginal reflex distance 1 (MRD1) also improved significantly, from -1.48 ± 1.36 mm before surgery to 2.94 ± 1.46 mm after surgery ($p < 0.001$). Postoperatively, MRD1 was ≥ 3 mm in 46 eyelids and < 3 mm in 16 eyelids. The mean lagophthalmos was 1.42 ± 1.20 mm at 3 months after surgery. All patients exhibited complete blink function postoperatively. Postoperative complications were rare during follow-up, with no cases of exposure keratitis observed. However, recurrence of blepharoptosis was noted in 6 patients (8 eyelids). All patients achieved satisfactory eyelid symmetry and contour, and no complications were reported until the last visit.

Conclusions: The modified surgical method achieves complete blink recovery, mild and rapid resolution of lagophthalmos, flexible eyelid motility, and a stable ocular surface. It is simple to perform, with few complications and lower recurrence. These advantages make it a valuable approach for treating congenital blepharoptosis with poor Bell's phenomenon.

Abstract No.: 202308

Mucous Membrane Graft in Symblepharon: A Case of Socket Reconstruction

First Author: Shalini KUMARI

Purpose: Symblepharon is partial or complete adhesion of palpebral conjunctiva of eyelid to bulbar conjunctiva of eyeball. Anatomical restoration of conjunctival fornices and cavity provides an opportunity to wear artificial eye in patients with anophthalmia. Division of adhesion, cicatrix-lysis & palpebral and bulbar

reconstruction of eyelid with full-thickness mucous membrane autograft from lip is a suitable replacement as it integrates readily with surrounding tissue.

Methods: A 27-year-old male, with a history of glass injury in right eye, 2 years ago, came with contracted socket and symblepharon (Grade IV A), with inability to retain COP (Custom Ocular Prosthesis). Surgery was performed under general anaesthesia. The adhesion was divided, scarred tissue was excised, surrounding conjunctiva was displaced to nearly cover bare surface on globe, and raw surface on lid was covered with full-thickness oral mucous membrane autograft, harvested from lower lip. Donor site at lower lip was covered with amniotic membrane. Conformer was placed and suture tarsorrhaphy was done, which was kept for 1-month.

Results: After 6 weeks, socket was fitted with COP, which was retained properly. The anophthalmic orbit showed no recurrence of symblepharon during follow-up period of 5 months post-operatively.

Conclusions: For grades III and IV symblepharons, residual and recessed conjunctiva are not sufficient to cover tarsal surface, procedures of either oral mucosal graft or conjunctival autograft to tarsus increase overall success. Rehabilitation of anophthalmic orbit and ability to wear artificial eye was restored with oral mucosal graft in this case.

Abstract No.: 204490

Multiple Basal Cell Carcinomas Presenting As Gorlin-Goltz Syndrome in an 86-Year-Old Caucasian Male From the Philippines: A Case Report

First Author: Adrian ZENAROSA

Co-Author(s): Catherine VIGO-MATIC

Purpose: To present a case of Gorlin-Goltz syndrome in an elderly male to highlight its diverse clinical manifestations. This report aims to improve awareness among healthcare professionals regarding the syndrome's broad spectrum of presentations, underscoring the critical importance of early recognition for prompt and appropriate patient management and care.

Methods: This report details the clinical presentation and diagnostic workup of an 86-year-old Caucasian male. His diagnosis was established by fulfilling established clinical criteria for Gorlin-Goltz syndrome. These clinical findings were subsequently confirmed through comprehensive physical examination, targeted radiological imaging, and the histopathological analysis of multiple biopsied skin lesions.

Results: The patient met the diagnostic criteria for Gorlin-Goltz syndrome. Histopathology confirmed multiple basal cell carcinomas on his lower eyelid, nasal dorsum, scalp, and back. Physical examination also revealed characteristic palmar pits on both of his hands. Skeletal evaluation identified significant

abnormalities, including cervicothoracic spondylosis and thoracic dextroscoliosis, a right-sided curvature of the spine.

Conclusions: This case demonstrates a classic Gorlin-Goltz syndrome presentation with its hallmark cutaneous and skeletal findings. A high index of suspicion is crucial when evaluating any patient with multiple basal cell carcinomas. Early and accurate diagnosis is essential for initiating timely, multidisciplinary management by appropriate specialists. This proactive approach is paramount to prevent the serious complications associated with this lifelong syndrome.

Abstract No.: 200700

Nasal Endoscopic Approach to Various Orbital Pathologies

First Author: Vikasdeep GUPTA

Co-Author(s): Ankur MOHAN, Nikhil RAJAN, Vaibhav SAINI

Purpose: The paper will highlight the role of Nasal endoscopic techniques in managing various orbital pathologies.

Methods: The study includes videos and discussion of directly and indirectly assisting management of various orbital pathologies through endoscopes including benign tumours of the orbit, traumatic orbital pathologies including blow out fractures associated with incarcerated extraocular muscles, fungal orbital pathologies, orbital abscesses, retained intraorbital foreign bodies, through nasal endoscopy.

Results: Nasal endoscopy can markedly improve the surgical outcomes in various orbital pathologies by reducing the morbidity, improving healing, and avoiding surgical scars and open approaches. Endoscopy can also assist in visualising the deeper inaccessible areas of the orbit to ensure adequate disease management.

Conclusions: Endoscopy has the potential to be a great tool in assisting with the management of orbital lesions, not just the ones lying in the medial aspect of the orbit. It can even help in managing intraorbital lesions.

Abstract No.: 205836

Neonatal Orbital Abscess: A Case Report

First Author: Mark Niño ESTRELLA

Co-Author(s): Armida SULLER-PANSACOLA, Charisse Ann TANLAPCO

Purpose: To report a rare case of Orbital Abscess in a Neonate

Methods: Case Report and Review of Related Literature

Results: This is a case of a 30-day-old infant who presented with a 6-day onset of left eye erythema, proptosis, and reduced ocular motility, accompanied

by fever and nasal discharge. Gingival abscesses were noted upon admission and were aspirated and submitted for testing. Craniofacial computed tomography scan revealed ethmoidal sinusitis, abscess formation, and erosive changes. Broad-spectrum IV was given. Direct aspiration of the orbital abscess was performed to decrease the bacterial load, with the sample submitted for testing. Culture of both the gingival and orbital aspirates yielded colonies of *Staphylococcus aureus*. Gradual clinical recovery was observed, and the patient was eventually deemed fit for discharge.

Conclusions: Orbital Abscess is a condition more commonly seen in children greater than 5 years old and rare in the neonatal age group. Adequate antibiotic administration and surgical drainage should be performed to reduce the bacterial load. A multidisciplinary approach should be adopted in treatment to hasten recovery and prevent life-threatening complications.

Abstract No.: 201758

Nose-y Neighbors: A Case of Ethmoid Sinus Tumor With Orbital and Frontal Sinus Extension

First Author: Camille Victoria SISON

Co-Author(s): Elaine Marie OMAÑA

Purpose: The purpose of this study is to present a case of ethmoid sinus adenocarcinoma with orbital and frontal sinus extension.

Methods: This is a case report of a 53 year-old male, Filipino, smoker with a 5 month history of drooping of the right upper eyelid with blurring of vision, and periorbital pain.

Results: Vision was hand movement with good light projection. Pupils were briskly reactive to light, and relative afferent pupillary defect was present. There was a firm, non-tender mass above the medial canthal tendon extending to the inferior orbital rim, and inferolateral globe displacement. Limitations in extraocular muscle movement, ptosis, proptosis, and complete nasolacrimal duct obstruction were noted. CT scan revealed an irregularly-shaped, heterogeneous hyperdense mass in the right ethmoid sinus area with extension to the orbit and frontal sinus. Incision biopsy showed adenocarcinoma. Metastatic work-up was unremarkable. Patient subsequently underwent non-lid sparing orbital exenteration combined with ENT and Neurosurgery procedures. Final histopathology results showed adenocarcinoma with perineural and lymphovascular invasion. Immunohistochemistry stains yielded positive CK7 and negative CK20 and p63 staining. Patient was referred to Radiation Oncology for post-operative radiotherapy.

Conclusions: This case highlights the need for a good clinical eye in cases of malignancy, and determination

if the tumor is primary, secondary, or metastases. In these cases, imaging and histopathology must be maximized, and multidisciplinary care is essential in treatment.

Abstract No.: 207549

Orbital Cellulitis Following Traditional Eye Remedies With Rosary Pea Seeds (Lal Gedi)

First Author: Sushant ADIGA

Co-Author(s): Rahula AHMED, Malita AMATYA, Dikshya BISTA, Purnima RAJKARNIKAR STHAPIT

Purpose: To describe a rare but serious cause of orbital cellulitis resulting from the traditional use of rosary pea (Lal Gedi) seeds as eye remedies in Nepal, and to highlight the urgent need for public awareness to prevent such harmful practices.

Methods: We present four cases of orbital cellulitis following direct ocular insertion of Lal Gedi seeds. Clinical history, examination, imaging, treatment, and outcomes were analysed. Literature on traditional ocular remedies and Rosary pea seed toxicity was also reviewed.

Results: All four patients developed acute orbital inflammation after seeds were retained in the conjunctival sac for several days. Two required surgical debridement in addition to intravenous antibiotics. Visual outcomes varied, with one patient retaining significant vision loss despite treatment. The toxic protein abrin, present in Lal Gedi seeds, is known to cause necrosis and exacerbate secondary infections. These cases underline a preventable cause of morbidity arising from culturally accepted but unsafe practices.

Conclusions: This series is, to our knowledge, the first to document orbital cellulitis caused by Lal Gedi seed use. Despite modern medical advances, traditional remedies remain common in rural Nepal and continue to place patients at risk of vision- and life-threatening complications. Raising public awareness through culturally sensitive education is vital to discourage harmful practices and promote timely medical care.

Abstract No.: 200903

Orbital Cellulitis Management in Pediatric and Adult Cohorts: A 12-Year Retrospective Analysis From a Tertiary Center

First Author: Mingyang WANG

Co-Author(s): Dongmei LI

Purpose: Orbital cellulitis (OC) is a vision-threatening infection requiring prompt medical and/or surgical intervention. This study evaluates clinical features, management outcomes, and predictors of surgical necessity in pediatric and adult OC patients.

Methods: Retrospective analysis of 40 OC patients (13 pediatric, 27 adult, ages: 34.8 ± 23.9 years) at Xi'an Fourth Hospital (2011–2023). The data collected and

analyzed retrospectively including demographics, signs and symptoms, concomitant diagnoses, inpatient management, imaging results, surgical culture results, visual acuity at presentation and last follow-up, duration of intravenous antibiotic treatment and sequelae of disease were collected.

Results: Surgery was required in 84.6% (11/13) of pediatric and 88.9% (24/27) of adult patients. *Staphylococcus aureus* (17.1%), *S. epidermidis* (11.4%), and MRSA (8.6%) predominated in cultures; 31.4% showed no growth. Ceftriaxone (45%) and cefotaxime (7.5%) were primary antibiotics. Surgical intervention significantly increased hospital costs ($\text{¥}13,317 \pm \text{¥}5,351$ vs. $\text{¥}1,843 \pm \text{¥}509$; $p < 0.0001$) but improved adult visual acuity (VA) from 0.5 ± 0.3 to 0.6 ± 0.4 ($p = 0.04$). All patients achieved symptom resolution.

Conclusions: OC necessitates surgery in >80% of cases regardless of age, driven by abscess formation or medical failure. Staphylococcal species (including MRSA) are key pathogens, warranting tailored empiric therapy. Cost-effective management algorithms integrating Chandler staging and vaccine history are recommended.

Abstract No.: 200541

Orbital Epstein-Barr Virus Associated Smooth Muscle Tumour in an Immunocompromised Patient With Systemic Lupus Erythematosus on Long-Term Immunosuppressive Therapy and Idiopathic CD4 Lymphopenia

First Author: Zhiwei David LAW

Co-Author(s): Yuxiang Daniel CHIN, Chun Yun Caroline LEE, Xin Rong LIM, Bundele Manish MAHADEORAO, Jian Li TAN

Purpose: We report a case of an immunocompromised patient with known systemic lupus erythematosus on long term oral steroids presenting with a rare right eye orbital Epstein-Barr Virus-associated smooth muscle tumour (EBV-SMT). She was subsequently diagnosed with idiopathic CD4 lymphopenia secondary to possible inborn error of immunity.

Methods: Orbital EBV-SMTs are rare neoplasms that primarily occur in immunocompromised individuals, with only a few cases reported. While generally indolent, they can be locally aggressive, causing mass effect and functional impairment. Our patient presented with rapidly progressive proptosis, optic nerve compression and orbital discomfort. A multidisciplinary approach involving the Oculoplastic Surgeon and Rhinologist leveraging pre-operative 3D-printed models, as well as transorbital and transnasal endoscopic surgical techniques was undertaken, achieving safe tumour debulking. Post-operatively, the patient's orbital discomfort and optic nerve functions improved, with a significant reduction in proptosis. Systemic screening revealed additional tumour foci, necessitating further collaborative

management with an Immunologist. The patient was commenced on sirolimus with ongoing surveillance.

Results: There is no standardized treatment for orbital EBV-SMTs, with surgical resection or debulking as possible approaches. Complete excision is challenging, while immunomodulation with antiviral therapy and immunosuppressive agents may confer benefit, with emerging therapies including bevacizumab and sirolimus as potential treatment options.

Conclusions: EBV-SMTs should be considered as possible aetiologies in immunocompromised patients or patients on immunosuppressive therapy for autoimmune diseases presenting with rapidly enlarging orbital masses. A multidisciplinary approach involving surgical resection or debulking, systemic evaluation, and immune modulation is essential to achieve optimal patient outcomes.

Abstract No.: 205483

Orbital Index in Indigenous Sri Lankan Skulls: A Comparative Morphometric Study

First Author: Madhuwanthi DISSANAYAKE

Co-Author(s): Harsha DISSANAYAKE, Madhawa DISSANAYAKE, Sajith EDIRISINGHE, Thisaroo WIJESEKARA, Surangi YASAWARDENA

Purpose: The orbital index (OI), derived from orbital height and width, is an important anthropometric parameter with clinical, forensic, and evolutionary relevance. Although studied in various populations worldwide, there is a lack of data on the orbital morphology of indigenous people (Vedda) of Sri Lanka.

Methods: Orbital height and width were measured in 28 dry skulls of indigenous Sri Lankans. The OI was calculated using the standard formula ($OI = \text{orbital height} / \text{orbital width} \times 100$). Comparative analysis was performed with a reference group of 19 non-indigenous Sri Lankan skulls. Statistical methods were applied to assess differences between the two groups.

Results: The mean ($\pm$ SD) right OI of Indigenous skulls was 78.94 ± 3.59 (range: 71.25 – 87.83), while the mean left OI was 81.72 ± 4.19 (range: 75.22 – 94.36). These values did not differ significantly from those of the non-indigenous sample for either side ($p > 0.05$). Mean ($\pm$ SD) right OI of non-indigenous skulls was 78.18 ± 4.90 while the mean left OI was 79.43 ± 6.85 . The orbital type among indigenous skulls was predominantly microseme ($OI < 83$), and the non-indigenous group also demonstrated a microseme pattern.

Conclusions: This is the first study to compare the orbital morphology in indigenous and non-indigenous Sri Lankan skulls. The findings highlight orbital index similarities compared to non-indigenous populations, with potential implications in orbital surgery, forensic identification, and anthropological research.

Abstract No.: 201217

Orbital Subperiosteal Abscess As the Ocular Manifestation of Melioidosis- a Case Report

First Author: Kar Yong CHONG

Co-Author(s): Hayati ABDUL AZIZ, Wai Seng CHIANG, Yong Zheng WAI

Purpose: To report a rare case of melioidosis presenting as a right orbital subperiosteal abscess, successfully treated with orbital incision and drainage and intravenous ceftazidime.

Methods: Case report.

Results: A 74-year-old male with diabetes mellitus and hypertension presented with a one-week history of fever and progressive right upper eyelid swelling. There was no recent travel abroad, water exposure, soil contact or skin wounds. Visual acuity was 6/60 in both eyes, with no relative afferent pupillary defect. Anterior segment and fundus examination were normal. Erythrocyte sedimentation rate and C-reactive protein were elevated; Other blood investigations, Chest X-ray and electrocardiography were unremarkable. Orbital Computed tomography showed a right orbital subperiosteal abscess with preseptal cellulitis. He was started on intravenous ceftriaxone and metronidazole, having previously received amoxicillin-clavulanate. Despite treatment, swelling worsened with severe chemosis. Orbital incision and drainage yielded 2ml of pus, which cultured *Burkholderia pseudomallei*, sensitive to ceftazidime. Intravenous ceftazidime 2g every 6 hours for 2 weeks was commenced, leading to clinical improvement. Abdominal ultrasonography was normal. He completed 3 months of oral trimethoprim-sulfamethoxazole (Bactrim) for eradication therapy. At follow-up, swelling had resolved and vision improved to 6/24.

Conclusions: Ocular melioidosis is a rare manifestation of melioidosis. Clinicians in endemic areas should maintain a high index of suspicion in patients with orbital infections, especially those with risk factors such as diabetes, to ensure early diagnosis, prompt antimicrobial therapy, and prevention of potentially devastating complications.

Abstract No.: 205078

Orbitopalpebral Neurofibromatosis Type 1 at a Tertiary Care Centre – Clinical Profile and Management

First Author: Mandeep Singh BAJAJ

Purpose: To retrospectively analyse the clinical presentation, imaging findings and surgical management of orbitopalpebral Neurofibromatosis Type 1 in a large series of patients who presented to our institute during a five-year period 2019-24.

Methods: The demographic data, clinical presentation, imaging findings and surgical interventions were

studied. Imaging included high resolution computed tomography, magnetic resonance imaging and ultrasonography. Surgical interventions and their outcomes were recorded in histopathologically confirmed cases.

Results: Seventy-six patients were included in this review. The mean age at presentation was 12.8 years (range 2-43 years) with an average follow-up of 3.8 years. 52 (68.4%) patients were male and 24 (31.6%) were female. Fifty-four (71.1%) patients presented with ptosis, 11 (14.5%) with proptosis, 28 (36.8%) with strabismus, 34 (44.7%) with visual impairment, 10 (13.1%) with sphenoid dysplasia, and 2 (2.6%) patients had associated optic nerve glioma. 63 (82.9%) patients underwent surgery. Surgical interventions included ptosis correction in 51 (67.1%), tumour debulking in 49 (64.5%), lateral canthal fixation in 33 (43.4%) and strabismus surgery in 23 (30.3%). Five (6.6%) patients had an enucleation for a disfigured blind eye. Forty-eight (63.2%) patients had a satisfactory cosmetic outcome, whereas 42 (55.3%) had adequate visual rehabilitation.

Conclusions: Orbitopalpebral Neurofibromatosis type 1 has a complex and varied clinical presentation. A detailed ocular, orbital, and systemic evaluation of each patient is essential. The management is challenging and has to be customised to tackle various components of the condition, to achieve optimal functional and cosmetic rehabilitation.

Abstract No.: 207473

Outcomes and Challenges of Pediatric Dacryocystorhinostomy: A Five-Year Experience from a Tertiary Eye Center in Nepal

First Author: Sushant **ADIGA**

Co-Author(s): Malita **AMATYA**, Dikshya **BISTA**, Purnima **RAJKARNIKAR STHAPIT**, Rohit **SAIJU**

Purpose: To evaluate the demographic profile, surgical outcomes, and complications of pediatric patients (<18 years) undergoing dacryocystorhinostomy (DCR) at a tertiary eye hospital in Nepal.

Methods: A retrospective analysis was conducted on 110 patients (119 eyes) who underwent pediatric DCR over the past five years. Variables assessed included age, sex, laterality, associated lacrimal anomalies, type of surgery, postoperative complications, and recurrence. Descriptive statistics were applied to summarize findings.

Results: The mean age at surgery was 10.5 years (range: 4-16), with a male predominance (61.8%). Unilateral disease was observed in 83% of cases, while bilateral disease was observed in 17%. Congenital lacrimal anomalies were present in 12.6% of patients, most commonly upper punctal atresia (6.7%). The majority of cases (85%) underwent external DCR with

intubation, while 15% were managed with endoscopic DCR. Recurrence requiring resurgery occurred in 6.7% of cases. Minor postoperative complications were documented, with cheese wiring being the most frequent. Overall, surgical outcomes were favorable, with high anatomical and functional success rates.

Conclusions: Pediatric DCR demonstrates high efficacy in treating nasolacrimal duct obstruction, with good anatomical and functional outcomes. Nevertheless, recurrence and tube-related complications remain important considerations. Refinement in surgical techniques and meticulous postoperative tube care are critical to further improving long-term success in the pediatric population.

Abstract No.: 200902

Outcomes of Patients With Dysthyroid Optic Neuropathy Treated With Intravenous Corticosteroids and/or Orbital Decompression Surgery: A Systematic Review and Meta-Analysis

First Author: Mingyang **WANG**

Co-Author(s): Dongmei **LI**

Purpose: Objective: To compare the efficacy of glucocorticoid treatment and orbital decompression (OD) in dysthyroid optic neuropathy (DON).

Methods: Data Sources: PubMed, EMBASE, and Cochrane Library were searched along with other sources. Study Selection: A total of 17 studies met the inclusion criteria. Data Extraction: Standard methodological guidance of the Cochrane Handbook was used and data were independently extracted by multiple observers. The primary outcomes were the improvement of best corrected visual acuity (BCVA). Secondary outcomes were proptosis reduction, change in diplopia, visual field defects, and intraocular pressure (IOP).

Results: The Δ BCVA in the ivGC + OD group was improved 0.26 LogMAR more than in the ivGC group ($P = .007$). The Δ BCVA in the OD group was better than in the ivGC group ($P = .008$). Posttreatment proptosis in the ivGC + OD and OD groups were improved further by 3.54 mm and 3.00 mm, respectively, than in the ivGC group ($P < .01$). The mean deviation (MD) in the ivGC + OD group was improved by an additional 5.33 dB than in the ivGC group ($P = .002$). The IOP in the ivGC + OD group was improved further than in the ivGC group ($P = .03$).

Conclusions: OD or ivGC + OD may be more effective in improving BCVA and MD and reducing proptosis compared with ivGC. Compared with ivGC alone, ivGC + OD is more effective in improving IOP than ivGC. Although this study improves the hierarchy of evidence in the treatment of DON, additional randomized controlled trials are needed to confirm this conclusion.

Abstract No.: 203651**PI3K/AKT Pathway Promotes Angiogenesis in Orbital Tissue of Thyroid-Associated Ophthalmopathy by Enhancing VEGF Expression***First Author: Jianshu KANG**Co-Author(s): Yanxia WANG*

Purpose: The purpose of this study is to provide new mechanistic insights and experimental evidence for targeted therapies in TAO.

Methods: In this study, the PI3K/AKT/mTOR/VEGF signaling pathway was identified through DIA and further analyzed using GO and KEGG enrichment analyses. Expression levels of key pathway components were validated using RT-qPCR, Western blotting, and immunohistochemistry. Additionally, orbital VECs from TAO patients were cultured in vitro and treated with PI3K inhibitor LY294002, anti-VEGF-A antibody bevacizumab, and triamcinolone. Cell proliferation, angiogenic potential, and cytokine secretion (TNF- α , IL-1 β , IL-6) were assessed using CCK-8, tube formation assays, and ELISA.

Results: Differentially expressed genes were significantly enriched in the PI3K/AKT/mTOR/VEGF pathway. RT-qPCR and Western blot analysis confirmed that mRNA and protein levels of Akt, mTOR, and VEGFA were markedly upregulated in TAO orbital tissue, with a higher VEGFA protein positivity rate. In vitro experiments demonstrated enhanced proliferation, angiogenesis, and cytokine secretion in TAO VECs. Treatment with LY294002 significantly inhibited PI3K/AKT phosphorylation, VEGFA expression, and inflammatory cytokine release, while bevacizumab primarily reduced VEGFA levels.

Conclusions: The PI3K/AKT/mTOR pathway facilitates angiogenesis and inflammation in TAO orbital tissue by upregulating VEGFA expression. LY294002, a specific inhibitor of this pathway, demonstrates potential therapeutic value. This study provides new mechanistic insights and experimental evidence for targeted therapies in TAO, warranting further clinical.

Abstract No.: 202064**Pathophysiology, Diagnosis and Management of Dry Anophthalmic Socket Syndrome (DASS)***First Author: Duoduo WU**Co-Author(s): Blanche LIM, Chris LIM, Fiona STAPLETON, Gangadhara SUNDAR, Louis TONG*

Purpose: Dry anophthalmic socket syndrome (DASS) is a multifactorial condition that presents a significant clinical challenge, with ocular prosthesis users frequently experiencing debilitating dryness and discomfort despite the absence of classical signs such as lid margin disease or tear-film instability. Despite its prevalence DASS remains poorly understood with

limited insight into its underlying pathophysiology. This review synthesises current evidence on the pathophysiology, diagnosis, and management of DASS.

Methods: A comprehensive PubMed search was conducted for English articles from inception to June 2025, including references of relevant studies. Keywords and MeSH terms included "DASS," "anophthalmia," "ocular prosthesis," and related terms.

Results: DASS is perpetuated by a vicious cycle of chronic mechanical friction between the ocular prosthesis and socket tissues. This initiates inflammation, meibomian gland dysfunction, and tear-film instability, further exacerbated by altered eyelid and socket anatomy, prosthesis materials, care routines, and socket microbiome dysbiosis. We propose a structured, four-step diagnostic framework integrating symptom questionnaires with objective markers of friction, blepharitis, and inflammation. A tiered-management algorithm is also presented, encompassing tear-film optimisation with artificial tears, anti-inflammatory therapy, in-office procedures, surgical options, and prosthetic modifications. Emerging innovations including hydrophilic surface coatings and 3D-printed ocular prostheses show promise in reducing friction and improving biocompatibility. Given the unique anatomical and biomechanical nature of the anophthalmic socket, a tailored approach incorporating both surface lubrication and immunomodulation is likely required for effective long-term management.

Conclusions: This review provides a structured, evidence-based framework for diagnosing and managing DASS among ocular prosthesis users.

Abstract No.: 206412**Proptosis As the Initial Presentation of Orbital Metastases From Breast, Thyroid, and Lung Cancer***First Author: Law JIN XING**Co-Author(s): Fatimah Suhaila BINTI SUKAIMY, Akmal Haliza BINTI ZAMLI, Wua Jzui NG, Kenneth TEOW KHENG LEONG*

Purpose: To highlight proptosis as an uncommon but important initial presentation of systemic malignancies and emphasize the role of ophthalmic assessment in diagnosing orbital metastasis.

Methods: We retrospectively reviewed three patients who presented with proptosis to the ophthalmology clinic. All underwent comprehensive ophthalmic assessment, contrast-enhanced imaging, and systemic evaluation with subsequent histopathological or oncological correlation.

Results: • Case 1: A 61-year-old woman with previously treated breast cancer presented with right eye proptosis, optic neuropathy, and restricted motility. Imaging showed an orbital mass with bone erosion.

Biopsy confirmed recurrent invasive breast carcinoma.

- Case 2: A 71-year-old woman with long-standing thyroid swelling developed a left supraorbital mass and proptosis. Orbital biopsy revealed metastatic carcinoma, while fine-needle aspiration suggested papillary thyroid carcinoma. Imaging confirmed additional systemic spread.
- Case 3: A 45-year-old man presented with right orbital wall mass and eyebrow swelling. Computed tomography revealed a right lung carcinoma with extensive metastases to orbit, bone, adrenals, and possible brain.

Conclusions: Orbital metastases, though rare, may be the first manifestation of systemic cancer. Ophthalmologists play a key role in recognizing atypical proptosis, which should prompt urgent multidisciplinary evaluation for underlying malignancy.

Abstract No.: 207279

Pseudoendocrine Sarcoma in the Orbit: A Case Report

First Author: Angelo Jud **CRUZ**

Co-Author(s): Honeylen Maryl **TEO**

Purpose: To report a rare orbital pseudoendocrine sarcoma

Methods: Case report

Results: A healthy 56-year-old female had 6 months of blurred left vision, bulging, and binocular diplopia. No consult was sought. Two months prior, she consulted an ophthalmologist. The requested orbital computed tomography revealed a contrast-enhancing, isodense, oval, 21x18mm lesion from the supero-medial orbit to the apex, abutting the optic nerve. She was referred for the same ophthalmic features. The family history was unremarkable for cancer. Best corrected vision was 20/20, right; 20/800 left. Left eye examination revealed relative afferent pupillary defect; hypertropia; -1 on adduction; 2.5mm relative proptosis; raised optic nerve. The rest was unremarkable. Orbitotomy (retrocaruncular) revealed yellow-tan to light brown, irregular, friable tissues (20x18x7mm aggregate measurement). Histopathology showed epithelioid cells with uniform, round, hyperchromatic nuclei, ample eosinophilic cytoplasm in nests/cords; low mitosis (0-3/10high power field); no ossification/atypia/necrosis. Immunohistochemistry was negative: cytokeratin (CK), CK7&20, GATA3, mammaglobin, chromograninA, synaptophysin, SMA, caldesmon, STAT6, CD34&99, calponin, EMA, HMB45, mucin4, SOX10, myogenin, p63; positive: S100, desmin, CD10. INI1 was retained. No EWSR1 gene rearrangement. Beta-catenin showed nuclear expression. The findings suggest pseudoendocrine sarcoma, a rare, intermediate-grade sarcoma of paravertebral soft tissues. A year after surgery, the left vision was 20/25. The remaining eye exam was unremarkable. Long-term follow-up for this unknown phenotype is required.

Conclusions: To our knowledge, orbital pseudoendocrine sarcoma has only been reported once. We presented a detailed clinical, gross anatomical, and histopathological description of this rare orbital entity.

Abstract No.: 202291

Quantitative Assessment of Biofilm Formation on Lacrimal Tubes Placed During Endoscopic Lacrimal Duct Recanalization

First Author: Kuniharu **TASAKI**

Co-Author(s): Takahiro **HIRAOKA**, Sujin **HOSHI**, Keita **KIKUCHI**, Tetsuro **OSHIKA**

Purpose: In endoscopic lacrimal duct recanalization (ELDR), a silicone lacrimal tube is temporarily placed after recanalization of the obstructed segment to allow mucosal repair. The tube is usually left in place for 1-3 months, but the scientific basis for this duration remains unclear. A major concern with prolonged intubation is biofilm formation, which may increase the risk of infection. This study quantitatively assessed biofilm formation on lacrimal tubes used in ELDR using crystal violet (CV) staining.

Methods: We analyzed 34 lacrimal tubes from 21 patients who underwent ELDR. Removed tubes were subjected to CV staining, and the bound dye was solubilized in ethanol. Absorbance was then measured to quantify biofilm formation.

Results: Biofilm was detected on all lacrimal tubes. The median absorbance (interquartile range) was 1.17 (0.51-2.03). A weak positive correlation was found between the intubation period and absorbance ($r = 0.32$, Spearman's rank correlation).

Conclusions: All lacrimal tubes placed during ELDR showed biofilm formation, and the amount of biofilm was modestly correlated with the intubation period. Because biofilm can induce treatment-resistant chronic infection, the intubation period should be kept to the minimum required. Future studies should evaluate the relationship between biofilm formation and clinical outcomes such as recurrence and complication rates.

Abstract No.: 206300

Radical but Rational: Orbital Exenteration in Rhino-Orbital-Cerebral Mucormycosis, a Case Report

First Author: Pallavi **KOLHE**

Co-Author(s): Satish **SHITOLE**

Purpose: Rhino-orbital-cerebral mucormycosis is a rapidly progressive, angioinvasive fungal infection with high morbidity and mortality. Orbital involvement is common, and intracranial extension significantly worsens prognosis.

Methods: A 12-year-old male child presented with Sudden loss of vision with Black eschar on the lid skin

and Drooping of the eyelid. Examination revealed Left Eye - Black necrotic tissue on eyelid, medial canthus, left side of nose, and half of cheek, No Perception of Light, Complete ophthalmoplegia, Frozen globe, Severe proptosis with tense orbit. Right Eye Examination was within normal limits.

Results: The patient was diagnosed with Rhino-orbital-cerebral mucormycosis. Underwent left-sided Orbital Exenteration + Functional Endoscopic Sinus Surgery with Paranasal sinus debridement under General Anesthesia. Extensive Debridement was done to remove infective foci. Wash given with Betadine and Amphotericin B. Merocel sponge used to pack Orbit. Pressure dressing was applied. Dressing was changed on alternate days under aseptic precautions, and systemic liposomal amphotericin B was continued.

Conclusions: Orbital exenteration in Rhino-orbital-cerebral mucormycosis is a radical yet life-saving procedure. Multidisciplinary decision-making, timely surgery, and continued antifungal therapy are essential for optimal outcomes. The decision should always balance the goal of saving life against the functional and cosmetic loss associated with globe sacrifice.

Abstract No.: 205939

Radiofrequency Ablation for Removal of Eyelid Nevus

First Author: Fiza **KHAN**

Co-Author(s): Om Prakash

Purpose: Eyelid nevi are mostly asymptomatic; however, patients often seek their removal for cosmetic concerns. The primary objective of treatment is excision, enhancement of cosmetic appearance, and reduction of functional impairment and the risk of malignancy. The treatment modalities available are surgical excision, CO2 laser removal, and ND:Yag removal; however, they come with their own risks. Our purpose is to study the effect of radiofrequency ablation in removing eyelid nevus in terms of clinical outcome, cosmesis, and complications, and to evaluate if it can be a less invasive modality for the treatment of such lesions.

Methods: Thirty-three eyes of patients aged 18–80 years with eyelid nevus underwent radiofrequency ablation of nevus, performed at a power setting between 5-20 W in Cut and coagulation mode using Ellman Surgitron Dual Radiofrequency equipment by keeping the ablating needle tip flushed with the surface of the nevus and ablating till the nevus height became levelled with the rest of the normal lid margin. Patients were followed for 3 months post-procedure at defined intervals. Outcomes assessed included treatment success (complete removal without residual or scarring) and post-operative complications.

Results: Of the 33 treated eyes, 32 (97%) achieved complete removal of eyelid nevus in a single session,

while 1 eye (3%) had a residual lesion <1 mm. Cosmetic outcomes were satisfactory in all patients. One eye (3%) developed a transient corneal epithelial defect due to intraoperative thermal injury, which healed with topical management. No other complications, such as lid notching, scarring, pigmentary changes, trichiasis, madarosis, or granuloma formation, were observed. It offered faster recovery and minimal post-op complications and can be performed as an OPD-based procedure, considering today's busy lifestyle.

Conclusions: Radiofrequency ablation is a safe, effective, and cosmetically favorable modality for treating eyelid nevus, with high success rates, minimal complications, and excellent patient satisfaction.

Abstract No.: 200452

Radiotherapy-Induced Changes in Corneal Morphology and Biomechanics in Myopathic Thyroid Eye Disease

First Author: Pengsen **WU**

Co-Author(s): Guiqin **LIU**

Purpose: To assess the differences in corneal morphology and biomechanics between patients with myopathic thyroid eye disease (TED) and normal controls (NCs), as well as the changes in these characteristics following radiotherapy.

Methods: Patients with active myopathic TED and age-, sex-matched NCs were enrolled. All patients underwent radiotherapy and were followed up for 6 months post-treatment. Complete ophthalmic examinations were conducted for all subjects. Corneal morphology was evaluated using the Pentacam, and biomechanics were assessed with Corvis ST.

Results: This prospective, comparative clinical study involved 50 TED patients and 30 NCs. Post-radiotherapy, the intraocular pressure (IOP), proptosis, disease activity, diplopia, and muscular index in TED patients significantly improved. Corneal morphological parameters such as back elevation (Db) and the index of surface variance were significantly greater in TED patients compared to NCs, while Ambrosio's Relational Thickness maximum was significantly lower. After radiotherapy, Db decreased, and posterior surface astigmatism increased with statistical significance. Significant biomechanical changes were observed in patients with TED, including reduced A2 time and peak distance, increased tomographic and biomechanical index (TBI), as well as diminished maximum whole eye movement length (WEML). Post-radiotherapy, a significant increase in WEML was observed. Correlation analysis suggested that improvements in ocular biomechanics may be linked to reductions in IOP and proptosis.

Conclusions: Patients with myopathic TED demonstrated observable corneal alterations, including increased surface irregularity, reduced corneal

hysteresis, and decreased orbital compliance, which indicate ectasia risk. Ocular biomechanical parameters may serve as potential quantitative biomarkers for assessing treatment effectiveness in TED management.

Abstract No.: 201991

Reconstruction Strategies for Traumatic Eyelid Defects: Comparative Evaluation of Skin Grafting and Flap Techniques: a Case Series

*First Author: Dewa Ayu Ina **DIANATA***

*Co-Author(s): Maria Yovita Saraswati **PELE ALU**, Ni Made Laksmi **UTARI**, Putu **YULIAWATI***

Purpose: Eyelid reconstruction after trauma requires restoration of function and aesthetics with minimal scarring and preserved visual integrity. For extensive defects (>75% of lid length), graft and flap techniques are selected based on defect size, tissue availability, and desired contour. This case series illustrates the rationale for technique selection and compares outcomes between skin grafting and flap reconstruction.

Methods: Case 1 A 48-year-old male was referred with full-thickness laceration and tissue loss involving the lateral lower eyelid following previous surgery. Due to unconsciousness, visual acuity and intraocular pressure could not be assessed. Examination revealed skin and tissue loss defect with septal exposure. Reconstruction was performed using a free retroauricular skin graft. Case 2 The second patient presented with lower eyelid skin defect and margin loss, a 42 mm irregular laceration with exposed soft tissue, and active bleeding. A pigmented, firm, nodular mass (27 × 17 mm) fixed to underlying tissue was also identified. Management included exploration, full-thickness lower eyelid reconstruction using a frontalis muscle flap, tumor excision, and histopathological assessment

Results: Both graft and flap sites healed well, with no cicatricial changes or lagophthalmos indicating in favorable functional and cosmetic outcomes

Conclusions: This case series highlights that both skin grafting and flap reconstruction are viable techniques for acute repair of traumatic eyelid defects with skin and tissue loss. Optimal cosmetic and functional outcomes can be achieved when the choice of technique is guided by appropriate indications and sound intraoperative decision-making, thereby minimizing the risk of complications such as cicatricial changes and ensuring satisfactory reconstruction

Abstract No.: 200400

Refractory Orbital Angiolymphoid Hyperplasia With Eosinophilia: A Case Report

*First Author: Sang Earn **WOO***

Purpose: To report a rare and refractory case of orbital angiolymphoid hyperplasia with eosinophilia (ALHE) in an elderly patient, with an emphasis on therapeutic challenges.

Methods: The medical records of a patient diagnosed with orbital ALHE via anterior orbitotomy and incisional biopsy through a transcutaneous skin approach were retrospectively reviewed. The primary outcome was clinical response to oral immunosuppressive therapy.

Results: A 90-year-old man presented with progressive swelling of the left periorbital area. Orbital computed tomography revealed a large, lobulated intraconal mass on left eye. Complete excision was not feasible due to the lesion's size and proximity to critical orbital structures. Anterior orbitotomy and incisional biopsy were performed. Histopathologic examination confirmed the diagnosis of ALHE. Initial therapy with oral corticosteroids led to transient symptom relief. However, symptom recurrence occurred upon tapering and discontinuation of oral corticosteroids. Corticosteroid therapy was subsequently resumed and titrated. Azathioprine (50 mg daily) was added as a steroid-sparing agent. The patient is currently maintained on oral prednisolone 5 mg daily.

Conclusions: This case highlights the diagnostic and therapeutic complexities of orbital ALHE, particularly in elderly patients for whom complete excision is not possible. Long-term immunosuppression may be required in refractory cases. Although rare, ALHE should be included in the differential diagnosis of orbital tumors.

Abstract No.: 205493

Role of Preoperative Intranasal Midazolam Spray for Anxiety Relief in Dacrocystorhinostomy Surgery Under Local Anesthesia

*First Author: Saugata **MAITY***

Purpose: Dacrocystorhinostomy surgery under local anesthesia often induces marked discomfort and anxiety in patients during operative procedure. Routine pre operative intranasal midazolam spray is a promising, noninvasive, safe procedure with minimal to nil side effects and without requirement of anesthetist's presence to reduce peroperative pain and anxiety.

Methods: All patients planned for dacrocystorhinostomy surgery were treated with 0.2mg/kg intranasal midazolam spray 30 minutes before the surgical procedure. All were operated under

local anesthesia and performed by the same surgeon. An anesthetist was not available at ot in all cases.

Results: All patients reported significantly lower anxiety and pain peroperatively treated with midazolam nasal spray. Heart rate and blood pressure measurement using multipara apparatus shown stable results during surgery. Almost three fourth patients were satisfied with their preoperative experience.

Conclusions: Intranasal midazolam spray produce conscious sedation to reduce anxiety and pain in Dacryocystorhinostomy patients peroperatively. It also improves per operative patient satisfaction and stabilise heart rate and blood pressure making an effective alternative to traditional sedation methods.

Abstract No.: 209694

Screening of Suspected Pathogenic Genes and Mechanistic Study of Craniofacial Fibrous Dysplasia

First Author: Xinyu **LI**

Co-Author(s): Hongfei **LIAO**, Bingyan **SHEN**, Min **WANG**, Wencan **WU**

Purpose: Conduct in-depth research on the pathogenesis of CFD and search for new therapies targeting specific pathogenic mechanisms.

Methods: Collect 9 family samples of CFD patients and send them for whole-genome exome sequencing to screen for shared gene variants in CFD, followed by bioinformatics enrichment analysis. By constructing two cellular disease models: the LV-GNAS R201H mutant cell model and the cAMP pathway activation model, the pathological conditions of CFD are simulated. The disease cell models are then co-cultured with normal cells using a Transwell system to explore the possible pathogenic mechanisms.

Results: GNAS mutations were detected by WES in orbital bone specimens with CFD lesions, with a detection rate of 100% (R201C 66.7%, R201H 33.3%), but no GNAS gene mutations were detected in peripheral blood DNA. A cell model with the LV-GNAS R201H mutation and a cAMP pathway activation model were constructed. Through Transwell co-culture experiments, it was confirmed that mutant cells can induce pathological transformation of wild-type cells via a paracrine mechanism. Moreover, by extracting exosomes from the co-culture system, the propagation effect of the disease phenotype was reproduced.

Conclusions: This study reveals the paracrine transmission mechanism of CFD and the exosome-mediated spread of disease phenotypes, providing key evidence for deciphering the cascade reaction of 'gene mutation-microenvironment remodeling-pathological propagation.'

Abstract No.: 204600

Severe Presentation of Bilateral Asymmetric Congenital Eyelid Eversion in a Hispanic Neonate

First Author: Joyce **MBEKEANI**

Co-Author(s): Nathan **ARBOLEDA**, Thomas **KENNEDY**, Se Eun **PARK**, Lily **YOUNG**

Purpose: Congenital upper eyelid eversion (CUEE), a rare disorder of unknown etiology, is usually present at birth. In the less than 100 cases reported, it was most often associated with collodion skin disorders, Trisomy 21, and African and Asian race/ethnicity. We present the clinical course of a Hispanic neonate, born with severe bilateral asymmetric CUEE.

Methods: Clinical presentation and course with photo images and investigations were documented.

Results: A 2-hour-old male, born to a 39-year-old (G3P3013), Hispanic female was referred by NICU for severe eyelid eversions. Pregnancy was complicated by gestational diabetes. He was a full-term, uncomplicated, spontaneous vaginal delivery. Examination revealed bilateral floppy upper eyelids with eversions with imbrication of upper eyelids over lower eyelids and chemosis of tarsal conjunctivae, left more than right eye. Anterior and posterior segments were normal. Subsequent B scans and neuroimaging confirmed normal globes, orbits and brain. All other investigations were unremarkable and genetic testing revealed Trisomy 21. He was managed conservatively with lubrication and moisture shields, resulting in complete resolution at 2 months of age. He continues to develop normally.

Conclusions: This case adds to the limited fund of knowledge of CUEE and supports its typically benign clinical course. Recognition of this rare condition by Neonatologists and Ophthalmologists, in neonates of all race/ethnicities, is imperative. Although the presentation can be striking, initial conservative management is justified with anticipation of complete resolution.

Abstract No.: 206413

Silicone Stent-Assisted Reconstruction for Lagophthalmos in the Only Seeing Eye With Electrical Burn-Induced Eyelid Contracture

First Author: Fitria **KUSUMASTUTI**

Co-Author(s): Fitri Setyani **ROKIM**

Purpose: To report the surgical management of lagophthalmos and medial canthal deformity secondary to severe facial contracture following electrical burn injury using silicone stent-assisted reconstruction.

Methods: A 24-year-old male sustained a high-voltage electrical injury after falling from an electric pole. He was initially treated by plastic surgery for extensive facial burns and contracture release. The right eye

had no light perception with a traumatic cataract and prior surgery. Meanwhile, the left eye retained minimal vision (6/40) but suffered from severe lagophthalmos and widened medial canthal distance due to contracture. Gold weight implantation, a standard option for lagophthalmos management, was not feasible in this patient due to extensive cicatricial changes and tissue condition. Reconstruction was performed by releasing the medial canthal contracture and intubating the inferior canaliculus with a silicone stent to restore canthal position and support eyelid closure.

Results: Postoperatively, the medial canthal position of the left eye was restored, lagophthalmos improved, and eyelid closure became more complete. The silicone stent provided stable support and reduced the risk of re-contracture. Functional and cosmetic outcomes were favourable compared with the preoperative state.

Conclusions: Silicone stent-assisted reconstruction offers a practical and effective solution for correcting lagophthalmos and medial canthal deformity caused by cicatricial eyelid contracture following electrical burn. This approach provided functional protection and aesthetic restoration in a young patient with limited remaining vision.

Abstract No.: 201516

Skin-Tarsus-Skin Combined With Orbicularis-Tarsus-Orbicularis Fixation Technique Creates a Stable and Natural-Appearing Double Eyelid

First Author: Qing YE

Purpose: In this study, the two surgical methods were integrated and applied to form a stable double eyelid that was close to the natural physiological structure and almost without any visible traces of surgery.

Methods: At the inner, middle, and outer sites of the double-eyelid line, 7-0 silk sutures were passed successively through the orbicularis oculi muscle at the lower edge of the incision, the tarsus/anterior tarsus tissue, and the orbicularis oculi muscle at the upper edge of the incision, and the skin was sutured with 8-0 thread. The remaining parts were fixed with 8-0 silk sutures successively passed through the skin at the lower edge of the incision, tarsus/ anterior tarsus tissue, and skin at the upper edge of the incision. Scar formation, incidence of complications, and patient satisfaction were observed and recorded during follow-up.

Results: All incisions healed well, without obvious congestion or swelling. All patients were followed up for 3 to 24 months (mean, 8 months). The curvature of the double eyelid was natural-appearing and smooth, and the shape was naturalistic. The scars were slight, and no depressed scars formed.

Conclusions: A skin-tarsus-skin combined with orbicularis fixation technique can produce a stable, long-lasting, natural-looking, smooth double eyelid.

Abstract No.: 202709

Stone in the Wings: A Rare Case of Sphenoid Osteoma-Induced Proptosis

First Author: Ragunath KUPPUSAMY

Co-Author(s): Umarani DHARMALINGAM, Yamini KANAGARAJAN

Purpose: To report a rare case of a giant sphenoid wing osteoma presenting with progressive proptosis and restricted elevation and abduction of the left eye. This case highlights the need to consider rare causes of proptosis alongside common differentials. Imaging—especially MRI—plays a crucial role in diagnosis and surgical planning by assessing lesion characteristics, soft tissue involvement, neurovascular compression, and intracranial extension, helping guide management and prevent complications

Methods: A 65-year-old female presented with a 2-year history of progressive left eye swelling and proptosis, along with limitations in upward and lateral gaze and binocular diplopia. Clinical examination revealed left-sided proptosis with restricted elevation and abduction, while visual acuity and fundus examination were normal. MRI demonstrated a dense, sclerotic, well-circumscribed bony mass arising from the left greater and lesser wing of the sphenoid bone, compressing the left orbital contents. The lesion was consistent with a giant osteoma. The patient was referred to neurosurgery for excision via craniotomy, considering the risk of irreversible complications due to mass effect

Results: The mass was successfully excised without complications. Postoperative recovery was uneventful, with resolution of proptosis and restoration of near-complete ocular motility

Conclusions: Giant osteomas of the sphenoid wing, though extremely rare, should be considered in the differential diagnosis of progressive proptosis and ocular motility restriction. This case highlights the crucial role of imaging in detecting atypical lesions often missed on clinical examination. While CT is preferred for evaluating bony tumors, MRI was used here to assess soft tissue involvement, neurovascular compression, and intracranial extension, essential for surgical planning.

Abstract No.: 206713**Successful Management of Epiphora in Punctal Agenesis With Three-Snip Punctoplasty***First Author: Safira NADIFA**Co-Author(s): Shanti F BOESOIRIE, Raden Angga KARTIWA, Niluh PUTU AYU DEWI WARDHANI, Mohamad RINALDI DAHLAN, Pradistya SYIFA YUDIASARI*

Purpose: Punctal agenesis is the absence of the lacrimal punctum caused by embryogenesis failure. This report aims to describe the management of punctal agenesis with a three-snip punctoplasty.

Methods: This report discusses a case involving a 31-year-old woman who presented with a history of constant tearing in the left eye since elementary school. She reported no ocular or systemic abnormalities. The patient's birth history was full-term and uneventful, with normal growth and development. Examination of the right eye was unremarkable. Examination of the left eye revealed the absence of both superior and inferior puncta, with a slight dimple in the expected area of the punctum. There were no signs of swelling, redness, discharge, or distichiasis in the punctal area. A diagnosis of punctal agenesis was established. The patient was managed with a three-snip punctoplasty procedure, which involves three sequential incisions to form a new punctal opening.

Results: The Anel test was performed immediately after the three-snip punctoplasty by evaluating the passage of fluorescein solution under endoscopic guidance. The test yielded a positive result, indicating the absence of nasolacrimal duct obstruction. One week after the procedure, the symptoms of epiphora had relieved, and both superior and inferior puncta were successfully formed.

Conclusions: Epiphora was the most common symptom of punctal agenesis. Surgical intervention, such as the three-snip punctoplasty, offers a minimally invasive treatment option with good outcomes.

Abstract No.: 200573**Surgical Outcome of Modified Frontalis Suspension Using Autogenous Fascia Lata for Congenital Ptosis in Children Under 3 Years Old***First Author: Nur Aulia AMIR**Co-Author(s): Yunia Irawati, Darmayanti SISWOYO, Hernawita SUHARKO*

Purpose: To describe the surgical outcome of modified frontalis suspension (FS) with autogenous fascia lata (AFL) in ptosis patients under three years of age with poor levator function.

Methods: Retrospective analytical study with 18 eyelids from 17 children who underwent FS with AFL.

All children underwent preoperative examination by assessing the size of the palpebral fissure, margin reflex distance, and levator function. Postoperative evaluation by assessing the functional and aesthetics of the eyelids, scars on the face and upper limbs and complications that occurred.

Results: The mean age at surgery was 21.61 months (12 months-36 months) with diagnosed congenital ptosis, consisting of 16 unilateral and 1 bilateral ptosis. 17 eyelids had excellent functional results, and only one had good results. 15 eyelids had excellent aesthetic results, and 3 eyelids had good results. There was one patient who developed postoperative keratitis. The surgical wound and limb area did not experience any complication. All patients had scars that were still visible but acceptable to the parents.

Conclusions: The frontalis suspension technique with AFL in this study is an effective, simple, and safe procedure performed in children under the age of three. Provides excellent postoperative evaluation results in terms of functionality, aesthetic, and can last for a long period of time.

Abstract No.: 203018**Teenager Patient With Relapsing Syphilitic Posterior Scleritis and Panophthalmitis***First Author: Chieh-hung YEN**Co-Author(s): Yue-ju TSAI*

Purpose: To report a case of recurrent syphilis causing syphilitic posterior scleritis, which developed into panophthalmitis.

Methods: Retrospective case report with medical images

Results: A 19-year-old female presented to a local ophthalmology clinic with unilateral ocular redness and swelling, and was initially diagnosed with conjunctivitis. Despite two to three weeks of medical treatment, the condition failed to improve, and she subsequently developed more pronounced eyelid and orbital swelling accompanied by decreased visual acuity. She was referred to our medical center with a working diagnosis of orbital cellulitis. Magnetic resonance imaging (MRI) revealed findings consistent with orbital cellulitis and panophthalmitis; however, ophthalmic examination suggested an atypical presentation of orbital cellulitis. Review of her past medical history revealed a documented syphilis infection several years earlier, for which she had completed standard treatment. The final diagnosis was syphilitic posterior scleritis with panophthalmitis.

Conclusions: Latent syphilis may relapse and manifest as severe ocular involvement, even in patients who have previously completed standard treatment. A thorough review of the patient's medical history was crucial for timely diagnosis in this case. The

patient exhibited no clinical features suggestive of neurosyphilis.

Abstract No.: 207370

The Impact of Steroid-Antibiotic Eye Ointment Use on Dry Anophthalmic Socket Syndrome: A Comparative Study Using Clinical and Cytological Tests

First Author: Mary Rose Pe YAN

Purpose: The paper aims to provide evidence supporting an effective, evidence-based management strategy for Dry Anophthalmic Socket Syndrome (DASS) to enhance clinical outcomes and patient quality of life. The report includes the clinical and cytological effects of steroid-antibiotic eye ointment in patients with DASS.

Methods: Patients with anophthalmic sockets and wearing ocular prosthesis were grouped into sockets not being treated with steroid-antibiotic ointment (Group A) and sockets receiving application of steroid-antibiotic ointment (Group B). For all participants in each group, the clinical history, OSDI symptom scores, slit-lamp findings, Schirmer tests, and conjunctival impression cytology were collected. Group A was started on steroid-antibiotic ointment treatment for 14 days and was re-evaluated.

Results: This study demonstrated measurable changes in both subjective symptoms and objective clinical signs of Dry Anophthalmic Socket Syndrome (DASS) after two weeks of steroid-antibiotic ointment use. Application of steroid-antibiotic ointment to anophthalmic sockets resulted in a reduction in the frequency and volume of mucoid discharge. There was improved comfort, reduced environmental sensitivity, and less perceived dryness.

Conclusions: This study highlights the potential of steroid-antibiotic eye ointment as an adjunctive treatment for Dry Anophthalmic Socket Syndrome (DASS), based on improvement in symptoms, tear film stability, ocular surface inflammation, and conjunctival cytology.

Abstract No.: 200277

The Most Underrated Villain in Dacryology-Canaliculitis: A Case Series

First Author: Raveesh BINDAL

Co-Author(s): Vishal SHARMA

Purpose: To highlight the need for accurate diagnosis and prompt treatment for cases of canaliculitis, and to prevent them from being missed or misdiagnosed.

Methods: Canaliculitis is a challenging condition to diagnose and treat. Herewith, we present a case series of 14 patients with Canaliculitis with varied clinical presentation and its management.

Results: It is an uncommon condition which ophthalmologists frequently misdiagnose and treat, usually as acute or chronic dacryocystitis, conjunctivitis, blepharitis, mucocele, and chalazion, thus leading to prolonged morbidity to the patient.

Conclusions: Canaliculitis is a challenging condition to eradicate, with majority cases either misdiagnosed or mistreated.

Abstract No.: 206141

The Repair of Ptosis Combining With Autologous Fat Grafting Secondary to TED Upper Eyelid Retraction operations—A Case Series of 3 Patients

First Author: Xiaoke YANG

Co-Author(s): Yu KONG

Purpose: To describe the repair of ptosis combining with autologous fat grafting secondary to TED upper eyelid retraction operations in 3 cases.

Methods: The authors present a retrospective case series of 4 eyelids of 3 patients with ptosis secondary to TED upper eyelid retraction operations. Patients underwent operations to treat ptosis secondary to over-excised Muller or levator muscles. Results were graded from eyelid measurements taken before and 2-4 weeks after reoperation.

Results: After reoperation, 3 eyelids of 3 patients had cosmetically and functionally satisfactory results. 1 eyelid was undercorrection and underwent another surgery to repair ptosis.

Conclusions: Overcorrection and autologous fat grafting is necessary in the repair of ptosis secondary to TED upper eyelid retraction operations.

Abstract No.: 200817

The Results of Cosmetic Eye Ring Surgery

First Author: Dong Ho LEE

Purpose: To evaluate the cosmetic effect and safety of eye enlargement surgery (Eye ring surgery)

Methods: It was conducted in 12 patients who underwent eye-ring surgery at our hospital from February 2024 to June 2024. Eye-ring surgery is a surgical procedure in which a thin silicone band in the shape of a ring is inserted into the space between the conjunctiva and sclera around the cornea. Two conjunctival incisions were made at 12 o'clock and 6 o'clock, and a subconjunctival tunnel was made and an implant was inserted. The progress of surgery was observed for more than 1 year and cosmetic satisfaction, complications, and revision surgery were investigated.

Results: A total of 12 patients were followed for more than 1 year, 1 male and 11 females. The mean age was 35.3 years, ranging from 26 to 60 years.

Cosmetic satisfaction after surgery was very high and all patients were satisfied. Postoperative complications initially included both subconjunctival hemorrhage and conjunctival edema, which improved after about two weeks. There were 4 cases where inflammation persisted and hyperemia continued after surgery, and in this cases, the ring was removed. After removing the ring, the conjunctiva healed without any complications in all cases. Ring removal was seen in early patients and there were no complications after learning curve.

Conclusions: The eye-ring surgery had a high postoperative cosmetic satisfaction. However, in some cases, it is necessary to remove it due to redness or conjunctival dehiscence.

Abstract No.: 206055

The Role of Gamma Knife Radiosurgery for Orbital Apex Cavernous Haemangioma

First Author: Yuen Tsing Adeline **HO**

Co-Author(s): Ka Ho Victor **HUI**

Purpose: To present a case of right orbital apex cavernous haemangioma, initially managed with medial orbital wall decompression but still suffered progressive visual deterioration, and to explore the role of Gamma Knife radiosurgery (GKRS) from existing literature.

Methods: A case of right orbital apex cavernous haemangioma presented with visual impairment was described, the relevant management options and outcome were discussed. A literature review of current evidence in the application of gamma knife surgery with an emphasis over its efficacy and safety were conducted.

Results: A 39-year-old male presented with right eye visual impairment due to an orbital apex cavernous haemangioma. Medial orbital wall decompression was performed by the ophthalmologist and the patient's visual acuity improved from 20/40 to 20/20, with recovery in his visual field defect. However, reemergence of right relative afferent pupillary defect in subsequent follow up and management options were discussed with the patient. Literature review reported Gamma knife radiosurgery can achieve a 70-80% chance of improving visual acuity with low risk of complications.

Conclusions: Orbital cavernous haemangioma can pose risk of visual impairment. Orbital wall decompression can provide temporary visual improvement in patients, but subsequent deterioration would be expected without definitive treatment for the cavernous haemangioma. For patients declining surgical resection, GKRS may serve as a potential option with reasonable rate of visual improvement.

Abstract No.: 201914

The Role of Mitochondria in the Regulation of Inflammation and Adipogenesis in an In Vitro Model of Graves' Orbitopathy

First Author: Gyeong Min **LEE**

Co-Author(s): Yeon Jeong **CHOI**, Sun Young **JANG**, Namju **KIM**, Ja Young **OH**, Jin Sook **YOON**

Purpose: To explore the role of mitochondrial function in the inflammatory and adipogenic responses of orbital fibroblasts (OFs) in Graves' orbitopathy (GO).

Methods: Orbital connective tissue was obtained from GO patients and control subjects. Primary OFs were cultured and stimulated with IL-1 β or TNF- α , with or without oligomycin (a mitochondrial ATP synthase inhibitor) or resveratrol (a mitochondrial enhancer). Inflammatory cytokine expression (IL-6, IL-8, PGE2, COX-2) was evaluated using qPCR, ELISA, and Western blotting. Phosphorylation of MEK1/2, NF- κ B, and p38 MAPK was analyzed. Mitochondrial activity was assessed by ATP levels, mtDNA copy number, mGOT activity, and MitoTracker staining. Adipogenesis was induced for 10 days, and lipid accumulation was assessed via Oil Red O staining and triglyceride assays.

Results: GO tissues exhibited significantly elevated levels of ATP, mtDNA, and mGOT. IL-1 β and TNF- α induced marked inflammatory cytokine expression in OFs, which was enhanced by oligomycin and suppressed by resveratrol. Oligomycin also increased, while resveratrol reduced, mitochondrial activity and adipogenic differentiation in OFs.

Conclusions: Mitochondrial dysfunction contributes to the proinflammatory and adipogenic phenotypes of GO orbital fibroblasts. Modulation of mitochondrial activity may serve as a novel therapeutic approach for GO.

Abstract No.: 200409

Think Twice: A Case of a Glial Heterotopia Mistaken for a Dacryocystocele in a Two-Year-Old Female From the Philippines

First Author: Louise **AGUIRRE**

Purpose: To present a case of Nasal Glial Heterotopia in a 2/F who showed the typical manifestations of a dacryocystocele.

Methods: CT scan results revealed a well-defined, ovoid, non-enhancing, cystic mass in the medial canthus of the right eye at the region of the right nasolacrimal gland, with appearance and location suggestive of a dacryocystocele. The patient underwent excision biopsy of the said mass.

Results: Histopathologic analysis revealed the specimen to be a nasal glial heterotopia.

Conclusions: When encountering a patient that presents with typical manifestations of a

dacryocystocele, one must also consider other differentials, including glial heterotopia. Imaging and histopathology play a key role in the diagnosis of such masses.

Abstract No.: 202538

Unusual Cause of Recurrent Acute Dacryocystitis: Ethmoid Mucocele Mimicking Nasolacrimal Duct Obstruction

First Author: Huy Thien Thanh HA

Co-Author(s): Quoc Anh NGUYEN

Purpose: To describe a rare presentation of recurrent dacryocystitis in a patient with patent lacrimal passage, secondary to compression from ethmoidal sinus mucocele.

Methods: A 45-year-old male presented with several episodes of acute dacryocystitis that responded to medical treatment. Between episodes, he did not experience epiphora. Clinical evaluation showed patent lacrimal syringing, but the dye disappearance test was positive with a high tear meniscus. Computed tomography revealed a well-defined, expansile hypodense lesion at the right lacrimal groove extending into the osseous nasolacrimal duct, consistent with an ethmoidal mucocele. In the caution of malignancy, explorative surgery was performed to clarify the underlying pathology.

Results: Intraoperatively, the nasolacrimal duct was found to have two compartments. The lateral compartment was continuous with the lacrimal sac, representing the physiological drainage pathway, while the medial compartment communicated with the ethmoidal sinus, consistent with a mucocele. Histopathologic analysis of the lesion demonstrated a lining of pseudostratified epithelium, confirming its sinus origin. This mucocele exerted compressive effect on the nasolacrimal duct, resulting in intermittent obstruction and recurrent dacryocystitis despite patent syringing. A standard external dacryocystorhinostomy was performed, re-establishing a functional drainage pathway. The patient recovered uneventfully, with no recurrence of infection during follow-up.

Conclusions: Recurrent dacryocystitis can occur even with apparent patency of the lacrimal drainage system. An ethmoidal sinus mucocele may masquerade as primary lacrimal disease by causing episodic obstruction. Combined imaging, histopathology, and careful surgical exploration are essential to establish the correct diagnosis and achieve successful outcomes.

Abstract No.: 200207

Upper Blepharoplasty Combine With Eyebrow Fixation on Treatment Severe Dermatochalasis

First Author: Nguyen THI THU HIEN

Co-Author(s): Huong DUONG DIEU

Purpose: Evaluate outcomes of 2 techniques: Upper Blepharoplasty and Eyebrow fixation throughout one skin incision.

Methods: A descriptive interventional study without a control group take part in 40 eyes with 6 months follow up. Patient selection: Dermatochalasis severe with eyebrow ptosis performing by one surgeon. Research indicators included: crease asymmetry, BFS, wrinkles, crease height, brow asymmetry, MRD1.

Results: 60% female, 60% age above 60 years old. MRD1 improve post operative, Almost Patients get symmetry in both eyes about crease and brow position. Postoperatively, improvement in both static and dynamic wrinkles at the lateral area. No severe complications can be found.

Conclusions: The combination of the two techniques maximizes both functional and aesthetic outcomes while minimizing scarring and other unwanted complications. This is a relatively safe and effective method for upper eyelid reconstruction.

Abstract No.: 201286

Using Artificial Intelligence to Diagnose Lacrimal Passage Obstructions Based on Dacryocystography Images

First Author: Hyun Jin SHIN

Purpose: Dacryocystography (DCG) has been used to illustrate the morphological and functional aspects of the lacrimal drainage system in the evaluation of patients with maxillofacial trauma and epiphora. This study developed deep-learning models for the automatic classification of the status of the lacrimal passage based on DCG

Methods: The authors collected 719 DCG images from 430 patients with nasolacrimal duct obstruction. The obstruction images were further manually categorized into 2 binary categories based on the location of the obstruction: (1) upper obstruction and (2) lower obstruction. An upper obstruction was defined as one occurring within the canaliculus or common canaliculus, whereas a lower obstruction was defined as one within the lacrimal sac, duct-sac junction, or nasolacrimal duct. The authors then established a deep-learning model to automatically determine whether a passage was patent or obstruction.

Results: The accuracy, precision, sensitivity, F1 score, and area under the receiver operating characteristic curve for the evaluation set of each deep-learning model were 99.3%, 98.8%, 99.5%, 99.2%, and 0.9998,

respectively, for obstruction detection, and 95.5%, 93.0%, 93.0%, 93.0%, and 0.9778 for classifying the obstruction location. Both receiver operating characteristic curves were skewed toward the left-upper region, indicating the high reliability of these models.

Conclusions: The high accuracies of the obstruction detection model (99.3%) and the obstruction classification model (95.5%) demonstrate that deep-learning models can be reliable diagnostic tools for DCG images.

Abstract No.: 202404

Using Transverse Superficial Expansion (TSFE) on Treatment Ptosis Recurrent

First Author: Nguyen **THI THU HIEN**

Co-Author(s): Dieu Huong **DUONG**, Thi Phuong Thao **NGUYEN**, Trong Van **PHAM**, Thi Thao **PHAN**, Thi Que Anh **VU**

Purpose: Evaluate outcomes of using TSFE on ptosis recurrent repair.

Methods: Uncontrolled interventional study.

Results: Time follow up at least 6 months. MRD1 increases. Symmetry about contour and crease. Complications: lagophthalmos, keratitis. Good results in functional and cosmetic. The surgical procedure achieved a good outcome in 96% of cases, with significant improvements in MRD1 and palpebral fissure height. Lid lag was observed in 100% of patients postoperatively, with subsequent improvement during the follow-up period.

Conclusions: The method employs local autologous material with good elasticity, ensuring proper eyelid and ocular function. It demonstrates long-lasting efficacy with favorable outcomes during the follow-up period. This represents a valuable alternative to synthetic materials in the management of recurrent ptosis.

Abstract No.: 200358

Varied Presentation of Isolated Orbital Rim Fractures With Displacement and Their Management in Two Cases

First Author: Vandana **SHARMA**

Co-Author(s): Easter **DAZIINE**, Jasneet **KAUR**

Purpose: To assess the clinical and radiological features of isolated orbital rim fractures and their management in two unique cases.

Methods: Two separate cases presented with history of trauma to face in a roadside accident. The first case complained of pain and diplopia on attempted upward movement in affected eye. Examination revealed a posteriorly displaced orbital rim fracture impinging on the posterior surface of globe and producing indenting effect on the retina visible on fundoscopy. The second

case complained of heaviness and diplopia in the affected eye. Examination revealed antero-inferiorly displaced fracture fragments of orbital rim impinging on the globe causing restricted movement and raised intraocular pressure.

Results: Surgical removal of the fracture fragments was done to achieve good cosmetic and functional results.

Conclusions: Orbital injuries may occur in the form of rim fractures in addition to blow out fractures. orbital rim fractures are usually asymptomatic and are left untreated. However, they may occasionally be symptomatic and need prompt surgical attention. Presentation of such fractures is highly varied and needs high degree of suspicion for diagnosis. Surgical intervention should be meticulous and guarded to remove only those parts of the bone that are causing significant morbidity.

Abstract No.: 204900

Vision-Saving Emergency Canthotomy in Orbital Compartment Syndrome Complicated by Orbital Cellulitis: From Hand Movements to 6/7.5 Visual Recovery

First Author: Irma Suwandi **SADIKIN**

Co-Author(s): Michael **HARTONO**, Agnesstacia Vania **LUMINTANG**, Rina La Distia **NORA**, Kiara **NURMATHIAS**

Purpose: Orbital compartment syndrome is a rare, sight-threatening emergency characterized by rapidly increasing intraorbital pressure that can cause irreversible vision loss. When complicated by orbital cellulitis, it creates secondary glaucoma and optic nerve compression requiring immediate surgical intervention. Purpose: This case demonstrates successful emergency management of orbital compartment syndrome, emphasizing rapid recognition and intervention in preserving vision.

Methods: A 68-year-old female presented with progressive right eyelid swelling over 2 weeks, with acute worsening 2 days prior to admission. Examination revealed restricted ocular motility, visual acuity reduced to hand movements, elevated intraocular pressure (57 mmHg), non-axial inferonasal proptosis, severe conjunctival chemosis, and grade 2 relative afferent pupillary defect with optic nerve pallor. Laboratory studies showed leukocytosis with elevated inflammatory markers. Orbital CT demonstrated significant soft tissue thickening in the right periorbital area with eyeball tenting and optic nerve stretching.

Results: Emergency canthotomy and cantholysis were performed, revealing bleeding and purulent material. Intraocular pressure decreased from 57 mmHg to 12 mmHg postoperatively. Staphylococcus aureus was identified and treated with appropriate antibiotics. High-dose steroids were administered for optic nerve compression. Visual recovery was remarkable: acuity improved from hand movements to 6/21 at one

month and 6/7.5 at two months. At six months, vision remained stable with minimal OCT and perimetry changes, maintaining 76% visual field.

Conclusions: Immediate recognition and emergency canthotomy with cantholysis successfully preserved vision in orbital compartment syndrome with orbital cellulitis. Despite severe initial presentation, prompt surgical intervention resulted in excellent visual recovery, emphasizing the critical importance of early identification and immediate decompressive surgery.

Abstract No.: 206560

When the Sinus Turns Sinister: Compressive Optic Neuropathy From a Sphenoid Sinus Mucocele

First Author: Maryanne ROMERO

Co-Author(s): Blanche LIM, Gangadhara SUNDAR

Purpose: To describe a rare case of orbital compressive neuropathy caused by a sphenoid sinus mucocele, highlighting the importance of considering paranasal sinus pathology in the differential diagnosis of sudden visual loss, and emphasizing the critical value of prompt surgical decompression.

Methods: A 64-year-old patient presented with hand movement vision in the right eye. Ophthalmic evaluation revealed a grade 3 relative afferent pupillary defect consistent with an optic neuropathy, but no evidence of disc pallor on fundus exam. MRI and CT imaging demonstrated a sphenoid sinus mucocele with compression of the optic nerve at the orbital apex. The patient promptly underwent endoscopic endonasal orbital decompression with marsupialization of the mucocele, followed by a post-operative course of dexamethasone.

Results: One day postoperatively, vision improved to counting fingers at close range, with 1/15 plates identified on the Ishihara test. Two weeks post-orbital decompression, vision had improved to 6/18, with all 15 plates of the Ishihara colour chart identified correctly. Follow-up imaging also confirmed complete drainage of the mucocele with adequate decompression of the orbital apex.

Conclusions: Early recognition and timely decompression of sphenoid mucoceles are crucial to prevent permanent vision loss and can result in remarkable visual recovery, particularly when presentation is acute and optic disc still pink, indicating potential for recovery.

Pediatric Ophthalmology and Strabismus

Abstract No.: 206016

A Case of Retinopathy Caused by Dual Variants in CRB1 and ABCA4

First Author: Yuke TIAN

Co-Author(s): Yun LI

Purpose: To report the clinical and molecular characteristics of a child with co-occurring variants in CRB1 and ABCA4.

Methods: A 3-year-9-month-old boy presented with bilateral decreased vision for more than two years, accompanied by nystagmus, strabismus, nyctalopia, and positive oculodigital sign. A comprehensive ophthalmic examination and whole-exome sequencing (WES) were performed.

Results: Visual acuity was unmeasurable due to poor cooperation and intraocular pressures were within normal limits. Cycloplegic refraction revealed high hyperopia bilaterally. Color fundus photography showed macular atrophy with yellowish changes, numerous yellow flecks, and scattered pigment clumps. Optical coherence tomography showed atrophy and thinning of the macular fovea, retinal pigment epithelium (RPE) and outer retina, as well as diffuse inner retinal thickening with indistinct lamination, along with scattered intraretinal hyperreflective dots. The parents were nonconsanguineous. Family history revealed that three paternal relatives had visual impairment attributable to homozygous pathogenic CRB1 variants. WES identified compound-heterozygous pathogenic variants in CRB1 in the proband, establishing a diagnosis of Leber congenital amaurosis type 8 (LCA8). Additionally, one pathogenic variant and one variant of uncertain significance (VUS) were identified in ABCA4, suggesting a possible concomitant diagnosis of Stargardt disease type 1 (STGD1).

Conclusions: To our knowledge, this is the first report of co-occurring variants in CRB1 and ABCA4. The diagnosis of LCA8 is definitive, whereas evidence for ABCA4-related STGD1 remains insufficient. VUS should be interpreted cautiously in a multigenic context, integrating phenotype-genotype correlation and segregation analysis within the family.

Abstract No.: 202373**A Perfect Storm in a Young Lens: A Case Report of Rapidly Progressive Bilateral Intumescent Cataracts in Beta-Thalassemia on Deferiprone Therapy and Management of the Argentinian Flag Sign***First Author: Arnan LIMMAHACHAI*

Purpose: To report a rare case of rapidly progressive bilateral intumescent cataracts in a pediatric patient with beta-thalassemia, discussing its multifactorial pathogenesis, surgical challenges, and the importance of ophthalmic monitoring.

Methods: We describe an 11-year-old girl with beta-thalassemia on deferiprone chelation therapy who presented with a three-week history of rapidly worsening vision. We detail the clinical presentation, surgical management, and postoperative course.

Results: On presentation, visual acuity was Hand Motion in the right eye and Finger Counting in the left. Slit-lamp examination revealed bilateral intumescent cataracts, more advanced in the right eye. The patient underwent phacoaspiration with in-the-bag intraocular lens (IOL) implantation in both eyes. The procedure was uneventful in the right eye. However, an Argentinian flag sign developed during capsulorhexis in the left eye, which was successfully managed, allowing for secure in-the-bag IOL placement. Three months postoperatively, her best-corrected visual acuity was 6/6 in both eyes.

Conclusions: Rapid cataract formation in young beta-thalassemia patients has a multifactorial pathogenesis, including iron overload, oxidative stress, and chelation therapy effects. Despite surgical complexities like the Argentinian flag sign, timely intervention with meticulous technique can achieve excellent visual rehabilitation. This case underscores the critical importance of regular ophthalmological monitoring for early detection and management of vision-threatening complications in this high-risk population.

Abstract No.: 205754**A Seven-Year Multicenter Cross-sectional Study on the Epidemiology of Childhood Chalazion in China***First Author: Jingjing JIANG
Co-Author(s): Li LI, Chan LIU*

Purpose: This large-scale multicenter cross-sectional study aimed to characterize the epidemiological patterns and identify risk factors for childhood chalazion requiring surgical intervention across children's medical centers in China.

Methods: A seven-year multicenter hospital-based cross-sectional study. Data were extracted from the Futang Updating Medical Records (FUTURE) system, including 117,009 pediatric patients who underwent

ophthalmic surgery under general anesthesia across 22 tertiary hospitals in China from 2016 to 2022. Participants were grouped by age, season, and geographic region (North vs. South China).

Results: Chalazion excision accounted for 28.62% of all pediatric ophthalmic surgeries, with stable annual proportions (25%-33%). The majority of cases (66.10%) occurred in toddlers aged 1-3 years, with a mean age of 3.3 years. Females predominated (54.57%), showing a higher risk than males (adjusted odds ratio, aOR = 1.52, 95% CI: 1.47-1.55, $P < 0.0001$). Geographic analysis revealed an 83% higher risk in North China compared to South China (aOR = 1.83, 95% CI: 1.77-1.88, $P < 0.0001$). Seasonally, autumn (aOR = 1.68, 95% CI: 1.61-1.75, $P < 0.0001$) and winter (aOR = 1.71, 95% CI: 1.64-1.77, $P < 0.0001$) were associated with significantly higher risks than summer.

Conclusions: This large-scale study identifies key demographic and environmental risk factors for childhood chalazion requiring surgery in China, including toddlers aged 1-3 years, females, residents in North China, and occurrence during colder seasons.

Abstract No.: 203502**A Study About the Relationship Between Growth and Myopia Progression in Korean Children***First Author: Hyuna KIM*

Purpose: This study investigated predictors of myopia progression by analyzing associations between ocular changes and growth-related indicators in Korean children and adolescents.

Methods: A prospective study was conducted from March 2023 to August 2025 in participants aged 5-17 years. Every three months, growth parameters (height, weight, serum IGF-1/BP3, bone age) and ocular measurements (visual acuity, cycloplegic refraction, axial length, choroidal thickness by OCT, ERG) were assessed. Questionnaires recorded parental myopia, near work, and outdoor activity. Factors associated with axial length changes were analyzed in subjects followed for ≥ 18 months.

Results: Fifty-three participants (mean age 8.71 ± 1.97 years; 14 boys, 28 girls) were enrolled with a mean follow-up of 12.75 ± 0.53 months. During follow-up, mean height increased from 133.33 ± 14.33 cm to 142.91 ± 10.99 cm and weight from 31.02 ± 9.96 kg to 34.84 ± 9.16 kg. Refractive error progressed from -2.01 ± 2.21 D to -2.56 ± 2.10 D, and axial length increased from 23.66 ± 1.28 mm to 24.13 ± 1.04 mm. Multiple regression showed initial axial length correlated with height, while axial length change was associated with age, follow-up duration, serum BP3, and ERG 30Hz flicker implicit time.

Conclusions: Taller children exhibited longer baseline axial lengths, independent of age and follow-up. Axial

elongation over one year was linked to age, BP3, and ERG measures, suggesting that growth and ocular parameters may predict myopia progression. Despite limitations of small sample size and short follow-up, these findings highlight potential markers for identifying children at risk of high myopia.

Abstract No.: 203551

Acute Acquired Comitant Esotropia: Unmasking the Enigma of Sudden-Onset Esodeviation in Adolescents and Adults

First Author: Rozalina LOEBIS

Purpose: To elucidate the clinical manifestation, therapeutic approaches, and surgical results of three cases with AACE, highlighting the significance of prompt identification and surgery.

Methods: Three patients, aged 13, 20, and 35 years, exhibited sudden-onset diplopia with concomitant esodeviation lasting for 7 to 12 months. Thorough ophthalmic evaluations encompassed visual acuity, cycloplegic refraction, Worth Four Dot Test, motility assessment, and posterior segment examination. All patients first underwent conservative treatment, which included complete optical correction, less screen exposure, increased outside activity, and adherence to the 20-20-20 rule. Surgical correction was undertaken after 6 months of persistent esodeviation.

Results: All cases exhibited 40 prism diopters of comitant esotropia at distance and near, with suppression patterns varying between patients. Conservative management failed to improve alignment. Surgical procedures included tailored medial rectus recessions, with an additional lateral rectus recession in one highly myopic case. All patients achieved orthophoria postoperatively. At 3-month follow-up, two patients maintained orthophoria with stable vision, while one was lost to follow-up.

Conclusions: All cases demonstrated 40 prism diopters of comitant esotropia at both distance and near, with variations in suppression patterns among patients. Conservative management did not result in improved alignment. Surgical interventions comprised customized medial rectus recessions, along with an additional lateral rectus recession in one case of significant myopia. All patients attained orthophoria following the surgical procedure. At the three-month follow-up, three patients exhibited orthophoria with stable vision.

Abstract No.: 204836

Affecting Factors of Visual Outcome in Pediatric Cataract Surgery

First Author: Ita CONITA

Co-Author(s): Liana EKOWATI, Arnila SAUBIG

Purpose: To analyze the factors that influence the visual outcome of pediatric cataract surgery.

Methods: This is a prospective cohort study. Pediatric cataract patients undergoing cataract surgery underwent preoperative and 1-month post-operative examinations. Postoperative visual outcomes were categorized into good and poor. Bivariate analysis uses the Chi-square test, the Fisher Exact test, the T-test, and the Mann-Whitney test.

Results: A total of 31 eye samples from pediatric cataract subjects were analyzed. Cataract onset was at a median age of 4 (0-8) years, and age at the time of surgery was 8 (6-14) years. Cataract onset and age at surgery had a significant effect on visual outcome, with $p = 0.037$ and $p = 0.010$. Good preoperative vision (≤ 0.48 LogMAR) was 2.6 times, RR 2.625 ($p = 0.001$), mild-moderate amblyopia was 4.1 times, RR 4.118 ($p = 0.000$), and cataract duration ≤ 63 months was 2, 7 times, RR 2.738 ($p = 0.037$), affecting good visual outcomes after pediatric cataract surgery

Conclusions: Cataract onset, age at surgery, preoperative visual acuity, cataract duration, and degree of amblyopia influence visual outcomes in pediatric cataract surgery.

Abstract No.: 203547

Age-Based Comparison of Surgical Correction Angles in Dose-Response in Bilateral Lateral Rectus Recession for Exotropia

First Author: Kosei OGA

Co-Author(s): Yuka MORITA, Tetsuro OSHIKA

Purpose: To evaluate the influence of age on the association between patient age and the surgical correction effect of bilateral lateral rectus (LR) recession (BLR) for exotropia.

Methods: This retrospective study included 41 patients who underwent bilateral BLR recession for exotropia. Patients were divided into four age groups: pediatric (4–14 years, $n = 10$), young adult (15–39 years, $n = 10$), middle-aged (40–59 years, $n = 11$), and elderly (≥ 60 years, $n = 10$). Exclusion criteria were Patients with high myopia (spherical equivalent ≤ -6.0 D or axial length ≥ 26 mm), reduced best-corrected visual acuity, or non-concomitant exotropia were excluded. Surgical correction per millimeter (mm) of LR recession, expressed in prism diopters (PD)/mm, was calculated at early (within 2 weeks) and late (2–6 months) postoperative follow-ups. One-way ANOVA with Tukey's post hoc test was used for statistical analysis.

Results: Mean early postoperative correction (PD/mm) was 1.990, 2.29730, 1.89790, and 2.651 in pediatric, young adult, middle-aged, and elderly groups, respectively, with no significant intergroup differences ($P = 0.052$). Late postoperative correction (PD/mm) was 1.69870, 2.09810, 1.700, and 2.8107, respectively, showing significant group differences ($P < 0.05$). Post hoc analysis demonstrated that elderly patients achieved significantly greater correction. Post hoc analysis showed the elderly group had significantly greater correction than pediatric and middle-aged groups ($P < 0.05$).

Conclusions: Elderly patients demonstrated a greater surgical correction effect after bilateral LR recession BLR for exotropia, suggesting that age may be an important factor in surgical planning indicating that age may influence the surgical dose-response relationship.

Abstract No.: 205231

Anatomical and Visual Outcomes of Vitrectomy in Infants With Stage 4 and 5 Retinopathy of Prematurity

First Author: Xu Kent **PEE**

Co-Author(s): Li Yen **CHAN**, Jason Allan **CHEAH**, Jamalia **RAHMAT**, Wan Wen **SOH**

Purpose: To study the post-vitrectomy anatomical and visual outcomes of stage 4 and 5 retinopathy of prematurity (ROP).

Methods: Retrospective cohort review of medical records of infants diagnosed with stage 4 and 5 ROP who underwent vitrectomy between 2016 and 2020 in a tertiary eye centre in Kuala Lumpur.

Results: Eighteen eyes of 11 infants (stage 4A ROP [$n=4$], stage 4B ROP [$n=4$], and stage 5 ROP [$n=10$]) were examined. The mean gestational age was 27.8 weeks (range 23 – 33 weeks), and the mean birth weight was 1095 grams (range 560 – 1680 grams). The mean corrected gestational age at surgery was 54.2 weeks (range 38 – 88 weeks). Retina reattachment was achieved in 5/18 (27.8%). The anatomical success rate was 50% in stage 4A, 50% in stage 4B, and 10% in stage 5. Four eyes (22.2%) underwent a second surgery. The mean follow-up period was 57.1 months. Among the 5 eyes with reattached retina, 3 eyes (60%) had a final visual acuity (VA) of better than light perception, while 6 eyes (33.3%) had a final VA of no light perception. Postoperative intraocular hemorrhage occurred in 3 eyes (16.7%). Long-term complications included cornea opacity ($n=4$, 22.2%), secondary glaucoma ($n=2$, 11.1%), phthisis bulbi ($n=2$, 11.1%), and secondary cataract ($n=1$, 5.6%).

Conclusions: Vitrectomy for stage 4 ROP resulted in relatively good anatomical and visual outcomes, but poor outcomes in stage 5 ROP. Vitrectomy in stage 5 ROP is controversial.

Abstract No.: 203776

Anisometropia in Preschool and School-Aged Children

First Author: Yu-chieh **YANG**

Co-Author(s): Chia-wei **LEE**, Der-chong **TSAI**, Chiao-yu **WANG**, Hsin-yu **YANG**

Purpose: This study investigates the prevalence, incidence, progression of anisometropia, and its associations with children's lifestyle factors in a cohort of in Yilan, Taiwan.

Methods: This research is a secondary analysis of data collected from a cohort study involving primary school and preschool students in Yilan County. Comprehensive data, including cycloplegic refraction and caregiver-administered questionnaires were collected. Anisometropia was defined as SE difference of $\geq 1.00D$ after cycloplegia.

Results: Between December 2023 and March 2024, 1,554 primary school children were screened and linked to preschool data. After excluding those with incomplete data ($n=1$), orthokeratology users ($n=2$), and amblyopia history ($n=39$), 1,511 children were included in the analysis. At baseline, 70 children (4.6%) had anisometropia (mean interocular SE difference: $1.38 \pm 0.53D$), with a mean interocular SE change of $-0.72 \pm 0.73 D/year$. Only 5 of these (7.1%) showed anisometropia progression $\geq 0.5D/year$. Children with progression had significantly faster SE progression rate in the more myopic eye compared to those without progression (-0.47 ± 0.41 vs. 0.22 ± 0.63 , $p = 0.019$). Among the 1,441 initially isometropic children, 72 (5.0%) developed anisometropia in primary school. Incident cases were more likely to have astigmatism $\geq 1.50D$ (40.3% vs. 12.9%, $p < 0.001$), spend less than 30 minutes outdoors on weekdays (28.6% vs. 41.2%, $p = 0.016$), and participate less in after-school sports (29.2% vs. 47.5%, $p = 0.002$). In multivariable analysis, astigmatism $\geq 1.50D$ (adjusted OR: 4.448; 95% CI: 2.679–7.386; $p < 0.001$), weekday outdoor time < 30 minutes/day (adjusted OR: 0.549; 95% CI: 0.332–0.942; $p = 0.029$), and not participating in after-school sports classes (adjusted OR: 0.491; 95% CI: 0.287–0.842; $p = 0.010$) were significant predictors of anisometropia onset.

Conclusions: The prevalence of anisometropia among preschool children in Yilan was 4.6%, and the incidence rate was 5.0%. Children who had significant astigmatism, spent less time outdoors and did not participate in after-school sports classes were more likely to develop anisometropia.

Abstract No.: 205130

Application of Computer-Aided Objective Quantitative Diagnosis Technology in the Evaluation of Surgical Outcomes for Infantile Congenital Esotropia

First Author: Daoman **XIANG**

Co-Author(s): Wensi **CHEN**

Purpose: To evaluate the application value of computer-aided objective quantitative diagnosis technology in the preoperative assessment and postoperative outcome evaluation of infantile congenital esotropia, and to analyze surgical outcomes across different age groups.

Methods: This retrospective case series study included 50 children with congenital esotropia, aged from 3 to 36 months, who were treated between September 2021 and December 2024. The «Computer-Aided Objective Quantitative Diagnosis Technology for Strabismus» was employed preoperatively to measure the angle of deviation objectively. All patients subsequently underwent surgical correction. Postoperative orthophoria rates at various intervals were compared among different age groups.

Results: The objective quantitative technology successfully obtained precise angle of deviation measurements in all infants. Postoperative orthophoria rates were favorable across all groups. Statistical analysis revealed no significant difference in orthophoria rates among different age groups at various postoperative follow-up points ($P > 0.05$).

Conclusions: The computer-aided objective quantitative diagnosis technology provides reliable data for infants who cannot cooperate with conventional examinations, serving as a cornerstone for precise surgery. This study demonstrates that, based on accurate diagnosis, surgical correction for congenital esotropia in infants under 36 months of age can achieve a high orthophoria rate comparable to that of older children. Early intervention may maximize the opportunity for the development of binocular vision and fusion function.

Abstract No.: 205704

Association Between Myopia and Intermittent Exotropia in Chinese Children

First Author: Qingyu **MENG**

Co-Author(s): Xi **WU**

Purpose: To compare the degree of myopia between the dominant and non-dominant eyes in children with intermittent exotropia (IXT) in China.

Methods: A total of 199 IXT children with myopia were included in this retrospective study and were divided into two groups according to the difference between near and distance exodeviation: basic IXT and convergence insufficiency (CI) IXT. Refractive errors

were analyzed by spherical equivalent (SE) values. Patients were further stratified into the anisometropia group and the non-anisometropia group.

Results: There were 127 patients in the CI IXT group, with a near exodeviation of $46.94 \pm 20.53\Delta$ and a distance exodeviation of $28.36 \pm 14.34\Delta$, and there were 72 (36.2%) patients in the basic IXT group, with a near exodeviation of $37.68 \pm 22.21\Delta$ and a distance exodeviation of $33.21 \pm 23.96\Delta$. The near exodeviation was significantly larger in the CI group than in the basic IXT group ($P < 0.001$). In the CI IXT group, the mean SE was -2.09 ± 1.45 diopters (D) in the dominant eye and -2.53 ± 1.44 D in the non-dominant eye, while in the basic IXT group, the mean SE was -2.46 ± 1.56 D in the dominant eye and -2.89 ± 1.37 D in the non-dominant eye. The anisometropia group included 43 patients, while non-anisometropia group included 156 patients. The near and distance exodeviation in the anisometropia group were $45.26 \pm 24.41\Delta$ and $33.53 \pm 23.31\Delta$, respectively, and those in the non-anisometropia group were $43.42 \pm 20.69\Delta$ and $29.07 \pm 16.84\Delta$, respectively. There were no significant differences in near and distance deviation between the two groups. The SE of the dominant eye was less myopic than that of the non-dominant eye in both the CI and anisometropia groups ($P = 0.002$ and $P < 0.001$, respectively).

Conclusions: Our study revealed that convergence insufficiency IXT is more common than the basic type in the pediatric myopic population and is characterized by higher inter-eye differences of myopia. The dominant eye was found to be less myopic in IXT patients, particularly in those with convergence insufficiency and anisometropia.

Abstract No.: 201957

Balanced vs. Imbalanced Binocular Stimulation Differentially Impacts the Visual Cortical Activity in Amblyopic Children

First Author: Hong **LIU**

Co-Author(s): Yuanyang **HUANG**

Purpose: To investigate the changes in neural activity in V1, V2, and V3 visual cortical areas of control participants and amblyopic patients during visual stimulation under four differing visual inputs.

Methods: A fast meridional retinotopic mapping paradigm was employed to efficiently localize regions of interest (ROIs) within the visual cortex. Four types of visual stimulation were achieved using a spatiotemporally modulating checkerboard paired with anaglyph red-blue glasses: amblyopic or non-dominant eye only(AE), fellow or dominant eye only(FE), balanced dichoptic(BE), and imbalanced-dichoptic stimulation (DE).

Results: Amblyopic patients exhibit significantly reduced neural activity across V1, V2, and V3

compared to control participants. DE resulted in the most significant reductions in cortical responses for amblyopes. In the control group, significant differences were observed between AE and BE, FE and BE, and BE and DE, while no significant differences were found between AE and DE. In the amblyopic group, significant differences were identified between AE and DE, FE and DE, AE and BE, FE and BE, as well as between BE and DE.

Conclusions: Imbalanced dichoptic stimulation resulted in the largest and most significant reductions in cortical responses, observed exclusively in the patient group, indicating a suppressive effect from the fellow eye. The data support the view that there is more scope for recovery of neural response levels with imbalanced-dichoptic stimulation compared to monocular approaches. Our experimental protocols and data provide direct comparative insights into developing more effective rehabilitation protocols for amblyopic children in the future.

Abstract No.: 202466

Bilateral Ankyloblepharon Filiforme Adnatum: A Case Report Highlighting the Critical Need for Early Recognition and Treatment

First Author: Takashi **NEGISHI**

Co-Author(s): Megumi **ITO**, Chihiro **KOIWA**, Chiaki **NAKAMURA**, Shintaro **NAKAO**

Purpose: To report a case of ankyloblepharon filiforme adnatum (AFA) which is a rare congenital anomaly characterized by bands of tissue connecting the upper and lower eyelids, which can lead to visual deprivation and subsequent amblyopia if left untreated.

Methods: Case report

Results: A one-month-old girl presented with bilateral eyelid adhesions causing restricted eyelid opening. Slit lamp examination revealed tissue bands connecting the eyelids bilaterally, with more severe restriction on the left side. Due to the risk of deprivation amblyopia during the critical period of visual development, surgical separation of the eyelid adhesions was performed under general anesthesia at three months of age using electrocautery. Histopathological examination confirmed keratinized stratified squamous epithelium. Postoperatively, significant hyperopia and anisometropia were noted, which showed myopic shift at two-month follow-up. Both eyelids remained well separated with good fixation and tracking in both eyes.

Conclusions: This case emphasizes the critical importance of early recognition and prompt surgical intervention in AFA to prevent visual developmental complications. Even though anisometropia was observed just after the surgery, emmetropization occurred within three months. Timely management is essential to avoid deprivation amblyopia and

anisometropia, particularly in unilateral or extensive cases.

Abstract No.: 203110

Bilateral Congenital Dacryocystocele: Successful Management With Nasal Endoscopy-Assisted Needle Aspiration

First Author: Kuo Hua **JUAN**

Co-Author(s): Wei Tsun **CHEN**

Purpose: Congenital dacryocystocele is a rare neonatal condition that presents significant diagnostic and therapeutic challenges, especially when conservative treatments fail. This case report aims to highlight the importance of early and comprehensive evaluation, including MRI, and to support nasal endoscopy-assisted needle aspiration as a timely intervention.

Methods: Case report.

Results: A 1-day-old male infant presented with a bluish mass below the left medial canthus, progressing to bilateral lesions within three days. Comprehensive ocular examination and MRI confirmed bilateral dacryocystocele with nasolacrimal duct dilation. Conservative management, including digital compression and topical antibiotics, was ineffective. On day ten, nasal endoscopy-assisted needle aspiration was performed to drain fluid from both cysts. The bilateral dacryocystoceles resolved completely without complications. The patient was monitored for seven months, with no recurrence observed.

Conclusions: This case underscores the rarity of congenital dacryocystocele at birth and demonstrates the critical need for a thorough evaluation, including imaging, in managing such cases. Our report highlights that when conservative treatment fails, prompt intervention with nasal endoscopy-assisted needle aspiration can prevent serious complications like airway obstruction or cellulitis. This case provides valuable insights into the management of this rare condition and reinforces the need for timely, decisive action to ensure optimal outcomes.

Abstract No.: 203849

Binocular Diplopia After Cataract Surgery: Incidence and Associated Factors in Tertiary Teaching Eye Center

First Author: Chayanan **WANGPAITON**

Co-Author(s): Wasawat **SERMSRIPONG**, Thammanoon **SURACHATKUMTONEKUL**

Purpose: To determine the incidence and identify associated factors of binocular diplopia following cataract surgery at Siriraj Hospital, Mahidol University.

Methods: This retrospective case-control study analyzed data from patients who underwent cataract surgery at Siriraj Hospital between January 2000 and June 2023. Postoperative binocular diplopia

was defined as symptomatic binocular diplopia with documented ocular misalignment on examination within 90 days after cataract surgery^{8,11}, identified using ICD-10 diagnosis codes. Collected data included patient demographics, underlying medical conditions, axial length, and operative details such as the type of surgery and anesthesia. Each case was matched with ten controls¹⁰ based on age, sex, and year of surgery. Statistical analyses included Chi-square tests, paired t-tests, and logistic regression.

Results: Among 90,885 patients who underwent cataract surgery, 13 developed postoperative binocular diplopia, yielding an incidence of 0.0143%, which is notably lower than previously reported rates (0.18–0.85%³⁻⁷). The mean age was 70.38 years, and 69.23% were female. Esotropia was the most common type of strabismus (46.15%), and muscle restriction or paresis was the most frequent underlying cause (53.85%). A significantly longer axial length was observed in cases compared to controls (24.58 ± 2.30 mm vs. 23.40 ± 1.33 mm; $p = 0.024$; odds ratio: 1.426, 95% CI: 1.047–1.942). No significant associations were found with diabetes mellitus, hypertension, dyslipidemia, or anesthesia type.

Conclusions: The incidence of binocular diplopia following cataract surgery was low in this study. A longer axial length was significantly associated with an increased risk of developing this complication. Awareness of this risk factor may inform preoperative counseling and management strategies.

Abstract No.: 206805

Biometry Changes in Children Undergoing Secondary Intraocular Lens Implantation After Congenital Cataract Surgery

First Author: Hening **NALURIA**
Co-Author(s): Srijana **ADHIKARI**

Purpose: To evaluate biometric changes prior to cataract extraction and secondary intraocular lens (IOL) implantation.

Methods: This is a retrospective study of electronic medical records (EMR) involving 118 pediatric patients with congenital cataract. They underwent surgery within 2010 to 2020. The patients recorded with cataract extraction and secondary IOL implantation were noted to collect the data concerning date of birth, gender, age of cataract extraction and of secondary IOL implantation, type of cataract, and side of affected eyes. Keratometry readings, axial length, and resulting intraocular lens power calculation were also collected.

Results: A total of 118 patients were included in the study, six with the unilateral cataract and 112 with the bilateral cataract. The most patient age who underwent secondary IOL implantation were one to five years old. The male patients with bilateral cataracts are 56.3% and the remaining are the female patients.

The most common type of cataract was total cataract, 50% (unilateral) and 76.8% (bilateral) respectively. The average axial length increased from 19.32 to 21.48 (P-value of 0.000). There was no difference between K1 and K2 parameters between prior to cataract extraction and secondary IOL implantation, the average K1 value decreased slightly from 42.71 to 42.60 (P-value of 0.635) and the average K2 increased from 44.89 to 48.06 (P-value of 0.217).

Conclusions: The patients showed biometric changes between prior to cataract extraction and secondary IOL implantation.

Abstract No.: 208319

Blau Syndrome Presenting With Diffuse Polyarthritis and Bilateral Intermediate Uveitis in a Child: A Case Report

First Author: Wency **TANG**
Co-Author(s): Charlene **YIM**

Purpose: To report a rare case of Blau syndrome with systemic and ocular manifestations at the age of two, emphasizing the importance of recognizing characteristic clinical features to facilitate early diagnosis and management.

Methods: A retrospective case review was conducted on a pediatric patient presenting with dermatologic, musculoskeletal, and ocular symptoms since the age of two. Clinical findings, ophthalmic imaging, and systemic workup were analyzed. Genetic testing for the NOD2 mutation was performed to confirm the diagnosis.

Results: A child presented at two years of age with diffuse erythematous skin rash and progressive joint stiffness involving both knees, elbows, and proximal interphalangeal joints. Recurrent left eye pain developed subsequently. Ocular examination revealed bilateral intermediate uveitis characterized by vitreous snowballs, choroidal foci, and mild anterior chamber reaction in the left eye. Imaging demonstrated synovial thickening consistent with tenosynovitis. Genetic analysis confirmed a heterozygous NOD2 gene mutation, establishing the diagnosis of Blau syndrome. The patient responded to systemic corticosteroids and immunomodulatory therapy, with improvement in joint mobility and ocular inflammation.

Conclusions: Blau syndrome should be considered in young patients presenting with the triad of granulomatous dermatitis, symmetric polyarthritis, and uveitis. Early recognition and genetic confirmation are critical to initiating timely immunosuppressive therapy, preventing visual morbidity, and long-term joint deformities. Ophthalmologists play a key role in identifying ocular features that may lead to diagnosis in this multisystem condition.

Abstract No.: 208305**Botulinum Toxin as an Initial Therapy for Management of Sixth Nerve Palsies Caused by Nasopharyngeal Carcinomas***First Author: Emily Suhan WONG**Co-Author(s): Carol LAM, Winnie LAU, Cheuk Sing YAM*

Purpose: The purpose of this study is to evaluate the efficacy and safety of botulinum toxin injection as a primary treatment for strabismus in a cohort of patients with nasopharyngeal carcinoma (NPC)-related chronic sixth nerve palsy.

Methods: We retrospectively reviewed all cases of NPC-related sixth nerve palsy receiving botulinum toxin injection in the Hong Kong Eye Hospital between January 2009 and January 2016. Only cases with diplopia for at least 6 months; and failed a trial of Fresnel prism therapy were recruited. We excluded cases with prior strabismus surgery and multiple cranial nerve palsies. Patients were offered botulinum toxin injection as primary treatment for their strabismus and were given further injections or offered surgery if diplopia persisted. Success with botulinum toxin was defined as a final distant orthophoria of <15 PD in primary gaze, no diplopia in primary position, and no head turn, as measured 6 months after the last injection, without requiring a second treatment.

Results: A total of 25 patients were included in the study. All patients received concurrent chemo-radiotherapy for NPC. There was a statistically significant reduction in the mean deviation at distant after the last injection compared to that at presentation ($P < 0.001$, Wilcoxin signed rank test). Overall, 7 patients (28%) achieved clinical success, and 15 patients (64%) remained diplopia-free by repeated botulinum toxin injections alone. Nine patients went on to receive definitive surgery, and all achieved good ocular alignment after surgery. Transient ptosis or vertical deviation was seen in 7 patients, which resolved within 3 months, and no serious complications arose from the treatment in our series.

Conclusions: Botulinum toxin injection is a relatively less-invasive alternative to surgery that can be done under a topical anesthesia setting, which improves patient's quality of life via reduction in diplopia. It is a recommendable initial option in patients with chronic nerve palsies who may have higher risks associated with strabismus surgery.

Abstract No.: 207361**CCDD's – Solving the Enigma***First Author: Sowmya RAVEENDRA MURTHY*

Purpose: To present two cases which represent the CCDDs is actually a spectrum of disorders with overlapping features.

Methods: Three-year-old child - right face turn, small left tilt. EOM left eye limited abduction and elevation with downshoot on abduction. APCT 20 pd left hypo with 12 pd ET which increased in left gaze. Overlapping features of CFEOM and inverse DRS were noted. Surgery was planned, FDT was tight for MR and IR intraoperatively. MR recession with Y split, along with IR recession, was done. Case 2 is of a thirteen-year-old chin up & right face turn. APCT showed right hypertropia of 25-30 pd with 18 pd XT. Ocular movements showed limited adduction, abduction, and depression in both eyes (left more than the right eye). There was a synergistic upshot on abduction and a downshoot on adduction with globe retraction in left eye. Intra-operatively, FDT was positive for LR, and MR with an extra muscle band lateral rectus in the left eye and abnormal superior oblique in the right eye was noted. LR was recessed, and a Y-split was done in both eyes, with SR recession in the right eye.

Results: Both cases had overlapping features of DRS and CFEOM. Both attained a good surgical outcome.

Conclusions: This case highlights the importance of understanding CCDD's as a spectrum of disorders with overlapping features and using intraoperative FDT to guide us towards surgical plan. Further the importance of paying attention to anatomical variations in these cases.

Abstract No.: 201377**Capos Syndrome: A Rare Entity in a Tertiary Eye Care Center of Bangladesh***First Author: Sidratul Muntaha NAZIN**Co-Author(s): Mohammad Mostafa HOSSAIN*

Purpose: CAPOS syndrome is a rare combination of cerebellar ataxia, pes cavus, optic atrophy and sensory neural hearing defect. Purpose of the study is to identify this rare disease, create attention and keep special concern in management of such case.

Methods: Miss X, 5 years old girl was hailing from cumilla with the complaints of uncoordinated eye movement, deviation of eye ball, dimness of vision, wide nasal bridge, high arch feet, walking problem, difficulty in balance, speech and hearing. Visual acuity was 6/60 Log MAR 1 in both eyes. Cycloplegic refraction showed -0.50 sph/ -0.50 cyl X180 in both eyes. Ocular exam revealed telecanthus, gaze evoked nystagmus, exodeviation. On systemic exam showed she had ataxia, scanning speech, mental retardation. Her Romberg's sign was positive. She was advised to do orthoptic evaluation, color fundus photograph (CFP), radiology of foot, audiometry. Orthoptic evaluation revealed 35Δ "V" pattern exotropia, BSV was absent, CFP showed primary optic atrophy. Audiometry reveals sensorineural hearing loss, radiology of foot showed increased in the calcaneal inclination angle $>30^\circ$, angle of longitudinal arch $<150^\circ$, Hibb's angle $<150^\circ$ which goes in favour of pes cavis foot.

Results: Finally cerebellar ataxia, pes cavus foot, optic atrophy, sensory neural hearing loss were detected from all the investigation report which all are the component of CAPOS syndrome.

Conclusions: Early detection and initiation for management of such case might reduce the visual morbidity and better life expectancy.

Abstract No.: 205777

Changes in Retinal Microcirculation After Horizontal Rectus Muscle Surgery in Patients With Strabismus: Mid-Term Observation Based on OCTA

First Author: Xiyu ZHAO

Purpose: To compare the changes in retinal microvascular density before and after horizontal rectus muscle surgery in patients with strabismus using the optical coherence tomography angiography (OCTA), and to analyze the reasons for these changes.

Methods: We prospectively enrolled 39 patients with strabismus (14 underwent one horizontal rectus muscle surgery; 25 underwent two). OCTA was performed preoperatively and at 1 day, 2 weeks, and 6 weeks postoperatively to measure macular vessel density (VD) in the superficial capillary plexus (SCP), intermediate capillary plexus (ICP), and deep capillary plexus (DCP) and assess longitudinal changes.

Results: At 2 weeks after surgery, both horizontal-rectus groups showed increased VD in the ICP and DCP across the whole 6×6 mm macula, with one group also showing increases in the SCP and ICP; within the 1–3 mm inner ring, ICP-VD rose in the temporal, superior, and nasal subfields for both groups, while one group exhibited additional SCP/ICP/DCP-VD increases in the superior and nasal subfields; within the 3–6 mm outer ring, both groups had higher DCP-VD in the superior and nasal subfields and higher SCP-VD in the nasal subfield, and one group also showed SCP/ICP-VD increases in the superior and nasal subfields; by 6 weeks, all VD measures returned to preoperative baseline.

Conclusions: Two weeks after surgery VD increased in select macular regions, unrelated to the number of operated muscles; by 6 weeks, all values returned to baseline. One-muscle surgery chiefly affected SCP/ICP; two-muscle surgery mainly involved ICP/DCP. Changes were concentrated in the nasal and superior macular quadrants.

Abstract No.: 205791

Changes in the Thickness of the Peripapillary Retinal Nerve Fiber Layer in Strabismus Patients After Horizontal Rectus Muscle Surgery

First Author: Xiyu ZHAO

Purpose: To evaluate peripapillary retinal nerve fiber layer (pRNFL) thickness after horizontal rectus surgery in strabismus using OCT.

Methods: We prospectively included 93 eyes from 73 patients. Group A underwent both medial and lateral rectus surgery; Group B underwent one horizontal rectus surgery. pRNFL was obtained on a 3.5-mm peripapillary circle preoperatively, at postoperative day 1, and week 2. Outcomes included global pRNFL, sectoral values (nasal, inferonasal, inferotemporal, superotemporal, superonasal), the papillomacular bundle (PMB), and the nasal/temporal (N/T) ratio.

Results: At day 1, both groups showed transient thickening in the PMB and temporal quadrant, consistent with short-term postoperative swelling or axoplasmic flow disturbance. In Group B, global, inferonasal, and inferotemporal thickness also increased. By week 2, all parameters—including sectors heightened at day 1—returned to baseline, and the N/T ratio showed no meaningful change across time points. No between-group differences were detected in the magnitude or pattern of change, indicating that the number of operated muscles did not modulate early pRNFL responses.

Conclusions: Early pRNFL thickening after horizontal rectus surgery is mild, sector-predominant (PMB/temporal), and self-limited, resolving within two weeks without sustained structural impact on the peripapillary retina. Similar recovery profiles in one-versus two-muscle procedures suggest a common, procedure-related transient response rather than a dose-dependent effect.

Abstract No.: 205968

Changing Trends in Causes of Visual Impairment and Blindness Among Bhutanese Blind School Students

First Author: Dechen WANGMO

Purpose: The aim of this study is to assess the changing trends and underlying causes leading to blindness and low vision, and study the referral patterns of children enrolled in the School for the Blind/MIK in Bhutan.

Methods: A cross-sectional descriptive study was conducted using secondary data from clinical hospital records. Diagnoses were classified anatomically and etiologically. Two independent ophthalmologists verified the diagnoses to ensure reliability. Descriptive statistics were used to analyze the distribution of VI

causes, and findings were compared with Bhutan's 2012 study and similar studies in the region.

Results: A total of 51 students (mean age: 14.9 years, Standard deviation (SD): 4.4) were included. Of these, 17 (33.3%) had moderate VI, 8 (15.7%) had severe VI, and 25 (49%) were blind. Retinal diseases (43.1%) were the leading cause of VI (Visual impairment) and blindness, marking a shift from previous studies where lens pathologies were predominant. Hereditary factors accounted for 62.8% of cases, while 49% of conditions were avoidable. The emergence of Retinopathy of Prematurity (ROP) highlights the need for improved neonatal screening programs. Comparative analysis with past Bhutanese and regional studies indicates shifting etiologies. Strengthening early intervention, genetic counseling, and ROP screening programs is crucial for addressing childhood blindness.

Conclusions: Our study highlights the changing trends in the etiology of childhood visual impairment and blindness in Bhutan, with avoidable diseases like ROP and cataracts becoming increasingly prevalent. This underscores the need for targeted public health interventions- improved neonatal care, early screening programs to reduce the burden of childhood blindness in Bhutan.

Abstract No.: 200873

Characteristics of Ocular Parameters and Influencing Factors of Refractive Lens Power in Children With Anisometropia

First Author: Rui **XIE**

Co-Author(s): Zhirong **WANG**, Yingting **ZHU**, Yehong **ZHUO**

Purpose: To investigate the characteristics of refractive lens power in children with anisometropia and analyze its relationship with anisometropia.

Methods: This cross-sectional study enrolled 128 participants with anisometropia, defined as a spherical power difference of ≥ 1.0 D and a cylindrical power difference ≤ 1.0 D between the two eyes. Participants were categorized into three groups based on the degree of anisometropia: the low anisometropia group (≥ 1.0 D and < 2.0 D), the moderate anisometropia group (≥ 2.0 D and < 3.0 D), and the high anisometropia group (≥ 3.0 D). Ocular biometric measurements were conducted by experienced ophthalmologists using the IOL Master 700, and refraction was performed after confirming adequate cycloplegia. The eye with higher myopia was defined as «the worse eye», while the fellow eye was described as «the better eye». Statistical differences in parameters between the worse eye and better eye were assessed using Student's T-test and paired T-test, with multiple comparisons analyzed using one-way ANOVA.

Results: This study included 128 children (63 boys, 65 girls) aged 5-18 years. The worse eyes exhibited

significantly longer axial length ($p < 0.001$), lower lens power ($p = 0.003$), deeper anterior chamber depth ($p = 0.005$), thinner lens thickness ($p = 0.012$), and weaker corneal power ($p = 0.001$) compared to the better eyes. In the high anisometropia group, the better eyes had stronger lens power ($p = 0.003$), but no significant difference was found in other parameters (including AL, CP, LT, etc.).

Conclusions: Decompensation in refractive lens power may serve as an indicator of advancing myopia.

Abstract No.: 202070

Clinical Experience and Outcomes of Muscle Transplantation in Strabismus

First Author: Min-hsiu **SHIH**

Purpose: A single eye recession-resection procedure could not sufficiently correct large-angle strabismus exceeding 60 prism diopters (PD) or recurrent strabismus greater than 35 PD. This report describes patients treated with a unilateral resection procedure combined with muscle transplantation to the recessed muscle.

Methods: Records of patients who underwent muscle transplantation for large-angle or residual/recurrent strabismus between January 1, 2024, and August 31, 2025, were reviewed. Data were collected regarding age, gender, visual acuity, type of strabismus, the surgical procedure performed, and preoperative and postoperative primary position deviations.

Results: Fourteen patients were included. Primary surgery (group A) was performed on 11 patients (4 males, 7 females), and secondary surgery (group B) on 3 patients (2 males, 1 female). The median age was 30 years (average 39.7 years; range 11 to 75 years). Group A patients had at least 60 PD exotropia, except one case with 45 PD deviation related to oculomotor nerve palsy. Group B exhibited recurrent exotropia greater than 35 PD in primary position despite previous standard recession of unilateral (one male received scleral buckle) or bilateral lateral rectus muscles. Postoperatively, four cases in group A and one in group B revealed residual deviation greater than 15 PD. Mild abduction restriction was noted in two patients based on Hess chart assessment.

Conclusions: Extraocular muscle transplantation in conjunction with a recession-resection procedure is a safe and useful alternative for large-angle or recurrent strabismus when uniocular surgery is desired.

Abstract No.: 205435

Clinical Outcomes of Gore-Tex Assisted Scleral Fixation of Intraocular Lenses in Pediatric Aphakia

First Author: Shaimaa **ALREFAIE**

Co-Author(s): Fawzia **ALHAIMI**, Rahaf **ALLUHAIDAN**, Abdullah **KHAN**

Purpose: To evaluate the short-term outcomes of four-point scleral fixated intraocular lenses (SFIOLs) using polytetrafluoroethylene (ePTFE; Gore-Tex) sutures in pediatric aphakia with insufficient capsular support.

Methods: A retrospective cohort study was conducted at King Khaled Eye Specialist Hospital, including 16 eyes of 16 patients aged 2–18 years who underwent SFIOL implantation with Gore-Tex 7-0 sutures between January 2023 and July 2025. Data collected included corrected visual acuity (logMAR), intraocular pressure (IOP), anterior chamber inflammation, IOL centration, and postoperative complications over a 16-week follow-up.

Results: Mean age was 9.4 ± 4.2 years; 82.4% were male. Mean corrected visual acuity improved from 0.76 ± 0.30 preoperatively ($n=8$) to 0.52 ± 0.27 at week 16 ($n=5$). Mean IOP decreased from 16.1 ± 3.9 mmHg to 14.8 ± 4.4 mmHg. All IOLs were well centered, with no suture erosion or significant complications; 70% had no postoperative events.

Conclusions: Gore-Tex-assisted SFIOL fixation in children provided stable IOL positioning, improved vision, and low complication rates in the short term. Further long-term studies are warranted.

Abstract No.: 202525

Clinical Predictors of Surgical Success in Intermittent Exotropia: A Retrospective Study

First Author: Han-chih **CHENG**

Co-Author(s): Pin-chun **WANG**

Purpose: To investigate clinical predictors of surgical success in intermittent exotropia and evaluate associated surgical outcomes.

Methods: We retrospectively reviewed patients who underwent surgery for basic intermittent exotropia (2017–2024) by a single surgeon at a tertiary center, with ≥ 3 months of follow-up. Data collected included age at surgery, deviation angle, refraction, and visual acuity. Surgical success was defined as residual exodeviation ≤ 10 prism diopters (PD) or esodeviation ≤ 5 PD at 3 months. Secondary outcomes included surgical dose–response and incidence of steroid-induced intraocular pressure (IOP) elevation.

Results: Of 90 patients analyzed, 69 (76.7%) achieved surgical success, while 2 (2.2%) developed overcorrection. Procedures included unilateral lateral rectus recession ($n=18$, 18–30 PD), bilateral lateral rectus recession ($n=59$, 35–70 PD), and recession–

resection ($n=13$, 35–70 PD). Alignment at postoperative week 1 (OR 7.88, $p=0.023$) and month 1 (OR 10.47, $p=0.008$) independently predicted final outcomes, whereas age, amblyopia, anisometropia, control status, and preoperative angle were not significant predictors. Mean surgical dose–response was 2.53 PD/mm (unilateral recession), 2.43 PD/mm (bilateral recession), and 3.13 PD/mm (recession–resection). Steroid-related IOP elevation, defined as IOP >21 mmHg or an increase of ≥ 5 –10 mmHg from baseline, occurred in 10 pediatric patients (11%).

Conclusions: Early postoperative alignment at 1 week and 1 month strongly predicted long-term surgical success. Recession–resection surgery may benefit patients with larger preoperative deviations. Pediatric patients are at higher risk of steroid-induced IOP elevation and require vigilant monitoring.

Abstract No.: 206053

Clinical Profile and Risk Factors Associated With Abusive Head Trauma-Related Retinal Haemorrhage in Infants

First Author: Zhen Ning **LOW**

Co-Author(s): Yie Ping **CHIN**, Sangeetha **THARMATHURAI**

Purpose: To describe the ocular findings and assess the risk factors associated with retinal haemorrhages in infants with abusive head trauma.

Methods: A retrospective study was conducted on all patients aged one year or younger diagnosed with AHT and referred for ophthalmological assessment at Hospital Tunku Azizah between 2019 and 2024. Demographic and clinical data were analyzed using descriptive statistics. Univariate and multiple logistic regression analyses were performed to identify risk factors associated with the presence of retinal hemorrhage.

Results: A total of 113 infants were included. The majority (77.9%) were aged 6 months or younger. Retinal haemorrhages were present in 28.3% ($n=32$) of patients, with bilateral, multilayered haemorrhages being the most common pattern. On univariate analysis, a Glasgow Coma Score (GCS) of less than 15 was significantly associated with retinal hemorrhage (Odds Ratio [OR]: 3.3; 95% Confidence Interval [CI]: 1.02–10.69; $p=0.046$). The presence of a subdural hemorrhage on neuroimaging was universal in the RH-positive group (100% vs. 36.8%). However, in the multiple logistic regression model, a GCS < 15 was no longer a statistically significant independent predictor (Adjusted OR: 2.44; 95% CI: 0.72–8.28; $p=0.153$). Other factors, including seizures, skull fractures, and demographic variables, were not significantly associated with RH.

Conclusions: Retinal hemorrhages are a frequent finding in infants with AHT and are strongly linked

to the co-existence of subdural haemorrhage. While depressed GCS showed an initial association with RH, it was not an independent predictor in a multivariate model. These findings underscore the importance of a comprehensive ophthalmological examination in all suspected AHT cases.

Abstract No.: 200378

Clinical Profile and Treatment Outcomes of Childhood Amblyopia at a Tertiary Eye Care Center in Western India

First Author: Muskan **MANGAL**

Co-Author(s): Harsh **JAIN**, Aditya **KELKAR**, Jai **KELKAR**

Purpose: To evaluate the demographic patterns, clinical characteristics, and visual outcomes of childhood amblyopia managed at a tertiary eye care center in Western India.

Methods: This was a retrospective, longitudinal, hospital-based study including 1382 children aged ≤ 12 years, enrolled in the outpatient department of a tertiary care center in India. Data were collected on demographics, type of amblyopia, treatment modalities, and changes in best-corrected visual acuity (BCVA).

Results: The mean age of participants was 4.54 ± 2.45 years, with a male predominance (55.3%). Refractive amblyopia was the most prevalent (73.3%), followed by strabismic (7.2%) and anisometropic amblyopia (6.7%). Treatment primarily included spectacles alone (74.3%), spectacles with occlusion (10.2%), occlusion alone (7.4%), and a combination of surgery, patching, and glasses (5.2%). The average occlusion duration was 2.46 ± 1.13 hours per day. After a median follow-up of 10 months (range: 6–84 months), mean BCVA improved significantly from 0.85 ± 0.42 to 0.55 ± 0.41 logMAR ($P < 0.001$). Subgroup analysis demonstrated significant visual improvement across all amblyopia types—refractive, strabismic, cataract-related, and ptosis-associated ($P < 0.001$ for each). Eyes with refractive amblyopia showed superior BCVA outcomes compared to those with cataract and strabismus ($P < 0.001$), and marginally better than those with ptosis ($P < 0.05$), both at baseline and final evaluation.

Conclusions: Refractive errors are the predominant cause of amblyopia in children. Timely identification, appropriate treatment, and consistent follow-up play a crucial role in improving visual outcomes, regardless of the underlying etiology.

Abstract No.: 206192

Comparison of Clinical Outcomes Between Highly Myopic and Non-Highly Myopic Patients With Good Visual Acuity Undergoing the Yokoyama Procedure

First Author: Yuka **MORITA**

Co-Author(s): Taizo **FUDONO**, Seito **HIRAOKA**, Takeshi **MATSUEDA**, Tetsuro **OSHIKA**

Purpose: To compare clinical findings between highly myopic and non-highly myopic patients with good visual acuity who underwent the Yokoyama procedure.

Methods: Seventeen patients with preoperative best-corrected visual acuity of 0.15 logMAR or better in both eyes who underwent bilateral Yokoyama procedures were retrospectively reviewed. Patients were divided into a high myopia group (axial length ≥ 27.0 mm; $n = 9$) and a non-high myopia group (axial length < 27.0 mm; $n = 8$). Age, axial length, dislocation angle, deviation, and binocular function were compared.

Results: Mean age was 61.3 ± 12.1 years in the high myopia group and 50.9 ± 20.4 years in the non-high myopia group. Best-corrected visual acuity (logMAR) was 0.02 ± 0.08 and 0.07 ± 0.02 . Axial length was 28.5 ± 1.0 mm and 24.8 ± 1.6 mm ($p < 0.01$), and dislocation angle $138.4 \pm 10.1^\circ$ and $129.8 \pm 9.5^\circ$ ($p = 0.01$). Preoperative deviation was 47.2 ± 15.1 PD and 40.0 ± 14.8 PD, and postoperative deviation -0.4 ± 6.0 PD and 2.4 ± 3.2 PD. All patients achieved fusion at distance and stereopsis at near.

Conclusions: The Yokoyama procedure successfully restored functional binocular vision. Axial length did not affect postoperative outcomes.

Abstract No.: 201473

Comparison of Visual Outcomes and Complications of Scleral-Fixated Intraocular Lens vs Retropupillary Iris Claw Lens in Children

First Author: Xu Kent **PEE**

Co-Author(s): Li Yen **CHAN**, Envira Zhi Yin **LEE**, Jamalia **RAHMAT**, Wan Wen **SOH**

Purpose: To compare the postoperative visual outcomes and complications between scleral-fixated intraocular lens (SFIOL) and retropupillary iris claw intraocular lens (ICIOL) in children.

Methods: A retrospective cohort analysis of 35 eyes (24 children) who underwent intraocular lens (IOL) implantation with either SFIOL or rpiCIOL between 2016 and 2023 in Kuala Lumpur Hospital, with at least 6 months follow-up duration.

Results: The mean age at surgery was 9.92 ± 3.23 years. The mean follow-up period of 18.1 months (range 1–58 months). The most common indication for SFIOL and ICIOL was ectopia lentis (29 eyes, 82.9%). Patients were

divided into SFIOL group (15 eyes of 11 children) and ICIOL group (20 eyes of 13 children). Best corrected visual acuity (BCVA) was maintained or improved in 83.0% and 93.8% in the SFIOL and ICIOL group respectively. The median BCVA changes 6 months postoperatively were +0.3 logMAR (IQR 0 logMAR) in the SFIOL group and +0.42 logMAR (IQR: 0.31 logMAR) in the ICIOL group ($p < 0.05$). Complications occurred in SFIOL group included transient high intraocular pressure in 1 eye and subluxated lens in 1 eye; in the rplCIOL group, inadvertent iris trauma occurred in 1 eye, subluxated lens in 1 eye, vitreous prolapse in 1 eye which managed surgically, and retinal detachment in 2 eyes of the same patient.

Conclusions: SFIOL and ICIOL both provide good visual outcome with minimal complications. However, long term follow-up of these children is necessary.

Abstract No.: 206763

Complicated Retinal Detachment in a Child With Von Hippel–Lindau Syndrome

First Author: Ray Jui-yen **LIN**

Co-Author(s): Hung-da **CHOU**, Eugene Yu-chuan **KANG**

Purpose: To report a case of complicated tractional retinal detachment in a 15-year-old boy with Von Hippel–Lindau (VHL) syndrome.

Methods: Case report.

Results: A 15-year-old boy with no prior medical history presented with 2 months of progressive blurred vision and a black shadow in his left eye. Corrected visual acuity was 1.0 OD and 0.05 OS. Fundus examination revealed multiple peripheral retinal tumors in both eyes. The left eye demonstrated tractional retinal detachment involving the macula, while the right eye showed tumors with dilated feeding vessels. Retinal hemangioblastoma with retinal detachment was suspected. The left eye underwent combined scleral buckle, vitrectomy, cryotherapy, membrane peeling, intravitreal Bevacizumab injection, and silicone oil tamponade. Although vision subjectively improved, corrected acuity remained 0.05, with residual inferior retinal detachment and partial tumor regression. The right eye was treated with intravitreal Bevacizumab and focal laser photocoagulation, maintaining vision of 1.0 with partial tumor regression. Brain MRI identified a posterior fossa hemangioblastoma, and genetic testing confirmed a heterozygous VHL mutation, p.Cys162Tyr (c.485G>A).

Conclusions: This case highlights bilateral retinal hemangioblastomas with tractional retinal detachment as a manifestation of VHL syndrome in childhood. Despite complex surgery, anatomical and functional recovery was limited. VHL syndrome should be considered in pediatric retinal detachment, and early recognition is crucial for timely ophthalmic and systemic management.

Abstract No.: 204252

Congenital Toxoplasmosis With Bilateral Chorioretinitis and Retinal Scarring: A Case Report

First Author: Lisa Berliani **TANAYA**

Co-Author(s): I Wayan Eka **SUTYAWAN**

Purpose: Congenital toxoplasmosis, caused by *Toxoplasma gondii*, is a transplacental infection that can result in severe ocular damage, most commonly chorioretinitis, leading to permanent retinal scarring and profound vision loss. The coexistence of early-onset ocular involvement and neurological complications in neonates is rarely reported.

Methods: A 3-week-old female infant presented with bilateral chorioretinitis and retinal scarring. Fundoscopy revealed macular fibrosis and peripheral retinal scars. Serological testing confirmed *T. gondii* infection with positive IgM and IgG. Neurological assessment showed neonatal meningitis and non-communicating hydrocephalus. The patient received a 6-week course of pyrimethamine, sulfadiazine, antibiotics, and corticosteroids. Ocular inflammation subsided, but residual visual impairment persisted.

Results: This case highlights the importance of early detection of congenital toxoplasmosis, particularly when associated with life-threatening neurological complications. Aggressive multidisciplinary management can control infection and limit progression, although the visual prognosis remains poor when the macula is involved.

Conclusions: Congenital toxoplasmosis with both ocular and central nervous system involvement requires prompt diagnosis, aggressive antiparasitic therapy, and close multidisciplinary monitoring to minimize permanent sequelae.

Abstract No.: 205469

Contrast Sensitivity Function in Children With Albinism and Its Association With Eye-Related Quality of Life

First Author: Junyi **LIU**

Co-Author(s): Jingsen **CHEN**, Jiangtao **LOU**, Xin **MA**, Jiahe **NIE**, Tong **WU**, Xinping **YU**

Purpose: To evaluate contrast sensitivity function (CSF) in children with albinism and its association with eye-related quality of life (ER-QOL).

Methods: This cross-sectional study included 56 children with albinism and 70 healthy controls aged 5–11 years. Monocular and binocular CSF was assessed using the quick CSF method; best-corrected visual acuity (BCVA), strabismus status, and genotype were recorded. The Pediatric Eye Questionnaire (PedEyeQ) measured ER-QOL.

Results: Groups were comparable in age and sex ($P > 0.05$). Children with albinism showed significantly

reduced CSF across all spatial frequencies, lower area under the log CSF (AULCSF), reduced CSF acuity, and poorer binocular summation ratio ($P < 0.01$). Within the albinism group, OCA1A genotype was associated with worse BCVA and CSF metrics than OCA2 ($P < 0.05$), and strabismus was linked to lower binocular summation ($P < 0.05$). All PedEyeQ domain scores were significantly lower in the albinism group ($P < 0.001$). Worse BCVA and CSF measures were correlated with lower child-reported PedEyeQ scores ($p = 0.264-0.411$, $P < 0.05$).

Conclusions: Albinism in childhood is associated with broad CSF deficits, influenced by genotype and strabismus. These functional impairments are correlated with reduced ER-QOL, suggesting that improving a children's contrast sensitivity function may have a positive impact on their daily living abilities and overall quality of life.

Abstract No.: 204982

Development of a Flexible Electrode for Electrical Stimulation of Rabbit Extraocular Muscle

First Author: Hee Kyung **YANG**

Co-Author(s): Jeoung-min **HWANG**, Dong Hyun Kim **KIM**

Purpose: To develop a flexible electrode for electrical stimulation of extraocular muscles and to evaluate the safety of applying direct electrical stimulation to muscles and its potential effects on ocular tissues in rabbits.

Methods: A flexible electrode was fabricated using a conventional photolithography process. This electrode comprised a 300-nm-thick platinum layer embedded within a 30- μ m-thick polyimide cable. In an in vivo study, five rabbits underwent electrical stimulation of the right superior and inferior rectus muscles. Stimulation consisted of electrical pulses applied for 5 minutes, three times a week for 4 weeks. Histological examination was conducted on the conjunctiva, extraocular muscles, sclera, and retina.

Results: Direct electrical stimulation of extraocular muscle using a flexible electrode could successfully elicit eye movement in rabbits. Histologic examination demonstrated no evidence of detrimental effects of the electrical stimulation.

Conclusions: Direct electrical stimulation of extraocular muscles using a flexible electrode could safely elicit eye movement without any ocular damage in rabbits.

Abstract No.: 205781

Double Trouble – A Case of Bilateral Persistent Hyperplastic Primary Vitreous

First Author: Shin Kiat **TAN**

Co-Author(s): Nur Afzan **BINTI MOHD JAFFAR**, Jamalia **BINTI RAHMAT**

Purpose: Persistent Hyperplastic Primary Vitreous (PHPV) is a rare congenital vitreoretinal disorder that results from the failure of regression of fetal vessels and embryonic vitreous within the eye. Common clinical features include leukocoria, microphthalmia, and cataract. PHPV is an important differential diagnosis of retinoblastoma and may present a diagnostic challenge. Here, we report a rare case of bilateral PHPV to emphasize the necessity of comprehensive clinical and radiological evaluation for accurate diagnosis and management.

Methods: Case report.

Results: A 4-month-old girl presented with poor eye contact and bilateral leukocoria. Ophthalmic examination found no proptosis or periorbital swelling. Both conjunctivae were white, and the corneas were clear. Posterior synechiae were present, but there was no fibrin or hypopyon in the anterior chamber. Dense retrolental membranes and haemorrhages obscured the fundus. B-scan ultrasonography showed bilateral homogenous opacities without calcifications. Orbital MRI identified bilateral vitreous haemorrhages, retinal detachments, and a structure extending from the retrolental region to the optic disc. No enhancing mass or calcifications were observed in either globe. Serial monthly examinations revealed persistent retrolental haemorrhages and poor visual development. Diagnostic enucleation of the right eye was performed, and histopathology confirmed features consistent with PHPV.

Conclusions: PHPV is the second most common cause of leukocoria after retinoblastoma. Comprehensive clinical examination and imaging are essential to distinguish between these conditions, as their management strategies differ significantly.

Abstract No.: 206718

Dynamic Association Between Amblyopia Severity Treatment Phases and Depressive Disorders in Children and Adolescents: a Multi-Timepoint Observational Cohort Study

First Author: Li **TANG**

Purpose: To examine depression risk across amblyopia severity levels (mild/moderate/severe) and treatment phases (diagnosis/intensive/maintenance), while exploring the mediating roles of treatment adherence and neuroendocrine changes.

Methods: A prospective cohort study was conducted with 150 amblyopic patients (50 mild, 100 moderate-

to-severe) and 50 healthy controls aged 7-16 years. Assessments at four timepoints [diagnosis (T0), 1 month (T1), 3 months (T3), and 6 months (T6)] included: 1. Amblyopia metrics: Best-corrected visual acuity, stereoscopic function(Titmus or TNO test); 2. Depressive symptoms: Metrics: Best corrected visual acuity; stereoscopic function; Children's Depression Inventory (CDI); Kiddie Schedule for Affective Disorders and Schizophrenia (K-SADS) interviews at T3. Analysis: Generalized estimating equations (GEE) analyzed temporal associations between amblyopia severity and depression. Structural equation modeling (SEM) tested the closed-loop pathway: treatment stress → depression → adherence decline → delayed visual recovery.

Results: 1. Severity: Moderate-severe group had 3.2× higher depression risk (OR=3.2, 95%CI:1.8-5.6) 2. Phase: Depression peaked at T3 (40% CDI↑, 33% adherence<50%) 3. Mediation: Cortisol↑ → Depression↑ → Adherence↓ → Vision recovery↓ (β=-0.29) 4. Protection: Good family function reduced risk 62% (FAD≤2.0)

Conclusions: Depression risk in amblyopia is critically influenced by disease severity and treatment phase: 1. Moderate-to-severe cases warrant psychological screening at diagnosis; 2. The 3-month treatment phase represents a critical window for psychological intervention; 3. Treatment stress triggers a cortisol-mediated depression cycle that impairs adherence and visual outcomes; 4. Family functioning serves as a key protective element, supporting integration of family empowerment into standard care. These findings provide a biopsychosocial evidence framework for precision management of amblyopia-depression comorbidity, advocating a shift from isolated vision correction to integrated mind-body care models.

Abstract No.: 205361

Effect of Different Types of Lenses on Eye Position and Myopia Control in Patients With Residual Small-Angle Exotropia With Myopia After Strabismus Surgery

First Author: Duo XU

Purpose: To compare the clinical effectiveness of multifocal myopia defocus spectacle lenses (HAL), orthokeratology lenses, and single-vision lenses in patients with residual small-angle exotropia with myopia after strabismus surgery.

Methods: A total of 135 patients with residual small-angle exotropia after strabismus surgery were selected in our hospital from 2021-06 to 2023-06, aged 6-18 years old, with a spherical equivalent(SE) -1.00D ~ -5.00D. According to the results of prism examination after strabismus surgery, the patients with residual exotropia ≥15 prism diopters (D) (block lenses) were voluntarily divided into three groups: the HAL group, the OK lens group, and the SVS group.

Results: After 1 year, the AL in the three groups were 25.15±0.92mm, 25.28±0.98mm, 25.32±0.95mm, respectively. Compared with an increase of 0.36±0.15mm in the SVS group after 1 year, the axial length of the HAL and OK lens groups increased by 0.17±0.64mm and 0.28±0.11mm, respectively, which were statistically significant (P < 0.05). Before intervention, the prism diopters of the HAL, OK lens, and SVS groups measured using the prism were -20.07±3.22 Δ, -19.34±3.10 Δ and -21.06±3.02 Δ (prism at 33 cm), respectively, and the differences were not statistically significant (P > 0.05). After 1 year, the prism diopters with the naked eye of HAL group and SVS group were: -17.95±3.63 Δ and -25.84±3.56 Δ, which increased by 2.12±0.41 Δ and -4.78±0.54 Δ, respectively, compared the preintervention values, with statistical significance (P < 0.05). After 1 year, the prism diopters of the three groups with lenses were -15.34±2.84 Δ, -24.52±3.45 Δ and -23.98±3.25 Δ, respectively, HAL group compared with OK group, SVS group, the difference was statistically significant (P < 0.05). The eye position control ability of the three groups before the intervention was 3.04±1.87, 3.14±1.57, 3.08±1.27, and after 1 year was 2.10±2.02, 4.12±1.41, 4.26±2.45, respectively. There was statistical significance between the HAL group and the OK group, the SVS group after the intervention (P < 0.05).

Conclusions: In patients with residual small-angle exotropia and myopia strabismus surgery, HAL lens can effectively control exotropic drifts and the axial length, particularly for better control of strabismus compared with OK lenses and SVS. However, exotropia drift and poor control of eye position can be seen in both wearing OK lens and SVS.

Abstract No.: 205126

Effects of Different Hyperopic Correction Patterns on Emmetropization in Children With Accommodative Esotropia

First Author: Daoman XIANG

Co-Author(s): Wensi CHEN

Purpose: To investigate the effects of different spectacle correction methods on changes in refractive errors and ocular biometric characteristics in children with accommodative esotropia.

Methods: This retrospective study included 95 children with accommodative esotropia, divided into a full correction group (n=62) and an undercorrection group (n=33). Spherical equivalent (SE) refraction and axial length (AL) were collected at baseline and years 1, 2, and 3. Non-parametric tests were used for statistical analysis.

Results: Refractive Change: The SE decreased significantly over 3 years in the undercorrection group (from 5.19D to 3.93D, P<0.05), with 86.7% of eyes showing a reduction. The full correction group showed

no significant change in the first two years, with a decline only evident by year 3. Ocular Biometrics: The increase in AL over 1 year was significantly greater in the undercorrection group (0.29 ± 0.44 mm) than in the full correction group (0.16 ± 0.12 mm, $P < 0.05$). No significant intergroup difference was found in corneal curvature. Intergroup Comparison: Significant differences were observed between groups in SE values at baseline, year 1, and year 2, as well as in the 1-year AL change (all $P < 0.05$).

Conclusions: Full hyperopic correction impedes emmetropization in children with accommodative esotropia, characterized by slowed reduction of hyperopia and axial elongation. Undercorrection appears to facilitate a more natural emmetropization process without compromising ocular alignment stability.

Abstract No.: 208383

Effects of Physical Activity and Inactivity on the Microvasculature in Children: The Hong Kong Children Eye Study

First Author: Lok Cheung **YUEN**

Co-Author(s): Jason C. **YAM**, Yuzhou **ZHANG**

Purpose: To investigate the effects of physical activity/inactivity on the microvasculature, measured from retinal photographs, in children.

Methods: All participants were from the Hong Kong Children Eye Study, a population-based cross-sectional study of children aged 6 to 8 years. They received comprehensive ophthalmic examinations and retinal photography. Their involvement in physical activity/inactivity and demographics were obtained from validated questionnaires. A validated artificial intelligence deep-learning system was used to measure central retinal arteriolar equivalent (CRAE) and central retinal venular equivalent (CRVE) from retinal photographs.

Results: In the final analysis of 11,959 participants, 6,244 (52.2%) were boys, and the mean age was 7.55 (1.05) years. Increased ratio of physical activity to inactivity was associated with wider CRAE ($\beta = 1.033$; $P = 0.007$) and narrower CRVE ($\beta = -2.079$; $P < 0.001$). In the subgroup analysis of boys, an increased ratio of physical activity to inactivity was associated with wider CRAE ($\beta = 1.364$; $P = 0.013$) and narrower CRVE ($\beta = -2.563$; $P = 0.001$). The subgroup analysis of girls also showed that the increased ratio of physical activity to inactivity was associated with a narrower CRVE ($\beta = -1.759$; $P = 0.020$), but not CRAE.

Conclusions: Increased activity in children is associated with healthier microvasculature, as reflected in the retina. Our study contributes to the growing evidence that physical activity positively influences vascular health from a young age and underscores the potential

of using the retinal vasculature as a biomarker for cardiovascular health.

Abstract No.: 203127

Endoscope-Assisted Surgery for Open Globe Injuries in Pediatric Patients: Safety, Efficacy and Outcomes

First Author: Kuo Hua **JUAN**

Co-Author(s): Chao Chun **HSU**

Purpose: To evaluate the efficacy and outcomes of endoscope-assisted surgery in pediatric patients with open-globe injuries involving the cornea.

Methods: This retrospective analysis includes six pediatric cases of open-globe injuries with corneal involvement treated between 2014 and 2023. Three injuries occurred at school and three at home. All patients initially received primary suturing and were referred for further management 3-14 days post-injury. Initial visual acuity ranged from hand motion to 1/60. Three patients presented with vitreous hemorrhage, and three with retinal detachment. Endoscope-assisted surgery was performed, including silicone oil tamponade in cases of retinal detachment. The follow-up period ranged from 8 months to 3 years.

Results: Postoperative visual acuity improved in all six patients before subsequent corneal treatment. Retinal detachment cases showed significant anatomical and functional recovery. Silicone oil tamponade ensured stable retinal attachment with no postoperative complications and no cases of proliferative vitreoretinopathy (PVR). There were no cases of intraocular foreign bodies (IOFB) in this cohort.

Conclusions: Our study, conducted over a follow-up period of 8 months to 3 years, confirms that endoscope-assisted surgery effectively manages complex open-globe injuries in pediatric patients. The absence of PVR may be due to the small case number or the specific case types, such as the lack of IOFB. These findings align with studies by Raju et al., Yonekawa et al., and Mansour & Al-Ghadban, though our cohort experienced fewer complications.

Abstract No.: 201006

Epidemics of ROP: Are We Handling Them Well?

First Author: Tanveer **CHAUDHRY**

Purpose: To highlight the burden of ROP and how to prevent blindness in developing countries.

Methods: This is a 15-minute lecture, teaching residents and upcoming ophthalmologists how we are dealing with ROP and what the way forward should be.

Results: Result shows that we are still facing the epidemic of ROP and we need to improve CMS teeming programs to prevent blindness from ROP.

Conclusions: ROP is a blinding disease in children, although with proper screening and staying vigilant, we can prevent blindness from this condition.

Abstract No.: 205123

Establishing a Novel Lens Opacities Classification System Based on Ultrasound Biomicroscopy (UBM) for Pediatric Cataracts: Reliability and Availability

First Author: Daoman XIANG

Co-Author(s): Wensi CHEN

Purpose: This study sought to develop and validate a lens opacities classification system based on ultrasound biomicroscopy (UBM) imaging to grade pediatric cataracts.

Methods: UBM images of patients at the hospital from September 2013 to November 2014 were used in this study. We summarized the characteristics of lenticular opacification in each of the following 4 zones: the anterior capsule (A); the cortex (C); the nucleus (N); and the posterior capsule (P). The UBM data and intraoperative videos were compared, and sensitivity, specificity, accuracy, and positive and negative predictive values were determined for our Lens Opacities Classification System based on UBM for Pediatric Cataracts (LOCS-UP) detection. Two physicians classified pediatric cataracts (anterior capsule, cortex, and posterior capsule) by extracting 146 images from the UBM database. Patients' data were recorded to calculate the kappa coefficients. The LOCS-UP was developed.

Results: Under this standard, all types of pediatric cataracts can be classified and acquired a code by the LOCS-UP. The LOCS-UP had the highest sensitivity (100%) and specificity (98.96%) in naming the anterior capsule and the lowest sensitivity (50%) and specificity (89.59%) in naming the posterior capsule. Its consistency at naming the anterior capsule was satisfactory (Kappa coefficient: 0.70), and it was also able to name the nucleus, cortex, and posterior capsule (0.56, 0.58, and 0.48, respectively).

Conclusions: LOCS-UP could name pediatric cataracts by providing an unique digital encoding, which could reflect characteristics exactly for different local lens anomalies to all kinds of pediatric cataract patients.

Abstract No.: 200854

Functional Vision Loss in a Child Following Neurologic Symptoms: A Case Report Highlighting Diagnostic and Psychosocial Considerations

First Author: Chao-jung WU

Co-Author(s): Chee-ming LEE

Purpose: To report a rare pediatric case of functional vision loss (FVL) following systemic neurologic

symptoms, and to emphasize the importance of comprehensive evaluation and psychosocial context in diagnosis.

Methods: A case report.

Results: An 8-year-old girl with a recent history of otitis media presented with bilateral hearing loss, headache, low-grade fever, and left-sided weakness for the past two weeks. She was admitted for further evaluation under the initial suspicion of Guillain-Barré syndrome. However, during hospitalization, she experienced sudden bilateral vision loss, reporting no light perception (NLP) and dyschromatopsia. Ophthalmologic examination revealed intact pupillary light reflexes and a positive blink-to-threat response. B-scan ultrasonography was unremarkable. Optical coherence tomography (OCT) of the retina and optic nerves also showed no abnormalities. Brain and orbital MRI demonstrated no structural lesions, and pattern visual evoked potentials (VEP) showed normal cortical responses. Despite her alarming subjective complaints, all objective findings were within normal limits. Further evaluation revealed significant psychosocial stressors within the family environment. Following psychiatric consultation and adjustment of medical therapy, her visual symptoms gradually resolved completely without any residual neurological deficits. These findings supported a diagnosis of functional vision loss.

Conclusions: Functional vision loss in children can mimic serious neurologic or ophthalmic disease. Thorough neurologic and ophthalmic evaluation is critical to exclude organic causes. Psychosocial assessment is essential for diagnosis and management, especially in pediatric patients with complex or inconsistent clinical findings.

Abstract No.: 201285

Geometric Centroid-Based Orbital MRI Analysis for Differentiating Between Superior Compartment and Complete Lateral Rectus Palsy

First Author: Hyun Jin SHIN

Purpose: To determine the diagnostic utility of centroid point analysis in differentiating between superior compartment lateral rectus (LR) palsy and complete LR palsy using orbital magnetic resonance imaging (MRI).

Methods: We retrospectively analyzed coronal orbital MRI obtained from 19 patients with unilateral abducens nerve palsy, comprising 14 and 5 with complete and superior compartment palsy. Cross-sectional images were obtained at 6, 9, and 12 mm posterior to the globe. The LR was manually segmented, and centroid-based metrics—including centroid difference (CD)—were calculated to assess vertical displacement of the muscle centroid. Conventional metrics such as relative atrophy and relative proportion at maximum cross-sectional area (MCS) were also analyzed. Diagnostic

accuracy was evaluated using receiver operating characteristic (ROC) analysis.

Results: The downward displacement of the LR centroid was greater in the superior compartment palsy group than in the complete palsy group. The median CD was 12.34% in the superior compartment group and 1.50% in the complete palsy group. ROC analysis demonstrated that CD achieved the highest diagnostic accuracy among all evaluated metrics, with an area under the ROC curve (AUC) of 0.97, sensitivity of 100%, and specificity of 92.86%. In contrast, conventional metrics such as relative atrophy and relative proportion at MCS showed worse diagnostic performance, with AUCs of 0.77 and 0.70, respectively.

Conclusions: CD provides a reliable and relevant metric for distinguishing superior compartment palsy from complete LR palsy. By capturing vertical geometric displacement reflective of selective atrophy, measuring CD increases diagnostic precision and supports clinical decision-making in complex strabismus cases.

Abstract No.: 205735

Granular Corneal Dystrophy in a Family: Case Presentation and Review of Clinical Manifestations

First Author: Florence **MANURUNG**

Co-Author(s): Tjahjono **GONDHOWIARDJO**

Purpose: To present a familial occurrence of Granular Corneal Dystrophy type 1 (GCD1), also known as Groenouw Corneal Dystrophy type 1, highlighting the clinical manifestations observed across affected family members.

Methods: A descriptive case study involving members of a single family diagnosed with GCD1. Clinical examinations were performed on three affected individuals: the mother and two children. Each patient underwent visual acuity testing, slit-lamp biomicroscopy, and corneal imaging to assess the extent and characteristics of corneal deposits. Family history was obtained to trace the pattern of inheritance. Genetic testing was not performed, but clinical findings were consistent with autosomal dominant inheritance of GCD.

Results: All affected family members exhibited bilateral, discrete, small white granular opacities located in the anterior stroma, primarily in the central cornea, with clear intervening spaces. These deposits had a breadcrumb- or snowflake-like appearance and were absent in the peripheral cornea. The two children reported mild blurred vision but maintained good visual acuity with corrective lenses. In contrast, the mother experienced progressive visual decline over time. No associated symptoms such as ocular pain, tearing, redness, or photophobia were reported. No associated systemic disease has been described.

Conclusions: Granular Corneal Dystrophy is a rare inherited disorder characterized by bilateral granular deposits primarily involving the central anterior stroma, resulting in progressive visual impairment. Early detection and diagnosis are crucial for appropriate management and genetic counselling, as well as for emphasizing the need for regular ophthalmic follow-up.

Abstract No.: 206530

Guidelines for ROP Screening in Thailand 2024

First Author: Phanthipha **WONGWAI**

Purpose: To set up guidelines for ROP screening.

Methods: Prospective registry database from major hospital involved in ROP care with participatory action research.

Results: The criteria for ROP screening are based on the registration: GA equal to or less than 34 weeks; BW equal to or less than 1500g.

Conclusions: From the data in this cohort if we followed these guideline, we will not miss the infant with any stage of ROP.

Abstract No.: 203960

Headaches Should Not Be Headaches Anymore

First Author: Nabila **RAHMAN**

Purpose: To report on 8 patients having headaches diagnosed with ocular muscle imbalances.

Methods: Reporting 8 cases of headaches age ranges 9 to 13 years old (5 boys and 3 girls), presented with headache, neck pain and occasional watering from eyes from past 4/5 months. Diagnosis was made by fusion test and other tests associated with the symptoms.

Results: Despite having vision 6/6 in both eyes and normal fundus findings they have been suffering with intolerable headaches sometimes with nausea and watering of eyes especially after day long studies or near work. After proper examination we found them to have ocular muscle imbalances mostly convergence insufficiency, accommodation insufficiency or fusional vergence dysfunction. They were given a simple pen exercise daily 3 times for 5 minutes and followed up after 3 months with better parameters and improved symptoms. They were also advised to cut off screen time, ensure 6/8 hours of sleep and proper rest.

Conclusions: Headaches for ocular muscle imbalances is not uncommon rather very frequent among this age group. It is absolutely treatable if diagnosed properly and treat accordingly. So migraine, sinusitis and other central causes may not be the reason of headache always.

Abstract No.: 201389
Hearing Loss in Waardenburg Syndrome: A Case Report and Systematic Review

First Author: Liu RUI

Purpose: We describe a case of Waardenburg syndrome type 2 and a systematic review, as well as the correlation between gene mutations and the disease.

Methods: A 10-year-old Han Chinese Girl came to the hospital because of poor visual acuity and distorted vision in her right eye for 3 days. Slit-lamp examination revealed diffuse iris hypopigmentation in both eyes. Fundus examination showed red, sunset-like fundus due to a lack of pigmentation in the retinal pigment epithelium layer and retinal protrusion in the macular area of both eyes. OCT image revealed the detachment of the retinal neuroepithelial layer in the macular area of both eyes. FFA showed fluorescence accumulation in the macular area in the late stage. mfERG of both eyes showed multiple peak changes and reduced amplitude.

Results: Given a family history of congenital hearing loss and pigmentary disorders, accompanied by accurately measured ocular distances to exclude dystopia canthorum. The diagnosis of Waardenburg Type II can be made with confidence which was finally confirmed through genetic testing.

Conclusions: Ophthalmologists should take an adequate realization of Waardenburg syndrome, which shows remarkable diversity in clinical presentation and morphology to avoid misdiagnosis. The application of early genetic counseling, Marriage and childbirth guidance, Prenatal diagnostic techniques and appropriate treatment of this disease are particularly important.

Abstract No.: 204141
How Squint Correction Impacts a Life

First Author: Tasnima RAHMAN

Co-Author(s): Nabila RAHMAN, Mostafa HOSSAIN

Purpose: To report on 5 patients of varying ages who went through squint correction, which had a great impact on their social life.

Methods: We selected 5 cases coming to our OPD with strabismus. They had to face social bullying, which became miserable with time. So they were examined in detail. After proper evaluation and several follow-ups, 1 of them was corrected by spectacles and the rest by surgery.

Results: All 5 of the patients experienced a drastic change in their social life. They became more confident and happy.

Conclusions: Awareness of strabismus among the population in developing countries like ours is very much essential. Timely treatment can turn someone's life into heaven.

Abstract No.: 205120
Image Features of Lens Opacity in Pediatric Cataracts Using Ultrasound Biomicroscopy

First Author: Daoman XIANG

Co-Author(s): Wensi CHEN

Purpose: To study lens opacity in pediatric cataract images captured using ultrasound biomicroscopy.

Methods: The medical records of patients operated on from September 2012 to October 2013 were reviewed retrospectively. Prior to surgery, patients were placed in the supine position under sedation with oral chloral hydrate for UBM imaging. Lens morphology was evaluated by UBM examination with a 50 MHz probe that was equipped with a water bag instead of the standard plastic shell. UBM images were compared to images captured from intraoperative videos.

Results: UBM examination was performed in 50 patients (including 10 infants) aged 2 months to 6 years. The UBM ecographic images showed features specific to pediatric cataract lenses. These features were used to define 2 types of anterior capsule of the lens, 4 types of cortex and nucleus of the lens, 3 types of posterior capsule of the lens, and membranous cataracts.

Conclusions: Capsule morphology and the cortex density of pediatric cataracts could be evaluated before surgery using UBM imaging. Adoption of this technique could provide useful preoperative information to surgeons.

Abstract No.: 201232
Incidence, Risk Factors, and Visual Outcomes of Ocular Hypertension Following Pediatric Closed-Globe Traumatic Hyphema

First Author: Kasem SERESIRIKACHORN

Co-Author(s): Ta Chen Peter CHANG

Purpose: To determine the incidence of ocular hypertension (OHT) following pediatric closed-globe injury (CGI) with traumatic hyphema, identify associated risk factors, and evaluate visual outcomes at final follow-up.

Methods: This retrospective cohort study included patients aged < 18 years who sustained CGI with traumatic hyphema between 2003 and 2023 at three tertiary care centers. OHT was defined as intraocular pressure >21 mmHg at any point post-injury. Visual impairment and blindness were classified according to the WHO criteria at initial and final visits. Multivariable logistic regression was used to identify risk factors for OHT.

Results: A total of 191 eyes from 191 patients were analyzed, with a mean age of 11.35 ± 4.7 years. Toy/BB guns were the leading cause of injury (32.5%). OHT developed in 88 eyes (46.1%); 61.4% were managed with medication alone, while the remainder required

surgical intervention. Significant risk factors for OHT included sickle cell spectrum (adjusted odds ratio [AOR] 29.94, $p=0.001$), high-grade hyphema (grades 3–4; AOR 6.56, $p=0.024$), and presenting visual acuity worse than 20/200 (AOR 3.98, $p=0.005$). The rate of blindness at final follow-up was higher in the OHT group compared to those without OHT (5.7% vs. 2.9%).

Conclusions: OHT is a common complication following pediatric traumatic hyphema and is associated with worse visual outcomes. Early identification of high-risk patients is essential for timely referral and intervention. Public awareness and protective measures against pediatric eye trauma should be emphasized.

Abstract No.: 204821

Integrating Clinical Outcomes and Single-Cell Transcriptomics to Understand Retinoblastoma Progression and Chemotherapy Response in a Resource-Limited Setting

First Author: Firdian MAKRUWARDI

Purpose: Retinoblastoma (RB), the most common intraocular malignancy in children, exhibits both tumor heterogeneity and variable clinical outcomes, particularly in resource-limited settings where delayed diagnosis and malnutrition are prevalent. While clinical predictors of mortality are established, the molecular mechanisms underlying tumor response to chemotherapy remain poorly understood. This study was to examine how clinical factors affect survival in pediatric retinoblastoma and to explore tumor responses to chemotherapy using single-cell transcriptomics, linking patient outcomes to underlying molecular mechanisms.

Methods: We performed a retrospective cohort study of 326 pediatric patients with extraocular RB, evaluating diagnostic delay, nutritional status, tumor laterality, and survival outcomes. Cox regression identified predictors of mortality. Separately, tumor samples from patients undergoing neo-adjuvant chemotherapy (NACT) were analyzed using single-cell RNA sequencing (scRNA-seq) to characterize tumor and microenvironmental remodeling. Transcriptomic data were processed for cell-type annotation, differential expression, and pathway enrichment to identify chemotherapy-responsive signatures.

Results: Median age at diagnosis was 13 months, with an overall mortality rate of 60% and two-year survival of 45%. Bilateral disease, poor nutritional status, and diagnostic delays exceeding 10.5 months were independent predictors of mortality. Single-cell analysis of ~71,126 cells revealed heterogeneous tumor populations, including proliferative cone precursor-like cells and tumor-associated macrophages (TAMs). NACT altered tumor composition by reducing proliferative fractions and remodeling TAM polarization, activating interferon and TNF signaling pathways. Chemotherapy-

responsive genes included downregulation of proliferation-associated markers (MKI67, TOP2A) and upregulation of immune-modulatory genes (CXCL10, CCL2).

Conclusions: Delayed diagnosis and poor nutrition are key clinical determinants of poor RB survival, while single-cell profiling highlights molecular mechanisms.

Abstract No.: 206036

Kid! Freaking Out

First Author: Chun Chun Jane YEUNG

Purpose: To share author's personal experience in doing a successful comprehensive clinical ophthalmic examination in young children

Methods: Descriptive. Modifications of routine adult clinical ophthalmic examination are suggested when doing examination of young children. Author's personal experience will be described, e.g. changing the sequence of examination, how to get the child to cooperate during examination.

Results: Author's personal experience will be described, e.g. changing the sequence of examination, how to get the child to cooperate during examination.

Conclusions: Clinical ophthalmic examination may be a freaking out experience for a child and may also be the same for the doctor. A lot of patience and some simple modifications of our routine clinical ophthalmic examination for adults will help greatly towards a successful examination in young children giving meaningful findings.

Abstract No.: 205684

Locked Behind the Lids

First Author: Aanchal SINGHAL

Co-Author(s): Shreya BHADANI, Manisha CHOUDHARY, Aajay DHANASEKARAN, Srinidhi N, Shrutakirti PARIDA

Purpose: To report a rare case of unilateral cryptophthalmos with umbilical hernia in a newborn.

Methods: A 3-day-old female neonate, born to a 19-year-old primigravida from a non-consanguineous marriage in Eastern India, presented with an undeveloped left eye. The infant was low birth weight. Maternal antenatal investigations (VDRL, HIV, HBsAg, TORCH profile) were negative, and ultrasound scans revealed no fetal anomaly. There was no family history of any congenital disorders. Examination revealed complete skin coverage over the left orbit without a palpebral fissure or identifiable globe, consistent with complete cryptophthalmos. The right eye appeared clinically normal. An associated umbilical hernia was also noted.

Results: The clinical features were suggestive of Fraser syndrome, although one of the major diagnostic criteria—syndactyly—was absent. The

infant was started on topical vitamin A gel to prevent desiccation of the malformed ocular surface. Parents were counselled regarding prognosis and staged reconstructive surgery options. Whole-genome sequencing identified a FRAS1 gene mutation, confirming the diagnosis.

Conclusions: This case underscores the diagnostic challenges of cryptophthalmos, which often remain undetected on routine antenatal ultrasonography. With a prevalence of only 0.043 per 10,000 live births, its recognition requires a high index of suspicion. The coexistence of cryptophthalmos with other systemic anomalies warrants comprehensive evaluation for syndromic associations such as Fraser syndrome. Early referral, multidisciplinary management, and structured parental counselling are essential for functional rehabilitation and psychosocial support.

Abstract No.: 205652

Macular Schisis in the Pediatric Eye: Diagnostic Challenges in X-Linked Retinoschisis

First Author: Jethro KHO

Co-Author(s): Alvina SANTIAGO

Purpose: To highlight the diagnostic challenges of X-linked retinoschisis in pediatric patients presenting with poor vision, particularly when standard clinical evaluation is limited.

Methods: Case report of 3 siblings, 2 of whom are males are presented.

Results: A 5-year-old male presented with bilateral blurred vision for one year. Family history revealed poor vision in his maternal grandfather and granduncle, suggesting an X-linked pattern of inheritance. The patient underwent a comprehensive ophthalmologic evaluation. Visual acuity was 20/100 in the right eye and 20/400 in the left. Dilated fundus examination revealed macular abnormalities. Optical coherence tomography (OCT) showed foveal thickening, large intraretinal cystic spaces, and retinal layer disorganization suggestive of macular schisis. His 1-year-old brother, who presented with esotropia, was examined under anesthesia. A more advanced form of disease with schisis and retinal detachment was seen in one eye. In contrast, their 7-month-old sister had a normal ophthalmologic examination. The pattern of findings across siblings, along with the family history, supported the diagnosis of X-linked retinoschisis.

Conclusions: X-linked retinoschisis is a hereditary macular dystrophy that may be overlooked in its early stages or misdiagnosed as other retinal conditions. This case underscores the importance of obtaining a detailed family history and maintaining a high index of suspicion, especially in young children who may not tolerate a full eye examination. Early recognition

is critical for preventing complications and enabling timely genetic counseling.

Abstract No.: 208317

Management of Cicatricial Retinopathy of Prematurity With Macula-Involving Tractional Retinal Detachment in an Extremely Premature Infant: A Case Report

First Author: Wency TANG

Co-Author(s): Charlene YIM

Purpose: To describe a case of cicatricial retinopathy of prematurity (ROP) in an extremely premature infant and outline the management process.

Methods: We reviewed a premature infant born at 24 weeks and 2 days with a birth weight of 0.546 kg. Systemic and ocular findings were collected from birth through post-operative follow-up. ROP screening, treatments, and outcomes were summarized.

Results: The infant had multiple neonatal complications, including necrotizing enterocolitis, respiratory distress syndrome with pneumothorax, pulmonary interstitial emphysema, patent ductus arteriosus requiring ligation, renal impairment, cholestasis, hypothyroidism, and suspected adrenal insufficiency. ROP screening at PCA 34 2/7 weeks revealed bilateral Zone I Type I ROP with plus disease (left eye worse). Intravitreal ranibizumab (0.2 mg/0.02 mL) was given to both eyes. The left eye regressed, but the right eye progressed to Zone I Stage 3 disease three weeks later, requiring laser photocoagulation at PCA 37 weeks. Subsequently, the right eye developed fibrovascular proliferation with falciform folds, disc dragging, and macula-involving TRD (Stage 4), consistent with cicatricial ROP. A pars plana vitrectomy with traction release at PCA 47 weeks flattened the retina and reduced traction on post-operative B-scan. At two weeks post-surgery, the retina remained attached with resolving subretinal fluid. The left eye remained stable with regressed ROP.

Conclusions: This case highlights the challenges of treating severe ROP in a very premature infant with multiple systemic issues. Management required sequential treatments including anti-VEGF injection, laser, and surgery, with decisions influenced by systemic condition and disease progression.

Abstract No.: 205163**Management of Retinopathy in Incontinentia Pigmenti: A Case Series of Two Infants Treated With Laser Photocoagulation and Anti-VEGF Therapy***First Author: Jing JIN**Co-Author(s): Yuanyue CUI, Baohai LIU, Hong LIU, Ting QIU, Jing XIA*

Purpose: Management of Retinopathy in Incontinentia Pigmenti: A Case Series of Two Infants Treated With Laser Photocoagulation and Anti-VEGF Therapy.

Methods: Two female infants (aged 3 days and 5 days at diagnosis) presented with cutaneous manifestations suggestive of IP. Both underwent dermatological consultation, comprehensive ophthalmological examination, including RetCam imaging, fundus fluorescein angiography (FFA), and genetic testing confirming IKBKG gene mutations. Both cases showed pre-retinal hemorrhage, retinal neovascularization, and temporal nonperfusion. One patient underwent retinal laser photocoagulation, and another patient received an intravitreal injection of an anti-VEGF agent (ranibizumab).

Results: Both patients were regularly followed with serial fundus examinations. In Case 1, laser photocoagulation led to regression of neovascularization without progression. In Case 2, anti-VEGF injection resulted in rapid regression of neovascularization and absorption of hemorrhagic components. No recurrence or disease progression was observed during follow-up (case 1: 24months, case 2: 9 months).

Conclusions: Both laser photocoagulation and intravitreal anti-VEGF therapy appear effective in halting disease progression in IP-associated retinopathy. Anti-VEGF agents may offer a minimally invasive alternative for managing neovascularization. Further studies are needed to optimize treatment protocols and evaluate long-term outcomes.

Abstract No.: 206005**Mobile Strabismus Surgery and Quality of Life: Early Outcomes From Thailand's Rural Eye Health Program***First Author: Wichapas KUSAKUL**Co-Author(s): Worawalun HONGLERTNAPAKUL, Natthiya LAILAKSIRI, Jipada PRUKSACHOLAVIT, Napa SUEBSAIPHROM*

Purpose: Strabismus is not only a visual problem but also carries a profound psychosocial burden, particularly for children in rural communities who face limited access to ophthalmic care. Mobile surgical units have been proposed as a strategy to reduce health disparities, yet evidence regarding patient-reported outcomes is scarce. This study assessed changes in quality of life (QoL) one month after strabismus surgery

performed in a mobile surgical program, and explored patient and caregiver perceptions of the service.

Methods: A prospective cross-sectional study was conducted among 35 patients undergoing strabismus surgery at a mobile unit based at Sisaket Hospital between January 21–24, 2025. Sociodemographic data and ocular history were collected through structured interviews. The validated Thai version of the EQ-5D questionnaire was administered before and one month after surgery; for young children, parent-proxy responses were obtained. Follow-up assessments were conducted by telephone. Differences in pre- and post-operative QoL scores were analyzed using the Wilcoxon signed-rank test.

Results: Mean EQ-5D index scores improved significantly from baseline to one month after surgery ($Z = -3.461$, $p < 0.001$). The largest gains were observed in domains of visual function and psychological well-being. Caregiver narratives frequently highlighted enhanced confidence and social interaction in children. Overall satisfaction with the accessibility and delivery of care via the mobile unit exceeded 91.42%.

Conclusions: Mobile strabismus surgical services provide more than ocular alignment; they deliver measurable improvements in patients' short-term quality of life and relieve psychosocial distress in families who might otherwise lack access to surgery. These findings underscore the potential role of mobile surgical programs in addressing inequities in eye care and support their inclusion in national eye health strategies.

Abstract No.: 202328**Moebius Syndrome: A Case Report***First Author: Ika PUSPITA**Co-Author(s): Florence MANURUNG*

Purpose: To describe the clinical features of a pediatric patient with Moebius syndrome and highlight the importance of multidisciplinary management.

Methods: A case report

Results: A 9-year-old girl was brought to our clinic with the main complaint of inability to move her eyes laterally. Since birth, she had been unable to close her eyes completely and demonstrated a mask-like facial expression, which recently resulted in bullying at school. Her mother reported no medical problems during pregnancy. On ophthalmic examination, best corrected visual acuity was 0.6 in the right eye and 0.5 in the left. Ocular alignment was orthophoric in the primary position, but there was marked limitation of abduction and mild limitation of adduction in both eyes. Nystagmus was absent. Neurological assessment revealed bilateral sixth and seventh cranial nerve palsy. Additional features included micrognathia. Systemic development was normal, and she had no difficulties at school. Brain CT scan showed no abnormalities.

Conclusions: Moebius syndrome requires a multidisciplinary approach involving ophthalmologists, neurologists, speech and occupational therapists, and psychologists. The primary goal of management is to optimize visual function, protect the ocular surface, and improve the patient's quality of life.

Abstract No.: 202314

Mom, Can I Go for a Walk? Prevention of Myopia in Schoolchildren in the Conditions of the City of Eastern Siberia With the Developed Aluminum Industry

First Author: Yulia LEUTKINA

Purpose: To study the publications on the role of pollution of atmospheric air with fluorine in development of myopia in schoolchildren for the definition of the effective methods of its prevention.

Methods: It is analyzed the publications over the last years on Google Scholar, PubMed, eLibrary, Crossref Metadata Search.

Results: It is determined the incidence of myopia among schoolchildren in Krasnoyarsk with its developed aluminum industry statistically exceeds the incidence among schoolchildren living in cities of the European part of Russia. APOModerate myopia in elementary grades among Siberians was 10.9%, in middle grades 23.8%, and among high school students 31.4%. In the European part of Russia, these figures were 5.6% in elementary school, 17.8% in middle grades, and 26.2% among high school students. Myopia prevention traditionally involves organizing the educational process, hygiene of visual load, physical activity, and time spent outdoors.

Conclusions: It is concluded that the issues of myopia prevention remain insufficiently covered. To study the effect of annual trips of children to an area free from the destructive effects of fluorine on the incidence of schoolchildren myopia.

Abstract No.: 205765

Multisystem Congenital Anomalies With MRI-Confirmed Cranial Nerve Malformations in Oculo-Auriculo-Vertebral Spectrum: A Case Report

First Author: Hyun-hae CHO

Purpose: Oculo-auriculo-vertebral spectrum (OAVS) is characterized by craniofacial and systemic malformations. Neurological involvement has been sporadically reported, but MRI-confirmed cranial nerve abnormalities remain uncommon. We present a case of OAVS with multiple congenital anomalies and distinctive cranial nerve findings on MRI.

Methods: A newborn presented with bilateral ear malformations since birth and tearing from the eyes while feeding, prompting a comprehensive work-up.

Clinical assessment, cardiac echocardiography, and brain MRI with high-resolution 3D sequences were performed. Cranial nerve courses and associated anomalies were systematically evaluated.

Results: The patient exhibited right microtia with congenital aural atresia, left dysmorphic ear with congenital aural stenosis, bilateral ossicular anomaly and possible bilateral vestibular enlargement. Additional anomalies included left-hand polydactyly and a muscular ventricular septal defect. Clinically, left facial weakness with mouth corner drooping was observed. MRI demonstrated: (1) asymmetric thickening of the right CN IV with nondelineable left CN IV; (2) anomalous common origin of CN V, VII, and VIII from the anterior profile of the middle cerebellar peduncle, forming a common trunk that subdivided into two nerves entering the Meckel cave and internal acoustic meatus, with partial misrouting of the left CN V; (3) nondelineable bilateral CN VI. Bilateral middle ear hypoplasia with soft tissue in the cavities was also noted.

Conclusions: This case illustrates rare and complex cranial nerve malformations in OAVS, with an unusual common trunk of CN V, VII, and VIII and absence of CN VI. Recognition of such anomalies is important for early diagnosis and management.

Abstract No.: 205546

Muscle Transplantation Technique for Large-Angle Strabismus

First Author: Ayu DIAH PERMATASARI

Co-Author(s): Ni Made Ayu SURASMIATI

Purpose: Large-angle strabismus remains a surgical challenge, particularly in patients with long-standing deprivation amblyopia. This case report evaluates the effectiveness of extraocular muscle transplantation as a monocular surgical approach.

Methods: A 27-year-old male with a history of traumatic cataract in the left eye underwent cataract extraction with intraocular lens implantation 10 years after injury. He presented with sensory esotropia: Hirschberg test revealed 30Δ esotropia, Krimsky test showed 75 prism diopter base out and fixation was limited due to deprivation amblyopia. Surgical intervention included 6 mm medial rectus recession with adjustable suture, 8 mm lateral rectus resection, and 5 mm autologous muscle transplantation. Outcomes were evaluated at 1 day, 1 week, and 3 months postoperatively.

Results: At 3 months, the patient achieved orthophoria with marked improvement in diplopia. Hirschberg testing confirmed stable ocular alignment, with minimal limitation in adduction. No major intraoperative or postoperative complications occurred. The procedure provided both anatomical correction and functional visual improvement.

Conclusions: Muscle transplantation is a safe and effective surgical option for large-angle strabismus, particularly in patients with monocular visual loss where unilateral correction is preferred. By utilizing autologous muscle tissue, it enables substantial alignment correction while avoiding bilateral four-muscle surgery, thereby reducing surgical morbidity. This case highlights its potential as a viable alternative for restoring ocular alignment and enhancing quality of life in complex strabismus

Abstract No.: 204949

Neuro-Ophthalmic Complications in a Pediatric Patient With Resected Fourth Ventricular Medulloblastoma: A Case Report

First Author: Unursaikhan **SODNOMBALJIR**

Co-Author(s): Tsengelmaa **CHULUUNBAT**, Munkhdelger **JAMIYANSHARAV**, Otgonsuren **NAMSRAIJAV**

Purpose: To report a pediatric case of medulloblastoma with neuro-ophthalmic complications and highlight the challenges in surgical management.

Methods: We retrospectively reviewed the patient's clinical course and management by collecting data from medical records, neuroimaging studies, and ophthalmologic evaluations. Visual acuity, extra-ocular movement, slit-lamp examination, and forced-duction test were analyzed. And we planned and performed the extraocular muscle transposition using the crossed adjustable suture technique.

Results: In 2021, the patient developed vomiting and progressive esotropia and was diagnosed with a medulloblastoma, for which he underwent surgical resection. Postoperatively, left facial palsy and sixth nerve palsy-related esotropia persisted. He subsequently received 31 sessions of radiotherapy and 32 courses of chemotherapy. In 2024, neurology follow-up showed no recurrence of the tumor. Ophthalmologic evaluation revealed left eyelid ptosis and persistent esotropia. Ptosis was surgically corrected, followed by a botulinum toxin injection to the left medial rectus, which proved ineffective. Extraocular muscle transposition using the crossed adjustable suture technique was then performed. Postoperative care included peribulbar corticosteroid injections and topical treatment. By postoperative day 10, visual acuity in the left eye improved from 0.02 to 0.25, with a slight improvement in esotropia. Fundus examination became possible, revealing attached retinas, pink optic discs, and preserved macular reflexes. Surgical outcomes will be monitored over a six-month period, with further intervention considered as needed.

Conclusions: Early recognition and management of ophthalmic complications are crucial for preserving visual function and enhancing quality of life. This case highlights the need for continued monitoring and

potential staged ophthalmic interventions even years after tumor treatment.

Abstract No.: 203591

Not Only the Tiniest: Oxygen Therapy and 1000–1499g Birthweight Drive ROP Risk—A Six-Year Surabaya Cohort

First Author: Rozalina **LOEBIS**

Co-Author(s): Muhammad **PRADJANTO**

Purpose: To identify independent risk factors for retinopathy of prematurity (ROP) and describe severity patterns in a large tertiary-care cohort from Indonesia.

Methods: Retrospective cohort of premature infants screened for ROP at Dr. Soetomo General Hospital (2017–2022). Inclusion followed local policy (typically gestational age [GA] <34 weeks and/or birth weight [BW] <2000 g). Outcomes were any ROP and stage severity. Bivariate analyses were followed by multivariable logistic regression with GA category, BW category, sex, twin birth, oxygen therapy, and blood transfusion. Model performance was summarized with AUC and Brier score.

Results: We analyzed 727 infants; 398 had ROP (54.7%). Severe ROP ($\geq$ Stage 3) accounted for 123/398 (30.9%) of ROP cases (16.9% overall). In the final multivariable model (GA + BW + covariates; AUC 0.668, Brier 0.226), two predictors remained independently significant: • Birthweight 1000–1499 g vs 1500–>2000 g: adjusted OR 2.33 (95% CI 1.41–3.84; $p=0.001$). • Oxygen therapy (Yes vs No): adjusted OR 1.99 (95% CI 1.17–3.36; $p=0.010$). Lower GA categories showed adverse directionality but did not retain statistical significance after adjustment. Sex, twin birth, and transfusion were not significant in the final model.

Conclusions: In this six-year cohort, moderate low birthweight (1000–1499 g) and oxygen therapy independently increased ROP risk—indicating vulnerability extends beyond only the tiniest or most immature infants. These findings support vigilant screening above the most extreme GA/BW strata and rigorous oxygen-targeting protocols in NICUs across middle-income settings

Abstract No.: 205472

Not as Rare as We Think? Pediatric Adverse Effects of Cycloplegia

First Author: Adit **MUHAMAD NURSIDIQ**

Co-Author(s): Mayasari **WAHYU KUNTORINI**, Nindya **ZANARIA LUBIS**

Purpose: To describe the systemic adverse effects following cycloplegic eye drop administration in a pediatric patient, which are often considered rare but may be underrecognized and underreported. This report also aims to raise awareness among

ophthalmologists of the importance of careful dosing and monitoring.

Methods: A 7 years old boy with myopia gravior undergoing cycloplegic refraction at our center was assessed. Clinical data were obtained from medical records, physical examination, and post administration observation.

Results: After receiving three sequential instillations of cyclopentolate 1% eye drops, the patient developed systemic manifestations including visual hallucinations, communication difficulties, ataxia, and unsteady gait. Vital signs showed a pulse of 104 beats/minute, respiratory rate of 24 breaths/minute, temperature of 36.7 °C, and oxygen saturation of 97%. The patient was admitted for observation and managed with supportive therapy only. Symptoms gradually subsided and resolved completely within 4 hours.

Conclusions: Adverse reactions to cycloplegic agents in children may not be as uncommon as the limited number of published reports suggests. This is the second reported case of cycloplegia-related adverse effects in pediatric patients at our center. Neuropsychiatric symptoms such as hallucinations and ataxia can occur, even with routine use. It should be kept in mind that, although considered rare, systemic adverse effects of cyclopentolate can develop particularly at concentrations >0.5%. Ophthalmologists should be mindful of both appropriate dosing and the potential risks when using cycloplegic agents in children.

Abstract No.: 202073

Ocular Albinism Associated With GPR 143 c.593T>G Variant

First Author: Min-hsiu SHIH

Purpose: Infantile nystagmus is often associated with visual sensory defects. In Asian children, ocular albinism type 1 characterized by foveal hypoplasia and sometimes iris discoloration, may be overlooked as a cause. The missense mutation c.593T>G in GPR143 is not novel, but its significance was not well defined.

Methods: Case report.

Results: A 6-month-old male infant presented with grayish irises and persistent horizontal nystagmus in both eyes for a month. He had undergone evaluations in the pediatric department, including lumbar puncture and electrophysiological tests. Laboratory investigations were conducted to rule out metabolic disorders. All results returned normal. Ophthalmological examination revealed heterochromic irises and a hypopigmented macula. Genetic analysis via whole exome sequencing identified a missense mutation (rs767317051, c.593T>G, p.Met198Arg) in the GPR143 gene encoding G-protein coupled receptor 143. Previously, we identified ten families carrying the same variant (c.593T>G) at genomic position 593 (ATG

> AGG) in exon 5 of GPR143, as detected by polymerase chain reaction. Based on the genetic results and clinical findings, a diagnosis of ocular albinism was established, although the results of optical coherence tomography were not available.

Conclusions: Genetic testing helps confirm diagnoses in unresolved patients with atypical phenotypes, but current databases are sometimes limited. Based on the PCR results of these families and WES of this boy, we believe the missense mutation c.593T>G in GPR143 is related to ocular albinism type 1.

Abstract No.: 206993

Ocular Manifestations and Diagnostic Approach in Apert Syndrome (Acrocephalosyndactyly Type I): A Rare Case Report

First Author: Kiki Rizki ARINDA

Co-Author(s): Aini NUZULUL

Purpose: To report a rare case of Apert Syndrome with ocular manifestation and its diagnostic approach.

Methods: A 4-month-old female patient, diagnosed with Apert Syndrome, presented with abnormal craniofacial morphology, syndactyly, and ocular abnormalities. A comprehensive examination was performed, including assessment of ocular alignment, anterior and posterior segment evaluation, orbital anthropometric measurements, and radiological imaging.

Results: The ophthalmologic examination revealed down-slanting palpebral fissures and hypertelorism, with an inner canthal distance of 32 mm, an outer canthal distance of 75 mm, and a canthal index ratio of 42.667. Funduscopy examination showed a normal fundus. Radiographic (babygram) imaging demonstrated an elevation of the orbital roof and ipsilateral lateral wall, consistent with the "harlequin appearance". Further multidisciplinary evaluations revealed craniosynostosis, syndactyly, and midfacial hypoplasia.

Conclusions: This case highlights the importance of early recognition and a multidisciplinary approach in managing Apert Syndrome, particularly in addressing ocular manifestations that may significantly impact visual development. Regular ophthalmic surveillance is essential for detecting complications such as increased intracranial pressure that could lead to atrophy papil, strabismus, and refractive errors, which, if managed promptly, can help preserve visual function and improve the patient's quality of life. This case highlights the importance of early recognition and a multidisciplinary approach in managing Apert Syndrome, particularly in addressing ocular manifestations that may significantly impact visual development. Regular ophthalmic surveillance is essential for detecting complications such as increased

intracranial pressure that could lead to atrophy papil, strabismus, and refractive errors, which, if managed promptly, can help preserve visual function and improve the patient's quality of life.

Abstract No.: 206035

Ocular Myasthenia Gravis Mimicking Mono-Ocular Elevation Deficit

First Author: Monalisa PATI

Co-Author(s): Shweta DHIMAN

Purpose: To report a case of ocular myasthenia gravis (OMG) mimicking mono-ocular elevation deficit (MED)

Methods: A 28-year-old male presented with binocular double vision for 5 months, which was more pronounced in the up-gaze. Left eye (OS) upper lid mild ptosis was present. The ice-pack test was negative. Nine gaze examinations revealed an elevation deficit in OS. The patient was provisionally diagnosed to have a MED OS. The MRI of the brain and orbit was normal. After 5 months, he had progressive ptosis in both eyes (OU). There was a limited depression of OS. The ice-pack test was positive this time.

Results: He was advised to undergo a single-fiber electromyography test and an anti-acetylcholine receptor antibody test. However, he did not report for the tests. He was diagnosed with OMG and was referred to a neurologist

Conclusions: OMG is a great mimicker. The clinician should be alert to the possibility of OMG as a diagnosis from different strabismus presentations, including MED, as in this current case

Abstract No.: 205563

Ophthalmic Clues to the Enigma of Syndromic Craniosynostosis

First Author: Manisha CHOUDHARY

Co-Author(s): Matuli DAS, Siddhartha KAR, Gayatree MOHANTY, Shrutakirti PARIDA

Purpose: To report two infants with syndromic craniosynostosis presenting with distinct ocular and systemic manifestations.

Methods: Case 1: A 5-month-old male baby presented with unilateral coronal craniosynostosis, cleft lip and palate, polysyndactyly, bilateral adherent leucoma, and proptosis. Ocular findings included nystagmus and absent red reflex. Cardiac evaluation revealed a patent ductus arteriosus, and MRI showed mild cerebellar tonsillar herniation. These constellation of craniofacial, ocular, and skeletal features was consistent with Carpenter syndrome. Case 2: A 1-year-old female baby presented with progressive bilateral proptosis and papilledema. CT revealed multisuture craniosynostosis with turribrachycephaly, midfacial hypoplasia, shallow orbits, a copper-beaten skull, and optic nerve tortuosity. Echocardiography identified an atrial septal

defect and patent ductus arteriosus. These findings were consistent with Crouzon syndrome.

Results: A complete ocular followed by systemic evaluation supported by neuroimaging and other diagnostic modalities helped in arriving at the correct diagnosis in these two patients.

Conclusions: Early recognition of syndromic craniosynostosis often hinges on ocular findings. The divergent phenotypes of Carpenter syndrome, with its craniofacial anomalies, ocular features, and skeletal malformations, and Crouzon syndrome, marked by cranial anomalies, ocular manifestations, raised intracranial pressure, and cardiac defects, illustrate the broad spectrum of systemic involvement. These cases underscore the critical need for early ophthalmic assessment, thorough systemic evaluation, and integrated multidisciplinary management in affected infants.

Abstract No.: 203566

Paediatric Open Globe Injuries

First Author: Brendon LEE

Co-Author(s): Elsie CHAN, Chameen SAMARAWICKRAMA

Purpose: To examine the epidemiology, visual outcomes, surgical needs, and socioeconomic costs of paediatric open globe injuries (OGI)

Methods: A 15-year retrospective, consecutive, review (2011-2024) of 200 eyes at two tertiary centres (Royal Victorian Eye and Ear Hospital and Royal Children's Hospital, Victoria). Patients were aged ≤ 18 . Outcome included best-corrected visual acuity (BCVA), operating theatre (OT) visits, comparison of existing prognostic models (TOTS - Toddler/Infant Ocular Trauma Score, POTS - Paediatric Penetrating Ocular Trauma Score, and BETT - Birmingham Eye Trauma Terminology), and cost analysis using Australian data.

Results: Preliminary data: the average age at time of injury was 11 years with similar male-to-female ratio. The most common location was in the home (57%) then schools (11%). A sharp object was most common (75%) causing lacerations (83%). Hyphaema occurred in 83%, iris prolapse/damage in 65%, lens injury in 43%, retinal injury in 33%. Time to initial surgical repair was 2.74 hours. Presenting mean logMAR VA was 1.46 [6/150] and improved to 0.83 [6/40]. There was an average of 10 follow up visits, and 2 further admissions, and many patients required multiple OT visits (average 2.7). In terms of prognostication, BETT was 10% Grade 1, 25% Grade 5 (worse), TOTS was 34% 1, 2% 6 (worse), and POTS 7% (best) and 41% (worse). Full data will be presented at the conference including socioeconomic costs using Australian data on admissions, OT visits, and follow up visits.

Conclusions: Paediatric open globe injuries remain a significant cause of injury, with poor visual outcomes and high surgical morbidity.

Abstract No.: 201780

Pediatric Clival Aneurysmal Bone Cyst Presenting With Abducens Palsy: A Case Report

First Author: Hui-chen **CHENG**

Co-Author(s): Wei-che **HUNG**, An-guor **WANG**

Purpose: To report a case of pediatric clival aneurysmal bone cyst presenting with abducens palsy.

Methods: Case report.

Results: An eight-year-old girl complained of diplopia for 3 months. Her mother noticed that she needed to turn her head to the right when gazing at objects on her right side. Esotropia was noted recently, and she was referred to our clinic. At our clinic, her best-corrected visual acuity was 6/5 in both eyes with a prompt pupillary light reflex. Right esotropia was noted, and the prism cover test showed 45 prism diopters of esotropia at the primary position. Extraocular muscle movement examination showed limited abduction in the right eye. Brain magnetic resonance imaging (MRI) disclosed a mass lesion over the clival region with extension into the posterior compartment of the right cavernous sinus. She then received an endoscopic endonasal approach for tumor removal. The pathology report showed fragments containing a cystic-like lesion with bland ovoid to short-spindle cells and tightly packed mononuclear cells. The tumor cells are focally reactive for USP6, and the CD34/ERG1 immunostaining highlights those endothelial cells, which confirmed the diagnosis of aneurysmal bone cyst. The tumor recurred, and the patient received another 2 EEA for tumor removal. At the end of an 8-month follow-up, she still had right esotropia and limited abduction in the right eye.

Conclusions: We reported a case of pediatric clival aneurysmal bone cyst presenting with abducens palsy. Aneurysmal bone cyst is rare at skull base and should be considered as differential diagnosis of cystic tumor at skull base in a child.

Abstract No.: 201853

Persistent Fetal Vasculature (PFV) Case Report in Mongolia

First Author: Tsengelmaa **CHULUUNBAT**

Purpose: Persistent fetal vasculature (PFV) occurs when the hyaloid vascular system fails to regress completely during fetal development, leading to a retrolental membrane attached to the posterior surface of the lens.

Methods: A case study involves a 4-year-old female patient presenting with bilateral poor vision and a

leucokoria in the left eye. At three months of age, a congenital cataract was diagnosed in the left eye. The left eye had no light perception. Further examination of the left eye showed the presence of a cataract, a retrolental fibrovascular membrane, and macular traction, which is a rare clinical feature.

Results: The patient underwent uneventful pars plana vitrectomy (PPV), lensectomy (PPL), and endolaser treatment for the left eye, achieving 100% globe retention. Six months postoperatively, right eye vision improved to 0.4 with correction (OD +3.00 DS/ Cyl -2.00 x180), and left eye visual acuity remained at light perception level with correction (OS +13.00 DS).

Conclusions: The primary goal of treatment is to prevent complications such as glaucoma and phthisis bulbi, avoid enucleation, restore ocular transparency, and manage amblyopia. During surgery, it is critical to prevent vitreous hemorrhage, retinal detachment while performing lensectomy and membrane removal.

Abstract No.: 205284

Phenotype and a Genotype Spectrum of Congenital Myopathies Presenting in an Ophthalmic Clinic

First Author: Shivani **BHANDARI**

Co-Author(s): Goura **CHATTANAVAR**, Ramesh **KEKUNNAYA**, Rachana **MARAGANI**, Vyshnavika **MUPPARAPU**

Purpose: Congenital myopathies are non- or slowly progressive inherited muscle disorders, typically presenting in infancy with hypotonia and often associated with facial weakness (myopathic facies). This study aims to develop algorithm to distinguish congenital myopathy from other causes of external ophthalmoplegia in pediatric population like CFEOM, Myasthenia gravis.

Methods: This retrospective study evaluates the phenotypic and genotypic features of patients with congenital myopathy and identifies clinical clues to differentiate it from other causes of external ophthalmoplegia.

Results: Seven patients (age: 7 months-5 years) were included. Ocular findings included bilateral ptosis in 6 (85.7%), limited ocular motility and strabismus in all (100%), with exotropia in 5 (71.4%). Additional features were lagophthalmos in 4 (57.1%), exposure keratopathy in 2 (28.5%), and facial dysmorphism with mask-like facies in 5 (71.4%). Pupillary responses were normal in all. Genetic testing revealed heterozygous pathogenic variants in RYR1 (3 cases, 42.8%) and DNM2 (1 case), and biallelic variants in VWA1, BIN1, and MYH2 (1 case each). Only the patient with the DNM2 variant had an affected sibling. Muscle biopsy was performed in 2 cases (28.5%). None underwent surgery for ptosis or strabismus. Myasthenia gravis and other causes of

external ophthalmoplegia were ruled out in all before genetic test.

Conclusions: Congenital myopathy should be considered in paediatric patients with ptosis and strabismus, especially when associated with facial dysmorphism, lagophthalmos, or systemic features. These signs help differentiate it from conditions like CFEOM and myasthenia gravis. Muscle biopsy and genetic testing aid in diagnosis.

Abstract No.: 202757

Potential Hazard of Repeated Low-level Red-light Therapy in Myopia

First Author: Huanyu **LIU**

Co-Author(s): Jie **PENG**, Peiquan **ZHAO**

Purpose: Repeated low-level red light (RLRL) exposure has emerged as a novel approach for myopia management; however, use of laser-based devices may carry potential risks. This study aimed to enhance ophthalmologists' understanding of RLRL treatment.

Methods: This retrospective case study reviewed clinical trials of RLRL as an adjunctive treatment for myopia, reported two cases of retinal injury after RLRL, and analyzed potential mechanisms of damage.

Results: Clinical trials have shown that RLRL can significantly improve axial length and spherical equivalent refraction compared with controls, with no treatment-related adverse events reported. Nevertheless, two retinal injury cases were observed at our center. A 12-year-old girl experienced BCVA decline from 20/20 to 20/30 in both eyes after five months of RLRL; multimodal imaging revealed foveal darkening, hypoautofluorescent foveal lesions, and ellipsoid zone disruption. After discontinuing treatment for three months, BCVA improved to 20/25 with partial restoration of outer retina. A 5-year-old boy with high myopia (−8.00 DS) and myelinated nerve fibers developed parafoveal detachment and disruption of the ellipsoid and interdigitation zones after ten months of RLRL. Following discontinuation for fifteen months, partial anatomical recovery and BCVA improvement from 20/40 to 20/33 were observed. Literature suggests RLRL-related OCT changes, including hyperreflectivity of the ellipsoid zone and photoreceptor outer segments, possibly linked to mitochondrial activation and increased outer segment turnover.

Conclusions: RLRL demonstrates promising short-term efficacy for myopia control. However, given potential risks, RLRL therapy should be used cautiously and monitored closely by ophthalmologists.

Abstract No.: 204217

Prevalence and Patterns of Refractive Errors Among Yemeni Patients Diagnosed With Strabismus

First Author: Tariq **ALDOAIS**

Co-Author(s): Mahfouth **BAMASHMUS**

Purpose: This study aimed to determine the prevalence and pattern of refractive errors among Yemeni patients diagnosed with strabismus.

Methods: A descriptive cross-sectional study was carried out between June 2022 and March 2025, the study sample included 1,079 strabismus patients who underwent a refractive error assessment. The complete data on strabismus type, refraction status, visual acuity, and amblyopia were collected and subjected to statistical analysis.

Results: Among Yemeni patients diagnosed with strabismus, hyperopia was prevalent (OD: 40.87%, OS: 40.06%), particularly in females and children. Myopia was less common (OD: 8.25%, OS: 7.51%) but increased in adults (18–40 years), whereas astigmatism is relatively uncommon; the results revealed high inter-eye refractive concordance (Kappa=0.851, $p<0.001$). The results indicate that the majority of patients with strabismus are in childhood and early adolescence, with respect to strabismus distribution, esotropia and exotropia were most prevalent at 53.57% and 35.77%, respectively. Moreover, hyperopia is more prevalent among esotropic patients, and myopic errors are slightly more common among exotropic patients. Furthermore, hyperopia was associated with the greatest prevalence of amblyopia, while myopia severely reduced visual acuity.

Conclusions: Esotropia and hyperopia are the most common kinds of optical anomalies, while the severe visual acuity loss is most associated with myopia. These findings underscore the clinical need for combined screening and early intervention to reduce the burden of refractive errors and their associated visual anomalies within Yemeni society.

Abstract No.: 201779

Refractive Changes and Determinants of Emmetropization in Hyperopic Children

First Author: Yudan **ZHONG**

Co-Author(s): Lei **FENG**, Yunsu **HE**, Jinrong **LI**, Qiuying **LI**, Xuan **QIU**, Yun **WEN**, Zixuan **XU**, Qingqing **YE**, Wentong **YU**, Junpeng **YUAN**, Yusong **ZHOU**

Purpose: To investigate the characteristics and determinants of annual refractive change in hyperopic children and to compare ocular parameters across subgroups.

Methods: This retrospective cohort study included children with baseline spherical equivalent refraction (SER) of +0.50 to +10.00 D, followed for >12 months

with at least two refraction measurements. Subgroups were defined by baseline SER (+0.50–2.00, +2.00–4.00, +4.00–6.00, +6.00–8.00, +8.00–10.00 D), baseline age (0–3, 3–6, 6–9, 9–12 years), and final SER status [myopia (SER ≤ −0.50 D), emmetropia (−0.50 < SER ≤ +0.50 D), persistent hyperopia (SER > +0.50 D)]. Intergroup comparisons were performed, and associations were analyzed using Spearman correlation and multivariate linear regression.

Results: A total of 591 hyperopic children were included (310 boys, 281 girls; mean baseline age 5.58 ± 2.21 years; baseline SER +4.33 ± 2.37 D; mean follow-up 31.75 ± 11.69 months). Based on baseline SER, the low-hyperopia group (+0.50–2.00 D) showed the smallest absolute annual SER change (−0.26 ± 0.32 D) and the slowest progression, with significant differences compared with the +4.00–6.00 D, +6.00–8.00 D, and +8.00–10.00 D groups (−0.34 ± 0.34 D, −0.37 ± 0.29 D, −0.41 ± 0.31 D; all P < 0.001). By final SER, persistent hyperopes had significantly higher baseline SER than emmetropic or myopic children (+4.55 ± 2.33 D vs. +1.60 ± 0.62 D and +1.61 ± 0.50 D; both P < 0.001). Age-stratified analysis showed increasing absolute annual change with age (−0.22 ± 0.25 D, −0.25 ± 0.27 D, −0.48 ± 0.36 D, and −0.47 ± 0.33 D for 0–3, 3–6, 6–9, and 9–12 years; overall P < 0.05). Pairwise comparisons showed no significant differences between the 0–3 and 3–6 years groups or between the 6–9 and 9–12 years groups, whereas all other comparisons were significant (P < 0.005). Multivariate linear regression identified baseline age and baseline SER as independent negative predictors of annual SER change, while sex and follow-up duration were not significant.

Conclusions: Annual refractive change in hyperopic children is primarily determined by baseline age and SER. Older age and greater hyperopia predict faster myopic progression, underscoring the need for early risk stratification and monitoring.

Abstract No.: 200134

Relationships Between Strabismus Measured by Maddox Rod Test and Stereopsis

First Author: Han-chih **CHENG**

Purpose: This study investigates the relationship between the angle of strabismus measured by the Maddox rod test and the impact on stereopsis, aiming to quantify the extent of stereopsis impairment across various angles of deviation.

Methods: Subjects included healthy adults (n=19; age 23–33 years, median=26) with horizontal and vertical strabismus angles measured using a Maddox rod test at a near distance of 33 cm. Stereoacuity was evaluated through the Titmus test (9 circles). For strabismus exceeding 10 PD, Bagolini and Worth 4-Dot (W-4-D) tests were employed to assess anomalous retinal correspondence (ARC) and binocularity.

Results: The findings show that small vertical strabismus (<3 PD) did not impair stereopsis. Horizontal strabismus of up to 18 degrees, as measured by the Maddox rod test, preserved stereopsis. Further, stereopsis levels did not diminish within the 18-degree range despite increasing deviation angles. Individuals with strabismus greater than 10 PD exhibited stable stereopsis results, supported by Bagolini and W-4-D evaluations.

Conclusions: The study concludes that small vertical deviations (<3 PD) and horizontal deviations below 18 degrees, as assessed via the Maddox rod test, do not significantly impact stereopsis. The Maddox rod test effectively quantifies strabismus angles relevant to stereopsis thresholds.

Abstract No.: 202789

Repeated Low-Level Red-Light Therapy for Progressive Myopia in Children: Two Case Studies

First Author: Loren **ROSE**

Co-Author(s): Angela **SCHULZ**

Purpose: Repeated low-level red-light (RLRL) therapy, emitting 650 nm, is a novel technology for myopia progression in children. We report two case studies.

Methods: A 10-year-old male and female with rapidly progressing myopia despite atropine (0.05%) and DIMS (male) HAL (female) lenses. Atropine was discontinued, pupils monitored until they measured 4mm. RLRL therapy was then initiated according to the manufacturer's protocol. Spherical equivalent (SE), axial length (AL), and sub-foveal choroidal thickness (CT) were monitored at 1, 2, 3, 6, 12 and 18 months.

Results: The male baseline SE −7.25D OD and −6.0D OS, AL 26.95mm OD and 26.34mm OS, and mean CT 105.08µm (SD 11.38) OD and 159.67µm (SD 2.67) OS. The female baseline SE −5.5D OD and −4.625D OS, AL 25.45mm OD and 25.15mm OS, and mean CT 157.6µm (SD 6.07) OD and 231.0µm (SD 6.03) OS. Following initiation of RLRL, both patients stabilised axial and refractive progression with the male final SE −6.75D OD and −5.75D OS, AL 26.40mm OD and 26.15mm OS and the female SE −4.75D OD and −4.00D OS, and AL 25.18mm OD and 25.20mm OS. Mean CT was significantly greater at each visit than baseline (p<0.001) for both patients. At last review, mean CT for male was 192.42µm (SD 7.94) OD and 207.50µm (SD 7.78) OS (18 months) and for female was 200.75µm (SD 3.72) OD and 270.00µm (SD 7.50) OS (12 months). Compliance was >90 % for both patients.

Conclusions: RLRL therapy may prove a useful tool in managing progressive, resistant myopia.

Abstract No.: 210113**Retinoblastoma Mimicking Orbital Cellulitis in an Infant: The Imperative of Advanced Imaging and Timely Intervention***First Author: Nazli GUL**Co-Author(s): Shafaq TANVEER*

Purpose: To highlight the diagnostic challenge of retinoblastoma presenting with features mimicking orbital cellulitis in an infant, and to emphasize the importance of advanced imaging for timely identification and management.

Methods: A 2-month-old male presenting with an 11-day history of fever, eyelid swelling, ocular discharge, and proptosis was evaluated clinically and under anesthesia. Imaging with MDCT and MRI was performed following initial management for presumed orbital cellulitis. Microbiological investigations and therapeutic response to antibiotics were documented.

Results: Clinical examination revealed erythematous lid swelling, proptosis, conjunctival chemosis, engorged scleral vessels, hazy cornea, and leukocoria. MDCT demonstrated intraocular calcifications, and MRI confirmed retinoblastoma with periscleral and perioptic spread. Despite transient improvement with antibiotic therapy targeting a Citrobacter-positive urine culture, definitive imaging findings established the diagnosis of Group E retinoblastoma with scleral involvement and no contralateral lesions. The patient was referred for chemotherapy with subsequent enucleation planned.

Conclusions: Retinoblastoma can masquerade as orbital cellulitis, potentially delaying diagnosis. A temporary response to antibiotics should not preclude further evaluation. The presence of leukocoria, proptosis, or intraocular calcifications necessitates prompt ophthalmologic and oncologic assessment for timely, life- and vision-saving intervention.

Abstract No.: 203901**Revised Outcomes on Myopia Progression in Abiliti Contact Lens Users: A Retrospective Cohort Analysis***First Author: Chelsea TAN**Co-Author(s): Sun CHEN HSIN, Deborah LEE*

Purpose: This study evaluates the effectiveness of Abiliti® contact lenses (CL), which utilise hyperopic defocus on the peripheral retina with an enhanced fitting algorithm and improved compliance rates, in controlling myopia progression in a pediatric population.

Methods: A retrospective analysis of 16 eyes in eight subjects with progressive myopia was conducted between November 2017 and July 2025. Subjects were fitted with Abiliti® and monitored for six months after initiation. The rate of myopia progression was measured in change in diopters (D) and axial length

(mm) over time. Refractive measurements were taken at baseline and six months. The rate of myopia progression with Abiliti® was compared to reported data from MiSight® CL and multifocal soft CL.

Results: Eight subjects (one male, seven females; mean age 12.0 ± 2.08 years) were included. The mean baseline spherical equivalent (SE) was -3.37 ± 2.67 D and mean initial axial length (AL) was 24.55 ± 0.95 mm. Seven (87.5%) of subjects used Abiliti® in conjunction with atropine eyedrops and one (12.5%) subject used Abiliti® as monotherapy for myopia control. Our study found that Abiliti® significantly reduced the rate of myopia progression ($\Delta SE -0.25 \pm 0.31$ D over 6 months; $\Delta AL 0.11 \pm 0.10$ mm over 6 months, 0.12 mm over 12 months).

Conclusions: Abiliti® demonstrates a significant reduction in the progression of myopia with comparable results to MiSight® CL ($\Delta SE -0.51 \pm 0.64$ D, $\Delta AL 0.30 \pm 0.27$ mm) and multifocal soft CL ($\Delta SE -0.51 \pm 0.06$ D, $\Delta AL 0.29 \pm 0.03$ mm). Abiliti® is a promising solution in slowing refractive changes and axial elongation for myopia management.

Abstract No.: 206029**Sacrificial Love of a Mother: Sight for Life***First Author: Suyi SIOW**Co-Author(s): Li Yen CHAN, Lee Zy ENVIRA, Jamalia RAHMAT*

Purpose: To report a very late recurrence of retinoblastoma in pregnancy.

Methods: Case Report

Results: A 26-year-old female in her third trimester of pregnancy presented with a large tumour in the vitreous cavity of her left eye. Diagnosed with advanced retinoblastoma in both eyes at 2.5 years old, she underwent right eye enucleation and systemic chemotherapy. Focal therapies and radiotherapy targeted the residual disease in her left eye. Following 13 years of tumour remission, she underwent uncomplicated cataract surgery with intraocular lens implantation. No intraocular recurrence was seen after the surgery and she underwent surgical removal of dense posterior capsule opacification 9 years (22 years of remission) after cataract surgery. Very low vision has been recorded as counting fingers over the years. Twenty two years after remission, a large tumour was seen on slit lamp examination. Further evaluation with B-scan ultrasonography and MRI supported suspicions of recurrent retinoblastoma with significant posterior segment involvement. The decision for a caesarean section and left eye enucleation at 31 weeks + 5 days gestation was reached following a multidisciplinary team discussion. Histopathology confirmed retinoblastoma with choroidal invasion. The patient was subsequently referred to the oncologist for systemic chemotherapy.

Conclusions: There are no previous reports of the recurrence of an intraocular tumour after 22 years in the literature. However, it is essential to recognise that recurrence can still occur after long remission. This highlights the critical importance of lifelong surveillance in patients with a history of retinoblastoma to monitor for any potential reemergence of the disease.

Abstract No.: 203785

Shadows, Signals, and Staring Still: A Rare Collision of Retinitis Pigmentosa, Bardet-Biedl Syndrome, Ocular Myasthenia, and Duane Retraction Syndrome

First Author: Subhangi SAHU

Co-Author(s): Matuli DAS, Shrutakirty PARIDA, Saswati SEN

Purpose: To report a rare presentation of retinitis pigmentosa in a child with Bardet-Biedl Syndrome, complicated by features suggestive of Duane's retraction syndrome and ocular myasthenia gravis.

Methods: A 10-year-old obese male with moderate intellectual disability presented with a two-year history of nyctalopia. Clinical examination revealed syndromic features including polydactyly, brachydactyly, delayed developmental milestones, and hepatosplenomegaly. Best-corrected visual acuity (BCVA) was 6/36, N12 in the right eye and 6/9, N10 in the left eye. Ocular examination showed mild ptosis, narrowing of the palpebral fissure on attempted adduction, and bilateral extraocular movement restrictions. Color vision and contrast sensitivity were reduced in both eyes. Fundus evaluation revealed optic disc pallor, mottling of the retinal pigment epithelium (RPE) at the macula, and mid-peripheral bony spicule pigmentation—findings consistent with rod-cone dystrophy. Serological testing was positive for anti-acetylcholine receptor (anti-AChR) antibodies, raising suspicion for overlapping ocular myasthenia gravis. Genetic testing confirmed a pathogenic BBS2 gene mutation, consistent with Bardet-Biedl Syndrome.

Results: The patient was diagnosed with Bardet Biedl Syndrome, Retinitis Pigmentosa and suspected Duane's retraction syndrome with autoimmune overlap (myasthenia gravis). Patient was then managed with pyridostigmine trial, low vision aids and monthly monitoring.

Conclusions: This is the first reported case of Bardet Biedl syndrome with associated ocular myasthenia to the best of our knowledge. BBS itself is very rare with a prevalence at 1:140000. This combination leads to significant visual and neuromuscular impairment, requiring multidisciplinary care and genetic counseling for family planning and early diagnosis.

Abstract No.: 200949

Short-Term Outcome Following Combined Trabeculectomy With Cataract Surgery and Intraocular Lens Implantation for Secondary Cataract and Glaucoma in Children

First Author: Quazi Sazzad IFTEKHAR

Co-Author(s): Halima ALIMI, Zafrul HASSAN, Syed Jahangir KABIR, Bipul SARKER, Lutful KABIR

Purpose: To see the outcome following combined trabeculectomy with cataract surgery and intraocular lens implantation for secondary cataract and glaucoma in children.

Methods: A retrospective observational study extracting demographic and clinical information from case notes of 10 children who had cataract extraction and trabeculectomy and IOL implantation for secondary cataract and glaucoma over a one year period from January to December 2018.

Results: Twelve eyes of 10 patients were enrolled with a mean follow-up period of 4.9months (range 2-9months). There was a 4:1 male: female ratio. 60% were younger than 8years of age at surgery. 58.4% of cataracts were steroid-induced, whilst trauma was responsible for 25%. Steroid-induced glaucomas constituted 58.4% and 41.6% were secondary open-angle glaucoma. VKC was associated with 41.6% of patients. Mean Pre-operative IOP was 17.9mmHg (range of 7 to 35mmHg) on an average of 1.3medications. Mean post-operative IOP was 12.2mmHg after 1month and 13mmHg after 3 months. Steroid-induced glaucomas had a mean post-operative IOP of 10.6mmHg without medication after 3 months, whilst it was 17mmHg with medications for secondary open-angle glaucoma from trauma and uveitis. Pre-operative visual acuity was poor in 50% and good in 16.7%. Post-operative BCVA was good in 41.7% and moderate in 8.3%. There were no intra-operative or short-term post-operative complications.

Conclusions: There was good short term control of IOP and significantly improved visual acuity following triple procedure for secondary cataract and glaucoma in children.

Abstract No.: 205600

Sight for Young Eyes-Tertiary Eye Care Experience in Pediatric Traumatic Cataracts

First Author: Mahathi VANKIREDDI

Co-Author(s): Divya Bhargavi KATTA, Riya MENDAPARA

Purpose: To study the outcomes of pediatric traumatic cataract surgery in a tertiary eye care centre.

Methods: A hospital-based interventional prospective study of 27 eyes of children with traumatic cataract who underwent cataract surgery was conducted. It was done either as a primary procedure or a second procedure based on the need, and follow-up was done

at 1 week, 1 month, and 3 months, and at each visit, visual acuity and slit lamp examination were done. At 3 months, stereopsis was also done.

Results: Mean age 9.70 $\pm$ 3.80 years. Males are more than females. Corneal opacity was the most common associated feature, and post op visual acuity significantly improved compared to pre-op op, with not much difference at 1 and 3 months, but in children less than 10 years of age, stereopsis was less compared to older children, and the difference between them was significant.

Conclusions: In traumatic pediatric cataract, visual acuity can be significantly improved by meticulous surgery. Stereopsis might take a longer time to regain. However, a young age<10 years is a significant factor for poor stereopsis and vision post-surgery.

Abstract No.: 200853

Silent Damage: Delayed Uveitis Following Blunt Ocular Contusion in a Pediatric Eye: A Case Report

First Author: Chao-jung **WU**

Co-Author(s): Chee-ming **LEE**

Purpose: To report a rare case of delayed-onset anterior and posterior uveitis following non-penetrating ocular trauma in a child.

Methods: A 12-year-old girl presented with blurred vision in her right eye two weeks after being struck by a basketball. Ophthalmic exam, OCT, and fluorescein angiography were performed. Laboratory tests ruled out infectious or autoimmune etiologies.

Results: Visual acuity in the right eye was 0.1. Slit-lamp revealed anterior chamber cells and posterior synechiae. Fundus showed optic disc swelling and hyperemia. OCT indicated RNFL thickening; FA revealed persistent vascular leakage. The left eye was normal. Laboratory findings were unremarkable. Diagnosis: post-traumatic uveitis.

Conclusions: Delayed uveitis may occur after blunt ocular trauma even in the absence of systemic disease. This case emphasizes the need for close monitoring of pediatric eye injuries for signs of late-onset inflammation.

Abstract No.: 205712

Sirolimus in Combination With Intravenous Methylprednisolone and Orbital Radiotherapy As First-Line Treatment for Active Thyroid Eye Disease: A Comparative Observational Study

First Author: Kenneth Ka Hei **LAI**

Co-Author(s): Kelvin **CHONG**, Alan **LEE**, Chiu Ming **NG**, Chi Pui **PANG**, Clement **THAM**, Kenneth **WONG**, Alvin **YOUNG**, Hunter Kl **YUEN**

Purpose: To compare the efficacy and safety of intravenous methylprednisolone (IVMP) plus orbital radiotherapy (ORT) combined with either sirolimus or mycophenolate mofetil (MMF) as first-line treatment for active, moderate-to-severe thyroid eye disease (TED).

Methods: We conducted a multicentre, prospective cohort study in patients with active, moderate-to-severe TED who received IVMP (500 mg weekly $\times$ 6 weeks, then 250 mg weekly $\times$ 6 weeks) with ORT in combination with either sirolimus (serum trough level 5–15 ng/mL) or MMF. The primary endpoint was overall TED response at 24 weeks, defined by a composite outcome including Clinical Activity Score (CAS), improvement in diplopia or motility, reduction in proptosis or eyelid aperture, and absence of disease progression. Secondary endpoints included changes in quality of life (GO-QoL), individual response rates for proptosis and CAS, extraocular motility (EOM) improvement, and treatment safety.

Results: A total of 72 patients were included: 36 in the sirolimus group and 36 in the MMF group. The mean age was 55 $\pm$ 8 years, and 65% were female. Baseline mean CAS was 2.5 $\pm$ 1.2 in the sirolimus group and 2.4 $\pm$ 1.1 in the MMF group. At 24 weeks, the proportion of responders was significantly higher in the sirolimus group compared with the MMF group (78% vs 56%, $P<0.05$). A greater proportion of sirolimus patients achieved an improvement in the diplopia score (50% vs 20%, $P<0.05$). Mean GO-QoL improvement was higher in the sirolimus group ($P<0.05$). No serious treatment-related adverse events occurred in both groups.

Conclusions: The addition of sirolimus to IVMP and orbital RT as first-line treatment for active TED appears more effective than the combination of IVMP, RT, and MMF. These findings suggest sirolimus may represent a promising immunomodulatory agent in the upfront management of TED, warranting further validation in randomized controlled trials.

Abstract No.: 205406

Step Count and Physical Activity in Children With Visual Impairment Compared With Normally Sighted Peers

First Author: Srijana **ADHIKARI**

Purpose: To measure step count and physical activity (PA) across different segments of the day in children with visual impairment compared with normally sighted peers.

Methods: One hundred children with VI and 100 normally sighted peers aged 7 to 17 years from integrated schools for the blind wore an actimeter on their non-dominant wrist for one week. PA outcomes included mean activity counts per minute in different segments of the day (Before, during, after school, and weekend). It was modelled using a series of generalised linear mixed effects models with vision, age, sex, time of day, and a vision by time of day interaction. Correlation between PA count per minute and step count per day was measured.

Results: Data of 83 children with VI and 77 normally sighted peers were included. Mean age 12.58 (SD = 3). Mean activity count per minute was lower in children with VI ($p < 0.001$) especially during and after school. They also spent more time performing light PA and less time performing vigorous PA across all periods of the day ($p < 0.001$). Mean step count per day was lower in children with VI compared with normally sighted peers ($p < 0.001$). There was a positive correlation between physical activity count per minute and the step count per day ($p < 0.001$).

Conclusions: Our findings indicate that children with VI participate less in physical activity. There is need for guidance to increase PA levels in these children.

Abstract No.: 200957

Steroid-Induced Increase Intraocular Pressure in Paediatric Patients With Acute Myeloid Leukaemia (AML) on FLAG Chemotherapy

First Author: Anis Azeanti **AZMI**

Co-Author(s): Nur Shahirah **AMIR HAMZAH**, Safinaz **MOHD KHIALDIN**

Purpose: To report a case of steroid- induced increase intraocular pressure in patient undergoing FLAG chemotherapy with corticosteroid eye drop regime.

Methods: Case report.

Results: FLAG is a chemotherapy regimen used for relapsed and refractory acute myeloid leukaemia (AML). The acronym FLAG represents the three main drugs used in the regimen: Fludarabine, Cytarabine and granulocyte colony-stimulating factor (G-CSF). High dose of Cytarabine used in this regime has a well-established risk of Cytarabine-induced keratoconjunctivitis, thus routine prophylaxis with topical corticosteroid eye drop is usually initiated in

patient undergoing FLAG chemotherapy. However, usage of topical corticosteroid eye drop can cause steroid – induced increase in intraocular pressure (IOP) and may lead to steroid- induced glaucoma. We report two cases of paediatric patients with relapsed AML undergoing FLAG chemotherapy and on prophylaxis prednisolone acetate eye drop 2 hourly. Both patients presented with headache after one week on prednisolone acetate eye drop that was initiated during the FLAG chemotherapy. Initial examination shows IOP range from 22-40 mmHg which responded to treatment with beta-blocker and prostaglandin analogue anti-glaucoma. Subsequently, lower potency topical corticosteroid eye drop was prescribed to minimize the elevation of IOP during on-going FLAG chemotherapy.

Conclusions: In patient undergoing FLAG regimen, it is crucial to use topical corticosteroid to minimize the inflammatory adverse effect on the eye, however, lower potency steroid is preferable to reduce the incidence of steroid- induced increase IOP and patient referral to Ophthalmology for IOP monitoring is crucial to prevent steroid- induced glaucoma.

Abstract No.: 205464

Structural and Functional Alterations in Concomitant Strabismus and Strabismic Amblyopia: A Multimodal Magnetic Resonance Imaging Study

First Author: Yiru **HUANG**

Co-Author(s): Zhengjia **DAI**, Daming **DENG**, Zitian **LIU**, Yanyan **WU**, Minbin **YU**

Purpose: To characterize alterations in white matter microstructure and spontaneous brain activity in patients with concomitant strabismus (CS) and strabismic amblyopia (SA) using multimodal magnetic resonance imaging (MRI).

Methods: Seventeen patients with CS, 19 with SA, and 22 age- and gender-matched normal controls (NC) underwent diffusion tensor imaging (DTI) and resting-state functional MRI (rs-fMRI). Fractional anisotropy (FA) and mean diffusivity (MD) were derived from DTI data to assess white matter integrity in visual pathways. The fractional amplitude of low-frequency fluctuations (fALFF) was calculated from rs-fMRI data to evaluate spontaneous brain activity.

Results: Relative to NCs, both CS and SA groups showed significantly increased MD and decreased FA in the optic tract, optic radiation, interhemispheric primary visual cortex, and medial temporal complex pathways. Aberrant fALFF was observed across multiple brain regions, including the parietal, occipital, frontal, and temporal lobes, as well as the insula, cerebellum, and hippocampus. The extent of microstructural changes (MD/FA) correlated positively with the duration of ocular misalignment. In SA patients, fALFF in the left middle frontal gyrus was negatively correlated with

the best-corrected visual acuity of the amblyopic eye. Although no significant differences in MD/FA were detected between CS and SA patients, receiver operating characteristic (ROC) analysis indicated that fALFF in the left middle frontal gyrus effectively discriminated SA from CS.

Conclusions: Chronic ocular misalignment is associated with microstructural abnormalities in the visual pathways and widespread disruptions in spontaneous brain activity, whose extent is linked to the severity of visual impairment, offering neurobiological insights into strabismus and strabismic amblyopia.

Abstract No.: 204682

Stuck, Not Severed: Medial Rectus Dysfunction Following Functional Endoscopic Sinus Surgery

First Author: Snehal **GANATRA**

Co-Author(s): Aniket **DAVE**, Dhvani **MAHESHWARI**, Bhavik **PANCHAL**, Nilesh **PATEL**

Purpose: To report a rare case of strabismus post-functional endoscopic sinus surgery (FESS), due to combined restriction from fat adherence and medial rectus paresis, and to highlight the diagnostic and surgical challenges.

Methods: A 42-year-old male developed binocular diplopia shortly after FESS. Examination revealed -4 limitation of right eye adduction associated with a 65 prism diopter exotropia. CT orbit showed an 11 mm lamina papyracea defect, while MRI demonstrated anterior displacement of the medial rectus adherent to the defect with posterior thickening. On surgical exploration, forced duction testing was +4 tight for the medial rectus and +2 tight for the lateral rectus. Dense adhesions were identified between the medial rectus, Tenon's capsule, and orbital fat, which were released. In addition, 5 IU botulinum toxin was injected into the lateral rectus muscle.

Results: On day 1, alignment showed minimal improvement. At 1 week, abduction was -3 from the botulinum toxin effect, but the patient was diplopia-free with only a small residual face turn, representing meaningful symptomatic relief. Ongoing follow-up is planned to evaluate medial rectus recovery and long-term alignment.

Conclusions: Medial rectus dysfunction after FESS is often attributed to transection, but this case highlights that fat adherence and tethering can also produce profound motility limitation and large-angle exotropia. While such a mechanism might be expected to cause esotropia, the coexistence of medial rectus paresis likely explained the exotropia. Even with adhesiolysis and botulinum toxin, full correction is difficult, highlighting the need for early imaging, tailored surgery, and patient counselling for multiple procedures.

Abstract No.: 205736

Surgical Outcome of Exotropic Duane Syndrome

First Author: Heba **FOUAD**

Co-Author(s): Ahmed **ALI**

Purpose: To evaluate the surgical outcome of exotropic Duane syndrome and the factors that can influence the outcome.

Methods: A retrospective study was performed on patients who had surgery for exotropic Duane syndrome with a minimum follow-up of 3 months. The ocular motility, the angles of deviation, the presence of abnormal head turn or overshoots, the surgical procedures performed, and their outcome were analyzed.

Results: Sixty-seven patients were identified (mean age, 11.3 years). In unilateral cases with exotropia <25 PD (n = 28), ipsilateral lateral rectus (LR) recession was performed in all cases, and orthophoria was achieved in 25 patients (89.3%). In unilateral cases with an angle ≥25 PD, ipsilateral LR recession was performed in 13 patients, bilateral symmetrical LR recession in eight patients, and unilateral LR recession and medial rectus (MR) resection in seven patients. Sequential contralateral LR recession for undercorrection was performed in seven patients. The success rate was highest in those who had unilateral LR recession and MR resection (66.7%). An increase in face turn occurred in 6 of 15 patients (40%) who had a simultaneous or sequential bilateral LR recession. In bilateral Duane syndrome, bilateral LR recession was performed in 10 patients, and was combined with ipsilateral MR resection in two patients, with a success rate of 75%. A higher success rate was associated with young age at surgery (P = .03), and smaller angle of deviation (p = .04). The mean follow-up was 6.3 months.

Conclusions: Surgical results in exotropic Duane syndrome are better in small angles of deviation and in younger age groups.

Abstract No.: 203360

Surgical Outcomes of Asymmetric Bilateral Medial Rectus Recession in the Treatment of Sixth Cranial Nerve Palsy

First Author: Hang **TRAN**

Co-Author(s): Giang **BUI**, Son **BUI**, Thanh **HA**, Lieu **LE**

Purpose: This study was conducted to evaluate the results of asymmetric bilateral medial rectus recession in the treatment of sixth cranial nerve palsy.

Methods: This study is a prospective and interventional clinical case series of 12 patients presenting with acute onset of symptomatic partial sixth cranial nerve palsy of > 6 months duration and the function of the lateral rectus muscle has partially or fully recovered, who received asymmetric bilateral medial rectus recession.

Results: A total of 12 patients (4 females 8 males ; mean age 35.25 ± 10.49) were included. Mean preoperative esotropia (ET) was $48.33 \pm 10.94\Delta$ in primary gaze at distance (range, 30-60 Δ), $53.33 \pm 11.15\Delta$ in ipsilateral gaze (range, 35-65 Δ). $43.34 \pm 9.01\Delta$ in contralateral gaze (range, 25- 55 Δ). Medial rectus recession averaged 5.62 ± 0.61 mm (range, 4.5- 6.5 mm) in the affected eye, 6.42 ± 0.60 mm in the unaffected eye (range 5.5-7.0 mm). The follow-up period is 6 months. In 11 cases (91.67%), the postoperative deviation in primary position was within 10 PD of orthotropia ($3.08 \pm 7.33\Delta$). Average esotropia in the ipsilateral position improved from $53.33 \pm 11.15\Delta$ preoperatively to $6.00 \pm 8.79\Delta$ postoperatively. 1patients (8.34%) had residual esotropia (>15 PD). A second resection of the lateral rectus muscle in the affected eye of 1 patient resulted in complete resolution of esotropia.

Conclusions: Our study showed that asymmetric bilateral medial rectus recession eliminated the esotropia in most of our patients with partial sixth cranial nerve palsy.

Abstract No.: 201596

The Affecting Factors, Motor Outcome, and Sensory Outcome of Post-Operative Muscle Correction of Acute Acquired Comitant Esotropia

First Author: Phakdichaya **CHIEWCHANWIT**

Co-Author(s): Arpha **PORNSETH**, Jirapa **SONGPETCHMONGKOL**, Phantaraporn **TANGTAMMARUK**

Purpose: To evaluate the factors influencing surgical outcomes and assess both motor and sensory results following muscle correction

Methods: A retrospective review was conducted on 35 patients who underwent strabismus surgery between August 2021 and June 2024. The primary outcome measures included motor success—defined as ocular alignment within 8 prism diopters at near and distance—and sensory success, characterized by stereoacuity ≥ 60 sec/arc, assessed at one-year follow-up. Factors including demographic data, refractive error, Neuro-imaging, duration before surgery, deviation angle, and surgical intervention were compared between groups.

Results: Mean age at onset was 11.6 ± 9.19 years, with male predominance (80%). Refractive error was minimal (-0.14 ± 2.17 D), and neuro-imaging was normal (94.3%). Mean duration before surgery was 19 ± 22.20 months. Pre-operative deviations averaged at near 45.43 ± 12.09 PD and distance 45.51 ± 11.40 PD. While 97.1%(34/35) achieved motor success, only 54%(19/35) attained sensory success. Statistical analysis revealed that factors such as age ($P = .17$), sex ($P = 1.0$), refractive error($P = .97$), deviation angle ($P = .58$ and $.79$), duration before surgery ($P = .36$),

and surgical intervention ($P = .69$) did not significantly influence outcomes.

Conclusions: Motor function can be reliably restored with surgery, but sensory recovery, including bifoveal fixation, may take additional time. Early surgical intervention is crucial, but patience is vital for full sensory restoration, highlighting the importance of individualized management.

Abstract No.: 203534

The Association between Anthropometric Parameters and Peripheral Retinal Defocus, Retinal Radius of Curvature in School-Age Children

First Author: Wu **HAO**

Purpose: To investigate the association between anthropometric parameters and peripheral retinal defocus axial, retinal radius of curvature in school-age children.

Methods: A case series study. From March to July 2025, 334 school-age children(334 eyes) treated in the Department of Pediatric Ophthalmology of Third Affiliated Hospital of Jinzhou Medical University were included. The central axial length(CAL) and PAL at 15°, 20° and 30° from the nasal and temporal side of the fovea were measured by SWan instrument under natural pupil conditions in a dark room, and absolute value of difference of peripheral axial length(| Δ DPAL|) were calculated, then calculated the retinal coordinates through the partial coherence interferometry(PCI) modeling method and converted them into retinal radius of curvature. The height, weight were measured, and body mass index(BMI) were calculated. Multivariate linear regression analysis were used to analyze the association between physical development indicators and ocular biometry parameters such as such as PAL, | Δ DPAL|, retinal radius of curvature and RDV.

Results: After controlling for confounding factors such as age, gender in multivariate linear regression, in E group, height was positively correlated with CAL, nasal and temporal PAL at 15°, 20° and 30°, nasal-temporal | Δ DPAL| at 15°, 20° and 30° ($P < 0.05$, which was negatively correlated with the retinal radius of curvature. while height had no correlation with SE ($P > 0.05$). In L-my group. Height was positively correlated with CAL($P < 0.05$), nasal and temporal PAL at 15°, 20° and 30°($\beta = 0.038-0.042$, $P < 0.05$), nasal-temporal | Δ DPAL| at 15°, 20° and 30° ($P < 0.05$), which was negatively correlated with the retinal radius of curvature($P < 0.05$) and SE($P < 0.05$). In H-my group. Height was positively correlated with CAL($P < 0.05$), nasal and temporal PAL at 15°, 20° and 30°($P < 0.05$), nasal-temporal | Δ DPAL| at 15°, 20° and 30°($P < 0.05$), which was negatively correlated with the retinal radius of curvature($P < 0.05$) and SE($P < 0.05$). However, weight and BMI of children with three groups was not

correlated with ocular biometry parameters such as PAL, |ADPAL| and retinal radius of curvature ($P>0.05$).

Conclusions: In taller school-aged children, the nasal PAL is longer than the temporal one and is accompanied by a smaller retinal radius of curvature, presenting as steep and asymmetric retinal morphology. However, weight and BMI has no correlation with PAL and radius of retinal curvature.

Abstract No.: 202857

The Burden of Vision Loss Due to Diabetic Retinopathy in Asia From 1990–2021: Findings From the Global Burden of Disease Study 2021

First Author: Yatu GUO

Co-Author(s): Dongyan ZHANG, Wei ZHANG

Purpose: We produced comprehensive estimates of VI due to DR in Asia. These estimates were segmented by location, age, and gender for the period between 1990 and 2021. Furthermore, we projected the burden of DR up to 2050.

Methods: The study included an analysis of DR-induced VI severity across Asian countries. The Estimated Annual Percentage Change was calculated to illustrate trends at the regional and national levels. Bayesian age-period-cohort analysis was used to project future prevalence trends up to 2050.

Results: From 1990 to 2021, the age-standardized prevalence rate (ASR) and YLDs rate of DR in Asia significantly increased, with higher rates consistently observed in women. The elderly experienced a greater burden, with increasing rates of VI and YLDs with age. Moderate vision impairment (MVI) constituted the majority of DR-related ASR in Asia. Most Asian countries have a Sociodemographic Index (SDI) at low-medium to medium levels, and correspondingly low ASR. According to BAPC projections, by 2050, the YLDs rate for DR in Asia will decrease to 3.92 for males and 4.96 for females.

Conclusions: Over the past 30 years, the burden of DR in Asia has increased, with persistent gender disparities and substantial variation among countries. This study displayed the importance of DR prevention, particularly for women and the elderly. BAPC projections suggested a decreasing trend in YLDs rate due to DR over the next 30 years.

Abstract No.: 203498

The Minimal Extraocular Muscular Limbal Incision: a New Conjunctival Approach to Strabismus Surgery

First Author: Wenqiu ZHANG

Co-Author(s): Longqian LIU

Purpose: To present a new, minimally invasive strabismus approach (Minimal extraocular surgery muscular limbal incision) for rectus muscle operations.

Methods: The study included 54 patients (age 14.63 ± 8.00 years) in the inpatient department of ophthalmology, West China Hospital, Sichuan University from January 2018 to January 2020. They were randomly assigned to the minimal extraocular muscular limbal incision group (group A) or the limbus incision group (group B). The operating time, intraoperative bleeding, conjunctival incision extending, ocular irritation, conjunctival hyperemia, conjunctival chemosis, lid edema and conjunctival scarring were recorded.

Results: The cure rates were 100% on postoperative day 1. 2 patients developed strabismus recurrence and 2 patients represented under correction in group A. 1 patient developed strabismus recurrence and 1 patient represented under correction in group B. The operating time of group A was shorter than that of group B ($P < 0.05$). The amount of intraoperative bleeding in group A was less than that in group B ($P < 0.05$). The conjunctival chemosis on day 1 and week 1 were different in 2 groups ($P < 0.05$). The conjunctival hyperemia of patients on day 1, week 1, month 1 and month 3 were also different ($P < 0.05$). However, the other indicators were not different among 2 groups at 1 day to 6 months postoperatively (all $P > 0.05$).

Conclusions: The new conjunctival incision is a safe, effective approach with less complications for strabismus surgery.

Abstract No.: 205365

The Relationship Between Small-Angle Intermittent Exotropia and Myopia Progression in Adolescents, and the Effect of Exotropia Surgery on Myopia

First Author: Duo XU

Purpose: To investigate the relationship between small-angle intermittent exotropia (IXT) and myopia in adolescents, and the effect of surgery on myopia.

Methods: Two hundred cases of IXT in the recent 1 year, aged 6~18 years, diopter $-1.00D \sim -7.50D$, were divided into two stages. The first stage: Observation group 100 was a small-angle IXT- $10 \sim 20$ and the score of eye position control ability NCS was ≤ 3 points, and the contrast intensity of IXT was $-20 \sim -50$, the NCS was > 3 points. In the second stage, patients with strabismus ≥ 15 and NCS (≥ 5) were treated with strabismus surgery.

Results: The spherical equivalent (SE) of the observation group and the control group was $-2.00 \pm 0.97D$ and $-1.95 \pm 0.65D$, respectively ($P > 0.05$). One year after treatment later, the SE were: $-3.25 \pm 0.68D$, $-2.75 \pm 0.72D$, the SE of both groups increased compared with that of pre-intervention ($P < 0.05$), and axial lengths (AL) of the two groups were: $24.98 \pm 0.28mm$ and $25.00 \pm 0.87mm$ ($P > 0.05$). After 1 year, the AL in both groups increased by $0.48 \pm 0.68mm$ and $0.32 \pm 0.28mm$, respectively, significantly higher than that of pre-intervention, and the observation group was higher than the control group ($P < 0.05$). After 1 year, the score of eye position control ability: observation group was 4.56 ± 1.62 , the control group was 6.75 ± 1.02 , and the control scores of both groups were increased by 2.45 ± 0.82 and 2.26 ± 0.67 , respectively, compared with 1 year ago, and the control force was worse ($P > 0.05$). The baseline convergence of the two groups was 17.04 ± 1.97 , 14.62 ± 1.47 ($P < 0.05$), and one year later it was 19.10 ± 2.02 and 11.12 ± 1.49 , respectively. (the second stage) The SE of the two groups before surgery were $-3.50 \pm 0.08D$ and $-2.54 \pm 0.02D$ ($P < 0.05$), and 1 year after surgery were $-4.06 \pm 0.28D$ and $-3.08 \pm 0.62D$, respectively, which were significantly increased compared with those before surgery ($P < 0.05$), but the differences were not statistically significant ($P > 0.05$). The AL in the two groups were $25.46 \pm 0.58mm$ and $25.30 \pm 0.76mm$ before surgery, and $25.64 \pm 0.38mm$ and $25.50 \pm 0.68mm$ one year after surgery.

Conclusions: Children with small-angle IXT and better eye position control ability are more likely to have myopia and increased AL drift in order to control the increase in eye position convergence than children with large-angle strabismus and poor eye position control, and surgical correction can significantly slow down the rapid progression of myopia.

Abstract No.: 202050

Through the Martini Glass: A Rare Case of Bilateral Persistent Fetal Vasculature"

First Author: Gebriellea DASS COWIE JOHN
Co-Author(s): Mohamad Israk B ISA, Nor Fadhilah BINTI MOHAMAD, Fhun LAI CHAN, Melissa WANG

Purpose: We present a rare case of bilateral Persistent Fetal Vasculature (PFV) in a 4-month-old boy presenting with leukocoria.

Methods: Case report.

Results: A 4-month-old boy presented with bilateral leukocoria since 2 months of age. He is the firstborn of a non-consanguineous union with unremarkable antenatal and perinatal history, no family history of malignancies. Examination revealed horizontal nystagmus, absent relative afferent pupillary defect, and retrolental masses in both eyes. Magnetic Resonance Imaging (MRI) of the brain and orbits revealed hypointense retrolental stalks connecting

the optic discs to the posterior lens capsules in both eyes, revealing a «martini glass» appearance along with bilateral anterior chamber distortion, right lens thickening, and optic nerve hypoplasia. Examination under anesthesia revealed bilateral microcornea, left corneal haze, posterior embryotoxon, posterior synechiae, shallow anterior chambers, congenital cataracts, and a normal intraocular pressure. Ultrasound doppler performed by paediatric radiologist confirmed vascular flow within the retrolental stalks. Referral to the paediatric team ruled out presence of any systemic disorders and syndromes.

Conclusions: This case shows the importance of a multidisciplinary collaboration in diagnosing and managing bilateral PFV, particularly when masquerading as intraocular malignancy.

Abstract No.: 203126

Traumatic Hyphema Followed by Vitreous Hemorrhage in a Pediatric Patient With Kawasaki Disease

First Author: Kuo Hua JUAN
Co-Author(s): Yi An LU

Purpose: To outline the complications and management of traumatic hyphema in a Kawasaki disease (KD) child on aspirin treatment.

Methods: Case report.

Results: A 9-year-old boy presented with sudden, painful, blurred vision in his left eye following a soccer ball injury three days prior. He had KD complicated with coronary artery aneurysms (CAAs) at 6 months old, and despite CAAs regression, he continued on prophylactic low-dose aspirin (3-5mg/kg/day). The initial visual acuity (VA) was hand motion, and the intraocular pressure (IOP) was 51 mmHg. The Slit lamp exam showed total hyphema, yet no retinal detachment or neoplasm was found on B-scan ultrasonography. Traumatic hyphema with ocular hypertension was impressed. Mannitol, acetazolamide, and topical antiglaucomatous drops were administered with successful IOP reduction (15 mmHg). We discontinued aspirin and added oral tranexamic acid for 1 week. Gradual reduction in hyphema and well-controlled IOP were recorded in 1-day and 3-day follow-up. However, an undetectable rise in IOP occurred during the one-week follow-up. We arranged anterior chamber irrigation with IOP and VA amelioration. Nevertheless, blurred vision recurred on postoperative day 6 despite a relatively stable IOP (16mmHg). Vitreous hemorrhage (VH) without retinal detachment was evident. Vitrectomy was performed, resulting in an improvement in VA to 6/10 on post-vitrectomy day 5 and maintained at 7 months follow-up without significant sequela.

Conclusions: The use of prophylactic aspirin may require a multidisciplinary discussion. VH may occur

with or after hyphema due to blood seeping from the anterior chamber or capillary damage in the ciliary body, necessitating prompt intervention.

Abstract No.: 202151

Trends of Pediatric Ocular Trauma in South Korea: An Epidemiological Study Based on the National Health Insurance Claim Database

First Author: Eun Hee HONG

Co-Author(s): Jiyeong KIM, Ungsoo KIM, Han Woong LIM

Purpose: To investigate the population-based incidence and patterns of pediatric ocular trauma using the comprehensive Korean National Health Insurance Service (NHIS) database.

Methods: We extracted data of patients under 18 years of age who visited the clinic and received an initial diagnosis of ocular trauma (based on the Korean Classification of Diseases) from 2010 to 2023. Diagnostic codes for ophthalmic trauma were categorized into 6 types: closed globe injury, open globe injury, orbital injury, cranial nerve injury, ocular & periocular burn, and other injury. The annual incidence of ocular trauma according to trauma types and demographics, including age and sex, were investigated.

Results: We identified 714,284 cases of first-time ocular trauma diagnoses during the study period. The average incidence (per 100,000 children) between 2010 and 2023 was 587.63 in total. The most common type was closed globe injury (87.5%), followed by orbital injury (7.6%). The incidence was significantly higher in boys than in girls overall (727.90 in boys; 437.09 in girls) and across all types. Age-specific patterns varied among trauma types. Annual incidence showed a decreasing trend from 2010 and 2023, with a sharp decline in 2020 during the COVID-19 pandemic, followed by increases between 2021 and 2023.

Conclusions: This nationwide population-based study provides valuable insights into pediatric ocular trauma epidemiology in South Korea over 14 years. By examining data spanning over a decade, the findings, including sex differences, age-specific patterns, and temporal trends, could provide valuable insights for developing targeted prevention strategies pediatric populations.

Abstract No.: 205593

True Transposition: A Novel Technique for Large-Angle Exotropia

First Author: Mahathi VANKIREDDI

Co-Author(s): Divya Bhargavi KATTA

Purpose: To study the efficacy of true transposition, a novel technique in the management of large-angle exotropia.

Methods: Retrospective analysis of case sheets of patients with exotropia of more than 55 PD, who underwent lateral rectus recession with medial rectus resection with true transposition was done.

Results: Among 10 patients, 4 had sensory exotropia, and the remaining had poor stereopsis. All had good correction with residual exotropia of no more than 10PD exotropia.

Conclusions: True transposition is an effective uniocular surgery for the management of large-angle exotropia with good results.

Abstract No.: 201280

Unlocking the Mystery: Surgical Outcomes in Exotropic Duane Retraction Syndrome With Severe Upshoot – A Case Report

First Author: Shahrina Mahfooz RAKA

Co-Author(s): Mamunur Rashid CHOWDHURY

Purpose: This report details an intriguing case of exotropic Duane retraction syndrome (DRS) characterised by pronounced upshoots and abnormal ocular motility in the left eye. We will also explore the surgical management employed at a leading tertiary centre in Bangladesh.

Methods: A 20-year-old patient presented with exotropic DRS in the left eye. Best-corrected visual acuity was 6/6 in the right eye and 6/9 in the left eye with -2.00 D cylinder at 180°. Ocular motility was full in the right eye, while the left eye showed both adduction and abduction deficits, severe upshoot on adduction, and narrowing of the palpebral fissure. Preoperative prism cover testing revealed 45° exodeviation. Binocular single vision was absent, with suppression of the left eye. Surgical intervention included bilateral lateral rectus recession (BLRC) of 9 mm and 15 mm Y-splitting of the left lateral rectus.

Results: Postoperatively, there was marked improvement in exodeviation and upshoot, with a reduction of palpebral fissure narrowing during adduction in the left eye. A small residual exodeviation remained. Diplopia resolved, and visual acuity was maintained.

Conclusions: BLRC combined with Y-splitting of the lateral rectus effectively reduces upshoots and corrects significant exodeviation in exotropic DRS, improving ocular alignment and cosmetic appearance, even in the

presence of severe motility deficits and preoperative suppression.

Abstract No.: 201216

Unmasking a Pediatric Brain Tumour Through Atypical Ophthalmic Signs

First Author: Chiu Ling LIM

Co-Author(s): Puspadevi ARMUGHAM, Azlyn Azwa JASMAN, Nurliza KHALIDDIN

Purpose: To report a rare presentation of a pediatric brain tumour initially manifesting as diplopia and headache, highlighting the importance of comprehensive neuro-ophthalmic assessment and timely neuroimaging for accurate diagnosis.

Methods: Case Report

Results: A 12-year-old boy with no prior medical history presented with a 7-month history of transient diplopia accompanied by intermittent occipital and frontal headaches. Two weeks before presentation, his father noted an inward deviation of the left eye. Examination revealed horizontal nystagmus and left sixth cranial nerve palsy. Visual acuity was 6/12 OU and 6/36 OS, with no improvement with pinhole. A relative afferent pupillary defect was present in the left eye. Both eyes anterior segment examination was unremarkable, with intraocular pressures of 16 mmHg in both eyes. Fundus examination showed bilateral optic disc swelling, along with dilated and tortuous retinal vessels. Urgent contrast-enhanced computed tomography of the brain and orbits demonstrated a well-defined, enhancing hyperdense lesion localized to the left thalamus, extending to the midbrain, with perilesional edema, mass effect, and acute hydrocephalus. The patient was admitted to the neurosurgical for emergency cerebrospinal fluid diversion.

Conclusions: This case underscores the importance of maintaining a high index of suspicion for intracranial pathology in children presenting with acute-onset strabismus and neurological signs. Early neuroimaging is crucial to ensure timely diagnosis and intervention, potentially preventing severe morbidity and mortality.

Abstract No.: 203963

Unusual Indication for Strabismus Surgery – More Than Meets the Eye

First Author: Alvin TEO

Co-Author(s): Sonal FARZAVANDI

Purpose: To present an unusual indication of strabismus surgery in a monocular patient with Graves' disease.

Methods: A 62-year-old lady with sight-threatening Graves' disease was treated with orbital radiotherapy, medical, and surgical decompression. Despite this, her left eye was blind from compressive optic neuropathy. She had a markedly restrictive hypotropia in the right

eye, causing her to adopt an extremely uncomfortable compensatory head posture, with severe muscular spasms in the neck and upper back. This affected her navigational ability, necessitating assistance in unfamiliar places. Hence, she insisted on surgery, and a right inferior rectus recession with conjunctival autograft was planned. Initial passage of the Mersilene suture through the muscle stump was not secure, and it was removed. A repeat attempt was made at an adjacent site. While pulling up the tight muscle to the desired recession point, a tiny scleral dehiscence was noted at the site of the original scleral pass with uveal exposure.

Results: The complication was identified. There was no vitreous prolapse, and the scleral dehiscence was sutured. Indirect ophthalmoscopy was unremarkable. The hang-back suture was repeated and anchored through more of the muscle stump. The conjunctiva was closed with an autograft.

Conclusions: This case illustrates an unusual indication for strabismus surgery in Graves' disease. Orbital radiation can affect the ocular surface and sclera. One must be prepared to handle unexpected complications and give the patient a good outcome.

Abstract No.: 205288

Unveiling the Differences Between Static Stereopsis and Motion-in-Depth Perception in Intermittent Exotropia

First Author: Xiaohang CHEN

Co-Author(s): Min LAN, Longqian LIU

Purpose: To evaluate and compare motion-in-depth perception and static stereopsis deficits in patients with intermittent exotropia who undergo surgical intervention, as well as in normal controls, utilizing consistent measurement techniques and protocols.

Methods: This prospective study included 40 postoperative patients with intermittent exotropia and 29 normal controls. All participants underwent comprehensive ocular examination, motion-in-depth perception, and static stereopsis evaluation using the same method. The threshold and response times for processing the stereopsis information were recorded.

Results: The threshold for motion-in-depth perception at 88 pixels/s was 73 (54–220 arc sec) in patients, and the threshold for static stereopsis was 35 (35–91.5 arc sec), which was significantly better than that in the motion-in-depth perception test ($p < 0.0001$). The motion thresholds for motion-in-depth perception ($p < 0.0001$) and static stereopsis ($p = 0.048$) in patients differed significantly from those in the control group. The time to completion of the static stereopsis test was less than that of the motion-in-depth perception test in patients with intermittent exotropia ($p < 0.0001$). The thresholds of the stereopsis test negatively correlated with the ocular deviation angle and positively

correlated with age in patients with intermittent exotropia.

Conclusions: Patients with intermittent exotropia who undergo surgical intervention had better static stereopsis than motion-in-depth perception, the response time for static stereopsis information processing was shorter than that for motion-in-depth perception. The thresholds of static stereopsis and motion-in-depth perception demonstrated significant correlations with both the ocular deviation angle and age among patients with intermittent exotropia undergoing surgical intervention.

Abstract No.: 205708

Validity and Reliability of the Indonesian Version Pediatric Eye Questionnaire in Children Age 5-11 Years With Low Vision

First Author: Eduard Jordi **LUMINTA**

Co-Author(s): Rita **SITA SITORUS**

Purpose: Assessment of functional vision and quality of life in children is hard to be done due to limitations in verbal communication or uncooperativeness, however it is important to be performed for comprehensive evaluation of children with visual impairment. One of the widely available instrument is the Pediatric Eye Questionnaire (PedEyeQ), but it is not directly applicable in Indonesia and must be adapted first. This poster will present the transcultural adaptation of PedEyeQ, as well as its validity and reliability testing.

Methods: The original PedEyeQ undergoes transcultural adaptation which includes forward translation by two sworn translators, reconciliation of translations, backward translation by another two translators, focus group discussion between experts, cognitive debriefing of the questionnaire, and last the pilot study involving 40 children with low vision along with their parents/guardians. Completed questionnaire then tested for validity using Content Validity Index (CVI) and spearman correlation between each question and total score from each domain. Reliability is tested using Cronbach Alpha to find the internal consistency of each domain in the questionnaire.

Results: The adapted PedEyeQ shows good validity with total agreement on all questions, achieving 100% CVI. Spearman correlation shows correlation of more than 0.30 with P value<0.05 on every questions, which passes the threshold for significant correlation between the score of each item to its total domain score. Cronbach Alpha results is more than 0.70 in all domain, implicating all the questions in each domain are testing the same concept.

Conclusions: The Indonesian version of the PedEyeQ is a valid and reliable tool to be used for assessment of functional vision and quality of life in low vision children and their parents. Further research must be

done to assess the external validity and full extent of its applicability in real world setting.

Abstract No.: 206944

Vertical Diplopia Following Glaucoma Surgery: Two Case Reports

First Author: Elpida **KOLLIA**

Co-Author(s): Eleni **PATSEA**

Purpose: To report two cases of vertical diplopia following glaucoma surgery and emphasize the importance of recognizing iatrogenic extraocular muscle injury.

Methods: Two patients developed persistent vertical diplopia after glaucoma surgery. The first was a 66-year-old female who underwent trabeculectomy. The second was a 78-year-old male who received a Paul® glaucoma valve implant. Both presented with vertical diplopia consistent with superior rectus under correction. Comprehensive work-up, including orbital magnetic resonance imaging (MRI) and blood tests, was performed to exclude alternative etiologies.

Results: In both cases, investigations did not reveal underlying systemic or orbital pathology. The clinical findings were consistent with injury related to surgical manipulation near the superior rectus muscle. Prism correction was prescribed and successfully alleviated diplopia, providing satisfactory functional outcomes without the need for surgical intervention.

Conclusions: Vertical diplopia is a rare but visually disabling complication of glaucoma surgery. These cases suggest that proximity of surgical manipulation during trabeculectomy or glaucoma drainage device implantation may predispose to superior rectus involvement. Early recognition, careful exclusion of alternative causes, and timely symptomatic management with prisms are essential to restore visual comfort and improve quality of life. Surgeons should remain aware of this potential complication and take precautions to minimize risk.

Abstract No.: 203489

Visual Experience-Dependent Ocular Dominance Plasticity in the Subcortical Structures

First Author: Xuefeng **SHI**

Purpose: Experience-dependent ocular dominance (OD) plasticity is a fundamental mechanism through which the visual system adapts to imbalances in input between the two eyes during development. Since the pioneering work of Hubel and Wiesel, this phenomenon has been extensively studied in the primary visual cortex (V1). However, the view that the visual cortex is the sole site of critical-period visual plasticity has now been challenged.

Methods: First, we demonstrate that the superior colliculus (SC) contains a substantial population of binocular neurons that exhibit robust OD plasticity during the critical period. Interestingly, while similarities exist between OD plasticity in SC and V1, there are notable differences in the mechanisms of this plasticity in the two regions. SC plasticity is independent of cortical input and is instead directly influenced by retinal projections. Furthermore, it is less affected by perineuronal nets compared to V1.

Results: Second, we also show that in the dorsolateral geniculate nucleus (dLGN), four-day monocular deprivation during the critical period in mice induces a significant OD shift in binocular neurons. This shift is driven primarily by potentiation of responses through the non-deprived eye, rather than depression of the deprived eye—a contrast to conventional observations in V1.

Conclusions: Collectively, these findings suggest that subcortical structures may contribute more significantly to developmental visual disorders such as amblyopia than previously recognized, which involves different neural mechanisms.

Abstract No.: 204456

Visual Function, Social Interaction, and Anxiety Among Schoolchildren: Findings from the LEARN-Well Preliminary Study

First Author: Kianti Raisa DARUSMAN

Co-Author(s): Beta ASWARNI, Ray Wagiu BASROWI, Christella CAROLINE, Muthia Utami DESPI, Nila Farid MOELOEK, Bunga PELANGI, Tanessa Audrey WIHARDJI

Purpose: Because uncorrected refractive errors (URE) can impair learning and psychosocial wellbeing, yet local evidence is scarce, we examined whether poorer visual function is associated with difficulties in social interaction and anxiety among Jakarta schoolchildren, and characterised related symptom burden (eye fatigue, headaches, gadget exposure), including in children with disabilities.

Methods: Mixed-methods cross-sectional preliminary study in 15 schools (12 public primary, 3 special) across four Jakarta municipalities. Participants were 1,254 students (grades 4–6). Visual function and vision-related quality of life were measured using the adapted Pediatric Eye Questionnaire (PedEyeQ); peer interaction and anxiety were assessed via structured questionnaires and explored qualitatively in focus groups with teachers and parents. Analyses comprised descriptive summaries and thematic synthesis.

Results: Among non-disabled students, 52.3% reported reduced visual function and 48.9% reported functional limitations; 63.0% had high-intensity gadget use, with 33.7% eye fatigue and 29.3% headaches. In students with disabilities, 21.2% reported eye fatigue, and qualitative data indicated reduced social participation

and higher anxiety. Across groups, teachers and parents linked visual difficulties with withdrawal and lower engagement in group activities; spectacle non-compliance was commonly attributed to discomfort and stigma.

Conclusions: Impaired visual function is associated with challenges in social interaction and anxiety among Jakarta schoolchildren. Integrating psychosocial assessment within school-based vision screening may reveal hidden burdens and enable earlier, holistic intervention and referral.

Abstract No.: 200947

Visual and Refractive Outcome Following Surgical Intervention for Visual Axis Opacity (VAO) in Children in a Tertiary Eye Hospital

First Author: Quazi Sazzad IFTEKHAR

Co-Author(s): Halima ALIMI, Jannatul FERDOUS, Mohammad Mostafa HOSSAIN, Shahrina MAHFOOZ, Shifat TOUFIQUE

Purpose: To study the outcome after intervention for visual axis opacification in pediatric age group.

Methods: A retrospective observational study extracting demographic and clinical information from case notes of patients who had membranectomy and/or capsule polishing between October 2017 and September 2018.

Results: Fifty-seven eyes of 51 patients were enrolled. There was a 2:1 male: female ratio. Mean age at cataract surgery was 5.9 years, whilst that for VAO surgery was 9.2 years. Postoperative visual acuity (by WHO definition) was good (between 6/6 and 6/18) in 33.3%, compared to 8.8% preoperatively. Whereas presenting visual acuity was poor (<6/60) in 61.4% preoperatively, this reduced to 30% postoperatively. Children >8 years of age at the time of VAO surgery had a greater proportion of good post-operative BCVA (52.6%), whilst 75% of children younger than 8 years at the time of surgery turned out with poor BCVA after VAO surgery. Visual outcome was influenced by age at cataract and VAO surgery, interval between cataract and VAO surgery, and type of cataract. There was a range of refractive shift of +0.25 to -5.25 with a mean myopic shift of 1.51D following membranectomy. Developmental cataracts proportionately had the best outcome of visual acuity.

Conclusions: There was a good proportion of children with significant improvement in visual acuity on the short term in spite of a mild myopic shift following membranectomy.

Abstract No.: 200265**Voluntary Unilateral Reflective Saccade in a Patient With Intermittent Exotropia: A Case Challenging Bilateral Oculomotor Coordination***First Author: Han-chih CHENG*

Purpose: To describe a rare oculomotor dissociation in intermittent exotropia (IXT) whereby a unilateral reflexive saccade occurs immediately after a bilateral fixation saccade, and to consider its cortical control implications.

Methods: Single-case observational study. Standard orthoptic and motility evaluation included nine-gaze testing, cover-uncover/alternate cover tests, and binocular function (Worth 4-dot; diplopia symptoms). Saccadic function was assessed under routine binocular viewing and with a targeted paradigm instructing a central fixation saccade followed by a reflexive saccade. Responses were observed repeatedly for consistency.

Results: Ocular motility was full without cranial nerve palsy or mechanical restriction. Cover testing confirmed IXT with outward drift on occlusion and realignment on uncovering. Worth 4-dot showed no suppression; the patient reported diplopia during exotropic episodes. Routine saccade testing was normal. Under the targeted paradigm, the patient consistently executed a bilateral fixation saccade to center and then a unilateral reflexive saccade with one eye while the fellow eye maintained fixation. During the unilateral movement, the fixating eye showed a brief nasal drift that quickly recentered, suggesting transient influence from the contralateral saccadic command.

Conclusions: Findings support asymmetric, eye-specific engagement of supranuclear generators: volitional (FEF-mediated) fixation maintained in one eye while a reflexive (PEF-mediated) saccade is expressed in the other. The brief nasal drift implies partial, overcome inhibition (e.g., via inhibitory burst neuron pathways). This dissociation challenges strictly bilateral models of saccade coupling and highlights cortical plasticity relevant to strabismus mechanisms and potential therapeutic strategies.

Abstract No.: 202217**When Fries Take the Sight: A Case Series of Vitamin A Deficiency in Picky Eaters***First Author: Thasyalanee KALI DAVAN**Co-Author(s): Goh Siew Yuen, Lim Thiam Hou, Jason Allan Seng Soon CHEAH, Norhafizah HAMZAH*

Purpose: To report 2 cases of severe vitamin A deficiency causing ocular complications in children, linked to a diet dominated by French fries.

Methods: Two pediatric patients with ocular signs of vitamin A deficiency and highly selective eating habits

were evaluated. Clinical features, laboratory findings, and treatment outcomes were analyzed.

Results: Case 1: A previously healthy child developed bilateral xerophthalmia and corneal involvement associated with a diet limited to French fries. He required hospitalization and parenteral vitamin A supplementation, with partial visual recovery. Case 2: An 8-year-old boy with autism spectrum disorder presented with progressive visual loss and nyctalopia. His diet consisted almost exclusively of fries, chips, and bread for 2 years. Fundus examination showed bilateral temporal optic disc pallor, and serum vitamin A was 0.38 $\mu\text{mol/L}$ (normal, 0.9–3.0 $\mu\text{mol/L}$). Despite biochemical correction after supplementation, visual outcome remained poor.

Conclusions: Vitamin A deficiency can occur in high-resource settings due to extreme dietary selectivity, leading to irreversible vision loss. Awareness and early nutritional intervention are critical for prevention.

Abstract No.: 203017**When Strabismus Twists the Spine: Undiagnosed Strabismus Leading to Torticollis and Scoliosis***First Author: Yilynn CHIEW**Co-Author(s): Siew Yuen GOH, Tong Keat TIEN*

Purpose: To describe a case where long-standing undiagnosed strabismus contributed to abnormal head posture with secondary musculoskeletal sequelae.

Methods: Case report.

Results: A 31-year-old Chinese woman was referred for worsening alternating exotropia. She had a history of persistent right head tilt since childhood, treated surgically for neck torticollis at age 6. During adolescence, scoliosis was noted and followed by orthopaedics, but later discharged as the curve remained mild and stable without need for surgical intervention. Detailed ophthalmic and orthoptic evaluations were performed. Best-corrected visual acuity was 6/9 in both eyes with anisometropic myopia. Examination showed a constant right head tilt of 11°, subtle left hemifacial asymmetry, and scoliosis. Orthoptic assessment demonstrated a large-angle alternating exotropia (30–35 prism dioptres at near, 25–30 PD at distance) with bilateral dissociated vertical deviation. Extraocular movements were full but convergence was poor. Despite torticollis surgery and orthopaedic monitoring, the underlying ocular misalignment had remained undiagnosed for decades. The patient's chronic compensatory head posture, adopted to optimise binocular function, likely induced secondary cervical contracture, facial asymmetry, and spinal loss of normal lordosis.

Conclusions: This binocular visual disorder is one of important differential diagnosis in ocular torticollis, if unrecognised, may precipitate irreversible skeletal

changes. Early recognition and visual therapy in this scenario are critical to prevent scoliosis and facial asymmetry. Multidisciplinary vigilance is essential to ensure patients with abnormal head posture undergo timely ophthalmic evaluation.

Abstract No.: 202226

When the Skin Speaks for the Eyes: A Case of Incontinentia Pigmenti

First Author: Tan TZE ERN CARYN

Co-Author(s): Norakmal BAHARI, Li Yen CHAN, Fazliana ISMAIL, Shyan Ling LAU, Jamalia RAHMAT

Purpose: To report a case of incontinentia pigmenti presenting with both ocular and cutaneous manifestations. Incontinentia pigmenti is a rare X-linked dominant genodermatosis primarily affecting the skin, eyes, and central nervous system. The diagnosis is based on presence of characteristic skin lesions at birth.

Methods: A 2-month-old term baby girl, delivered via caesarean section due to breech and small gestational age, was referred for ophthalmologic evaluation after pathognomonic skin lesions consistent with incontinentia pigmenti were noted at birth. Family history revealed that the patient's mother and maternal aunt, two of five siblings had similar undiagnosed skin changes in childhood, which had progressed through stages characteristic of incontinentia pigmenti. Initial ophthalmic examinations at birth and at one month were normal. However, at two months, retinal abnormalities were detected, prompting referral to our centre.

Results: Examination under anaesthesia revealed bilateral retinal ischemia. The right eye showed perifoveal infarction, tortuous vessels, dot hemorrhages, and a large superonasal hemorrhage. The left eye had inferotemporal retinal ischemia, Roth spots, arteriovenous shunting, exudates, and preretinal hemorrhage. Fluorescein angiography confirmed vascular occlusion in both eyes, with no neovascularization. Bilateral 360° peripheral laser photocoagulation was performed. Her skin lesions progressed to the pustular-hyperkeratotic stage and were co-managed with dermatology. At one-month follow-up, foveal infarcts and retinal ischemia had resolved, with improved retinal vasculature and skin lesions transitioning to hyperpigmentation.

Conclusions: This case underscores the need for early recognition of incontinentia pigmenti and multidisciplinary care to prevent irreversible ocular complications and improve outcomes.

Refractive Surgery

Abstract No.: 204482

A Case of Reticular Epithelial Corneal Edema Due to Ripasudil Post-Implantable Collamer Lens (ICL) in a Young High Myopic Patient

First Author: Vijaylaxmi B

Co-Author(s): Vineeth B BHIMSHETTY

Purpose: To study the earliest time onset of reticular epithelial corneal edema in post ICL patient started on Ripasudil eye drop for raised IOP and corneal haze - a side effect of the drug.

Methods: A 21-year-old female with a high refractive error was advised a bilateral phakic intraocular lens. Preoperatively, intraocular pressure was OU- 20mmHg and the anterior segment was within normal limits. A fundus examination -myopic fundus. She underwent OU phakic intraocular lens surgery. The right eye was uneventful postoperatively. In left eye post-operative rise of intraocular pressure was 60mmHg. She was started on tablet acetazolamide 250mg stat; brimonidine + timolol eye drops twice a day, nepafenac eye drops two times a day, topical antibiotic with steroid combination, and lubricating eye drops. Post-operative day 1(POD-1)-left eye intraocular pressure was 40 mmHg, stromal corneal edema ,same treatment was continued. On Post-op day 5- IOP was 30mmHg with persistence of corneal edema for which she was started on Ripasudil eye drop (0.4%) twice a day. Two days later, i.e, On Post-op day 7, IOP was 23mmHg and had developed epithelial edema with localized honeycomb appearance suggestive of reticular epithelial corneal edema on anterior segment optical coherence tomography. Ripasudil (0.4%) eye drop was discontinued.

Results: Post-op day 10 -IOP was 22mmHg with resolution of corneal epithelial edema and visual acuity.

Conclusions: Reticular epithelial corneal edema as a well-established side effect of ripasudil and netarsudil. The potential risk factor in our case was pre-existing corneal edema, though the patient had no co-morbidities. Timely recognition and management of corneal edema in patients on ROCK inhibitors ensures better long-term ocular outcomes.

Abstract No.: 203679

A Preliminary Clinical Study in Visual Quality of Wavefront-Optimized and Corneal Wavefront-Guided Femtosecond Lasik for Myopic Astigmatism

First Author: Yuanyuan LU

Purpose: Comparing the clinical efficacy and postoperative visual quality of the wavefront-optimized

FS-lasik (WFO) group and the wavefront aberration-guided FS-lasik (WFG) group in the correction of myopia and astigmatism.

Methods: A total of 107 patients from Shenyang Aier Excellence Eye Hospital were selected. Patients with myopic astigmatism were treated using a 1050 Hz high-repetition excimer laser. The safety, efficacy, and corneal aberrations were compared preoperatively and 1, 2, 3, and 6 months postoperatively.

Results: The mean uncorrected distance visual acuity in WFO group and the WFG group were significantly improved at 1 day, 1 week, 1, 3 and 6 months after surgery. Corneal higher-order aberrations (HOAs) increased after treatment in both groups, although fewer HOAs were induced in the corneal wavefront-guided group than in the aberration-free group. There was no significant difference between the two groups in Trefoil at 1, 3 and 6 months after operation compared with preoperative. There was no significant change in the coma of the WFO group compared with the WFG group at 1 and 3 and at 6 months, the coma of the WFG group was significantly lower than that of the WFO group. The Strehl Ratio in the WFG group increased more significantly than that in the WFO group at 3 and 6 months after surgery.

Conclusions: Both aberration-free and corneal wavefront-guided FS-lasik have excellent safety and effectiveness for correction of myopic astigmatism. The high-order aberrations introduced by the corneal wavefront aberration-guided surgery are fewer, which can further optimize the visual quality of patients.

Abstract No.: 207122

A Rare Case of Bilateral Anterior Lens Dislocation in a Patient With Homocystinuria

First Author: Komal **PRIYA**

Co-Author(s): Jitendra **SINGH**, Satya Prakash **SINGH**

Purpose: This case underscores the importance of recognizing the ocular signs of homocystinuria, as early diagnosis and intervention can significantly improve patient outcomes and quality of life. Regular ophthalmic evaluations are crucial for patients with known metabolic disorders, enabling timely identification and management of lens dislocation and other associated complications.

Methods: A 42-year-old male with poor vision, watering, and redness was diagnosed with homocystinuria and bilateral anterior lens dislocation. Left eye showed spontaneous dislocation with corneal decompensation requiring lensectomy, vitrectomy, and iris claw implantation. Right lens was repositioned behind the pupil with pilocarpine and laser iridotomy to prevent glaucoma.

Results: Postoperatively, at day 1 the visual acuity was noted to be finger counting at 3 metres in the LE. After 2 weeks of follow up the BCVA in the RE was 6/24 with

-1.5DS/-1.25DC at 140 degrees, BCVA in LE was 6/60 with -2.00 DS/-0.75DC at 90 degrees.

Conclusions: Bilateral anterior spontaneous dislocation of the lens is a notable ocular manifestation in patients with homocystinuria, a genetic disorder linked to impaired methionine metabolism. The elevation of homocysteine levels in this condition can lead to structural changes in connective tissues, including the zonules that support the lens. This weakening may predispose the lens to dislocation, often presenting bilaterally.

Abstract No.: 203581

A Systematic Review and Network Meta-Analysis of Laser Refractive Surgery Modalities for the Correction of Myopia

First Author: Claire **GOH**

Co-Author(s): Ruochen **DU**, Eric **JIN**, Blanche **LIM**, Chris **LIM**, Chen-hsin **SUN**

Purpose: This systematic review and network meta-analysis aims to assess and compare the efficacy, predictability and safety outcomes of different surgical approaches in the correction of refractive errors in individuals with myopia. The three categories of comparison are flap-based corneal surgery, advanced surface ablation, and kerato-lenticule extraction (KLEx).

Methods: A literature search was performed on PubMed, EMBASE and ClinicalTrials.gov from inception to 03 March 2025. Outcomes included were efficacy (uncorrected distance visual acuity (UDVA) $\geq 20/20$, $\geq 20/25$, and $\geq 20/40$), safety (loss of ≥ 1 and ≥ 2 lines of best corrected visual acuity (BCVA) post-operatively) and predictability (post-operative spherical equivalent (SE) within $\pm 0.5D$ and $\pm 1.0D$ of the target refraction). All randomised controlled trials comparing two different categories were included. Outcome data were extracted at the last reported time point.

Results: Thirty-two articles with a total of 3224 eyes (2186 participants) were included. There were no statistically significant differences between any pair of treatment categories in terms of efficacy, safety and predictability ($p > 0.05$). In treatment comparative analyses with SUCRA, flap-based corneal surgery was ranked first in efficacy (UDVA $\geq 20/20$), and advanced surface ablation was ranked first in safety (loss of ≥ 1 lines of BCVA post-operatively) and predictability (post-operative SE within $\pm 1.0D$ of the target refraction).

Conclusions: In conclusion, categories of flap-based corneal surgery, advanced surface ablation, KLEx have broadly comparable outcomes in efficacy, safety, and predictability.

Abstract No.: 201607

Accuracy of Predictive Formulas for Vault Height in Phakic IOLs: A Comparative Study of IPCL and ICL

First Author: Sonam **YANGZES**

Co-Author(s): Divya **CHALLA REDDY**, Amit **GUPTA**

Purpose: To compare predicted and actual postoperative vault heights using NK and KS formulas in eyes implanted with phakic intraocular lenses (IPCL V2.0 and ICL), and evaluate their accuracy alongside other biometric parameters.

Methods: Forty eyes (20 IPCL, 20 ICL) underwent preoperative anterior segment OCT for predicted vault height, lens size (via NK and KS formulas), and crystalline lens rise. White-to-white was measured using digital calipers, Pentacam, and IOL Master. Postoperative vault height was measured at one month with AS-OCT.

Results: Mean preoperative BCVA was 0.2 LogMAR. Predicted lens sizes were 12.99 ± 0.41 mm (NK) and 13.57 ± 0.22 mm (KS), with predicted vault heights of 750.23 ± 350 μ m and 469.05 ± 141.81 μ m, respectively. The implanted lens size was 12.86 ± 0.56 mm, and actual postoperative vault was 713.59 ± 268.52 μ m. Pentacam measurements correlated best with accurate sizing.

Conclusions: NK and KS formulas assist in predicting vault height but show discrepancies, highlighting the need for refinement and integration with biometric parameters for improved accuracy.

Abstract No.: 205744

Analysis of the Correlation Between the Center Position of the Cut and Visual Quality After Myopia Correction Using VisuMax 800 Femtosecond Laser: A Prospective, Non-Blinded Trial

First Author: Di **WANG**

Co-Author(s): Xinyi **GU**, Meiyang **LI**, Xingtao **ZHOU**

Purpose: To explore the relationship between the center position of the cut and visual quality after myopia correction using VisuMax 800 femtosecond laser small incision lenticule extraction (SMILE pro).

Methods: A total of 97 patients (193 eyes) undergoing SMILE pro myopia correction were consecutively enrolled. The position of the cutting center was measured using corneal topography obtained with a Scheimpflug camera (Pentacam HR; Oculus, Wetzlar, Germany). The OPD system was used to measure the total ocular coma, spherical aberration, and trefoil aberration.

Results: Three months after surgery, the average efficacy index (postoperative UDVA/preoperative CDVA) was 1.07 ± 0.11 . The postoperative uncorrected

distance visual acuity (UDVA) of all eyes was 0.8 or better, and 99% of eyes achieved UDVA of 1.0 or better. The postoperative spherical equivalent (SE) was $+0.12 \pm 0.27$ D, and no patient complained of visual symptoms such as double vision after surgery. The offset of the corneal cutting center from the corneal apex was 0.13 ± 0.12 mm. Compared with preoperatively, the postoperative higher-order aberrations (tHOA) changed by 0.14 ± 0.57 μ m, the vertical coma aberration (totZ3-1) changed by 0.09 ± 0.14 μ m, the postoperative trefoil aberration changed by 0.11 ± 0.28 μ m, and the postoperative spherical aberration (totZ40) changed by 0.05 ± 0.08 μ m. The vertical eccentricity was correlated with vertical coma aberration, with a Pearson correlation coefficient of 0.195 and $p < 0.01$.

Conclusions: The offset of the cutting center of the VisuMax 800 femtosecond laser for myopia correction is small.

Abstract No.: 206073

Bathopsis vs Stereopsis: Why Blended Vision Works

First Author: David **BECKERS**

Co-Author(s): Lena **BECKERS**

Purpose: To define the concept of bathopsis and contrast it with stereopsis in the context of binocular vision after intraocular lens (IOL) implantation. While stereopsis refers to depth perception based on retinal disparity between nearly identical images, bathopsis describes depth perception arising from binocular fusion of non-identical images, allowing functional vision even in the presence of interocular asymmetry.

Methods: Binocular visual outcomes were analyzed in patients following bilateral IOL implantation. Parameters included uncorrected distance, intermediate, and near visual acuity, stereoacuity, and patient-reported photic phenomena. Functional performance was assessed in relation to the underlying mechanisms of stereopsis and bathopsis.

Results: Binocular uncorrected distance visual acuity reached a mean of 0.0 logMAR, while intermediate and near visual acuity were sufficient for daily tasks without additional correction. Stereoacuity was maintained in the functional range, with most patients achieving ≤ 100 arcsec. Photic phenomena such as glare and halos were reported but were generally mild and not associated with reduced satisfaction. The coexistence of good functional acuity at different distances with preserved though not perfect stereoacuity supports bathoptic integration, whereby the brain fuses slightly dissimilar images into a coherent binocular percept.

Conclusions: Bathopsis provides a physiologic explanation for the success of blended vision strategies. By tolerating controlled interocular differences, it preserves useful depth perception while extending

the range of functional vision, offering a more robust binocular outcome than reliance on stereopsis alone.

Abstract No.: 204015

Battle of the Beams: VisuMax 500 vs 800 — The Laser Upgrade Story

First Author: Sneha G V

Co-Author(s): Sriganesh, Sheetal BRAR

Purpose: To compare the clinical outcomes, ease of separation and patient satisfaction following SMILE performed with VISUMAX 800 in one eye and VISUMAX 500 in the contralateral eye

Methods: A total of 30 patients undergoing bilateral SMILE procedures were included, wherein both eyes of each patient were randomised to receive treatment with VM 800 in one eye and with VM 500 in the contralateral eye for correction of myopia and myopic astigmatism. Intra-operatively, docking time, suction time, laser time and surgical time were noted and post-operatively visual and refractive results, contrast sensitivity and patient satisfaction was assessed at 3 months post-op

Results: The mean docking time and surgical time was significantly lower in the VM800 group (46.53 ± 11 sec and 4.52 ± 2.33 min) compared to VM500 group, 68.25 ± 15 sec and 6.22 ± 2.04 min respectively ($p < 0.001$). No significant differences were observed in the first day and 3 months mean UDVA, CDVA, SE, post-op Higher Order Abberations (HOA), Objective Scatter Index (OSI), Modular Transfer Function (MTF) and subjective contrast sensitivity at all spatial frequencies between the groups, ($p > 0.05$). Patient's scores regarding subjective symptoms were comparable, however, the overall satisfaction with the surgical experience was rated significantly better in the VM800 group

Conclusions: No significant differences were observed in clinical outcomes between the two laser systems, however, the surgical workflow and patient reported intra-operative experience was significantly better with VM 800

Abstract No.: 205650

Beyond the Flap: Surgical Management for Epithelial Ingrowth Following Laser-Assisted In Situ Keratomileusis - A Case Report

First Author: Angga FAJRIANSYAH

Co-Author(s): Elfa Ali IDRUS, Faris MADYAPUTRA, Patriotika MUSLIMA, Arief MUSTARAM

Purpose: To report a case management of epithelial ingrowth emerging 18 months after Femtosecond LASIK surgery in Cicendo Eye Hospital, Bandung, Indonesia.

Methods: A 37-year-old male came to Cicendo Eye Hospital with the chief complaint of blurred vision in his right eye for 1 year. He had a history of Femtosecond LASIK surgery 18 months before. Both

eyes' visual acuity after Femtosecond LASIK surgery was improved to 1.0, then his right eye vision started to decrease gradually within 6 months after the surgery. Ophthalmological examination revealed right eye visual acuity was 0.2, epithelial ingrowth was found under the corneal flap, then he underwent flap reopening, epithelial debridement, and flap suturing procedure for the right eye.

Results: Suture removal was done 3 months following the flap closure, with the final visual acuity of the right eye being 0.4 with a pinhole of 0.63.

Conclusions: Epithelial ingrowth is a rare but serious vision-threatening complication following LASIK surgery. Epithelial ingrowth is a rare but serious vision-threatening complication after ocular surgery. Management of epithelial ingrowth is focused on the surgical removal of involved tissues. Appropriate management of epithelial ingrowth can lead to a good visual prognosis.

Abstract No.: 205190

Clinical Experience in the Diagnosis and Treatment of Marginal Keratitis Associated With Corneal Refractive Surgery

First Author: Wei PENG

Purpose: To explore the characteristics and clinical diagnosis and treatment of marginal keratitis related to laser corneal refractive surgery through four typical cases.

Methods: Retrospective analysis of medical history, clinical data, and treatment process of four patients with postoperative marginal keratitis after corneal laser refractive surgery (LRS) in outpatient clinic.

Results: All four patients were female, experienced diverse symptoms, including red eyes, watering, and occasional photophobia. There also be an insidious onset with no specific discomfort. Among them, two cases had unilateral onset, and two had bilateral onset. The onset time ranged from 5 hours post-operation to one week post-operation. Three cases occurred after LASIK surgery, with infiltrative lesions surrounding the corneal flap, and intact corneal epithelium, classified as non-infectious peripheral keratitis. One case occurred after SMILE surgery, the lesion was located between the limbus and the pupillary margin, manifested as marginal ulcerative keratitis located. It located at the corneal stroma layer, lens capsule bag level, accompanied by epithelial damage and infectious inflammation. All four patients were treated with broad-spectrum antibiotics, corticosteroids drugs, and immunosuppressants for anti-inflammatory purposes and recovered, achieving satisfied corrected vision. The course of the disease ranged from one week to two months.

Conclusions: The onset of marginal keratitis related to corneal refractive surgery is insidious and diverse. Non-

infectious factors are the main causes, but infectious factors should not be overlooked. anti-infection treatment should not be neglected. The pathogenesis is intricate and complex. requires further research.

Abstract No.: 201550

Clinical Outcomes and Predictability of the MPL Gen-2 Calculator in Phakic Lens Implantation: A One-Year Case Series

First Author: Chan SUET MEI

Purpose: To report clinical and safety outcomes following Medennium Phakic Lens (MPL) implantation and to assess the refractive predictability of the MPL Gen-2 Calculator.

Methods: This consecutive case series included 80 eyes implanted with the MPL over a one-year period. Clinical outcomes were assessed at a uniform 6-month follow-up. Evaluated parameters included refractive accuracy (mean refractive spherical equivalent, residual cylinder, and percentage of eyes within ± 0.50 D and ± 1.00 D of intended correction), uncorrected and corrected distance visual acuity, and calculator predictability. Safety assessments included intraocular pressure, endothelial cell density, and adverse events. Patient-reported quality of vision and satisfaction were also documented.

Results: At 6 months, 92% of eyes were within ± 0.50 D and 98% within ± 1.00 D of target refraction. Residual cylinder was ≤ 0.50 D in 85% of eyes. Uncorrected distance visual acuity of 20/25 or better was achieved in 90% of eyes, with no significant loss of corrected vision. The MPL Gen-2 Calculator demonstrated excellent predictability, with mean prediction error approaching zero. No serious complications, such as cataract formation, pupillary block, or persistent IOP elevation, were observed. Transient halos and glare were reported in a small number of patients but generally improved over time. Overall patient satisfaction with vision was high.

Conclusions: MPL implantation was associated with stable refractive outcomes, a favorable safety profile, and high patient satisfaction. The strong performance of the MPL Gen-2 Calculator supports its role as a reliable tool for surgical planning in high myopia correction.

Abstract No.: 206399

Comparison of Lenticular Scanning Quality and Visual Outcomes of Keratorefractive Lenticule Extraction Between VisuMax 800 and 500 Systems

First Author: Jing ZHAO

Co-Author(s): Yongle BAO, Jiayi HU, Zhanying WANG, Xingtao ZHOU

Purpose: To compare lenticular scanning quality and its impact on early visual outcomes between keratorefractive lenticule extraction (KLEx) performed with VisuMax 800 and VisuMax 500 systems.

Methods: Consecutive patients aged 18-46 years were recruited between November 2024 and March 2025. Opaque bubble layer (OBL) and lenticular surface regularity were measured using intraoperative imaging and scanning electron microscopy. Visual acuity and refractive error were assessed at 1 and 3 months postoperatively.

Results: A total of 140 participants (140 eyes) were included (70 per group). The VisuMax 800 group had significantly lower OBL proportions ($3.97 \pm 2.58\%$ vs. $2.44 \pm 0.52\%$, $P < 0.001$) and better lenticular surface regularity scores (11.85 ± 2.56 vs. 14.98 ± 4.05 , $P = 0.002$). In the VisuMax 800 group, higher Flat K and Steep K correlated with larger OBL areas ($\beta = 0.412$, $P < 0.001$; $\beta = 0.358$, $P = 0.002$) and larger optical zones were associated with better lenticular surface regularity ($\beta = 0.535$, $P = 0.038$). Compared with the VisuMax 500 group, the VisuMax 800 group showed slightly better visual acuity at 1 and 3 months postoperatively ($P < 0.001$), with no significant difference in refractive error. In the VisuMax 800 group, smaller OBL proportions were associated with better visual acuity at 1 and 3 months postoperatively ($\beta < 0$, $P < 0.05$), while better lenticular surface regularity was correlated with lower astigmatism at 3 months postoperatively ($\beta = -0.574$, $P = 0.002$).

Conclusions: Intraoperative lenticular scanning parameters and quality affect early postoperative visual outcomes. VisuMax 800 provided slightly improved scan quality and early postoperative visual compared with VisuMax 500.

Abstract No.: 204661

Comparison of Visual and Refractive Outcomes Between Same-Day and Scheduled Femtosecond Laser-Assisted in Situ Keratomileusis (LASIK) for Myopia in a Tertiary Hospital

First Author: Alyssa Marie HIZON

Co-Author(s): Nicolette Eunice CHUA, Cristina Erika ELAZEGUI, Reginal Robert TAN

Purpose: This study compared the postoperative visual and refractive outcomes of myopic patients of same-

day versus scheduled femtosecond LASIK at a tertiary hospital, evaluating safety, efficacy, predictability, and stability at three months post-surgery.

Methods: This retrospective, single-center study reviewed records of 790 myopic eyes of femtosecond LASIK at St. Luke's Medical Center, Bonifacio Global City, from February 2022 to February 2025. Patients were categorized into two groups based on timing and type of preoperative assessment. The same-day LASIK (SD) group underwent refractive screening and LASIK on the same day without cycloplegic refraction, while the scheduled LASIK (SCH) group had screening and surgery on separate days and received cycloplegic refraction. Visual and refractive outcomes were evaluated at three months using standardized refractive surgery reporting indices.

Results: Of the 790 eyes analyzed, 338 underwent SD and 452 underwent SCH. UDVA of 20/20 or better was achieved in 83% of SD eyes and 88% of SCH eyes. Efficacy index was comparable between groups ($p = 0.16$). Safety was better in the SCH group, with 5% of SD eyes and 4% of SCH eyes losing >2 lines of CDVA, and a higher safety index in SCH (1.04 vs 1.02, $p = 0.04$). Predictability was also superior in SCH (index 1.00 vs 0.98, $p < 0.001$), with 99% of SD and 98% of SCH eyes within ± 1.00 D of target SE. Stability was comparable ($p = 0.56$), with a mean SE change of -0.01 D over three months. Postoperative astigmatism was <0.50 D in 96% of SD and 95% of SCH eyes, and <1.00 D in 100% of both groups.

Conclusions: Same-day LASIK achieves comparable efficacy and short-term refractive stability to scheduled LASIK in adult myopic patients. However, scheduled LASIK demonstrates slightly superior safety and predictability, supporting its continued use in comprehensive preoperative planning, while also validating the selective application of same-day LASIK in appropriate candidates.

Abstract No.: 203383

Corneal Keratometry and Visual Outcome Predictability After Small Incision Lenticule Keratomileusis (SILK) in 100 Eyes of a Malaysian Population

First Author: Chan **SUET MEI**

Purpose: To evaluate corneal keratometry changes after Small Incision Lenticule Keratomileusis (SILK) and assess visual outcome predictability with the current nomogram in a Malaysian population.

Methods: This retrospective case series included 100 eyes treated with SILK using the Elita femtosecond laser for myopia and myopic astigmatism. Preoperative assessment included manifest refraction spherical equivalent (MRSE), uncorrected (UDVA) and corrected distance visual acuity (CDVA), and keratometry (K1, K2, Kmean). Postoperative follow-up was at day 1, week 1,

and six weeks. Main outcome measures were changes in keratometry and correlation with refractive change. Visual predictability was assessed by the proportion of eyes within ± 0.50 D and ± 1.00 D of attempted correction. Additional analyses included UDVA, CDVA, safety and efficacy indices, and complications.

Results: At six weeks, keratometry showed central flattening proportional to correction, though less per diopter compared with LASIK. ΔK_{mean} correlated strongly with $\Delta MRSE$ ($R^2 > 0.9$). Predictability was high, with over 80% of eyes within ± 0.50 D and more than 95% within ± 1.00 D. Most eyes achieved UDVA of 20/25 or better. Safety and efficacy indices exceeded 1.0, and no eye lost two or more lines of CDVA. Outcomes were stable from week 1 to 6, with few minor complications.

Conclusions: SILK provided safe, stable, and accurate correction of myopia and astigmatism in a Malaysian population, inducing less keratometric flattening than LASIK while maintaining high predictability.

Abstract No.: 201920

Do High Myopes Need Further Retinal Assessment Prior to Refractive Surgery?

First Author: Christopher **GO**

Co-Author(s): Colin **CHAN**, Michael **LAWLESS**, Jonathan **LIN**, Gerard **SUTTON**

Purpose: High myopia impacts vision-related quality of life and often represents a significant risk factor for vision-threatening complications. Caution is required during assessment, particularly if considering elective ocular procedures. We investigate the incidence of clinical retinal signs and referral pathway in a population of high myopes seeking refractive surgery.

Methods: Retrospective, consecutive cohort of 58 patients (116 eyes) with high myopia (spherical error, SE > -6 D) seeking refractive surgery at a private clinic between January and June 2025. Retinal imaging was performed (Optos ultra-widfield imaging) and analysed by an independent retina sub-specialist. Incidence of retinal findings and institutional tertiary referral patterns were recorded.

Results: Mean age was 33.9 ± 6.4 years. Mean SE was -7.55 ± 1.29 D (-6.0 to -10.75 D). Retinal findings were identified in 24.1% of patients (14/58) of patients and 19.0% (22/116) of eyes overall. Abnormalities were predominantly peripheral retina (59.1% of eyes) including white without pressure (WWP). Six eyes were noted to have ≥ 1 pigmented retinal hole and one noted previously undiagnosed retinal tear <1 disc diameter (DD). Concordance in clinical diagnosis and referral occurred in 13/14 patients.

Conclusions: A notable proportion of patients with high myopia presenting for refractive surgery selection exhibited retinal abnormalities confirming the need for caution. Although these complications may not represent absolute contraindications to surgery in

all cases, positively the existing diagnosis and rate of tertiary retinal referral was excellent, reaffirming the current assessment protocol.

Abstract No.: 201428

Effect of ICL Implantation on ACD and IOP: A Comparative Study

First Author: Khaled ABDELATY

Purpose: To evaluate the effect of ICL implantation on the ACD and IOP. This study was on 39 eyes of 25 patients. The age range was 20-43 years. Corneal thickness mean was 537.54. The reasons for ICL surgery were: high myopia, post-KP, and post-cornea crosslinking.

Methods: All patients underwent uneventful ICL implantation and were followed up for more than one year. A comparison was done pre-operative and post-operative for the IOP using the Goldmann applanation tonometer and ACD using the Orbscan II z.

Results: The IOP was slightly increased post-ICL implantation from a mean of 12,62 mm Hg with 1,73 SD to a mean of 13.1 mm Hg with 1,76 SD. ACD was decreased from a mean of 3,11 mm with 0,359 SD pre-operative to 2.65 mm with 0.68 SD post-operative.

Conclusions: In spite of the fact that ACD is decreased by the ICL implantation, it is obviously not affected by any means, any organic or visual outcomes. Nevertheless, the IOP is not to be mentioned as a difference that ICL can affect in uneventful surgeries.

Abstract No.: 207902

Expanding Surgical Options in Keratoconus: Role of Topography-Guided Custom Ablation (TCAT) and Topography-Guided Removal of Epithelium (TREK)

First Author: Tulika CHAUHAN

Co-Author(s): Surveen Kaur ARNEJA, Akanksha KOUL, Raghav MALIK

Purpose: To compare visual and anatomical outcomes of Topography-Guided Custom Ablation Treatment (TCAT) and Topography-Guided Removal of Epithelium in Keratoconus (TREK) performed in eyes with different stages of keratoconus.

Methods: This prospective interventional series included 20 eyes of 20 patients with keratoconus. Ten eyes with mild to moderate keratoconus (Amsler-Krumeich stages I-II, thinnest pachymetry >430 μ m) underwent TCAT followed by corneal cross-linking (CXL). Ten eyes with advanced keratoconus (stages III-IV, thinnest pachymetry <430 μ m) underwent TREK (topography-guided epithelial removal with minimal or no stromal ablation) followed by accelerated CXL. Pre- and postoperative assessment included uncorrected and best-corrected visual acuity (UCVA,

BCVA), manifest refraction, keratometry, and corneal topography at baseline, 1 month and 3 months.

Results: Both groups showed significant improvement in corneal regularity and visual function. Mean BCVA and mean maximum keratometry improved in both the groups. No sight-threatening complications, persistent haze, or progressive ectasia were observed during follow-up.

Conclusions: TCAT combined with CXL provides effective visual and topographic improvement in mild to moderate keratoconus, while TREK with CXL is a safe, tissue-sparing option in advanced disease where stromal ablation is contraindicated. Both approaches expand the surgical armamentarium for stage-appropriate keratoconus management.

Abstract No.: 205475

Exploring Visual Performance of Ray-Tracing vs Topography-Guided LASIK

First Author: Prabhjot SINGH

Co-Author(s): Deepthi R H, Abha SHAH

Purpose: To evaluate the visual and refractive performance of Customized Ray-Tracing-Guided LASIK (RTG) and Topography-guided LASIK (TG).

Methods: A total of 503 eyes undergoing RTG LASIK (n=261) or TG LASIK (n=242), were assessed at 12 months post-op using visual acuity testing, achieved Spherical Equivalent and coefficient of determination (R^2) to evaluate the predictability of refractive outcomes.

Results: At 12 months, 72% of RTG eyes achieved UDVA >20/20 compared to 19% in TG group. Gain of lines occurred in 67.3% of RTG eyes vs. 17.2% in TG ($p<0.05$). R^2 was higher in for RTG group (0.999) than TG group (0.966). Both platforms achieved 100% accuracy within ± 0.50 D, and 96% had 20/20 vision in 1 week. Astigmatism achieved was ≤ 0.25 DC in both groups ($p=0.03$).

Conclusions: RTG LASIK demonstrated visual acuity outcomes that were non-inferior to TG LASIK. However, the gain of lines was better in RTG LASIK compared to those who underwent TG LASIK.

Abstract No.: 206324

Exploring the Impact of Refractive and Ocular Residual Astigmatism on Stereopsis After Photorefractive Keratectomy in Patients With Myopic Astigmatism

First Author: Mohammad TOBEIHA

Co-Author(s): Pegah NOORSHARGH, Alireza PEYMAN, Mohsen POURAZIZI

Purpose: To investigate the impact of refractive and ocular residual astigmatism (ORA) on stereopsis after

photorefractive keratectomy (PRK) for corrections of myopic astigmatism.

Methods: This prospective observational study conducted on patients who underwent PRK for treatment of myopia and myopic astigmatism using a Schwind Amaris 1050RS excimer laser system. Stereoacuity was measured using the stereo Fly test before and after the surgery. We evaluated the impact of pre-op refractive and internal astigmatic components on stereopsis outcome after surgery. To calculate ORA, we calculated the vectorial difference between corneal plane refractive astigmatism and keratometric astigmatism.

Results: Ninety-six eyes from 96 patients including 70 females (72.9%), with a mean age of 29.83 ± 7.39 years were enrolled. The average stereoacuity measured in log units before and after PRK was 1.65 ± 0.09 and 1.63 ± 0.07 , respectively ($P=0.17$). Patients who showed stereopsis improvement had a higher mean cylindrical error compared to those who did not ($P=0.04$). The average pre-treatment ORA was 0.84 ± 0.37 in patients who experienced deterioration in stereopsis, 0.77 ± 0.35 in patients who maintained the same level, and 0.80 ± 0.35 in patients who showed improvement ($P=0.77$).

Conclusions: This study showed the potential relationship between higher astigmatism and the enhancement of stereopsis after PRK. Furthermore, our study found no significant impact ORA on the outcomes of stereopsis following PRK.

Abstract No.: 205890

Fine Needle Diathermy for Corneal Neovascularization Prior to Photorefractive Keratectomy: A Case Report

First Author: Maureen Anne REYES

Co-Author(s): Keshia Lourdes DUYONGCO-LENON

Purpose: To assess the efficacy of fine needle diathermy (FND) in inducing regression of corneal neovascularization prior to photorefractive keratectomy (PRK), with the objective of optimizing corneal transparency, minimizing postoperative complications such as haze or recurrent neovascularization, and ultimately improving visual and refractive outcomes.

Methods: We present a case of a 33-year old Filipino female who presented with blurring of vision on both eyes. Ocular examination showed uncorrected visual acuity of counting fingers at 1 meter, a 1.3 millimeter by 2.5 millimeter corneal opacity with a large feeder vessel at the superotemporal paracentral area on the left eye, which resulted to a significant astigmatism of -1.50 at axis 120, and moderate compound myopia. Patient was started on Moxifloxacin Dexamethasone eyedrops, 1 drop four times a day for 2 weeks to the affected eye and underwent FND to address the corneal neovascularization. Post-FND, Levofloxacin and

Prednisolone Acetate eyedrops, 1 drop four times a day were placed for a week. Once the isolated feeder vessel was deemed stable after 2 weeks, PRK was done.

Results: Intraoperatively, obliterated vessels were visualized and carefully monitored during the ablation. At 1 month postop, best corrected visual acuity is 20/25+2 and J1 for both eyes with a refraction of spherical equivalent -1.75 on the left eye. Slitlamp examination shows clear cornea and stable obliterated vessels at the post FND area.

Conclusions: FND prior to PRK is crucial for regressing corneal neovascularization, which reduces intraoperative bleeding, limits postoperative haze, and supports better visual outcomes.

Abstract No.: 206508

From Cataract Removal to Ocular Surface Health: Comparing KDEI and OSDI in Dry Eye Diagnosis

First Author: Karina Ayu Pramesti

Co-Author(s): Indri Wahyuni, Intifada, Ismi Zuhria, M.Nurdin Zuhri, Rina La Distia Nora

Purpose: This study aimed to evaluate differences in the diagnosis of DED in cataract patients before and after phacoemulsification using two subjective instruments: the Indonesian Dry Eye Questionnaire (KDEI) and the Ocular Surface Disease Index (OSDI).

Methods: A quasi-experimental study was conducted on 40 cataract patients undergoing phacoemulsification at Universitas Airlangga Hospital. Evaluations were performed at three time points: preoperatively, one week postoperatively, and one month postoperatively. DED diagnosis was established using KDEI and OSDI scores. Comparative analysis was performed with the Kruskal-Wallis test, while the Mann-Whitney test was used to compare both instruments.

Results: Analysis revealed no significant differences in DED diagnosis using KDEI ($p = 0.438$) or OSDI ($p = 0.367$) across the three observation points. The Mann-Whitney test showed no significant differences between KDEI and OSDI at baseline ($p = 0.117$) and one month postoperatively ($p = 0.058$), although a significant difference was observed at one week ($p = 0.024$).

Conclusions: Phacoemulsification did not significantly alter the diagnosis of DED within one month of follow-up based on KDEI or OSDI. KDEI demonstrated consistent performance comparable to OSDI, supporting its validity as a culturally adapted tool for Indonesian patients.

Abstract No.: 203748

Initial Outcomes of Trans-epithelial Photorefractive Keratectomy With Bausch and Lomb's PROSCAN Aspheric Treatment Compared With OCTAVIUS Topography-Optimised Treatment

First Author: Julian **TAGAL**

Purpose: Bausch and Lomb's TENEO Model 2 can perform transepithelial photorefractive keratectomy (tPRK) with different ablation profiles: The PROSCAN aspheric profile minimises induction of spherical aberrations, whereas OCTAVIUS uses individual corneal topography data to provide customised ablation profiles. This study compared the visual and safety outcomes with OCTAVIUS ablation profile compared with the default PROSCAN ablation profile.

Methods: This was a prospective, single-blind study conducted at OasisEye Specialists in Kuching, Malaysia. Thirty-three patients with mild to moderate myopic astigmatism received tPRK with PROSCAN in one eye and OCTAVIUS in the fellow eye in an alternating OD/OS arrangement. Target refraction was plano. Outcomes measured 3 months postoperatively included monocular uncorrected and corrected distance visual acuity (UDVA/CDVA), induced and total higher order and spherical aberrations (HOA/SA), and contrast sensitivity.

Results: At baseline, mean±standard deviation (SD) age was 31.7±4.2 years and mean±SD spherical/cylindrical refractive error was -4.02±1.53/-0.95±0.71 (PROSCAN) and -3.98±1.34/-1.02±0.67 (OCTAVIUS). At 3 months, mean±SD logMAR UDVA was -0.00±0.08 for both PROSCAN and OCTAVIUS (p=0.92). Mean±SD logMAR CDVA was -0.04±0.05 for both PROSCAN and OCTAVIUS. 76% and 67% of eyes achieved 20/20 Snellen UDVA with PROSCAN and OCTAVIUS, respectively, and no eye lost ≥2 lines of Snellen CDVA. Mean±SD induced HOA/SA were 0.45±0.20 μm/0.42±0.23 μm (PROSCAN) versus 0.38±0.22 μm/0.34±0.19 μm (OCTAVIUS); p=0.06 for both comparisons). Mean±SD log percent contrast sensitivity was 1.98±0.08 (PROSCAN) versus 2.02±0.12 (OCTAVIUS; p=0.13). There were no perceived dysphotopic differences between eyes.

Conclusions: The individualised OCTAVIUS profile is generally comparable to the aspheric PROSCAN profile in terms of visual acuity and safety outcomes.

Abstract No.: 206294

Intraoperative ICL Vault Measurement Using Callisto-Guided Anterior Segment OCT: Correlation With Postoperative Vault

First Author: Sanjalee **THAKAR**

Purpose: To compare intraoperative ICL vault measurements obtained using Callisto-guided

intraoperative anterior segment OCT with postoperative vault measurements and assess the predictive accuracy of intraoperative readings.

Methods: This prospective observational study included patients undergoing ICL implantation for myopia/hyperopia or myopia/hyperopia with astigmatism. Intraoperative vault was measured immediately after ICL implantation using Callisto-guided microscope-integrated AS-OCT. Postoperative vault was measured at post-op day 1 and 1 week using standard AS-OCT.

Results: A total of 61 eyes from 31 patients were analysed. Mean central intraoperative vault was 533 ± 121 μm, while mean postoperative vault at day 1 was 577 ± 132 μm.

Conclusions: Intraoperative vault measurement using Callisto-guided AS-OCT provides a dependable predictor of postoperative vault, corresponding to postoperative values. This real-time assessment can guide surgical decision-making, optimize ICL positioning, and potentially improve patient outcomes.

Abstract No.: 205724

LASIK Enhancement After Primary Myopic LASIK

First Author: Lipi **MITTAL**

Co-Author(s): Mukesh **PATIL**, Divya **SINGH**

Purpose: To evaluate refractive, visual outcomes and complications in patients who underwent Lasik enhancement after primary myopic Lasik.

Methods: This non-comparative retrospective study was performed on 58 eyes of 46 patients (one eye in 34 patients and both eyes in 12 patients). The study was conducted at a tertiary eye centre between March 2017 and March 2022. All patients who presented with «Post-primary myopic Lasik refractive error and regression» were considered for flap lift retreatment using the ALCON WAVELENGTH EX500 EXCIMER LASER platform. Patients with a minimum one-year follow-up post-Lasik enhancement were included. Complications post-enhancement were also evaluated. The outcomes were measured in terms of safety, effectiveness and predictability of the procedure. Statistical analysis was done by using SPSS software.

Results: In our study, males accounted for 39% (18) and females accounted for 61% (28). Before primary myopic Lasik, the mean sphere, cylinder and spherical equivalent were -4.02 ±1.95(range -0.75 D to -9D), -0.75±0.77(range from 0D to -4D), -4.39 ±1.90 (range -0.875D to -9.125 D). Before flap lift retreatment, the MSE was -1.31 ± 0.44 (range -0.75 D to -2.38D) and post enhancement, the MSE was -0.03 ±0.55 (range +0.88D to -1.00D). Post-enhancement visual outcomes showed 51 of 58(88%) eyes and 56 of 58(97%)eyes were within ±0.5D and ±1D respectively. None of the eyes lost BCVA of more than one line. 4 out of 58(7%)

eyes developed Epithelial Ingrowth (Grade 1) and 1 of 58 (2%) eyes had flap-related complications (micro striae).

Conclusions: Flap-lift technique is a safe, effective and predictable procedure for the management of post-myopic Lasik residual or regressed refractive error.

Abstract No.: 203815

Managing Cap-Lenticular Adhesion in SMILE Surgery: Management Using Modified Dissection Technique

First Author: Kumar Kartikay RAJAURA

Co-Author(s): Siri GOWDA, Manpreet KAUR

Purpose: CLA occurs in 1.8-2% of SMILE cases, causing cap-lenticular adhesion that complicates extraction and may lead to incomplete removal or cap perforation, requiring systematic management.

Methods: A total of 760 eyes were operated using a modified dissection technique, CAMP-SWIPE-SLURP, where the CAMP technique delineates anterior/posterior planes using a cap incision, anterior entry, and the meniscus sign. The SWIPE technique sweeps the anterior plan. SLURP technique dissects the posterior plane quadrant-wise, leaving pillars of strength for controlled lenticule extraction.

Results: No cap lenticular adhesion was noted in any of the cases performed by this technique.

Conclusions: CLA management protocol enables 100% lenticule extraction with zero complications. This systematic approach transforms a challenging complication into manageable procedure, improving SMILE safety & outcomes. Technique provides reproducible solution for surgeons encountering CLA.

Abstract No.: 207188

Outcomes of Manual Cyclotorsion Compensated Small Incision Lenticule Extraction in Correction of Myopic Astigmatism

First Author: Disha GOYAL

Co-Author(s): Sudarshan KHOKHAR, Aishwarya RATHOD

Purpose: Assessment of visual and refractive outcomes, efficacy, safety, and predictability, of manual cyclotorsion compensated Small Incision Lenticule Extraction (SMILE) in correction of myopic astigmatism.

Methods: A total of 93 eyes from 57 participants, with myopic astigmatism ranging from -0.5D to -2.0D, underwent SMILE using the Visumax 500 laser platform by a single surgeon. Preoperatively, 0-90-180 degree limbal axis marking on slit lamp was done using gravity assisted bubble marker, and intraoperatively, 0-180 degree mark was extended to optic zone, followed by matching of the limbal marking with reticule

on the screen of Visumax platform by rotating the suction plate after docking and before laser treatment for cyclotorsion compensation. Uncorrected visual acuity (UCVA), best-corrected visual acuity (BCVA), spherical and cylindrical refractive errors, Pentacam parameters, iTRACE aberration values, intraoperative and postoperative complications were measured from baseline to 12-month follow-up.

Results: Preoperative mean spherical refractive error was $-3.64 \pm 1.16D$ and cylindrical error was $-0.84 \pm 0.32D$. Intraoperative rotation was unnecessary for 26% of eyes, and no eye experienced suction loss during rotation. At 12 months, the efficacy index was 0.98, safety index was 1, and predictability was high, with 100% of eyes within $\pm 0.25D$ of the target refractive astigmatism. Correction index of 0.99 to 1.01 and angle of error (1-2 degrees) was noted at various follow-up points.

Conclusions: Manual cyclotorsion compensated SMILE is safe, feasible, and effective for correction of low to moderate myopic astigmatism (up to -1.75D). It does not cause suction loss or complications from limbal marking and yields predictable outcomes using Visumax 500 laser system.

Abstract No.: 204866

Real-World Results of Phakic IOLs in Indian Myopes

First Author: Madhuvanthi MOHAN

Co-Author(s): Sujatha MOHAN

Purpose: To describe the demographics, refractive outcomes, and visual results of phakic intraocular lens (IOL) implantation performed at a tertiary eye care center over an 18-month period

Methods: A retrospective observational audit was performed of all patients undergoing phakic IOL surgery between February 2024 and September 2025. Data collected included number of procedures, laterality, lens type (spherical vs toric), and trends in procedure volume over time. Outcome measures included pre- and postoperative refractive error (spherical equivalent, cylinder) and uncorrected/best-corrected distance visual acuity (UDVA/BCVA). Safety events such as lens explantation, infection, or endothelial complications were also noted

Results: A total of 96 phakic IOL procedures were performed. Both spherical and toric phakic IOLs were implanted, with toric lenses accounting for a significant subset. At 3 months, the majority of patients achieved UDVA of 6/9 or better, with a high rate of refractive predictability ($\pm 0.50 D$ of target in most cases). Cylinder reduction was greater in the toric IOL group. No sight-threatening complications were observed; one explantation was documented. The majority of procedures were routine and uneventful

Conclusions: Phakic IOL implantation is a safe and effective option for correction of high myopia, providing excellent refractive accuracy and visual outcomes. This observational study highlights increasing uptake of the procedure in an Indian tertiary center, with good safety and high patient satisfaction

Abstract No.: 203965

Retreatment Using LASIK, PRK, or ICL for Myopic Regression After Corneal Laser Refractive Surgery

First Author: Miguel Roberto ANG

Co-Author(s): Robert Edward ANG, Zoe DOROY, James JACOMINA, Michelle QUINTO-ARANETA, Ryan TORRES

Purpose: To evaluate outcomes of retreatment for myopic regression after primary LASIK or PRK and to explore factors associated with pre-retreatment refractive error.

Methods: Retrospective cohort of eyes undergoing retreatment with LASIK, PRK, or ICL implantation after prior LASIK/PRK. Outcomes included UDVA, CDVA, MRSE, and safety and efficacy indices through 6–12 months. Associations between baseline factors and pre-retreatment MRSE were assessed.

Results: 158 eyes were included (136 LASIK, 12 PRK, 10 ICL). Early postoperative outcomes improved significantly for LASIK (UDVA 0.37 to 0.04 logMAR; MRSE -1.28 D to -0.12 D) and ICL (UDVA 0.68 to 0.03 logMAR; MRSE -2.72 D to 0.03 D). PRK also produced significant UDVA gains (0.63 to 0.06 logMAR). Efficacy and safety indices were near or above 1.0 across groups. A longer interval since primary surgery was significantly linked to more negative MRSE, consistent with greater regression. Mild correlation between pre-retreatment MRSE and age, initial MRSE, and tissue ablation were observed. Complications were low (7.9%).

Conclusions: Retreatment for myopic regression with LASIK, PRK, or ICL was safe and effective, with stable outcomes through 6–12 months. Regression was multifactorial and not predicted by baseline characteristics, though longer intervals between surgeries were significantly associated with greater myopic regression.

Abstract No.: 201967

Role of Vitamin D Containing Eye Drops in Reducing Post Photorefractive Keratectomy Haze

First Author: Meghavi PANDYA

Co-Author(s): Jatin ASHAR, Tanvi JAIN, Amit PATHAK, Prateek THANVI

Purpose: To study the role of Vitamin D (Vit D) in Eye Drops (E/D) in Post Photorefractive Keratectomy (PRK) in terms of healing time and haze

Methods: 50 patients undergoing PRK surgery were divided into 2 groups. Groups were matched in terms of age (18-35) & refractive error (Spherical equivalent -0.75 diopter (D) - -7 D). Postoperative protocol was Tapering dose of topical E/D Predforte1% (over 1 month), antibiotics for 1-week, Topical Cyclosporine 0.05% (without Vit D in group 1 and with Vit D in group 2) for 6 weeks & Sodium Hyaluronate 0.18% (without Vit D in group 1 and with Vit D in group 2) for 6 weeks. Postoperative time for epithelial healing, haze and comfort were studied.

Results: Post operative all patients had Uncorrected Visual Acuity (UCVA) $\geq 20/30$ at 1 week. Epithelial healing was in 4 days in group 1 and 3 days in group 2. Haze at 1 month was not seen in any patient in group 2 and in 4 patients in group 1. All patients in group 2 were comfortable by the end of 2nd day & 3rd day in group 1.

Conclusions: VitD promotes healing & reduces haze after PRK. Post PRK patient discomfort and pain due to poor and delayed healing in the post operative period is a major issue. Haze may lead to poor visual outcome. VitD promotes healing of the epithelium and decreasing haze. VitD containing drops may help to improve the outcomes in patients undergoing PRK.

Abstract No.: 205947

Safety, Efficacy and Predictability of Femto-Second Laser Assisted Keratomileusis and Transepithelial Photo-Refractive Keratectomy Using Different Optical Zones in Myopia and Compound Myopic Astigmatism

First Author: Jiji P VIJAYAN

Co-Author(s): Ramya SAMPATH

Purpose: To evaluate outcomes of different Optic zones, 6.3 and 7mm in Transepithelial keratectomy (TRANS PRK) and Femtosecond Laser-assisted in situ keratomileusis (FEMTO LASIK).

Methods: We retrospectively reviewed patients with myopia or myopic astigmatism, 22 eyes of 11 patients who underwent FEMTO LASIK surgery, and 24 eyes of 12 patients who underwent TRANS PRK surgery. Uncorrected visual acuity, pupil diameter, vertical coma, spherical aberration, and RMS HOA were evaluated. Efficacy index and predictability were calculated. The changes in Higher Order Aberrations were compared. The optic zone diameter was correlated with pupillary diameter and changes in higher-order aberrations. Patients' age, gender, optic zones, and ablation depth are collected from patients' records.

Results: The mean age was 24 years for FEMTO LASIK and 26 years for TRANS PRK. The efficacy index was found to be 0.945 in both groups. Predictability is the proportion of treated eyes with a postoperative refraction up to 0.50 diopters (D) within the target refraction, which is 68% in FEMTO LASIK and 92 % in

TRANS PRK. Postoprefraction less than -1.00D is found in 100%. The UCVA over 0.63 was 100% in two groups, 1 month and 3 months postoperatively. The change in vertical coma, spherical aberration, and higher-order aberrations was not statistically significant at 3 months in both groups. The higher-order aberrations were found to be lower with larger optic zones in both types of procedures.

Conclusions: Both 6.3 mm and 7 mm optic zones are safe and effective. Larger optic zones yield better HOA outcomes, supporting their use in refractive correction.

Abstract No.: 204865

Short-Term Outcomes of Femtosecond LASIK and SMILE in Myopia More Than -5D: A Consecutive Case Series

First Author: Madhuvanthi **MOHAN**

Co-Author(s): Sujatha **MOHAN**

Purpose: To compare early visual recovery and short-term outcomes of Femtosecond LASIK (FS-LASIK) and Small Incision Lenticule Extraction (SMILE) in patients undergoing refractive surgery for myopia more than -5D at a tertiary eye care centre.

Methods: A prospective, consecutive case series was conducted between January and March 2025. Patients undergoing FS-LASIK (n≈100 eyes) or SMILE (n≈90 eyes) were included. Preoperative refraction, uncorrected distance visual acuity (UDVA) on postoperative day 1 (POD1), and at 1 month were analyzed. Primary outcomes were the proportion of eyes achieving UDVA ≥6/6 at each timepoint and incidence of residual refractive error (<6/9). Astigmatism correction was assessed separately.

Results: On POD1, 82% of FS-LASIK eyes achieved UDVA ≥6/6 compared to 68% of SMILE eyes, reflecting faster visual recovery in the LASIK group. By 1 month, outcomes were comparable, with 98% of FS-LASIK and 96% of SMILE eyes achieving UDVA ≥6/6. Residual vision <6/9 persisted in 2% of FS-LASIK and 4% SMILE cases. Astigmatism correction was effective in both groups, with no significant difference in residual cylinder. No sight-threatening complications occurred.

Conclusions: Both FS-LASIK and SMILE provided excellent short-term visual outcomes in patients with high myopia. FS-LASIK offered faster early visual recovery, while SMILE matched outcomes by 1 month. At 1 month, >95% of eyes in both groups achieved UDVA ≥6/6, underscoring the high predictability and safety of modern corneal refractive surgery. SMILE may offer added biomechanical and ocular surface advantages, whereas FS-LASIK remains advantageous where rapid early rehabilitation is desired.

Abstract No.: 207383

Small Incision Lenticule Extraction Retreatment in a Patient With High Residual Refractive Error After Photorefractive Keratectomy: A Case Report

First Author: Vardhaman **KANKARIYA**

Purpose: To demonstrate the utility of SMILE as an enhancement tool.

Methods: A 36-year-old male underwent uneventful small incision lenticule extraction (SMILE) for the correction of his high residual refractive error 12 years after photorefractive keratectomy (PRK). Preoperatively, uncorrected distance visual acuity (UDVA) was counting fingers in both eyes. Corrected distance visual acuity was 20/20 in the right and 20/30 in the left eye due to amblyopia. One month after SMILE, UDVA was 20/20 and 20/30 in the right and left eye, respectively; post-PRK corneal haze had reduced. During the 4-year follow-up, UDVA remained stable and there were no complications. SMILE could be a good alternative approach for retreatment in post-PRK patients.

Results: One month after SMILE, UDVA was 20/20 and 20/30 in the right and left eye, respectively; post-PRK corneal haze had reduced. During the 4-year follow-up, UDVA remained stable and there were no complications. SMILE could be a good alternative approach for retreatment in post-PRK patients.

Conclusions: SMILE could be a good alternative approach for retreatment in post-PRK patient.

Abstract No.: 203953

Spherical Equivalent (SE) Outcomes After Suture Manipulation in Postoperative Deep Anterior Lamellar Keratoplasty (DALK) Patients

First Author: Dhilan **ELVITIGALA**

Co-Author(s): Chamika **DE SILVA**, Niruththan **KUMARAVADIVEL**, Dushyantha **WARIYAPOLA**

Purpose: The objective is to determine how pre- and post-suture manipulations, adherence to the concept of corneal coupling, and the timing of suture removal affect the Spherical Equivalent (SE) outcome.

Methods: This retrospective study involved 40 manipulations in 18 patients who underwent DALK from 2020 to 2021 for keratoconus. All the surgeries were performed by a single consultant eye surgeon using the big bubble (BB) technique at a single eye institute. All grafts were anchored to the host using 16 interrupted 10/0 nylon sutures. Data was obtained from hospital and patient records. Objective and subjective SE and mean K readings were monitored.

Results: The average time for suture removal was 12.71 ± 4.58 months, ranging from 6 to 20 months.

The mean pre-suture subjective SE was -1.55 ± 1.65 diopters, and the mean post-suture subjective SE was -1.56 ± 1.62 diopters. The mean pre-suture objective spherical equivalent (SE) was found to be -1.45 ± 2.27 diopters, while the mean post-suture objective SE was -1.61 ± 2.32 diopters. The average pre-suture mean K value was 44.90 ± 1.67 diopters, while the average post-suture mean K value was 44.88 ± 1.72 diopters.

Conclusions: The findings of this study demonstrate that the suture manipulation in DALK procedures adhered to the concept of corneal coupling. The results obtained from three key parameters, namely subjective SE, objective SE, and mean corneal K values, support this conclusion. Additionally, the study revealed that a longer waiting period before suture removal was associated with minimal changes in the spherical equivalent.

Abstract No.: 202512

Tear Biomarkers and Ocular Surface Response to Adjunct Topical Pirenixine After LASIK and PRK: A Randomized Controlled Trial

First Author: Phit **UPAPHONG**

Co-Author(s): Nattayaporn **APAIJAI**, Winai **CHAI DAROON**, Nipon **CHATTIPAKORN**, Siriporn **CHATTIPAKORN**, Napaporn **TANANUVAT**, Chanisa **THONUSIN**

Purpose: To evaluate the effect of adjunctive topical pirenixine (PRX) on tear biomarkers and ocular surface parameters following laser in-situ keratomileusis (LASIK) and photorefractive keratectomy (PRK).

Methods: This intraindividual eye-level randomized controlled trial assigned one eye to receive adjunctive 0.005% PRX eye drops four times daily from 14 days before surgery through six months after surgery, while the fellow eye received standard care alone. Tear fluid was collected at screening, surgical day, and at 1-day, 1-week, 1-month, 3-month, and 6-month follow-up visits for multiplex polymerase chain reaction analysis.

Results: A total of 24 PRK participants (48 eyes; mean age, 310.8 ± 6.0 years) and 22 LASIK participants (44 eyes; mean age, 32.3 ± 76.7 years) were included. In the LASIK group, PRX-treated eyes showed a significant reduction in tear monocyte chemoattractant protein-1 (MCP-1) at day 1 post-surgery (effect -90.18 ; 95% CI, -168.06 to -12.29). In the PRK group, MCP-1 was significantly reduced at month 6 (effect -83.66 ; 95% CI, -151.16 to -16.16). Interleukin-8 (IL-8) was also significantly decreased in LASIK eyes (effect -113.80 ; 95% CI, -227.21 to -1.62). Other biomarkers showed no significant differences, although most inflammatory cytokines demonstrated a downward trend with PRX. Clinical parameters, including tear breakup time, conjunctival hyperemia, and corneal staining, showed no significant differences, while central corneal stromal opacity revealed a nonsignificant trend toward reduction with PRX.

Conclusions: Adjunctive PRX therapy demonstrated mild anti-inflammatory effects by reducing MCP-1 and IL-8 after LASIK and PRK. However, these biochemical improvements were not accompanied by changes in clinical outcomes.

Abstract No.: 204030

The Kappa Conundrum: Comparison of Outcomes With Normal Versus Large Angle Kappa in SMILE - When Your Angle Throws a Tantrum

First Author: Sneha G V

Co-Author(s): Sriganesh, Sheetal **BRAR**

Purpose: To compare the visual and refractive results, induced aberrations, and objective scatter index in normal versus large angle kappa following SMILE performed with VisuMax 800 (SMILE Pro).

Methods: A total of 50 eyes from 50 patients undergoing SMILE Pro with VisuMax 800 were included for correction of myopia and myopic astigmatism. Eyes were divided into normal angle kappa (<0.5 mm), $n=25$ eyes, and large angle kappa (>0.5 mm), $n=25$ eyes. Docking and centration were achieved using the CentraLign-assisted centration aid. Intraoperative decentration value (in mm) was noted from the PDF of treatment planning after the surgery. Post-operatively, UDVA, Objective scatter Index (OSI), induced aberrations, and patient satisfaction were evaluated for both groups.

Results: The mean pre-op angle kappa value in the standard group was 0.07 ± 0.03 mm versus the large angle kappa group (0.52 ± 0.08 mm), $p < 0.001$. At the end of the 3-month follow-up, the number of eyes seeing 20/20 or better was 92% ($n=23$) and 88% ($n=22$) in the normal and large angle kappa groups, respectively. No eye in either group had a loss of 2 lines or more. All eyes in the normal and 96% ($n=24$) eyes in the large angle kappa group had post-op SE and cylinder predictability between ± 0.5 D. Intra-operative treatment decentration was significantly higher in the large angle kappa group (0.18 ± 0.07 mm) versus the normal angle kappa group (0.11 ± 0.08 mm), $p=0.01$.

Conclusions: CentraLign assisted centration resulted in favourable eye results with normal and large angle kappa. Irrespective of the pre-operative value of the angle kappa group, mean decentration in both groups was within 0.2 mm, without any differences in clinical outcomes and patient satisfaction.

Abstract No.: 205436**The Visual Quality of Patients With High Myopia After ICL V4c and Ray-Tracing Guided LASIK***First Author: Yanjia LI**Co-Author(s): Xuefei YANG, Huiqin ZHANG, Qian ZHANG, Bo ZHAO*

Purpose: The aim of this study is to compare visual quality outcomes of implantable collamer lens (ICL) V4c and ray-tracing guided femtosecond laser-assisted in situ keratomileusis (RT-LASIK) in patients with high myopia ($-6.00D < SEQ < -10.00D$).

Methods: In this prospective comparative study, 60 eyes from 32 patients who underwent ICL and 60 eyes from 30 patients who underwent RT-LASIK were included. Preoperative characteristics, including uncorrected distance visual acuity (UDVA), best-corrected distance visual acuity (BDVA), manifest refractive spherical equivalent (MRSE) and higher-order aberrations (HOAs) for a 4mm pupil (spherical aberration, coma, trefoil), were compared between the two surgical groups. Postoperative assessments at 3 months included measurements of UDVA, MRSE, HOAs, as well as the modulation transfer function (MTF) and point spread function (PSF) under a 4mm optical zone using OPD-Scan.

Results: The preoperative characteristics indicated no statistically significant differences ($p > 0.05$). At the 3-month postoperative follow-up, there were no statistically significant differences in UDVA, MRSE, MTF, PSF and root mean square (RMS) value of total ocular aberrations between the RT-LASIK and ICL groups ($p > 0.05$), indicating RT-LASIK provided comparable visual quality with ICL implantation. However, analysis of HOAs revealed significant differences between the RT-LASIK and ICL groups (0.184 ± 0.047 vs 0.118 ± 0.038 , $p < 0.05$). Specifically, trefoil and vertical coma were significantly different (0.012 ± 0.056 vs -0.045 ± 0.044 , $p < 0.05$) (-0.095 ± 0.078 vs -0.002 ± 0.060 , $p < 0.05$), while spherical aberration showed no significant difference (0.002 ± 0.054 vs 0.007 ± 0.035 , $p = 0.750$). However, analysis of HOAs revealed significant differences between RT-LASIK group and ICL group (0.184 ± 0.047 vs 0.118 ± 0.038 , $p < 0.05$). Specifically, trefoil and vertical coma were significantly different (0.012 ± 0.056 vs -0.045 ± 0.044 , $p < 0.05$) (-0.095 ± 0.078 vs -0.002 ± 0.060 , $p < 0.05$), while spherical aberration showed no significant difference (0.002 ± 0.054 vs 0.007 ± 0.035 , $p = 0.750$).

Conclusions: In this study, RT-LASIK, a corneal laser procedure, achieved postoperative visual quality comparable to that of ICL. This is likely because RT-LASIK does not introduce spherical aberration. Thus, both RT-LASIK and ICL represent viable and effective surgical options for patients with high myopia.

Abstract No.: 202481**Three-Month Visual Outcomes After PRESBYOND Laser Blended Vision: A Prospective Study***First Author: Yu-lun LO**Co-Author(s): Chao-kai CHANG, Chen-cheng CHAO, Tzu-te HU, Yu-ting JENG, Chia-yi LEE, I-hung LIN, Jia-hong LIU, Hsin-his WU*

Purpose: To report 3-month visual and refractive outcomes following PRESBYOND Laser Blended Vision

Methods: Methods: Three-month visual and refractive outcomes in 30 patients treated with PRESBYOND laser-blended vision micro-anisometropia were analyzed. Distance vision, intermediate vision (80cm, including DCIVA: distance-corrected intermediate visual acuity), near vision (40cm, including DCNVA: distance-corrected near visual acuity) and stereoacuity were recorded.

Results: Pre-op mean SE was -5.18 ± 1.79 D. Post-op: SE -0.18 ± 0.36 D (distance), -1.14 ± 0.54 D (near); 83% within ± 0.50 . CDVA: Pre-op $\geq 20/20$ in 100%, $\geq 20/16$ in 12%. Post-op binocular VA: UDVA $\geq 20/20$: 80%; $\geq 20/25$: 100%. UNVA $\geq 20/25$ ($\sim J1$): 70%; $\geq 20/40$ ($\sim J3$): 93%; $\geq 20/50$ ($\sim J5$): 100%. DCIVA improved from 0.14 ± 0.14 logMAR (Snellen 0.73) to 0.04 ± 0.14 logMAR (Snellen 0.90). ($p = 0.004$). DCNVA improved from 0.43 ± 0.20 logMAR (Snellen 0.38) to 0.29 ± 0.17 logMAR (Snellen 0.52) ($p = 0.002$). Five patients received retreatments; 15% of eyes lost 1 line of CDVA no eyes lost ≥ 2 lines. Post-op mean binocular UDVA was 0.02 ± 0.05 logMAR (Snellen 0.96). Mean binocular UIVA was 0.00 ± 0.09 logMAR (Snellen 1.00). Mean binocular uncorrected near visual acuity (UNVA) was 0.09 ± 0.13 logMAR (Snellen 0.81). Pre-op and post-op near-corrected stereoacuity was 34 and 36 seconds of arc ($p = 0.778$).

Conclusions: At 3 months, PRESBYOND achieved good binocular distance, intermediate, and near vision, while maintaining functional stereoacuity. Improvements in DCIVA and DCNVA reflect enhanced depth of focus, confirming PRESBYOND as a safe and effective presbyopia correction strategy.

Abstract No.: 201275**Visual Acuity Outcome After Femtosecond Lasik and Trans-Epithelial Photorefractive Keratectomy***First Author: Yulia PRIMITASARI*

Purpose: To compare the visual acuity outcome post femtosecond LASIK and Trans-PRK surgery.

Methods: This study was a retrospective. Visual acuity of pre-post Femtosecond LASIK and Trans-PRK surgery was retrospectively collected from medical records from 2022 to 2024. Femtosecond LASIK was performed using the usual technique using Ziemer Z8 for flap formation and Schwind 750Hz for excimer laser, while

Trans-PRK was performed using Schwind 750Hz and mytomicin c was given at the end of the operation. All patients had spherical equivalent more than -5 Diopter. We compared the visual acuity between the two techniques after D-1, D-7 and D-30 post operatively.

Results: Twenty-four eyes from 15 patients had been performed Trans-PRK, whereas 44 eyes from 25 patients had femtosecond LASIK surgery. The mean spherical equivalent was -9.76D and -7.7D before Trans-PRK and femtosecond LASIK respectively. The mean visual acuity at day-1, day-7 and day-30 after surgery were 0.5, 0.8 and 0.9 for Trans-PRK and 0.9, 0.9, 0.9 for femtosecond LASIK. Despite the difference in visual acuity on the first and seventh days post operatively, there was no significant difference at 30 days after the procedure. Additionally, there was also no significant difference in residual corneal thickness in both procedures.

Conclusions: There is no significant difference in postoperative visual acuity outcome between Trans-PRK and femtosecond LASIK surgery. Since the visual acuity outcome are not significantly different from the two techniques, Trans-PRK could be considered as an option in certain conditions such as thin corneas or very high myopia.

Retina (Medical)

Abstract No.: 205958

3-Arm Comparison of Aflibercept 2mg (Eylea), Aflibercept 8mg (Eylea HD), and Faricimab (Vabysmo) in the Treatment of Diabetic Macular Oedema (DMO)

First Author: Samantha KITSON

Co-Author(s): Zora DAI, Steven TOH

Purpose: To compare efficacy and safety of aflibercept 2mg (aflibercept-L), aflibercept 8mg (aflibercept-H), and faricimab 6mg in treatment-naïve and switched diabetic macular edema (DMO) patients, addressing the lack of real-world direct comparative data.

Methods: A retrospective study at Princess Alexandra Hospital (Jan 2023–Jun 2025) analyzed DMO patients treated with aflibercept-L, aflibercept-H, or faricimab.

Results: The study included 113 patients (198 eyes): 80 eyes (aflibercept-L), 42 eyes (aflibercept-H), and 76 eyes (faricimab). Mean ages were similar (60 ± 13 , 63 ± 10 , 64 ± 9 years). Treatment duration was shortest for aflibercept-H (24 ± 6 weeks) compared to aflibercept-L (54 ± 33 weeks) and faricimab (50 ± 24 weeks). Percentages of treatment-naïve patients with 70% ($n=56$) vs 36% ($n=15$) vs 30% ($n=23$) respectively. Mean VA improvements were comparable across groups (-0.08 ± 0.38 vs -0.08 ± 0.39 vs -0.03 ± 0.39 logMAR; $p=0.757$). Mean CST reductions were also

similar ($-80 \pm 147 \mu\text{m}$, $-44 \pm 124 \mu\text{m}$, $-68 \pm 122 \mu\text{m}$; $p=0.395$). Faricimab had the highest treatment cessation rate (13%, $n=10$) compared to aflibercept-L (8%, $n=6$) and aflibercept-H (0%). Resolution of IRF was highest in faricimab (29%, $n=21$) versus aflibercept-L (23%, $n=18$) and aflibercept-H (9%, $n=3$). SRF resolution rates were 100% ($n=12$), 33% ($n=2$), and 54% ($n=7$) for aflibercept-L, aflibercept-H, and faricimab, respectively. Three cases of new diabetic vitreous hemorrhage occurred in the aflibercept-L group, none in others.

Conclusions: Aflibercept-L, aflibercept-H, and faricimab provide comparable VA and CST improvements and extended treatment intervals. Faricimab may offer higher treatment cessation rates and better anatomical outcomes compared to aflibercept-H.

Abstract No.: 207469

A 3D-Bioprinted in Vitro Model for Retinal Vascular Coupling

First Author: Jian ZHAO

Co-Author(s): Xinyuan ZHANG

Purpose: This study aims to develop a biomimetic, three-dimensional in vitro model for retinal vascular coupling using digital light processing (DLP) bioprinting technology, establishing an experimental platform to explore the pathogenesis of retinal vascular diseases.

Methods: Rat retinal microvascular endothelial cells (REC) and retinal ganglion cells (RGC) were co-encapsulated within a hydrogel scaffold via DLP bioprinting to create the 3D co-culture model. The model's mechanical properties, including Young's modulus and pore structure were evaluated using mechanical testing and scanning electron microscopy, respectively. After 72 hours of culture in complete medium with normal glucose (5.5 mM), cell morphology and spatial distribution were observed under optical and fluorescence microscopy. Cell viability was assessed using Calcein-AM/PI staining.

Results: The 3D in vitro model exhibited a Young's modulus comparable to the native inner retinal layer, with uniformly distributed pores. Microscopic observation revealed an interconnected network of RGC-REC cells, with cell viability greater than 90%.

Conclusions: The 3D in vitro model successfully created a structurally biomimetic and cytocompatible 3D-bioprinted retinal vascular coupling model. This model provides a reliable in vitro platform for investigating the pathogenesis of retinal diseases.

Abstract No.: 206151**A Case Report of Bilateral Bullous Central Serous Chorioretinopathy***First Author: Van Nam Phuong PHAN**Co-Author(s): Quoc Tung MAI*

Purpose: To report the diagnosis and treatment of a patient with bilateral bullous central serous chorioretinopathy (CSCR).

Methods: A case report.

Results: A 43-year-old female, a self-employed trader, complained of visual loss in both eyes for 5 months. She reported no medical history. In the systematic review, she reported having emotional distress related to family issues for 6 months. She was diagnosed with Vogt-Koyanagi-Harada disease in the right eye at another center and received a bolus of intravenous methylprednisolone for 3 days. In the initial visit, she was taking oral Medrol with a dose of 32 mg/day and Cellcept 500 mg/day. After the treatment, she noticed the gradual reduced vision in both eyes. The best-corrected visual acuity (BCVA) was 20/160 in both eyes. The anterior segment, intraocular pressure, and confrontation visual field were unremarkable. The fundus examination showed the bullous retinal detachment inferiorly and extending to the macula in both eyes. Multiple subretinal fibrin and pigment epithelial detachments in the posterior pole were confirmed by optical coherence tomography. On the fluorescein angiography imaging, many leakage points were significantly detected. The fundus autofluorescence was used to evaluate the content of subretinal fluid. Accordingly, the patient was diagnosed with bilateral bullous CSCR as well started oral Spironolactone 50 mg per day and gradually tapered oral Medrol. At the 6-week follow-up, the patient showed better BCVA, and subretinal fluid was partially resolved.

Conclusions: Bullous CSCR is a rare variant of chronic CSCR and requires several differentiations. The timely diagnosis is crucial for appropriate treatment.

Abstract No.: 203924**A Case of Hypertensive Uveitis With Intravitreal Faricimab***First Author: Samantha KITSON**Co-Author(s): Andrew MCALLISTER*

Purpose: To report a novel case of hypertensive uveitis with intravitreal faricimab.

Methods: This is a case report. A 69-year-old woman undergoing treatment of bilateral diabetic macular edema with intravitreal faricimab presented for routine review. Ophthalmic examination was performed, including VA, intraocular pressure, gonioscopy, and slitlamp examination. Findings consistent with

hypertensive uveitis prompted further infectious/inflammatory/infiltrative uveitis screen.

Results: The patient developed hypertensive uveitis in the left eye (four weeks after the third injection) with an intraocular pressure of 42 mmHg. Slitlamp examination revealed fine keratic precipitates and mild anterior uveitis. Anterior chamber angle was open on gonioscopy, and there was no vitritis or vasculitis. At the review a week later, the patient had developed hypertensive uveitis in the right eye (six weeks after the fourth injection) with intraocular pressure of 35 mmHg. Slitlamp examination revealed fine keratic precipitates, open angles, and mild vitritis. There was no vasculitis. At both presentations, the patient had preserved VA with no significant visual symptoms. The hypertensive uveitis resolved in both eyes with a course of steroid and antihypertensive eye drops. The uveitis screen was negative apart from elevated urine protein (negative beta-2 microglobulin), which could be explained by known diabetes and hypertension.

Conclusions: Hypertensive uveitis is a potential adverse reaction to intravitreal faricimab. This case highlights the importance of monitoring intraocular pressure in patients undergoing treatment with faricimab and emphasizes the need for reporting other cases in the community.

Abstract No.: 204892**A Case of Intraocular Metastasis From Lung Cancer***First Author: Lifeng QIAO**Co-Author(s): Huaqin XIA*

Purpose: To report a rare case of intraocular metastasis originating from lung cancer.

Methods: The patient was diagnosed with lung adenocarcinoma four years ago and had been receiving ongoing targeted therapy combined with chemotherapy. The current diagnosis was stage IV left lung adenocarcinoma with malignant pleural effusion. The patient presented to our outpatient department with a one-month history of decreased vision in the right eye.

Results: The visual acuity of the right eye was Hand Motion (HM). B-scan ultrasonography revealed multiple solid masses on the wall of the right eyeball, protruding into the vitreous cavity. Scanning Laser Ophthalmoscopy (SLO) showed two large subretinal solid masses located in the nasal and inferotemporal regions, bulging towards the vitreous cavity. Ultrasonography indicated the dimensions of the larger mass were approximately 15 x 11 mm. Contrast-enhanced ultrasonography demonstrated hypervascular tumoral lesions with partial necrosis.

Conclusions: The findings were consistent with intraocular metastasis from lung cancer. The patient

was advised to consult the oncology department for continued systemic anti-tumor therapy.

Abstract No.: 206621

A Case of Iridofundal Coloboma With Ocular Toxoplasmosis

First Author: Sehajbir PANNU

Co-Author(s): Jayant SHARMA

Purpose: To diagnose a case of a young male with unilateral blurring of vision.

Methods: A 25-year-old male presented with blurring of vision in right eye with V/A of right eye PL+ve, PR +ve since 25 days not associated with floaters or photophobia Patient also complains of redness and heaviness in right eye since 7 days H/O of diminished vision in right eye since childhood for which he went government medical college when he was 10 years old where he was educated of congenital malformation in right eye.

Results: Slit lamp examination: mild diffuse conjunctival congestion, A/C cells 2+, flare 1+, typical iris coloboma @ 5 o'clock, ear drop shaped pupil, multiple lenticular opacities in peripheral cortex, lens zonules absent inferiorly, dilated fundus examination: vitreous haze grade 3, whitish yellow patch of about 2DD with fluffy margins at 1DD away from disc present along the supratemporal arcade, few peripapillary lesion, haemorrhages present, perivascular sheathing, infiltrates along the vessels, fundal coloboma type 7. Findings: OCT macula - inflammation of retina, flattening of foveal region without any subretinal fluid, fundus photography of lesions and coloboma, TOXO-IGM: positive.

Conclusions: Iridofundal coloboma with ocular toxoplasmosis.

Abstract No.: 202532

A Case of Multifocal Posterior Pigment Epitheliopathy Associated With Choroidal Detachment

First Author: Mai HONDA

Co-Author(s): Kota ARAI, Kokoro KONUMA, Tadashi NAKANO, Shunpei OGAWA, Daisuke SHINOHARA

Purpose: To report a rare case of multifocal posterior pigment epitheliopathy (MPPE) complicated by choroidal detachment (CD).

Methods: Case report.

Results: A 58-year-old male with chronic myeloid leukemia (CML) under nilotinib was referred following unsuccessful steroid therapy for suspected Vogt-Koyanagi-Harada disease. He presented with blurred vision in the right eye, with best-corrected visual acuity of 0.5 in the right and 0.9 in the left. Fundus examination revealed circumferential peripheral CD and serous retinal detachment (SRD) in the right eye,

and retinal pigment epithelium (RPE) abnormalities in the left eye. Fluorescein angiography (FA) revealed multiple posterior exudative spots with active leakage. The axial length was 24 mm with no scleral thickening. Although CD is atypical, the findings were consistent with those of MPPE, and retinal photocoagulation was performed at the leakage points. Subsequently, the SRD worsened, leading to the discontinuation of nilotinib owing to its possible contribution. Additional FA-guided laser treatment was applied to the persistent leakage sites. Three months later, both the SRD and CD demonstrated marked improvements. Complete resolution was achieved at 5 months, with visual recovery in the right eye.

Conclusions: Although the potential role of nilotinib cannot be excluded, the clear therapeutic response to photocoagulation strongly supports MPPE as the primary pathology. This case highlights the fact that MPPE may require repeated FA-guided laser treatments for effective management, even in the presence of atypical findings such as CD.

Abstract No.: 200399

A Curious Case of Juvenile Retinoschisis: A Case

First Author: Kashish MODI

Co-Author(s): Amit MEHTANI, Ropfuleno PESEYIE

Purpose: Evaluating X-linked recessive inheritance of Retinoschisis in a family.

Methods: Patient's subjective and objective refraction was done, slit lamp bio microscopy was done to rule out any media opacities, fundus examination was done, and SD-OCT OU was performed.

Results: 3 males in the family were affected by retinoschisis.

Conclusions: X-linked recessive retinoschisis runs in the family, precautionary treatment to avoid RD in the late stages was explained.

Abstract No.: 205991

A Curious Case of Retinal Angiomatous Proliferation in a 34-Year-Old Treated With Intravitreal Bevacizumab

First Author: Dimitra Novalita TENDRA

Co-Author(s): Grimaldi IHSAN, Erwin ISKANDAR, Arief KARTASASMITA, Rova VIRGANA, Made Indra WIDYANATHA

Purpose: Retinal angiomatous proliferation (RAP) is a challenging subtype of neovascular age-related macular degeneration characterized by intraretinal neovascularization that may progress to subretinal and choroidal involvement. Anti-VEGF therapy is the cornerstone of RAP management. I present a case of RAP treated with intravitreal bevacizumab

monotherapy, demonstrating the efficacy of this anti-VEGF agent in treating this complex retinal condition.

Methods: Case report.

Results: A 34-year-old woman presented with central blurred vision in her right eye. The ophthalmological examination showed visual acuity of 1.0 log 2 for the right eye and 0.6 log 25 for the left eye. The right eye examination revealed intraretinal hemorrhage at the fovea and an intraretinal hyperreflective lesion on OCT, with a focal vascular tuft on OCTA. The left eye was normal. She was diagnosed with Retinal Angiomatous Proliferation (RAP) Stage I on the right eye and treated with a single intravitreal bevacizumab (1.25 mg/0.05 mL) injection. At three-week follow-up, the visual acuity of the right eye improved to 0.6 log 25, hemorrhage resolved, and OCTA showed decreased vascular flow, indicating a positive response to treatment.

Conclusions: This case demonstrates the management of retinal angiomatous proliferation with a single intravitreal bevacizumab. The treatment resulted in visual acuity improvement and anatomical resolution of the lesion. These findings support the use of anti-VEGF therapy, specifically bevacizumab, as an effective first-line treatment option for RAP lesions, providing both functional and anatomical benefits.

Abstract No.: 200526

A Dose-Response Study of Same-Day Bilateral Subtenon Triamcinolone in Diabetic Macular Edema

First Author: Milka **MAVIJA**

Co-Author(s): Sanela **BURGIĆ**, Bojana **MARKIĆ**, Miljana **TEPIĆ POPOVIĆ**, Biljana **TOPIĆ**

Purpose: To compare the efficacy and safety of posterior subtenon injections (STI) of triamcinolone acetonide in doses of 0.5 mL (20 mg) and 1 mL (40 mg) in the treatment of diabetic macular edema (DME) with features of clinically significant macular edema (CSME) and numerous hard exudates.

Methods: This prospective study included 60 patients (120 eyes) with type 2 diabetes and bilateral CSME. Each patient received a 0.5 mL STI dose in one eye and a 1 mL dose in the fellow eye, on the same day. None had prior laser, anti-VEGF, or corticosteroid treatment. Best-corrected visual acuity (BCVA), intraocular pressure (IOP), and optical coherence tomography (OCT) parameters—including central macular thickness (CMT), intraretinal fluid (IRF), subretinal fluid (SRF), and hyperreflective foci (HRF)—were assessed at baseline and at 2, 4, 8, and 12 weeks post-injection.

Results: Both doses led to significant improvements in BCVA and reductions in OCT biomarkers. The 1 mL group showed greater functional and anatomical improvement: BCVA improved from 55 to 80 letters vs. 55 to 70 letters in the 0.5 mL group. CMT decreased from $386 \pm 48 \mu\text{m}$ to $312 \pm 35 \mu\text{m}$ (1 mL), and from

$375 \pm 53 \mu\text{m}$ to $322 \pm 41 \mu\text{m}$ (0.5 mL). IOP remained stable in the 0.5 mL group but increased in the 1 mL group (from $15.3 \pm 4.5 \text{ mmHg}$ to $20.6 \pm 3.0 \text{ mmHg}$).

Conclusions: Both STI doses are effective for DME. The 1 mL dose provides greater visual and structural benefit but carries a higher risk of IOP elevation, requiring close follow-up.

Abstract No.: 207259

A Macular Masquerade: Diagnostic Dilemma in Bilateral Focal Choroidal Excavation

First Author: Subhangi **SAHU**

Co-Author(s): Shreya **BHADANI**, Manmath Kumar **DAS**

Purpose: To describe a rare case of bilateral focal choroidal excavation (FCE) in a healthy young female.

Methods: A 19-year-old female presented with central scotoma in the right eye for 2 years and in the left eye for 2 months. Best corrected visual acuity (BCVA) was 6/9, N8 in the right eye and 6/6, N6 in the left. Colour vision and contrast sensitivity were normal bilaterally. Anterior segment examination was unremarkable. Fundus examination revealed vitelliform deposits at the fovea with surrounding retinal pigmentary epithelium (RPE) hypertrophy.

Results: Optical coherence tomography (OCT) demonstrated bilateral focal choroidal excavation along with RPE hypertrophy in both eyes. Fundus fluorescein angiography (FFA) revealed subfoveal blocked fluorescence of the choroid and surrounding RPE window defects in both eyes. Based on imaging, a diagnosis of bilateral non-conforming type FCE was made.

Conclusions: Focal choroidal excavation is typically unilateral and often detected incidentally. Bilateral FCE in a young, otherwise healthy individual is exceedingly rare. Multimodal imaging (OCT and FFA) was critical to confirm the diagnosis despite minimal symptoms. Clinicians should be aware of such atypical bilateral presentations, as FCE can be associated with pachychoroid spectrum disorders, central serous chorioretinopathy, choroiditis, or secondary choroidal neovascularization. Careful long-term follow up is essential to detect potential complications

Abstract No.: 201578

A Pilot Study of Scleral Thickness in Polypoidal Choroidal Vasculopathy (PCV)

First Author: Worathon **KULROTWICHIT**

Co-Author(s): Supathida **JIAMSAWAD**, Nopasak **PHASUKKIJWATANA**, Thanchanit **SAWETRATANASTIEN**

Purpose: To evaluate scleral thickness in patients with polypoidal choroidal vasculopathy (PCV) compared to age-matched normal controls and explore its correlation with choroidal thickness.

Methods: In this prospective cross-sectional pilot study, 30 eyes with PCV and 30 normal age-matched control eyes were enrolled. Scleral thickness was measured using swept-source anterior segment optical coherence tomography (SS-AS OCT) at 6 mm posterior to the scleral spur in four quadrants (nasal, temporal, superior, and inferior), and at 10 mm posterior to the scleral spur in the temporal quadrant only. Choroidal thickness was measured using spectral-domain OCT with enhanced depth imaging. Intraclass correlation coefficients (ICCs) were calculated to assess intra- and inter-rater reliability.

Results: There was no statistically significant difference in mean scleral thickness between the PCV and control groups in any of the measured quadrants (all $p > 0.05$). Although the temporal sclera at 10 mm showed a numerically greater thickness in PCV eyes, the difference did not reach statistical significance. Intra-rater and inter-rater ICCs exceeded 0.75 for all measured parameters, indicating good reliability. No statistically significant correlation was found between choroidal and scleral thickness in any of the measured quadrants (all $p > 0.05$).

Conclusions: Although eyes with PCV tended to exhibit increased scleral thickness in certain quadrants, these differences were not statistically significant relative to controls. No correlation was found between scleral thickness and mean choroidal thickness. Further studies are needed to clarify whether scleral thickness contributes to Polypoidal Choroidal Vasculopathy disease pathogenesis.

Abstract No.: 205879

A Rare Case of Retinitis Pigmentosa Sine Pigmento in a 21-Year-Old Filipino Female Initially Diagnosed As Idiopathic Intracranial Hypertension

First Author: Pauline Gabrielle **LACSAMANA**

Co-Author(s): Marie Joan **LOY**, Buenjim **MARIANO**

Purpose: To present a rare case of Retinitis Pigmentosa sine pigmento (RPSP) initially presenting as idiopathic intracranial hypertension, emphasizing the diagnostic challenge posed by the absence of typical retinal pigmentation.

Methods: A 21-year-old female presented with bilateral peripheral visual loss. Visual acuity was 20/20 and Ishihara score was 9/11 in both eyes. Anterior segment findings and intraocular pressures were unremarkable. Fundoscopy showed mild optic disc elevation with preserved margins and absence of vessel obscuration. Fundus photos revealed retinal mottling and lattice degeneration bilaterally. Perimetry demonstrated severe generalized depression with preserved paracentral islands of vision. Fluorescein angiography revealed late disc staining, diffuse patchy hyperfluorescence, and peripheral perivascular leakage. Optical coherence tomography (OCT) showed

global thinning of macular ganglion cell and inner plexiform layers. Brain MRI was unremarkable.

Results: Despite the absence of classic bony spicule pigmentation, the constellation of functional and structural findings led to a diagnosis of RPSP. The patient's presentation highlighted the diagnostic complexity of atypical RP variants, particularly in young patients without overt fundus pigmentary changes.

Conclusions: RPSP can mimic other neuro-ophthalmic conditions and may delay appropriate management due to its subtle retinal appearance. Clinicians must maintain a high index of suspicion in patients with peripheral vision loss, even in the absence of pigmentary changes. Ancillary tests such as electroretinography and genetic analysis are valuable in confirming the diagnosis. While no definitive cure exists, early diagnosis enables initiation of supportive measures including vitamin A and lutein supplementation, and close monitoring to potentially slow disease progression.

Abstract No.: 200855

A Rare Constellation: Diabetic Ketoacidosis, Rhino-Orbital Mucormycosis, Cherry-Red Spot, and Viral Infection in a Single Patient

First Author: Drishti **KAUSHAL**

Co-Author(s): Anerudh **MATHUR**, Arushi **RATTAN**, Ram Lal **SHARMA**

Purpose: Early identification of Diabetic ketoacidosis to prevent deadly complications in a patient also positive for a deadly virus.

Methods: detailed history taking and thorough clinical evaluation of the patient.

Results: This case highlights the potential for simultaneous occurrence of multiple severe pathologies in immunocompromised patients. Early recognition and multidisciplinary management are critical to improving outcomes.

Conclusions: This case underscores the need for high clinical suspicion for mucormycosis in diabetic patients presenting with acute ocular symptoms, especially in the presence of DKA and other immunosuppressive conditions. Coexistent CRAO and chronic HBV infection pose additional diagnostic and therapeutic challenges.

Abstract No.: 206220

A Therapeutic Challenge: Managing Vitreous Hemorrhage After AAPFV Surgery in a Child

First Author: Jia **YANG**

Co-Author(s): Yu **TIAN**

Purpose: To establish an optimal, cost-effective approach for the pharmacological management of vitreous hemorrhage post-surgery in infants.

Methods: A case report.

Results: A 79-day-old male infant presented with a grayish discoloration of the left pupil for 10 days. Key findings included conjunctival injection, corneal edema, complete angle closure and an increased IOP in the left eye. The infant was diagnosed with secondary angle-closure glaucoma and pupillary seclusion in the left eye. Since fundus examination of his right eye was unremarkable, AAPFV was highly suspected as the cause. To prevent vision loss and deprivation amblyopia, surgery is necessary. We did excision of the rigid fibrovascular membrane, pupilloplasty, peripheral iridectomy and anterior chamber reconstruction for him. No signs of intraocular hemorrhage. However, he developed vitreous hemorrhage 10 days after surgery, which had worsened by one month postoperatively, requiring further management. Should vitrectomy be performed immediately to avoid deprivation amblyopia? In our previous clinical experience, our department successfully managed submacular hemorrhage in leukemia children by intravitreal injection of recombinant tissue plasminogen activator (rt-PA), with promising results. We therefore flexibly adopted intravitreal rt-PA injection for this infant. Follow-up examination showed near-complete resolution of the vitreous hemorrhage and a good ocular condition. Aggressive refractive correction and amblyopia therapy were initiated with good OCT results, and the infant continues to be followed up.

Conclusions: The use of intravitreal rt-PA established a treatment that prevented the injuries and expenses associated with a second vitrectomy. This case of AAPFV is instrumental in showcasing a new pharmacological strategy for pediatric postoperative vitreous hemorrhage.

Abstract No.: 201628

A Twisting Tale: Bartonella Panuveitis Masquerading as Endophthalmitis in a Patient With Ankylosing Spondylitis

First Author: Ru Bin **SEAH**

Co-Author(s): Hanizasurana **HASHIM**, Nurnadia **KAMARUDDIN**, Nazima **SHADAHT ALI**, Justin Dieu Siang **YEAH**

Purpose: To report a case of Ocular Bartonella panuveitis with successful therapeutic vitrectomy in a patient with Ankylosing Spondylitis.

Methods: Case report.

Results: A 46-year-old Chinese man with underlying ankylosing spondylitis was referred from a private practice with 1 1-week history of eye pain and redness. He denied having a fever. The uveitic history was unremarkable except for having a vaccinated cat at home and no history of cat scratch. He was diagnosed with ankylosing spondylitis at 20 but never required steroids or immunosuppressants. He had good postoperative vision following left eye cataract surgery. Oral Prednisolone 15 mg OD and a topical steroid

were started by the treating ophthalmologist, but no clinical improvement was observed. Left eye vision was counting fingers on presentation. Examination showed signs of panuveitis. There was severe fibrinous uveitis with 4+ cells in the anterior chamber, an IOP of 15, and dense vitritis precluding fundal view, supported by B scan findings. Patient was treated as endogenous endophthalmitis initially with intravitreal tap and antibiotic injections until the Bartonella IgM serology was detected positive. He subsequently underwent therapeutic vitrectomy. Post-operatively, he was started on oral doxycycline for six weeks and tapering prednisolone regime. Other investigations, including infective screening, inflammatory markers, and intra-operative cultures, were negative. The vision improved dramatically to 6/9 two weeks post-operation.

Conclusions: Ocular Bartonella panuveitis can present as severe inflammation mimicking endophthalmitis. Early therapeutic vitrectomy should be considered, as it offers a promising visual outcome and alleviates patient distress.

Abstract No.: 200514

Acute Choroidal Neovascularization in a 16-Year-Old Female With High Myopia: A Rare Case Report

First Author: Syeda Ghazala **SHAHNAWAZ**

Purpose: Timely management of acute choroidal neovascularization (CNV) in a 16-year-old female with high myopia, presenting with sudden visual disturbance.

Methods: A 16-year-old highly myopic female (-22.00 diopters spherical [DS] both eyes) presented with sudden onset of a black spot and blurred vision in the right eye for 12 hours. Unaided visual acuity (VA) was 6/60 in both eyes, improving to 6/6 with correction. Anterior segments were normal. Fundoscopy showed myopic degenerative changes and a dark lesion near the right macula. Optical coherence tomography (OCT) revealed central macular edema >350 µm bilaterally. Topical nepafenac was initiated. Optical coherence tomography angiography (OCT-A) confirmed active CNV in the right eye. Intravitreal ranibizumab was administered within 48 hours.

Results: Next-day follow-up showed stable VA with no signs of endophthalmitis. At four weeks, best-corrected visual acuity (BCVA) was 6/24 in both eyes. Fundoscopy showed near-complete CNV regression with minimal neovascular remnants. A second intravitreal injection (bevacizumab) was given on day 40. OCT-A after one week showed complete CNV resolution. Final BCVA improved to 6/9 in both eyes with high myopic correction (-25.00 DS right eye, -22.00 DS left eye).

Conclusions: Acute CNV in teenagers with high myopia is extremely rare. Early diagnosis using OCT-A and timely anti-vascular endothelial growth factor

(anti-VEGF) therapy led to excellent anatomical and functional outcomes. This case highlights the importance of early diagnosis, imaging and treatment in high-risk young patients.

Abstract No.: 207064

Advances in Understanding and Treating Central Serous Chorioretinopathy

First Author: Xinyuan ZHANG

Purpose: characterized by idiopathic focal serous detachment of the neural retina and/or retinal pigment epithelium (RPE) in the posterior pole. In the recent 15 years, with the development of advanced imaging techniques such as optical coherence tomography (OCT), a novel concept of pachychoroid spectrum disorder (PCD), has been described. This comprehensive review aims to highlight the currently available evidence on the pathogenesis, diagnosis, multimodality imaging features, and management strategies, including recent findings related to CSCR.

Methods: PubMed, Medline, Springerlink, the Cochrane Library, Google Scholar, and EMBASE Medline database from the year 1990 to November 28, 2022, have been searched to retrieve English articles with the following key terms: «central serous chorioretinopathy», «central serous retinopathy», «chorioretinopathy», «central serous retinopathy» and «CSCR». The search is limited to the terms «epidemiology» or «risk factors» or «pathogenesis»; or «management» or «treatment» or «trial» or «randomized» to focus on the findings of randomized clinical trials, cohort studies, meta-analyses, reviews, and technological advancements in the past decade.

Results: We highlighted the currently available evidence on the pathogenesis, diagnosis, multimodality imaging features, and management strategies, including recent findings related to CSCR.

Conclusions: CSCR is continuously updated based on the understanding of the pathogenesis of pachychoroidal spectrum disorder and venous overload choroidopathy.

Abstract No.: 205518

Alagille Syndrome Diagnosed by a Novel Pathogenic JAG1 Mutation: A Case Report

First Author: Kejia YUAN

Co-Author(s): Yun LI

Purpose: ALGS (Alagille syndrome) is a rare autosomal dominant genetic disorder affecting multiple organs. Primarily caused by mutations in the JAG1 or NOTCH2 genes. To report the ocular and systemic manifestations of a pediatric case of ALGS caused by a novel frameshift mutation in the JAG1 gene.

Methods: A case report of a 6-year-old boy presenting with reduced bilateral visual acuity for over two years.

The diagnosis was established through comprehensive ophthalmic and systemic evaluations, followed by NGS (next-generation sequencing) and Sanger sequencing of the patient and his parents.

Results: Ophthalmic examination revealed high myopia and central retinal pigmentary changes. Systemic evaluation identified hepatomegaly, jaundice, abnormal liver function, hypercholesterolemia, xanthomas, aortic stenosis, patent foramen ovale, and growth retardation. NGS and Sanger sequencing identified a novel heterozygous frameshift mutation in the JAG1 gene: c.2493_2500delinsCACCTTG/ p.Gly832ThrfsTer7. This variant was absent in population databases and predicted to be pathogenic by bioinformatics analysis. Parental testing revealed no detectable mutation, suggesting germline chimerism or a de novo event. The diagnosis of ALGS was confirmed based on the characteristic clinical features and genetic findings.

Conclusions: This case highlights a novel pathogenic JAG1 mutation underlying ALGS. It underscores the importance of a multidisciplinary approach for children presenting with ocular anomalies (such as posterior embryotoxon or retinal pigmentary changes) accompanied by systemic signs like cholestasis or cardiac defects. Genetic testing is crucial for definitive diagnosis, as novel mutations can occur.

Abstract No.: 201462

An Aggressive Masquerade Mimicking Invasive Fungal Sinusitis

First Author: Zhen Ning LOW

Co-Author(s): Nor Azita AHMAD TARMIDZI, Yie Ping CHIN, Michael Dau Bing NGU

Purpose: To report a case of atypical presentation of plasmablastic lymphoma with orbital, sinonasal and marrow involvement.

Methods: Case report.

Results: A 44-year-old man with diabetes presented with two days of reduced vision and painless swelling of the left eye (LE), accompanied by intermittent fever and 5 kg weight loss over one month. LE vision was 6/30 with a relative afferent pupillary defect. Anterior segment was unremarkable apart from conjunctival injection. Fundus examination revealed cotton wool spots and flame-shaped haemorrhages at the posterior pole, with normal vessels, a pink optic disc (cup-disc-ratio 0.3), and a superotemporal choroidal mass measuring two-disc diameters. Orbital and brain computed tomography demonstrated posterior orbital wall thickening, a retrobulbar soft tissue lesion with perineural enhancement, bulky lacrimal gland, and sinonasal lesions with cavernous sinus involvement, suggestive of invasive fungal sinusitis. Multidisciplinary inputs from otolaryngology and infectious disease were sought. Nasal endoscopy showed diffuse mucosal

swelling and sloughing. He was treated for invasive fungal sinusitis. Despite treatment, his condition deteriorated, with vision declining to hand movements, bilateral proptosis, severe chemosis, subconjunctival haemorrhage, exudative retinal detachment, and progression of the choroidal mass. Further workup showed pancytopenia, retroviral positivity, Epstein–Barr virus positivity, and Salmonella bacteraemia. Bone marrow biopsy confirmed plasmablastic lymphoma. He was referred for urgent radiochemotherapy but subsequently succumbed to the illness.

Conclusions: Plasmablastic lymphoma with orbital involvement can mimic infection or inflammation. Early biopsy and multidisciplinary collaboration are crucial for timely diagnosis and treatment.

Abstract No.: 205432

Association Between Glaucoma and Retinal Vein Occlusion: Evidence From Real-World Big Data

First Author: Fang Yu **LIN**

Co-Author(s): Cheng Kuo **CHENG**

Purpose: To evaluate the association of retinal vein occlusion in glaucoma patients.

Methods: Data were drawn from 127 healthcare organizations within the TriNetX platform, a de-identified electronic health record database, covering the period from January 1, 2010, to December 31, 2020. Propensity score matching was utilized to minimize confounding. Kaplan-Meier curves assessed event-free probabilities, and the Cox proportional hazards model evaluated treatment effects on our outcomes. Subgroup analyses demonstrated a consistent trend toward higher RVO risk in the glaucoma group across most subgroups, including both sexes, patients with or without diabetes, and those with hypertension.

Results: After 1:1 propensity score matching, each cohort included 158,026 participants. Glaucoma patients exhibited a significantly higher incidence of RVO compared to those without glaucoma (1.15% vs. 0.23%), with a hazard ratio (HR) of 5.86 (95% CI: 5.24–6.56, $p < 0.0001$). This elevated risk extended to both subtype, CRVO (0.65% vs. 0.07%; HR 10.92, 95% CI: 8.97–13.30) and BRVO (0.64% vs. 0.18%; HR 4.30, 95% CI: 3.76–4.90), with a markedly stronger association for CRVO. Kaplan-Meier curves demonstrated an early and sustained divergence favoring higher cumulative incidence in the glaucoma cohort (log-rank $p < 0.0001$). Subgroup analyses demonstrated a consistent trend toward risk reduction across most subgroups, including both sexes, patients with or without diabetes and hypertension.

Conclusions: Glaucoma is strongly associated with an increased risk of retinal vein occlusion, with the greatest relative risk observed for CRVO. This

association persists across key clinical subgroups (sex, diabetes, hypertension) after rigorous propensity score matching. Our findings using large real-world database reinforce that patients with glaucoma warrant heightened surveillance for RVO, particularly CRVO.

Abstract No.: 209433

Association Between Serum Thyroid-Stimulating Hormone Levels and Nonproliferative Diabetic Retinopathy in Chinese Patients With Type 2 Diabetes: A Cross-Sectional Study

First Author: Weiwen **HU**

Co-Author(s): Qiong **ZHOU**

Purpose: The association between thyroid-stimulating hormone (TSH) and type 2 diabetes mellitus (T2DM) has been well-established. However, the potential link between TSH levels and nonproliferative diabetic retinopathy (NPDR) remains insufficiently explored. This study aimed to examine the relationship between TSH levels and NPDR in a cohort of Chinese patients diagnosed with T2DM.

Methods: A total of 493 individuals with T2DM were included in this cross-sectional study. Participants were classified into two groups based on fundus oculi examination: the non-diabetic retinopathy (NDR) group ($n = 250$) and the NPDR group ($n = 243$). Demographic and clinical data were collected through medical record reviews and direct interviews. Statistical comparisons of demographic data and biochemical parameters were performed using either the Student's t-test or the Mann-Whitney U test. Logistic regression models were employed to assess the relationship between TSH levels and NPDR.

Results: No significant differences were observed between the groups in terms of age, sex, body mass index (BMI), alcohol consumption, or diabetes duration. However, systolic blood pressure (SBP), smoking prevalence, TSH levels, blood urea nitrogen (BUN), and urinary microalbumin (mALB) were significantly higher in the NPDR group compared to the NDR group ($P < 0.05$). Conversely, individuals in the NDR group exhibited higher levels of thyroxine (T4), glutamic pyruvic transaminase (ALT), fasting C-peptide (FCP), and 2-hour C-peptide (2hCP) than those in the NPDR group ($P < 0.05$). Spearman's correlation analysis revealed a negative correlation between TSH levels and HbA1c across all participants ($r = -0.13$, $P < 0.05$). In the NPDR group, TSH was negatively correlated with HbA1c ($r = -0.21$, $P < 0.01$) and positively correlated with diabetes duration ($r = 0.15$, $P < 0.05$). Multivariate logistic regression analysis identified high TSH levels, sex, diabetes duration, high-density lipoprotein cholesterol (HDL-C), HbA1c, FCP, and SBP as significant factors associated with NPDR (odds ratio [OR] > 1 , $P < 0.05$). Receiver operating characteristic (ROC) curve

analysis determined an optimal TSH cutoff value of 2.145 mIU/L for predicting NPDR.

Conclusions: This study highlights an independent association between serum TSH levels and NPDR in individuals with T2DM in the Chinese population. Elevated TSH may serve as a potential risk factor for NPDR and could prove to be a valuable marker for screening diabetic microangiopathy.

Abstract No.: 203769

Association of Hb and HbA1c With Severity of Diabetic Retinopathy

First Author: Muna KHAREL

Purpose: To Study the Association of Hb and HbA1c With Severity of Diabetic Retinopathy

Methods: This hospital based, cross sectional observational study was conducted in Shree Birendra Hospital, Chhauni, Kathmandu during the period of 12 months from January, 2019 to January, 2020. Diagnosed cases of Diabetic Retinopathy were evaluated for severity with associated Hemoglobin and Glycated Hemoglobin levels.

Results: There were total of 112 patients enrolled in the study. The mean age of the patients was 56.8 (SD $\pm$ 7.63) years with male to female ratio of 2:1. Of the total, 89.4% had non proliferative diabetic retinopathy and rest had proliferative and advanced retinopathy. Higher hemoglobin (more than 12 g/dl, $P < 0.05$) were found to be associated with milder forms of DR. Higher level of HbA1c (more than 9% , $P < 0.05$) were associated with eyes with more severe forms of diabetic retinopathy. Lower Hb to HbA1c ratios (less than 1.28, $P < 0.05$) were associated with severe forms of DR.

Conclusions: HbA1c levels remain one of the most reliable predictors of glycemic control and are likely to remain same for many years to come. But as our study points out, hemoglobin is also equally important to understand the disease process. Hemoglobin should also be considered while managing cases of diabetic retinopathy along with HbA1c. This might better aid in devising proper management and follow-up in patients by identifying the eyes "at risk" of deterioration earlier.

Abstract No.: 205601

Atrial Fibrillation in Retinal Artery Occlusions: A Review of Literature Across Cardiology and Ophthalmology

First Author: Chi Lik AU

Purpose: Atrial fibrillation (AF) increases the risk of cardioembolic events, but its extent on the eye is uncertain. Our study aims to review the literature and determine the reported prevalence of AF in patients diagnosed with retinal artery occlusions (RAO).

Methods: A structured literature search was conducted on 20 March 2025 in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Electronic databases searched included PubMed, MEDLINE, Scopus, and the Cochrane Central Register of Controlled Trials. A combination of free-text terms and Medical Subject Headings (MeSH) related to "atrial fibrillation" and "retinal vascular occlusions" was used to maximize sensitivity. Inclusion criteria are studies with raw data on the prevalence of AF in RAO patients. Retinal vein occlusion (RVO) studies, or studies with non-separable RAO-RVO data, were excluded. Following full-text screening, the following key data were extracted from each study: author, year, study design, sample size, and key results. A thematic synthesis was then conducted to identify patterns across studies.

Results: A comprehensive search of the literature yielded 2,431 articles, of which 15 met the inclusion criteria and contributed to the data extraction and subsequent analysis. Publication year ranged from 2010 to 2023, with a total of 29,288 RAO patients included. Studies reported 5.3 % - 49.4 % prevalence of AF in patients diagnosed with RAO. A total of 4,679 (16.0 %) RAO patients had AF upon RAO diagnosis, and subsequent cardiology workup found even more AF.

Conclusions: Cardiology workup in RAO patients is essential; underdiagnosis of AF within patients diagnosed with RAO is not uncommon.

Abstract No.: 201515

Atrophy Secondary to Non-Dry AMD Associated Pathologies: A Review

First Author: Ethel Zi Xie NG

Co-Author(s): Elina NG, Wei Kiong NGO, Maverick Wenhao WONG

Purpose: To review geographic atrophy (GA) arising from non-dry AMD associated pathologies and highlight clinical distinction from drusen-mediated GA in dry age-related macular degeneration (AMD).

Methods: A narrative review of the published literature was conducted, synthesizing evidence from multimodal imaging, histopathology and clinical studies describing atrophy in conditions other than dry AMD.

Results: Seventeen studies were identified across six diagnostic categories. Despite converging on morphologically similar zones of photoreceptor and RPE loss, these entities demonstrated distinct pathogenic drivers. In exudative AMD, atrophy developed both within and beyond choroidal neovascular membranes, with reticular pseudodrusen and intraretinal cysts as possible risk factors, while quiescent CNV sometimes slowed lesion progression. Pachychoroid disease and chronic CSC were linked to chronic choroidal congestion and hyperpermeability, with characteristic imaging features including pachyvessels,

pachydrusen, gravitational tracks and stalactite-like photoreceptor changes. In high myopia, atrophy might be driven by mechanical stretch, lacquer cracks and staphyloma, often compounded by inflammatory lesions such as punctate inner choroidopathy or multifocal choroiditis. Post-inflammatory atrophies (Birdshot chorioretinopathy, Acute Zonal Occult Outer Retinopathy) displayed immune-mediated injury with subretinal deposits, cystoid changes and variable response to immunosuppression. Inherited retinal degenerations (CRX-related disease, Maternally Inherited Diabetes and Deafness, Stargardt disease) result from primary genetic defects in photoreceptor or RPE metabolism and structure, causing cell-autonomous degeneration independent of complement-mediated pathways driving GA in AMD.

Conclusions: GA represents a morphological endpoint of diverse biological processes rather than a single disease entity. Accurate recognition of subtypes is essential to avoid misclassification, refine prognostication and guide development of targeted, mechanism-based interventions.

Abstract No.: 201715

Atypical Central Serous Chorioretinopathy With Large RPE Rips

First Author: Debarun **SHARMA**

Co-Author(s): Yamini **TULSIANI**

Purpose: To discuss two year follow up of an atypical CSC case which presented with large pigment epithelium detachment (PED) extending anterior to equator which later developed RPE avulsion leading to exudative detachment.

Methods: A 54-year-old female presented with blurring of vision in both eyes with a history of topical steroid use for the past 2 years. BCVA was 6/18 OD and 6/24 OS. Fundus examination revealed patchy pigmentary alteration at the posterior pole, PED along the superotemporal arcade, and a large PED in the superonasal quadrant OD. OS showed pigmentary changes at the posterior pole, PEDs along the superotemporal and inferotemporal arcades, nasal to the disc, and a large PED with NSD in the superonasal quadrant extending anterior to the equator.

Results: ICGA revealed early hypo fluorescence with pooling of dye in PEDs. FFA revealed smoke stack leaks at the posterior pole OU. OCT confirmed intraretinal cystic edema and neurosensory detachment. A double-frequency Nd YAG laser was used along with identified focal leaks in the OU. At 1-month follow-up, BCVA was reduced to 6/60 OS. Fundus examination revealed multiple RPE avulsions at previously documented PED sites and inferior bullous detachment. FFA showed hyperfluorescence at sites of RPE avulsions with leakage into NSDs. The patient was started on a topical carbonic anhydrase inhibitor, which was continued for six months. Exudative detachment slowly resolved

over a period of 4 months with final vision of 6/36 OS maintained at 2-year follow-up.

Conclusions: This is a unique case with large peripheral PEDs extending anterior to the equator, associated with atypical CSC.

Abstract No.: 201794

Avacincaptad Pegol for Geographic Atrophy: 3.5-Year Results From the GATHER2 Open-Label Extension Trial

First Author: Timothy **LAI**

Co-Author(s): Andrew **CHANG**, Carl J. **DANZIG**, Jeffrey S. **HEIER**, Frank G. **HOLZ**, Arshad M. **KHANANI**

Purpose: Avacincaptad pegol (ACP) is FDA approved for the treatment of geographic atrophy (GA) secondary to age-related macular degeneration. The efficacy and safety of ACP have been demonstrated in two pivotal clinical trials, GATHER1 and GATHER2, in patients with non-center-point-involving GA. This 18-month open-label extension (OLE) study (NCT05536297) assessed the long-term safety of ACP 2mg treatment in patients with GA who previously completed the 24-month GATHER2 trial.

Methods: A total of 278 patients who completed GATHER2 through the month 24 visit on either ACP 2mg or sham were administered ACP 2mg monthly from Months 1-17 of the OLE, with a final follow-up visit at Month 18. Patients were treated with ACP 2mg up to 42 months (3.5 years) or 18 months if previously on sham in GATHER2. The primary endpoint was safety, which included reporting of adverse events whether or not deemed related to the injection procedure or treatment.

Results: In GATHER2, both monthly and every-other-month ACP 2mg demonstrated a reduction in GA lesion growth vs sham at 2 years. There were no reports of retinal vasculitis, ischemic optic neuropathy, or serious intraocular inflammation. In year 2, the incidence of choroidal neovascularization in the study eye was 7.3% for monthly ACP 2mg, 4.3% for every-other-month ACP 2mg, and 5.4% for sham. The safety of ACP 2mg from the 18-month OLE of GATHER2 will be presented.

Conclusions: Long-term results from the GATHER2 OLE will provide valuable information on the tolerability of ACP 2mg for GA over a 3.5-year treatment period.

Abstract No.: 207386

Bardet-Biedl Syndrome in a Chinese Patient With a Novel Homozygous Pathogenic BBS5 Variant

First Author: Xiaohe **YAN**

Purpose: Bardet-Biedl syndrome (BBS) is a rare, autosomal recessive genetic disorder with multi-systemic symptoms, including polydactyly (the presence of extra fingers or toes), obesity, renal

anomalies, retinal dystrophy, and cognitive impairment. Our study reported a previously unreported BBS5 homozygous variant in a Chinese patient with BBS.

Methods: A comprehensive ophthalmologic examination was conducted. The whole exome sequencing and Sanger sequencing were utilized to detect pathogenic genes. Protein structure prediction and multiple sequence alignments were performed.

Results: An 18-year-old female presented with blurry vision and night blindness since childhood. Upon conducting a general assessment, polydactyly, obesity, and learning disability were also identified. Ophthalmologic examination revealed severe retinal degeneration. Whole Exome Sequencing and Sanger sequencing detected a new homozygous variant in BBS5 (NM152384.3: exon 3: c.185 del: p.L62Wfs*16). The protein structure prediction showed substantial deletions of amino acid segments caused by the variant. The multiple sequence alignments indicated that the amino acids corresponding to the variant were in a highly conserved region of the BBS5 protein, underscoring their essential role in maintaining protein function.

Conclusions: These findings enrich the mutational spectrum and expand the phenotypic and genotypic heterogeneity of Bardet-Biedl Syndrome.

Abstract No.: 205971

Beyond Hemangioblastoma, New Findings of Retinal Vascular Changes in Von Hippel-Lindau Syndrome

First Author: Ruilin ZHU

Co-Author(s): Liu YANG

Purpose: Previous research has not thoroughly investigated alterations in the peripheral retinal vasculature in VHL. In this report, we studied a series of patients with VHL syndrome to examine the far peripheral retinal vascular characteristics with widefield fluorescein angiography.

Methods: We retrospectively reviewed the VHL patients who underwent wide-field fundus fluorescein angiography. Far peripheral retinal vascular pathology was recorded by two experienced ophthalmologists. The correlation between the peripheral retinal changes was analyzed.

Results: Sixty-three eyes from 33 patients were included in this study. The mean age of the patients was 34.30 years. Forty-three of them (68.25%) had hemangioblastomas seen on widefield FFA. The total number of RHs was 109 in these patients. Far peripheral retinal fluorescein angiography changes included capillary leakage, abnormal capillary network, and capillary nonperfusion. The peripheral retinal capillary leakage was noted in 14 eyes (22.22%). The capillary leakage was significantly related to whether there was RH located between the equator and ora

serrata of the retina ($p=0.0006$). An abnormal capillary network (ACN) was found in three eyes. Two eyes had peripheral capillary nonperfusion.

Conclusions: Beyond the RHs in VHL syndrome patients, the far peripheral vascular features were also noted. Investigation of these features could be helpful to clarify the pathogenesis of VHL retinal abnormality.

Abstract No.: 206295

Beyond the Darkness: Navigating Oguchi Disease With a Singular Case Insight

First Author: Hajra MALIK

Co-Author(s): Shehrbano ABBAS, Saman GULZAR, Najia UZAIR

Purpose: To report a case of Oguchi disease featuring the characteristic Mizuo–Nakamura phenomenon in a child, and to illustrate how dark adaptation affects fundus appearance and aids in diagnosis.

Methods: A 9-year-old girl presenting with complaints of impaired night vision was evaluated clinically. Assessment included measurement of best-corrected visual acuity, dilated fundus examination, and observation of the fundus before and after prolonged dark adaptation (2 hours).

Results: At presentation, best-corrected visual acuity in both eyes was 20/100. Fundus examination revealed a bilateral metallic sheen across the retina. After 2 hours of dark adaptation, the goldenyellow metallic sheen resolved, demonstrating the Mizuo–Nakamura effect — the hallmark clinical sign of Oguchi disease.

Conclusions: This case underscores the diagnostic value of prolonged dark adaptation and fundus re-examination in suspected Oguchi disease. Recognition of the Mizuo–Nakamura phenomenon helps to distinguish this rare stationary night blindness condition and avoid misdiagnosis.

Abstract No.: 203579

Beyond the Hype- Anti-VEGF: A Silver Bullet or Just One Tool?

First Author: Noor UL AIN

Co-Author(s): Tayyaba GUL MALIK

Purpose: To highlight the importance of comprehensive clinical evaluation, rather than reliance on diagnostic imaging alone, in guiding treatment decisions.

Methods: A 34-year-old female patient presented to our outpatient department with an 8-week history of decreased vision in both eyes. Initial symptoms began 8 weeks prior, with decreased vision in the right eye, prompting consultation with a local ophthalmologist. Following investigations, the patient received an intravitreal anti-vascular endothelial growth factor (VEGF) injection, resulting in improved vision, although blurriness persisted. Notably, the patient reported a recent history of influenza, which resolved

spontaneously. Anterior segment examination revealed normal findings in both eyes. However, fundoscopic examination disclosed creamy white placoid lesions at the posterior pole and equator in both eyes. Based on clinical examination and investigations, a diagnosis of acute posterior multifocal placoid pigment epitheliopathy (APMPPE) was established. Review of the patient's optical coherence tomography (OCT) images revealed increased macular thickness, which likely prompted the initial treating ophthalmologist to administer anti-VEGF therapy. However, APMPPE is a self-limiting condition that does not require anti-VEGF injections. This case highlights the importance of comprehensive clinical evaluation, rather than reliance on diagnostic imaging alone, to guide treatment decisions. We also investigated potential associations with cerebral vasculitis via magnetic resonance imaging (MRI).

Results: This case emphasizes the need for thorough history-taking and clinical examination before initiating sophisticated treatments.

Conclusions: Not all patients with increased macular thickness require anti-VEGF therapy, and unnecessary procedures should be avoided to prevent potential complications.

Abstract No.: 204242

Beyond the Known: Expanding the Phenotype of Retinitis Pigmentosa in a Patient With Novel Mutation in ABCA4

First Author: Steven Matthew LEE

Co-Author(s): Manuel Benjamin IBANEZ IV

Purpose: Retinitis pigmentosa (RP) is a hereditary retinal disease characterized by bony spicule pigmentation, waxy optic disc pallor, and vessel attenuation. It exhibits genotypic heterogeneity with multiple genes, including the ABCA4 gene. Stargardt disease (STGD) and ABCA4-retinopathies, are caused by pathogenic variants in the ABCA4 gene inherited in an autosomal recessive manner. This gene encodes an importer flippase protein that prevents build-up of vitamin A derivatives toxic to the retinal pigment epithelium. Build-up of which results in the characteristic finding of yellow, pisciform flecks in STGD. Diagnosing ABCA4R is complex due to its phenotypic heterogeneity, with ABCA4 being known to cause RP, STGD, and cone-rod dystrophy (CRD).

Methods: A comprehensive history and ocular examination with molecular testing were done.

Results: A 30-year-old Asian male presented with poor bilateral vision since childhood. Best corrected visual acuity was counting fingers at 1 foot on the right and hand movement on the left. Examination showed overlapping features of both RP and STGD, with features of a uveitic process, including mild inflammation, and unilateral persistent pupillary

membranes. Uveitis work-up showed inconclusive results. An inherited retinal dystrophy panel done revealed a compound heterozygous mutation in the ABCA4 gene, with one variant being novel. (ABCA4 c.4253+5G>A, c.161-23T>A).

Conclusions: To our knowledge, this is the first reported case of ABCA4-RP caused by this novel compound heterozygous mutation. It therefore contributes to incidence reporting and profiling of inherited retinal dystrophies, and demonstrates their phenotypic and genotypic heterogeneity, which aid in the diagnosis and management of these diseases.

Abstract No.: 202327

Beyond the Spicules: A Rare Case of Retinitis Pigmentosa Sine Pigmento Unmasked by a Novel Mutation in IDH3A

First Author: Miguel Enrique ROA

Co-Author(s): Manuel IBANEZ IV, Steven Matthew LEE, Juan Paulo RIEGO DE DIOS

Purpose: Retinitis pigmentosa (RP) is the most commonly diagnosed inherited retinal dystrophy affecting approximately 1 in 4000 individuals worldwide. Classic findings of RP include optic nerve pallor, vessel attenuation and bony spicule like pigments especially in the periphery. However, there are also atypical forms of retinitis pigmentosa like RP sine pigmento where there is absence of its characteristic pigmentary epitheliopathy. This paper reports a case of a 32-year-old male presenting as an atypical case of retinitis pigmentosa sine pigmento, first-ever recorded with compound heterozygous mutations in IDH3A, a gene that has only been reported in 4 other cases of typical RP to date.

Methods: A patient from a non-consanguineous Filipino family was clinically diagnosed with RP at the Ocular Genetics clinic. Complete ophthalmic examination was done, as well as diagnostics (fundus photo, fundus autofluorescence, ocular coherence tomography of the macula, full field electroretinography, visual field test). In addition, an inherited retinal dystrophy panel of 330 was requested.

Results: Fundus findings of our patient revealed midperipheral degeneration, vessel attenuation, with absence of bony spicules. Genetic testing revealed the patient to be compound heterozygous for two variants IDH3A c.27+2T>G, and IDH3A c.415G>T (p.Asp139Tyr).

Conclusions: In summary, we report a rare case of a patient presenting with RP sine pigmento and harboring novel IDH3A mutations, expanding the genetic spectrum of IDH3A variants associated with RP. There are only 4 reported cases of IDH3A-related typical RP and none presenting as sine pigmento like our patient.

Abstract No.: 202296

Bilateral Choroidal Osteoma With Secondary Choroidal Neovascular Membrane: A Rare Case Report

First Author: Md.Zaman **SAKIB**

Co-Author(s): Md.Anwarul **AZIM**, Md.Dedarul **HASSAN**, Mostafiz **HOSSAIN**

Purpose: To present a rare case of bilateral choroidal osteoma with choroidal neovascular membrane (CNVM) in a young female and to highlight the importance of multimodal imaging and intravitreal anti-VEGF therapy.

Methods: A 32-year-old woman presented with gradual dimness of vision in her left eye for six months. There was no history of trauma, systemic illness, or family history of ocular disease. Ocular examination revealed a whitish, slightly elevated subretinal lesion with distinct margins in the peripapillary region of the right eye. The left eye demonstrated a large hypopigmented lesion involving the macula with associated pigmentary changes. Multimodal imaging, including B-scan ultrasonography, optical coherence tomography (OCT), fundus fluorescein angiography (FFA), and fundus autofluorescence (FAF), confirmed the diagnosis of bilateral choroidal osteoma with secondary CNVM and pigment epithelial detachment in the left eye.

Results: The patient was diagnosed with bilateral choroidal osteoma, complicated by CNVM in the left eye. She was treated with intravitreal anti-VEGF injections, which resulted in stabilization of vision and reduction of CNVM activity. She was scheduled for regular follow-up with multimodal imaging for monitoring progression.

Conclusions: Bilateral choroidal osteoma is uncommon and may result in severe visual impairment when complicated by CNVM. Early diagnosis using multimodal imaging and timely intervention with anti-VEGF agents can help preserve vision and improve patient outcomes.

Abstract No.: 203307

Bilateral Dengue-Associated Multiple Evanescent White Dot Syndrome (MEWDS) - a Clinical Vignette

First Author: Muhammad Haris Zakaria **AHMAD**

Co-Author(s): Pooi Wah **LOTT**, Norlina **RAMLI**

Purpose: Dengue fever has emerged as a significant public health challenge in Malaysia, characterized by its hyperendemic status and alarming trends in incidence and mortality. Between the year 2015 and 2021, Malaysia reported over 600,000 cases of dengue, accompanied by approximately 1,200 associated fatalities, highlighting a troubling escalation in the disease's impact. Rarely, ophthalmic manifestations may be present such as reduction in visual clarity, retinal haemorrhages, and scotoma. As the incidence

of dengue fever continues to rise, understanding its implications and the factors contributing to its severity is crucial for public health interventions and strategies in Malaysia.

Methods: This is a case report.

Results: A 20-year-old gentleman of Chinese ethnicity presented with a right eye central scotoma on a recent admission for a dengue fever. He is otherwise fit without any remarkable medical history, use of any medications, nor known drug allergies. Visual acuity was 6/36 on the right; 6/18 on the left, with bilateral central scotoma on the perimetry. Diagnosis was made based on OCT and ICGA. Vision improved with oral Prednisolone to 6/6 bilaterally. However, the central scotoma persisted over the right eye.

Conclusions: This case highlights the significance of recognising MEWDS, particularly in the context of systemic infections like dengue, and emphasizes the need for ongoing awareness and research into the factors contributing to non-resolution in atypical presentations. Although MEWDS is generally self-resolving, it is imperative to identify risk factors that may contribute to poor resolution of symptoms which include young age and poor presenting visual acuity.

Abstract No.: 206849

Bilateral Diffuse Uveal Melanocytic Proliferation With Ciliary Mass Lesion: A Case Report

First Author: Yi **CAI**

Co-Author(s): Xiaoxin **LI**, Jianhong **LIANG**, Shi **XUAN**

Purpose: To report a rare case of Bilateral Diffuse Uveal Melanocytic Proliferation (BDUMP) associated with a biopsy-proven primary ciliary body melanoma, and to discuss the clinical implications for diagnosing the primary malignancy in this paraneoplastic syndrome.

Methods: A 62-year-old man presented with a four-month history of bilateral painless vision loss. He underwent a comprehensive ophthalmic evaluation, including fundus examination and ultrasound biomicroscopy (UBM), along with extensive systemic screening for an occult primary malignancy over a four-year period. Due to the progressive enlargement of a ciliary body mass noted in the right eye, the patient underwent intraocular tumor resection. The excised tissue was analyzed via histopathology and immunohistochemical staining.

Results: Fundus examination revealed a characteristic leopard spot-like pattern consistent with BDUMP. Initial UBM identified a 2.3 × 2.18 mm mass in the ciliary body of the right eye. Despite four years of follow-up, systemic evaluations failed to identify a primary non-ocular malignancy. However, the ciliary mass demonstrated progressive growth. Histopathological analysis of the resected tissue confirmed a malignant melanoma. Immunohistochemistry was positive for

HMB45, S-100, and MelanA, with a Ki-67 proliferation index of 15%. The patient subsequently received an external scleral radiographic applicator as adjuvant therapy. The iris in the right eye remained flat postoperatively.

Conclusions: While BDUMP is typically considered a paraneoplastic manifestation of systemic malignancies, this case provides direct evidence that a primary intraocular tumor, specifically a ciliary body melanoma, can be the underlying cause. This finding highlights the importance of diligently monitoring uveal melanocytic lesions in patients with BDUMP.

Abstract No.: 206675

Bilateral Proliferative Retinopathy Secondary to Hereditary Ovalocytosis: A Case Report

First Author: Law **JIN XING**

Co-Author(s): Nur Afiah **BINTI KAMALUDDIN**, Wan Norliza **BINTI WAN MUDA**

Purpose: To describe a rare case of proliferative retinopathy associated with hereditary ovalocytosis, highlighting its clinical course, management, and outcomes.

Methods: Case report.

Results: A 27-year-old man presented with progressive blurred vision in the right eye upon waking. Initial visual acuity was 6/30 in the right eye and 6/15 in the left. Fundus examination revealed right vitreous hemorrhage and subretinal exudation at the inferotemporal arcade, with bilateral peripheral telangiectatic vessels. Optical coherence tomography (OCT) showed central retinal thickness of 358 μm with intraretinal fluid and vitreomacular traction in the right eye, while the left eye measured 262 μm without fluid. Fundus fluorescein angiography demonstrated extensive capillary nonperfusion and peripheral neovascularization in both eyes. Laboratory investigations excluded connective tissue and infectious causes. A full blood picture revealed ovalostomatocytes, confirming hereditary ovalocytosis. The patient underwent multiple sessions of bilateral panretinal photocoagulation, which stabilized both eyes with resolution of vitreous hemorrhage. Final visual acuity improved to 6/9 in the right eye and 6/6 in the left. He later developed focal tractional fibrosis with a horseshoe tear at the inferotemporal arcade, requiring vitreoretinal surgery, but remained undecided regarding intervention.

Conclusions: Hereditary ovalocytosis may manifest as bilateral proliferative retinopathy, mimicking other proliferative retinal diseases in young adults. Early systemic workup, timely panretinal photocoagulation, and close follow-up are essential to preserve vision and prevent complications.

Abstract No.: 206506

Bilateral Serous Retinal Detachment Associated With Denosumab: A Case Report

First Author: Woong-sun **YOO**

Purpose: To describe bilateral serous retinal detachment (SRD) associated with denosumab and its course after drug cessation.

Methods: Observational case report of a 70-year-old woman on a HER2 receptor blocker for breast cancer and denosumab for osteoporosis/bone-metastasis prevention. Examinations included best-corrected visual acuity (BCVA), dilated funduscopy, optical coherence tomography (OCT), and fluorescein angiography (FA), with longitudinal follow-up.

Results: At presentation, BCVA was 0.4 OD and 0.5 OS. Fundus and OCT showed bilateral SRD. FA demonstrated pooling in both eyes without definite focal leakage. During follow-up, medication-related osteonecrosis of the maxilla occurred, leading to dental surgery and denosumab discontinuation. Thereafter, SRD gradually regressed bilaterally; final BCVA improved to 1.0 OD and 0.8 OS, with no recurrence during subsequent visits.

Conclusions: Denosumab may be associated with bilateral SRD in the absence of angiographic leakage. Recognition of this potential adverse effect is important; reviewing antiresorptive therapy and considering drug cessation in multidisciplinary consultation may result in anatomic resolution and visual recovery.

Abstract No.: 202228

Bilateral Wyburn Mason Syndrome: When Rare Gets Even Rarer

First Author: Jayant **SHARMA**

Co-Author(s): Ranjan **BEHERA**, Abhishek **BHATIA**, Shreya **NARANG**, Sehajbir Singh **PANNU**, Somya **SHARMA**

Purpose: WMS is an accidental finding and can be confirmed in the eye by ophthalmoscopy or OCT, showing loops of vessels extending to the peripheral retina. These loops are present diffusely and must be differentiated from those of Neovascularization. Patients must be screened for CNS involvement, as it can cause occlusions or ischemia.

Methods: An 8-year-old male child presented with complaints of b/l visual loss, which was painless and gradually progressive. Noted by his parents when he was not able to track objects over the last 2 months. The best corrected visual acuity was light perception OD and counting fingers 2 feet OS with sluggishly reacting pupils with full and free ocular movements in all directions. The A/S was normal, fundus of both eyes revealed dilated, convoluted, and tortuous large caliber vessels extending to the

periphery with formation of loops suggestive of AVMs, more prominent over the disc and in the right eye. The OCT revealed hump shaped lesions over the optic disc with a normal macula. CE-MRI revealed AVMs in the capsulothalamoganglionic region of the midbrain with no active hemorrhage, prominent flow voids with enlarged deep cerebral veins, and multiple tortuous vessels seen along the Circle of Willis. In the neurologist's opinion, only observation was advised since there were no active CNS symptoms or hemorrhage.

Results: The presence of AVM's in the brain and both eyes confirms the diagnosis of very rare Bilateral Wyburn Mason Syndrome.

Conclusions: This case highlights rarity of already rare disease which can have severe life threatening complications if not detected in time.

Abstract No.: 200728

Bisphenol S Promotes Age-Related Macular Degeneration via Lipid-Metabolic Disruption

First Author: Yao **ZONG**

Purpose: Age-related macular degeneration (AMD) is the leading cause of elderly blindness. Apart from genetics, environmental pollutants such as bisphenol S (BPS) have emerged as additional risk factors. BPS disrupts lipid homeostasis and disorganizes photoreceptors in zebrafish, suggesting its potential to induce AMD. We investigated whether BPS directly drives AMD and delineated its mechanistic basis.

Methods: AB and *apoe*^{-/-} zebrafish were exposed to environmentally relevant BPS concentrations (1–100 µg/L) from 3 hpf to 120 dpf. Retinal pigment epithelium (RPE)-derived ARPE-19 cells were employed to dissect the nuclear receptor Liver X Receptor α (LXR α)-mediated pathway, focusing on oxidative stress, cellular senescence, and inflammation.

Results: Chronic BPS exposure produced basal linear lipid deposits in AB retina and reduced antioxidants/elevated oxysterols—early AMD hallmarks. In *apoe*^{-/-} zebrafish, photoreceptor loss indicated late-stage AMD. In ARPE-19 cells, BPS dose-dependently up-regulated lipogenic genes (*lrx α* , *fasn*, *acc*, *srebp1/2*) and suppressed autophagy genes (*lcn3*, *atg3*, *p62*), causing TAG and TC accumulation. GW3965 (LXR α agonist) mimicked BPS; GSK2033 (antagonist) reversed the phenotype. siLXR α abolished BPS effects, confirming LXR α dependence.

Conclusions: BPS activates LXR α , driving RPE lipid synthesis and autophagy blockade. Deposited lipids undergo retinal oxidation, triggering RPE degeneration. Environmentally relevant BPS constitutes a novel AMD risk factor.

Abstract No.: 204067

Causal Effects of PCSK9 and HMGCR Inhibition on Ocular Diseases a Mendelian Randomization Study With Positive Control Analysis

First Author: Lianhui **WANG**

Purpose: This Mendelian randomization (MR) study validated the analytical framework using coronary artery disease (CAD) as a positive control and evaluated the causal effects of lipid-lowering targets PCSK9 and HMGCR on ocular diseases, including age-related macular degeneration (AMD), diabetic retinopathy (DR), retinal artery occlusion (CRAO), retinal vein occlusion (RVO), and retinitis pigmentosa (RP), to inform therapeutic repurposing.

Methods: Genetic instruments were selected from SNPs strongly associated with PCSK9 (8-12 SNPs) and HMGCR (7 SNPs) in GWAS. Five MR methods (MR Egger, weighted median, inverse variance weighted, etc.) estimated causal effects using odds ratios (OR) with 95% confidence intervals (CI) ($p < 0.05$). CAD served as a positive control to validate methodological robustness. Sensitivity analyses included heterogeneity testing, pleiotropy adjustment, and leave-one-out validation.

Results: 1. CAD (Positive Control): PCSK9 inhibition consistently reduced CAD risk (all methods $p < 0.001$, OR=0.47-0.53); HMGCR inhibition showed protective effects aligning with statin efficacy (weighted median OR=0.76, $p=0.003$). 2. AMD: PCSK9 inhibition exhibited protective effects (MR Egger OR=0.53, $p=0.023$), while HMGCR showed null associations. 3. DR: HMGCR inhibition increased DR risk (weighted median OR=1.41, $p=0.021$); no effect was observed for PCSK9. 4. Other Ocular Diseases: An implausibly high HMGCR-CRAO association (OR=68.44, $p=0.20$) was deemed unreliable due to wide CI; neither target showed significant effects on RVO or RP.

Conclusions: CAD as a positive control confirmed MR validity. PCSK9 inhibition demonstrates therapeutic potential for AMD with a favorable safety profile, whereas HMGCR inhibition may elevate DR risk, necessitating clinical risk-benefit evaluation. These findings prioritize PCSK9 inhibitors for multi-disease applications and underscore precision strategies for statin therapy.

Abstract No.: 200645**Central Retinal Vein Occlusion in the Young Associated With Hormonal Intrauterine Device Use: A Case Report***First Author: Maria Christine DY**Co-Author(s): Noriell Jonathan MAMACLAY*

Purpose: To report a case of central retinal vein occlusion (CRVO) in a young patient on hormonal intrauterine device (IUD).

Methods: A 19-year old Filipino female came in for sudden painless blurring of vision on the left associated with a generalized headache. The medical, family, and social histories were unremarkable. However, the patient revealed that she was on a progestin IUD without a concurrent oral contraceptive for almost two years. Visual acuity (VA) was counting fingers. Fundus examination showed diffuse intraretinal hemorrhages along the posterior pole and mid-peripheral retina with vessel dilatation and tortuosity. The anterior segment findings and fellow eye were normal. Baseline optical coherence tomography (OCT) for macular edema, cardiovascular, and coagulability workups tested negative.

Results: Two weeks later, the patient reported spontaneous improvement in vision at 20/20 without any interventions done. Repeat fundus examination showed significant decrease in hemorrhages and vessel tortuosity. The patient was then advised to monitor for recurrence of symptoms or new onset ophthalmic complaints.

Conclusions: CRVO in the young is usually associated with hypercoagulable or inflammatory systemic conditions. Extensive laboratory evaluation with thorough history taking should be done to elicit possible thrombotic etiologies including hormonal contraceptive use, especially oral medications. Visual prognosis is variable, but poor baseline VA and retinal ischemia are worse indicators. Female patients of reproductive age should, therefore, be properly counseled regarding this risk.

Abstract No.: 207293**Central Serous Chorioretinopathy in Pregnancy – A Retrospective Observational Study***First Author: Disha AGARWAL**Co-Author(s): Shreyas TEMKAR*

Purpose: To study the clinical characteristics and course of central serous chorioretinopathy (CSC) in pregnancy.

Methods: This retrospective study included eight antenatal patients presenting with acute CSC over a period of two years. Medical records, ophthalmological findings, and optical coherence tomography (OCT) characteristics were reviewed. Patients were followed up for at least three months after the resolution.

Results: The mean gestational age at presentation was 30.00 weeks. Six patients (75%) had unilateral involvement. The median best corrected visual acuity (BCVA) at presentation was 20/40. No attributable systemic risk factors could be identified. The mean CFT at baseline was $498.67 \pm 160.74 \mu\text{m}$. Pigment epithelial detachments were noted in 8 eyes (80%), and dipping of outer retinal layers was noted in 5 eyes (50%). Subretinal exudation (fibrin) of a variable amount was noted in 9 eyes (90%). No intervention was given to any of the patients. Two patients had resolution of CSC before delivery and rest 6 patients had resolution after delivery. Seven patients delivered female babies. At follow-up visits after the resolution, even though patients gained back good vision (median BCVA 20/25), nearly 70% of eyes showed disruption of outer retinal layers on OCT at areas corresponding to previous NSDs.

Conclusions: Although CSC in pregnancy has a self-resolving course with a return of good visual acuity in all the patients, nearly 2/3rd of patients had disruption of outer retinal layers corresponding to the area of previous NSDs. Microperimetry studies can shed light on subtle visual dysfunction in such patients.

Abstract No.: 206758**Challenges in the Diagnosis and Management of Serous Retinal Detachment***First Author: Syafira Kamila FATHONI**Co-Author(s): Aditia Apriyanto HARYONO, Grimaldi IHSAN, Erwin ISKANDAR, Arief S KARTASASMITA, Farid Mufid MADYAPUTRA, Rova VIRGANA, Made Indra WIDYANATHA*

Purpose: This case report aims to provide insights into overcoming diagnostic uncertainties and optimizing outcomes in Serous Retinal Detachment (SRD).

Methods: A 26-year-old woman presented with sudden vision loss of the left eye for one week, accompanied by metamorphopsia, flu-like syndrome, tinnitus, and meningeal signs. The best corrected visual acuity (BCVA) was 0.2 and 1.0 in the left and the right eye, respectively. Fundus examination revealed lobulated SRD with macular involvement in the left eye, followed by similar findings in the right eye at the second visit. The presence of bilateral lobulated SRD involving the macula, along with systemic manifestations, strongly supported the diagnosis of Vogt-Koyanagi-Harada disease. She underwent intravitreal triamcinolone acetonide (IVTA) injection and was referred to a rheumatology consultant. A comprehensive systemic assessment was carried out, and the rheumatologist diagnosed the patient with Sjögren syndrome with ocular involvement. She was treated comprehensively with IVTA injection, topical prednisolone acetate, oral immunosuppressants, and a steroid-sparing agent.

Results: Careful follow-up showed complete resolution of subretinal fluid and was accompanied by full visual recovery, with BCVA improving to 1.0 in both eyes.

Conclusions: Serous retinal detachment presents significant diagnostic and management challenges due to its diverse underlying etiologies. Thorough etiological investigation and close multidisciplinary collaboration are essential, as delayed or inappropriate treatment can lead to substantial morbidity. This case highlights that, despite different speciality perspectives, early detection and carefully tailored management strategies are critical to achieving favourable visual outcomes and preserving long-term vision.

Abstract No.: 207069

Characterization of Retino-Choroidal Vasculature in Obstructive Sleep Apnea Patients in Hong Kong: A Swept-Source Optical Coherence Tomography Case Control Study

First Author: Arnold Shau Hei CHEE

Co-Author(s): Carol CHEUNG, Mary HO, Ka Wai KAM, Kin Wang TO, Alvin YOUNG

Purpose: To evaluate retinal and choroidal vascular metrics in Chinese patients with obstructive sleep apnea (OSA) compared to age-matched healthy controls using swept-source optical coherence tomography (SS-OCT).

Methods: OSA patients were diagnosed via polysomnography and grouped by Apnea-Hypopnea Index (AHI). Age-matched healthy controls were recruited for comparison. Quantitative analysis of parafoveal retinal and choroidal vasculature was performed using SS-OCT on all subjects' right eyes.

Results: Twelve Chinese OSA patients (mean age 52.4 ± 9.1) and ten controls (mean age 57.4 ± 12.1) were analyzed. The mean AHI in the OSA group was 22.5 (range 7-45). Retinal vessel density (VD) at the foveal core was significantly higher in the OSA group for both the deep capillary plexus (DCP: 0.167 ± 0.065 vs. 0.115 ± 0.08 , $p=0.046$) and superficial capillary plexus (SCP: 0.436 ± 0.065 vs. 0.115 ± 0.08 , $p=0.026$). No significant differences were found in foveal avascular zone (FAZ) area, circularity, or fractal dimension. For choroidal metrics, the subfoveal Haller's layer in OSA patients showed lower choroidal vascular index (CVI: 0.618 ± 0.019 vs. 0.631 ± 0.021 ; $p=0.153$), choroidal thickness (CT: $210 \pm 48.6 \mu\text{m}$ vs. $251 \pm 71.2 \mu\text{m}$; $p=0.089$), and choroidal area (CA: $204431 \pm 48270 \mu\text{m}^2$ vs. $244532 \pm 71300 \mu\text{m}^2$; $p=0.089$), though these did not reach statistical significance. AHI was more negatively correlated with CVI of the subfoveal Sattler's layer ($p = -0.5175$, $p=0.0860$) than the Haller's layer ($p = -0.1049$, $p=0.7459$).

Conclusions: OSA patients demonstrated higher foveal retinal vessel density but lower choroidal vascular parameters. A higher AHI was more strongly correlated with reduced CVI in the Sattler's layer, suggesting a potential dose-response relationship between OSA severity and choroidal impairment.

Abstract No.: 207126

Choroidal Detachment Secondary to Hypotony From Corneal Wound Dehiscence in a 40-Year-Old Female: A Case Report

First Author: Jill GENUINO

Co-Author(s): Jose Timothy Martin CHUA, Janice JORDAN-YU, Rachelle PEREZ, Kent WEE

Purpose: To report a case of choroidal detachment secondary to hypotony from a corneal wound dehiscence three months after an uneventful pars plana vitrectomy and phacoemulsification with insertion of an intraocular lens.

Methods: This is a case report.

Results: A 40-year-old female sought consultation due to gradual progressive blurring of vision of the right eye after an unremarkable operation. She is a known case of rhegmatogenous retinal detachment, previously undergone pars plana vitrectomy with silicone oil tamponade and removal of silicone oil with phacoemulsification and intraocular lens insertion. She noted improvement of vision; however, three months later, she noted blurring of vision. Clinical examination revealed a shallow anterior chamber and a positive Seidel's test over the corneal tunnel incision. B-scan ultrasonography confirmed choroidal detachment. She underwent immediate suturing of the corneal wound using nylon 10-0. Immediate improvement in vision was noted. Initially, Seidel's test was negative; however, after one week, Seidel's tests were repeatedly positive for leak. She was managed conservatively with a bandage contact lens, but still offered no resolution. Hence, a repeat suture was added. Visual acuity and choroidal folds progressively improved.

Conclusions: Even after several months following intraocular procedure, corneal wound dehiscence may still occur. Immediate diagnosis of choroidal detachment and prompt treatment of wound dehiscence as root cause of hypotony is vital for good visual prognosis.

Abstract No.: 202288

Clinical Application of Artificial Iris in Severe Ocular Trauma

First Author: Yi LEI

Purpose: Iris defects cause visual dysfunctions such as photophobia, glare, and decreased visual acuity, along with significant cosmetic concerns and psychological burden. Artificial iris implantation can effectively treat partial and complete iris defects. This study evaluates the clinical application of artificial iris implantation for reconstructing iris defects resulting from severe ocular trauma and other diseases.

Methods: The application focused on key issues including the selection of artificial iris type, principles of surgical management, preoperative assessment

for combined intraocular lens implantation, and perioperative management protocols.

Results: Artificial iris implantation effectively restored optical barrier function, improved visual outcomes, and enhanced cosmetic appearance. Standardized evidence-based protocols were applied for indications and contraindications, criteria for selecting the type of artificial iris, essential surgeon-patient communication points, preoperative evaluation, surgical management principles and critical techniques, comprehensive perioperative care protocols, and strategies for managing long-term postoperative complications, leading to successful visual and structural rehabilitation.

Conclusions: Artificial iris implantation provides an effective treatment for partial and complete iris defects, significantly improving visual function and cosmetic outcomes. The standardization of key clinical issues ensures the safe, effective and consistent application of artificial iris implantation technology.

Abstract No.: 204276

Clinical Characteristics and Outcomes of Treatment Naïve Polypoidal Choroidal Vasculopathy Patients From a Tertiary Centre in Malaysia

First Author: Adeline Mae Li **KHAW**

Co-Author(s): Roslin Azni **ABDUL AZIZ**, Shelina Oli **MOHAMAD**, Nor Fariza **NGAH**

Purpose: To report the baseline characteristics, treatment patterns and clinical outcomes of treatment-naïve polypoidal choroidal vasculopathy (PCV) patients at year 1 and final visit.

Methods: Single centre, retrospective cohort study involving 62 newly diagnosed PCV patients in 2021-2022. Demographics, visual acuity (VA), optical coherence tomography (OCT), indocyanine green angiography (ICGA) (if performed) and treatment data were collected at baseline, year 1 and final visit. Logistic regression analysis was performed to determine predictors of VA maintenance or gain at year 1. The associations of baseline subretinal hyperreflective material (SHRM) and final injection interval with OCT biomarkers and other variables were tested using Pearson chi-squared test and Fisher Exact test.

Results: Mean age was 66.63 years with a male (54.8%) and Chinese (48.4%) predominance. Anti-vascular endothelial growth factor (anti-VEGF) was the first choice of treatment in 71.0% of patients with a mean number of 6.42 injections in year 1. Mean baseline VA was 48.34 logMAR letters. VA gain of 5.55 letters at year 1 and 5.51 letters at final visit was seen, but this was not statistically significant. There was significant reduction in mean CST from baseline (430.58um) for year 1 and final visit ($p<0.001$). ICGA

was performed in 32 patients (51.6%). A final injection interval of 12 weeks or more was achieved in 37% of patients, over a mean follow-up of 25.61 months. Ocular adverse events were retinal pigment epithelium (RPE) rip ($n=3, 4.8\%$), intra-ocular inflammation (IOI) ($n=2, 3.2\%$) and lens touch ($n=1, 1.6\%$). Predictors of VA maintenance or gain at year 1 include age (adjusted OR 0.88, $p=0.014$) and poorer presenting VA (adjusted OR 8.4, $p=0.018$). Baseline SHRM was significantly associated with type of pigment epithelial detachment (PED) at baseline ($p<0.001$), but did not affect VA outcome or total number of injections. A significant association was seen between final interval of injection with baseline PED subtype ($p=0.032$).

Conclusions: This study highlights the real-world management of PCV patients in a tertiary government hospital setting in Malaysia. Significant anatomical but not functional gains were attained at year 1 and final visit with a slightly lower number of injections at year 1 compared to an ideal clinical trial setting.

Abstract No.: 203664

Clinical Profile and Visual Outcomes of Central Serous Chorioretinopathy in Females: A Retrospective Analysis

First Author: Amrit **BANSTOLA**

Co-Author(s): Suraj **ADHIKARI**, Deepak **DHAKAL**, Jyotsna **PANDEY**

Purpose: To evaluate demographic profile, risk associations, clinical features, and outcomes of central serous chorioretinopathy (CSCR) in female patients.

Methods: A retrospective review was conducted of females diagnosed with CSCR. Data on age, laterality, systemic associations, visual acuity (VA), OCT findings, fluorescein angiography (FFA) patterns, management, and follow-up outcomes up to 12 months were analyzed.

Results: A total of 125 eyes were included. The majority were aged 36–50 years (59.2%). CSCR was unilateral in 75.2% and bilateral in 24.8%. At presentation, 60% had VA 0.1–0.5 LogMAR, while 22.4% had 0 LogMAR. OCT showed subretinal fluid $>300\ \mu\text{m}$ in 44.8%, and pigment epithelial detachment in 65.6%. Subretinal fibrin/deposit was seen in 23.2%. FFA demonstrated ink-blot pattern in 28% and smoke-stack in 4.8%, with extrafoveal leaks most frequent (17.6%). Systemic associations were noted in 26.4%: steroid use (12%) and pregnancy (3.2%). Laser was performed in 20.8%, with most cases observed. At 1 month, 21.6% showed complete resolution of fluid, increasing to 27.2% at 3 and 6 months, and 20% at 12 months. VA recovery was favorable, with 26.4% achieving 0 LogMAR at 1 month and 22.4% at 6 months. Recurrence occurred in 14.4% of cases.

Conclusions: In females, CSCR predominantly affects the 36–50 year age group, with unilateral presentation

and frequent association with steroids and pregnancy. Visual prognosis is generally favorable, though persistence and recurrence highlight the need for tailored follow-up and management.

Abstract No.: 202088

Combined Central Retinal Vein Occlusion and Cilioretinal Artery Occlusion in a Young Female

First Author: Shreya NARANG

Co-Author(s): Abhishek BHATIA, Shagun KORLA, Gian Chand RAJPUT, Jayant SHARMA

Purpose: To report a rare case of idiopathic unilateral ischemic central retinal vein occlusion (CRVO) associated with cilioretinal artery occlusion (CLRAO) in a young female, and to emphasize the diagnostic and therapeutic considerations.

Methods: A 31-year-old female presented with sudden, progressive, painless blurring of vision in the left eye for three days. Ocular examination showed best-corrected visual acuity (BCVA) 5/60 in the left with a relative afferent pupillary defect. Intraocular pressure and anterior segment were unremarkable. Fundus of the left eye showed disc edema, dilated tortuous veins, flame-shaped, dot-blot hemorrhages in all quadrants, and retinal whitening in the cilioretinal artery distribution with a cherry-red spot and Roth spots. OCT confirmed edema of the retinal nerve fiber layer with macular thinning. Systemic evaluation revealed microcytic hypochromic anemia with elevated erythrocyte sedimentation rate and positive C-reactive protein. Other systemic tests were normal.

Results: The patient was diagnosed with idiopathic ischemic CRVO with CLRAO and iron deficiency anemia. Management was done accordingly. The patient is under regular follow-up.

Conclusions: CRVO with CLRAO is an uncommon clinical entity. The transient hemodynamic blockage of the cilioretinal artery due to elevated intraluminal pressure in the retinal capillary bed may explain its pathogenesis. Prompt diagnosis and multidisciplinary management are essential for optimal outcomes.

Abstract No.: 208550

Comparative Analysis of Activation of Macrophages/Microglia in Diabetic Retinopathy and Familial Exudative Vitreoretinopathy

First Author: Jiakai LI

Co-Author(s): Xia CHEN, Xiaolin FANG

Purpose: To compare the activation patterns and functional roles of retinal macrophages/microglia in Familial Exudative Vitreoretinopathy (FEVR) and Diabetic Retinopathy (DR), focusing on their contributions to vascular pathology and inflammation.

Methods: FZD4 knockout mice were used as a FEVR model, characterized by genetic defects in angiogenesis, while streptozotocin (STZ)-treated C57BL/6 mice were used as a DR model, exhibiting hyperglycemia and microvascular changes. Retinal function was assessed via electroretinography, and vascular density was quantified. Retinal macrophage/microglia populations, polarization states, and pro/anti-inflammatory cytokine profiles were analyzed using immunohistochemistry and ELISA.

Results: FEVR mice showed reduced b-wave amplitudes and decreased vascular density, while DR mice displayed increased retinal vasculature and elevated fasting glucose. DR was associated with a higher number of retinal macrophages/microglia and greater M2-like polarization compared to FEVR. Proinflammatory cytokines (IL-1 β , TNF- α , IFN γ) were significantly elevated in DR. Both conditions upregulated Ang-1 and IL-10, with a stronger IL-10 response in DR. DR also increased anti-inflammatory factors such as bFGF, TIMP-1, TGF β 1, and VEGF-A more than FEVR, reflecting a more dynamic inflammatory balance.

Conclusions: Macrophages/microglia play distinct roles in FEVR and DR. While FEVR shows reduced activation and vascular density, DR exhibits robust macrophage/microglia expansion, polarization, and cytokine production, suggesting greater involvement in both inflammatory damage and repair. Modulating macrophage/microglia polarization may represent a therapeutic strategy for these retinal diseases.

Abstract No.: 204577

Comparative Outcomes of Faricimab and Aflibercept 8 mg in Neovascular AMD Refractory to Aflibercept 2 mg

First Author: Areum JEONG

Co-Author(s): Seungchul BAEK, Min SAGONG

Purpose: To evaluate the real-world efficacy of switching to aflibercept 8 mg or faricimab in patients with neovascular age-related macular degeneration (nAMD) who showed resistance to aflibercept 2 mg.

Methods: This retrospective chart review included 159 patients with refractory nAMD who had received at least three consecutive injections of aflibercept 2 mg at 4–8-week intervals before switching therapy. After switching, assessments included best-corrected visual acuity (BCVA), central retinal thickness (CRT), choroidal thickness, maximum height and width of pigment epithelial detachment (PED), and the presence of intraretinal or subretinal fluid (IRF/SRF).

Results: Over six months, mean BCVA and CRT did not show the difference between aflibercept 8 mg group (n = 78) and the faricimab group (n = 81). At month 6, the faricimab group demonstrated significant improvements in CRT, subfoveal choroidal thickness

(SFCT), Haller layer thickness, and maximum PED height, whereas the aflibercept 8 mg group did not show significant changes in these parameters. In addition, a lower proportion of eyes with IRF and/or SRF was observed in the faricimab group at month 6 ($p = 0.003$).

Conclusions: In nAMD patients resistant to aflibercept 2 mg, faricimab and aflibercept 8 mg achieved similar BCVA and CRT outcomes, but faricimab provided greater anatomical improvements, particularly in PED reduction and fluid resolution. These findings suggest that faricimab may offer additional structural benefits in aflibercept 2 mg-resistant nAMD.

Abstract No.: 200509

Comparing the Efficacy of Two Injectable Steroids, Intravitreal Triamcinolone Acetonide and Dexamethasone Intravitreal Implant for Treating Diabetic Macular Edema

First Author: Renuka Nikit **SARWATE**

Co-Author(s): Jayant **SARWATE**, Nikit **SARWATE**

Purpose: To compare the efficacy of two injectable corticosteroids, triamcinolone acetonide (IVTA) & dexamethasone (dex) intravitreal implant for treating diabetic macular edema (DME).

Methods: This was a retrospective study at a single tertiary center in rural Maharashtra (INDIA). Eyes treated with either intravitreal triamcinolone 4 mg or intravitreal dexamethasone 0.7 mg implant for center involving DME and with follow up of 6 months were included. Main outcomes were VA, IOP measurement, IOP lowering medications, CMT and time to next treatment of any kind.

Results: There were 21 eyes in the IVTA group and 23 eyes in the dex group. Mean VA was logMar 1.01 in IVTA and 0.99 logMar in dex group. VA gain was statistically significant at 1 month with logmar 0.51 ($p < 0.001$) but not significant at 6 months with logmar 0.75 ($p > 0.001$) in IVTA group. VA gain was statistically significant at 1 month with logmar 0.4 ($p < 0.001$) and at 6 months with logmar 0.35 ($p < 0.001$). Mean CMT decreased by 90.72 mm with IVTA at 1 month with p value < 0.001 & decreased by 157 mm with dex group at 1 month with $p < 0.001$ both statistically significant. Average Mean time to next injection was 13.80 weeks for IVTA and 18.75 weeks for dex group. Mean IOP increased by 3.5 mmHg and 0.6 mmHg in IVTA and dex group respectively.

Conclusions: Both groups showed similar efficacy in reducing DME and visual improvement but IVTA group had decline in VA at 6 months due to rebound phenomenon with IVTA injection.

Abstract No.: 205524

Comprehensive Diagnosis of a Pediatric Case With ABCA4-Related Stargardt Disease Type 1 via Multimodal Imaging and Genetic Testing

First Author: Kejia **YUAN**

Co-Author(s): Yun **LI**

Purpose: STGD (Stargardt disease) typically manifests in childhood or adolescence, leading to irreversible vision loss. To elucidate the diagnostic process of ABCA4-related STGD1 (Stargardt disease type 1) in a child through multimodal retinal imaging and genetic confirmation, highlighting key differentiating features.

Methods: A case report of a 9-year-old boy presenting with a 6-month history of progressively reduced visual acuity in both eyes. Diagnostic workup included fundus photography, SLO (scanning laser ophthalmoscope), OCT (optical coherence tomography), FA (fluorescein angiography), and whole-exome sequencing.

Results: Fundus photography revealed macular retinal pigment epithelium atrophy. SLO imaging showed multiple punctate and patchy hyperautofluorescent deposits in the posterior pole. OCT demonstrated foveal thinning and outer retinal atrophy. FA revealed a classic «dark choroid» sign. Genetic testing identified compound heterozygous ABCA4 variants: a maternal pathogenic variant (c.4539+1100A>G) and a paternal likely pathogenic variant (c.3482G>A/p.Arg1161His). The diagnosis of STGD1 was confirmed.

Conclusions: This case underscores the critical role of multimodal imaging (particularly OCT and FA) and genetic testing in the early and accurate diagnosis of STGD1 in children presenting with bilateral vision loss and macular changes. While no curative treatment exists, establishing a molecular diagnosis is essential for prognostic counseling, genetic risk assessment, and eligibility for future clinical trials.

Abstract No.: 201084

Declining Incidence of Retinopathy of Prematurity: A Retrospective Review at a Tertiary Care Center in Bangladesh (2022–2024)

First Author: Tariq Reza **ALI**

Co-Author(s): Ferdous Akhter **JOLLY**

Purpose: Retinopathy of prematurity (ROP) is a major cause of preventable childhood blindness among preterm and low birth weight infants. While advances in neonatal care have significantly improved the survival rates of preterm babies, they have also influenced the patterns and burden of ROP. Monitoring ROP incidence is crucial to assessing the impact of enhanced neonatal practices.

Methods: A retrospective record review was conducted for all infants who underwent ROP screening at BSMMU between 2022 and 2024. Collected data

included sex, gestational age at delivery, ROP diagnosis, type and severity of ROP, zone and stage of disease, and annual trends in ROP incidence. Descriptive statistics were used for analysis.

Results: A total of 2352 eyes (1176 babies) were screened for ROP. The majority were born between 32 and 35 weeks of gestation. ROP was diagnosed in 627 eyes (26.7%). Aggressive ROP was the most frequent presentation (46.1%). More advanced stages (Stages 4 and 5) comprised 21.4% of cases. Notably, with each subsequent year, the number of babies eligible for ROP screening increased (712 in 2022, 722 in 2023, and 918 in 2024). Despite this rise, the incidence of ROP showed a declining trend: 31.5% in 2022, decreasing to 26.6% in 2023, and further to 23% in 2024, suggesting improvements in neonatal care and preventive practices over time.

Conclusions: The steady decline in ROP incidence over the past three years suggests that ongoing improvements in neonatal care practices are positively impacting disease rates. Early screening, timely intervention, and quality neonatal care still remains essential.

Abstract No.: 205577

Diagnostic Value of Optical Coherence Tomography Angiography Findings and Their Correlation With Glycated Hemoglobin and Renal Biomarkers Across Different Stages of Diabetic Retinopathy

First Author: Mohammad **TOBEIHA**

Co-Author(s): Alireza **DEGHANI**, Amirhossein **DEGHANI**, Mohammad **MALEKAHMADI**, Mohammad Hossein **SHAFIEYOUN**, Pegah **VERADI ESFAHANI**

Purpose: To evaluate the diagnostic value of optical coherence tomography angiography (OCTA) parameters and their correlation with glycated hemoglobin (HbA1c) and diabetic nephropathy biomarkers in patients across different stages of diabetic retinopathy (DR).

Methods: In this analytical cross-sectional study, 151 participants were enrolled, including type 2 diabetic patients classified into five DR stages and non-diabetic controls (ND). Demographic, clinical, and laboratory data (HbA1c, urinary albumin, urinary creatinine, albumin-to-creatinine ratio, blood urea nitrogen, serum creatinine, glomerular filtration rate) were collected. OCTA imaging assessed superficial and deep capillary vessel densities (SCVD, DCVD), foveal avascular zone (FAZ), ganglion cell complex (GCC), retinal thickness, radial peripapillary capillary (RPC) density, and retinal nerve fiber layer (RNFL) thickness. Statistical analyses included group comparisons, correlation analyses, and ROC curve evaluation.

Results: OCTA revealed progressive declines in SCVD, DCVD, and RPC density with increasing DR severity ($p < 0.001$). Retinal thickness and GCC thickness

increased, while RNFL decreased in advanced stages. FAZ area peaked in moderate NPDR before declining in proliferative DR ($p = 0.002$). GFR correlated positively with OCTA vascular metrics. ROC analysis indicated GCC (AUC = 0.68) and retinal thickness (AUC = 0.67) had better diagnostic accuracy than vessel density parameters.

Conclusions: OCTA parameters demonstrate progressive vascular and structural alterations across DR stages, closely associated with systemic glycemic and renal biomarkers. Structural metrics such as GCC and retinal thickness outperform vascular densities in diagnostic accuracy, supporting their integration into early detection and monitoring strategies for DR.

Abstract No.: 202733

Dipeptide Alanine-Glutamine Ameliorates Retinal Neurodegeneration in an STZ-Induced Rat Model

First Author: Mingyan **WEI**

Co-Author(s): Qian **CHEN**, Ke **FENG**, Shiyong **LI**, Zuguo **LIU**, Yuhang **ZHANG**

Purpose: This study aims to investigate the potential therapeutic effects of the dipeptide alanine-glutamine (Ala-Gln) on diabetic retinal neurodegeneration and to delineate its mechanism of action.

Methods: The Streptozotocin (STZ)-induced rat model was used as a DR model. ERG was used to measure the neuronal function of the retina. Western blot analysis was performed to test the expression of proteins. Immunofluorescence staining was used for the detection and localization of proteins.

Results: In diabetic rats, the amplitudes of ERG were declined, while Ala-Gln restored the declined ERG. Retinal levels of inflammatory factors were significantly decreased in Ala-Gln-treated diabetic rats. Ala-Gln mitigated the declined levels of glutamine synthetase and ameliorated the upregulated levels of glial fibrillary acidic protein (GFAP) in diabetic retinas. Moreover, Ala-Gln upregulated the glycolytic enzymes pyruvate kinase isozymes 2 (PKM2), lactate dehydrogenase A (LDHA) and LDHB and stimulated the mTOR signaling pathway in diabetic retinas. The mitochondrial function was improved after the treatment of Ala-Gln in diabetic retinas.

Conclusions: Ala-Gln ameliorates retinal neurodegeneration by reducing inflammation and enhancing glucose metabolism and mitochondrial function in DR. Therefore, manipulation of metabolism by Ala-Gln may be a novel therapeutic avenue for retinal neurodegeneration in DR.

Abstract No.: 201423**Disease-Associated Microglia Induce Epithelial-Mesenchymal Transition in Retinal Pigment Epithelial Cells via SPP1-ITGAV Axis***First Author: Ziling LIU**Co-Author(s): Ning AN, Dongcheng LIU, Yijie LU, Bo QIN, Chuanghe ZHANG*

Purpose: Age-related macular degeneration (AMD) is a leading cause of vision loss, with the dry form characterized by RPE degeneration. This study aimed to explore the role of microglia in the retinal microenvironment and their contribution to RPE degeneration in dry AMD, focusing on the potential mechanisms and therapeutic interventions.

Methods: We investigated the retinal microenvironment in NaIO₃-induced retinal degeneration using single-cell transcriptomics. Immunofluorescence was employed to identify and confirm the presence of specific cell subsets. Co-immunoprecipitation (coIP) was utilized to investigate protein-protein interactions. Electroretinography (ERG) was conducted to assess the functionality of retinal tissue in mice, while H&E staining was performed to evaluate structural damage of the retina. Additionally, antibodies were administered intravitreally as an intervention in the animal model.

Results: A distinct subgroup of disease-associated microglia (DAM) expressing high levels of Secreted Phosphoprotein 1 (SPP1) was identified during the progression of dry AMD. SPP1+ DAM cells promoted EMT in RPE cells through the SPP1-ITGAV interaction. Mechanistically, ITGAV was cleaved by γ -secretase upon SPP1 binding, releasing an intracellular domain (ITGAV-ICD) that translocated to the nucleus and acted as a transcriptional regulator of EMT-related genes. Targeting the SPP1-ITGAV interaction with specific antibodies effectively protected RPE cells and photoreceptors, restoring visual function in a mouse model of dry AMD.

Conclusions: This study uncovers a novel communication pathway between microglia and RPE cells involving the SPP1-ITGAV axis, which drives retinal degeneration through EMT. Therapeutically targeting this pathway offers a promising strategy to mitigate vision loss in dry AMD.

Abstract No.: 205872**Double Ocular Assault: Bilateral Proliferative Hypertensive Retinopathy and Hypertensive Choroidopathy in a 33-Year-Old Male With Malignant Hypertension***First Author: Pauline Gabrielle LACSAMANA**Co-Author(s): Marie Joan LOY*

Purpose: This case highlights a rare presentation of hypertensive retinopathy with retinal neovascularization in a young male with end-stage

chronic kidney disease (CKD), emphasizing the interplay between severe systemic hypertension, uremia, and ocular vascular complications.

Methods: A 33-year-old male with end-stage CKD presented with sudden bilateral blurring of vision during a hypertensive crisis. The patient was stabilized at the emergency level and subsequent improvement in vision was noted. Ocular examination and imaging were then performed.

Results: By the time the patient was seen, the visual acuity improved to 20/70 (right) and 20/30 (left). Anterior segments were unremarkable but fundus findings revealed slightly blurred disc margins, arteriovenous narrowing, dilated tortuous vessels, dot-blot hemorrhages, and exudates. Elschnig spots and Siegrist streaks were also noted at retinal midperiphery. Fluorescein angiography confirmed retinal ischemia and neovascularization. One month later, the patient developed vitreous hemorrhage in the right eye. PRP and intravitreal injection of anti-VEGF was performed in the affected eye. There was subsequent resolution of hemorrhage and visual improvement following increased dialysis adherence and blood pressure control.

Conclusions: While hypertensive retinopathy is a well-known ocular manifestation of systemic hypertension, neovascularization is rarely seen. This case illustrates that in patients with severe CKD and malignant hypertension, ischemic retinal changes may progress to proliferative stages. Contributing factors may include elevated VEGF-A and reduced angiopoietin-1 in advanced CKD. Early recognition and treatment, including PRP and anti-VEGF therapy, are crucial to preserving vision in such complex presentations.

Abstract No.: 203947**Dual Retinal Pathology: A Rare Case of Retinitis Pigmentosa With Central Serous Chorioretinopathy (CSCR)***First Author: Swati SHARMA**Co-Author(s): Ramandeep SINGH*

Purpose: To present a rare case of retinitis pigmentosa with central serous chorioretinopathy.

Methods: A female in her late 30s presented to the retina clinic with complaints of diminution of vision in her right eye for one and a half months. On ocular examination, BCVA in RE was 6/24 and LE 6/6. IOP was within normal limits in both eyes. Anterior segment examination was unremarkable in both eyes. Fundus examination showed bilateral pigment deposits in a bony spicule pattern in the mid periphery of the retina with mild arteriolar attenuation, with the right eye having a dull foveal reflex and subtle elevation at the posterior pole; however, in the left eye, the foveal reflex was sharp. The disc was within normal limits in both eyes.

Results: Macular OCT revealed pigment epithelial detachment in the right eye with subretinal fluid. FFA showed an ink blot pattern of hyperfluorescence along with a focal area of leakage in the right eye. Full-field ERG revealed reduced rod response in both eyes. The left macular OCT was within normal limits.

Conclusions: CSCR with retinitis pigmentosa is a rare occurrence. Multimodal imaging helps us to aid in confirming the clinical diagnosis.

Abstract No.: 202415

Dual Therapy in Aggressive ROP: Anti-VEGF First, Minimal Laser Next

First Author: Arup Krishna **CHOUDHURY**

Co-Author(s): Sarwar **ALAM**, Mahua **CHAKRABORTTY**, Quazi Sazzad **IFTEKHAR**, Mominul **ISLAM**, Mostafizur **RAHMAN**

Purpose: To describe the outcome of dual therapy with intravitreal anti-VEGF injection followed by limited laser in an infant with aggressive retinopathy of prematurity (A-ROP).

Methods: A preterm infant, born at 30 weeks gestation with a birth weight of 1.1 kg, had a history of neonatal sepsis, 10 days of NICU stay, and oxygen therapy for 7 days. At the first screening on day 28 of life, the infant was diagnosed with A-ROP in posterior Zone II with plus disease. Intravitreal bevacizumab was administered on the same day. The infant was closely monitored, and at 6 weeks post-injection, targeted peripheral laser photocoagulation was applied to the residual avascular retina.

Results: The disease regressed successfully with resolution of plus and neovascular activity. The macula remained preserved. Only minimal laser scars were noted, which are expected to reduce the long-term risk of high myopia and visual field constriction compared to extensive laser monotherapy.

Conclusions: This case demonstrates that dual therapy with anti-VEGF followed by limited laser can be an effective approach in managing A-ROP. The strategy provides rapid regression with anti-VEGF while ensuring permanent disease control through selective laser, potentially optimizing long-term structural and functional outcomes.

Abstract No.: 200486

Epidemiological Analysis of Diabetic Retinopathy: Prevalence, Patterns, and Risk Factors Among Type 2 Diabetic Patients in Cambodia, 2024

First Author: Sreyla **CHORK**

Co-Author(s): Piseth **KONG**

Purpose: DR (Diabetic retinopathy) is a leading cause of visual impairment worldwide, particularly in adults. In Southeast Asia, DR is a growing concern with rising

diabetes prevalence. However, data from Cambodia remain limited. This study examined the prevalence, patterns, and risk factors of DR among type 2 diabetic patients, Phnom Penh, Cambodia.

Methods: A cross-sectional study enrolled 150 type 2 diabetic patients aged 40–70 years, who underwent DR screening in the hospital's endocrinology department from May to July 2024. Socio-demographic, clinical, and laboratory data were collected using a checklist. DR severity was classified into mild, moderate, severe NPDR (Non-proliferative diabetic retinopathy), or PDR (Proliferative diabetic retinopathy). Logistic regression was applied to identify associated risk factors.

Results: Among 150 participants, 45.3% diagnosed DR, with mild NPDR being the most common (63.2%). The mean age was 55 ± 7.4 years, and 63.3% were male. DR prevalence was highest in those aged 56–60 years (26.5%). Macular oedema was present in 8%. Significant risk factors included hypertension, dyslipidemia, poor glycemic control, and elevated HbA1c. Age, diabetes duration, and occupation showed no significant associations. Visual acuity impairment was minimal in early DR stages but worsened considerably in advanced DR.

Conclusions: This study provides foundational data on DR in Cambodia, emphasizing the critical role of early detection, regular retinal screening, and management of vascular risk factors to reduce the burden of DR and prevent vision loss.

Abstract No.: 206524

Evaluating the Efficacy of OZURDEX (DEX-I) in Combination With Anti-VEGF Therapy for Treatment-Naïve Inflammatory DME: A Prospective Cohort Study

First Author: Xiaoyan **Ji**

Purpose: This study aimed to evaluate the efficacy and safety of combining anti-VEGF therapy with DEX-I in treatment-naïve patients with inflammatory DME.

Methods: In this prospective study, 40 eyes with treatment-naïve inflammatory DME were randomized to either anti-VEGF monotherapy (control group, n=20) or combination therapy with anti-VEGF and DEX-I (combination group, n=20). The control group received a 5+PRN anti-VEGF regimen. The combination group received initial anti-VEGF plus DEX-I, completed a 5-injection anti-VEGF loading phase, and then received PRN retreatment (anti-VEGF and/or DEX-I). Patients were followed monthly for 52 weeks, with assessments of BCVA, CST via OCT, and IOP.

Results: BCVA Improvement: The combination group showed significantly greater BCVA gains at 4 weeks (12.15 vs. 7.70 letters, $P < 0.001$) and 52 weeks (23.20 vs. 10.75 letters, $P < 0.001$). At week 4, significant response rates ($\geq +10$ letters) were higher in the combination group (60% vs. 25% control), with no

poor responses (0% vs. 20% control). At week 52, significant response rates further improved in the combination group (95% vs. 75% control), with no poor responses in either group. CST Reduction: CST improvements were superior in the combination group at 4 weeks (-277.70 vs. -212.00 μm , $P<0.0001$) and 52 weeks (-348.15 vs. -262.85 μm , $P<0.0001$). At week 4, significant CST response rates (reduction $>40\%$ or $\text{CRT}\leq 300\mu\text{m}$) were higher in the combination group (80% vs. 20% control). At week 52, significant response rates increased to 95% in the combination group versus 75% in the control group. Injection Burden: The combination group required fewer injections (6.55 vs. 9.15, $P<0.001$). Safety: IOP increases were higher with combination therapy (12.05 vs. 2.7 mmHg, $P<0.0001$) but manageable topically; no significant cataract progression occurred.

Conclusions: Combination therapy with DEX-I and anti-VEGF provided superior visual and anatomical outcomes with reduced injection frequency compared to anti-VEGF monotherapy, demonstrating a favorable risk-benefit profile for treatment-naïve inflammatory DME. This approach offers a promising new strategy for DME treatment.

Abstract No.: 205986

Exudative Maculopathy in a Case of Unilateral Proliferative Retinopathy

First Author: Tavish GUPTA

Co-Author(s): Rohan CHAWLA, Mohammed SABIR, Nawazish Fatma SHAIKH

Purpose: To report a rare case of proliferative radiation retinopathy complicated by secondary choroidal neovascular membrane (CNVM) in an adult, and to review its multimodal management

Methods: A 40 year old diabetic male with a history of left orbital diffuse large B cell lymphoma treated with external beam radiotherapy (30 Gy in 15 fractions) presented three years post radiation with gradually progressive diminution of vision and floaters in the left eye. Clinical examination revealed florid neovascularization at the posterior pole with multiple microaneurysms and dispersed vitreous hemorrhage and fluorescein angiography (FA) revealed multiple leakages. The patient underwent panretinal photocoagulation (PRP), pars plana vitrectomy (PPV) with phacoemulsification and intraocular lens implantation.

Results: Initial fundus examination revealed florid proliferative radiation retinopathy with disc and retinal neovascularization, leading to vitreous hemorrhage. After PRP and PPV, best corrected visual acuity (BCVA) improved to 6/9. Six weeks later, OCT and FA demonstrated a sub-foveal CNVM characterized by late leakage and a hyperreflective subretinal lesion, with a drop in visual acuity to 3/60. He was given intravitreal Anti-VEGF injection, which led to complete regression

of the CNVM and gain of BCVA to 6/60. No recurrence was observed at six month follow up.

Conclusions: Proliferative radiation retinopathy occurs in up to 7% of eyes following ocular irradiation and may rarely be complicated by CNVM formation. Identification requires imaging, including OCT and FA, and prompt treatment with intravitreal anti VEGF can yield excellent anatomical and functional outcomes. This case highlights the importance of a multimodal approach in managing radiation induced ocular complications

Abstract No.: 204014

Exudative Retinal Detachment Secondary to Uveal Effusion Syndrome in Nanophthalmos: A Case Report

First Author: Hui Yun GOH

Co-Author(s): Josephine En Hui LEE, Pei Fang NEOH, Evelyn Li Min TAI

Purpose: To report a rare case of bilateral uveal effusion syndrome in a patient with nanophthalmos presenting with exudative retinal detachment.

Methods: Case report

Results: A 31-year-old Malay lady presented with one week history of sudden, painless blurring of vision in the left eye, preceded by intermittent headaches. She had longstanding poor vision since childhood but was otherwise healthy. Best-corrected visual acuity was 6/24 in the right eye and hand movement in the left eye. Fundus examination revealed bilateral disc swelling, inferior choroidal detachment in the right eye, and a total exudative retinal detachment with 360° choroidal detachment in the left eye. Axial length was markedly reduced (right 16.92 mm, left 16.70 mm), consistent with nanophthalmos, and refraction showed high hyperopia (right +13.0 D, left +12.5 D). Computed tomography of orbits confirmed bilateral choroidal detachment without intracranial lesion. She was treated with intravenous methylprednisolone for five days followed by tapering dose of oral prednisolone. At three months, right eye vision was static while left eye improved to 2/60. The right eye showed complete resolution of choroidal detachment, while the left eye demonstrated partial reduction. Optical coherence tomography confirmed reducing subretinal fluid of the left eye. Surgical intervention was offered but deferred due to guarded visual prognosis and patient preference.

Conclusions: Nanophthalmos predisposes to uveal effusion syndrome and exudative retinal detachment due to structural scleral abnormalities. While corticosteroids may achieve partial resolution, surgical intervention such as sclerotomy may be required in persistent cases. Visual prognosis remains guarded, especially in amblyopic eyes.

Abstract No.: 205774

Follow-Up Report of a Case of Focal Choroidal Excavation Secondary to COVID-19 Infection

First Author: Leilei WANG

Co-Author(s): Shiheng LU, Xiaowei TONG, Yuelan ZOU

Purpose: This case report documents a focal choroidal excavation (FCE) case demonstrating dynamic transformation between conforming and nonconforming types with retinal pigment epithelial (RPE) detachment lesions.

Methods: A 36-year-old male presented with one-day central blurred vision and metamorphopsia in his left eye, shortly after a COVID-19 infection. Visual acuity was 1.0 with spectacles in both eyes. Fundus examination revealed yellow-white punctate lesions in the foveal area of the left eye. Optical coherence tomography (OCT) showed intact retinal structures with an outward depression and increased outer choroidal signal. Fundus fluorescein angiography (FFA) showed punctate fluorescence at capillary ends without significant late phase leakage. Indocyanine green angiography (ICGA) showed annular hyperfluorescence and vessel dilation in the macular area.

Results: At 17 months follow-up, the lesion evolved to a nonconforming type with a hyporeflective space between the neuroepithelial and RPE layers. Mean visual acuity within the central 10° visual field marginally improved from 29.4 to 31.6. At the 20-month follow-up, the lesion returned to a conforming type. Three RPE elevations appeared near the fovea without blood flow signals. The choroid showed thickening with dilated large vessels at the ends of the excavation, consistent with pachychoroidal features.

Conclusions: This case illustrates the dynamic nature of focal choroidal excavation with transformations between conforming and nonconforming types. Multiple sub-RPE elevations suggest potential mechanisms related to RPE damage and unstable choroidal vascular perfusion pressure.

Abstract No.: 204591

From Breast to Retina, From Darkness to Light: Vision Restored After Breast Cancer Treatment

First Author: Zhen Pang MOI

Co-Author(s): Shir Yen WANG

Purpose: Exudative retinal detachment (ERD) occurs when there is accumulation of fluid between sensory retina and retinal pigment epithelium (RPE) layer. The spectrum of ERD etiologies includes inflammatory, infectious, and neoplastic among others.

Methods: A case report.

Results: A 45-year-old female with no prior medical illness presented with one month history of left eye (LE) vision drop preceded by chronic cough and significant weight loss for two months. Her right eye (RE) visual acuity was 6/9 whereas LE was hand movement (HM) with positive relative afferent pupillary defect (RAPD). Both eyes anterior segment examination was unremarkable. Fundus examination revealed LE ERD with choroidal lesions. Fundus fluorescein angiography (FFA) demonstrated multiple discrete small hypo-fluorescent spots (superior temporal-ST, inferior temporal-IT, midperiphery) with hyperfluorescent leakage over ERD area. Thorough systemic examination done showed palpable mass over right breast with both tumor markers CA19-9 and CEA raised. Further imaging and biopsy confirmed the diagnosis of metastatic breast carcinoma. Patient was co-managed with surgical and oncology teams. After six months of systemic chemotherapy, LE vision improved from HM to 6/9 with complete resolution of LE ERD and regression of bilateral choroidal lesions.

Conclusions: Breast is the most common primary source for choroidal metastasis. A high index of suspicion and meticulous systemic evaluation are essential for timely diagnosis and improving survival. With appropriate treatment, sight can be preserved and even restored.

Abstract No.: 202775

Globe Rupture Secondary to a Spontaneous Expulsive Suprachoroidal Hemorrhage in a Patient With Penetrating Keratoplasty: A Case Report

First Author: Xia HUIKA

Co-Author(s): Ma QINGMIN, Zhao ZHIHUA

Purpose: To report a rare case of globe rupture following a spontaneous expulsive suprachoroidal hemorrhage with a past ocular history of penetrating keratoplasty.

Methods: Case report.

Results: A 53-year-old man presented with a spontaneous clot exuding from his left eye with a history of falls. The patient denied a history of trauma or rubbing in the left eye when falling down. Note that the left eye had corneal injury from adolescence. What's more, the left eye had a past ocular history of penetrating keratoplasty and cataract operation. Both eyes were highly myopic. The patient had been blind in the left eye for more than one year. He received an emergency operation for corneal cracking, suturing, and removal of the artificial lens. A few days later, the patient underwent a second operation of orbit evisceration with a hydroxyapatite orbital implant in his left eye.

Conclusions: Spontaneous expulsive suprachoroidal hemorrhage with a past ocular history of penetrating

keratoplasty is a rare case. Fall may be a pertinent ocular factor for patient with a past ocular history of penetrating keratoplasty. Possibly high myopic and broken corneal suture may be the most susceptible to spontaneous expulsive suprachoroidal hemorrhage and leading to globe rupture.

Abstract No.: 202492

High Dose Aflibercept for Submacular Hemorrhage in Neovascular Age-Related Macular Degeneration: A Case Series

First Author: Geoffrey BROADHEAD

Co-Author(s): Andrew CHANG, Thomas HONG, Hemal MEHTA, Long PHAN, James WONG

Purpose: To report the initial outcomes of high dose aflibercept (HDA) as monotherapy for submacular hemorrhage (SMH) in neovascular age-related macular degeneration (nAMD).

Methods: Retrospective case series of patients with treatment-naïve nAMD presenting with foveal involving SMH of ≥ 1 disc diameter (DD) in size and treated with HDA monotherapy with at least 3 months of follow up. Data was collected on demographics, Snellen visual acuity (VA, converted to early treatment of diabetic retinopathy (ETDRS) letters), central macular thickness (CMT), SMH size in DD and injection frequency.

Results: 8 eyes of 8 patients were included. Mean age was 80.8 years, 50% of patients were female and mean baseline SMH size was 1.8 DD. At presentation, mean VA was 21 letters (2-60 letters range) and 50% of eyes had a presenting VA of $\leq 20/200$ Snellen equivalent. VA significantly improved to 48 letters at month 3 ($p=0.03$), with 62% of eyes having a >15 letter vision gain at 3 months. Mean presenting CMT was 611 μm and significantly reduced to 388 μm at month 3 ($p=0.045$).

Conclusions: HDA monotherapy is able to reduce CMT and improve vision in cases of nAMD related SMH, a condition excluded from initial clinical trials of HDA. Further studies and longer follow up will assist in determining the role of HDA in the management of SMH related to nAMD.

Abstract No.: 207647

High-Sensitivity C-Reactive Protein as a Key Biomarker for Diabetic Retinopathy

First Author: Hanyu WU

Co-Author(s): Xinyuan ZHANG

Purpose: To investigate the role of high-sensitivity C-reactive protein (hsCRP) in the occurrence and progression of diabetic retinopathy (DR) in patients with type 2 diabetes mellitus (T2DM).

Methods: This is a nested case-control study that recruited 157 T2DM patients (157 eyes) from May 2017 to October 2024. Based on the diagnostic criteria of the 2017 American Diabetes Association (ADA),

patients were sub-grouped to the diabetes mellitus (DM), non-proliferative diabetic retinopathy (NPDR), and proliferative diabetic retinopathy (PDR) groups. 58 age- and sex-matched non-diabetic individuals were included as normal controls. Fasting blood glucose (FBG), hemoglobin A1c (HbA1c), and hsCRP levels were measured by biochemical examination. Visual acuity, intraocular pressure, slit-lamp examination, dilated fundus examination, color fundus photography, optical coherence tomography (OCT), and OCT angiography (OCTA) were performed.

Results: After adjusting for age, gender, DM duration, hypertension duration, FBG, and HbA1c, multivariable logistic regression identified hsCRP as a significant risk factor for DR (OR=1.20, 95% CI 1.07-1.35, $P=0.002$). Spearman's coefficient analysis revealed a positive correlation between hsCRP and both FBG ($r=0.292$, $P<0.001$) and HbA1c ($r=0.239$, $P<0.001$).

Conclusions: Serum hsCRP levels may serve as a valuable biomarker for predicting the presence and severity of diabetic retinopathy.

Abstract No.: 203988

Hypertensive Uveitis After Intravitreal Faricimab Injections

First Author: Yunhua LOO

Co-Author(s): Shaan WIRYASAPUTRA

Purpose: Intraocular inflammation is a rare but potentially sight-threatening complication that can occur after intravitreal anti-vascular endothelial growth factor (anti-VEGF) injections. This adverse event has been under scrutiny in recent years, particularly with some of the newer agents, such as Brolucizumab which is associated with occlusive vasculitis. Faricimab is a newer anti-VEGF medication that has been approved for the treatment of diabetic macular oedema, cystoid macular oedema from retinal vein occlusion and neovascular age-related macular degeneration and long term safety data is still being collected. Here, we report 4 cases of subacute intraocular inflammation associated with raised intraocular pressure that developed following intravitreal Faricimab.

Methods: Case series of 6 eyes in 4 patients that developed hypertensive uveitis after intravitreal Faricimab.

Results: The 4 patients presented two to twelve weeks after their last intravitreal Faricimab. The intraocular inflammation was limited to the anterior chamber in the first patient while in the other three patients, there was anterior chamber and retrolental inflammation, as well as retinal vascular sheathing in one patient. All patients were treated successfully with topical steroid and glaucoma medications and the intraocular inflammation resolved with cessation of further intravitreal Faricimab injections.

Conclusions: It is imperative to be cognizant that non-infectious intraocular inflammation can occur after intravitreal anti-VEGF therapy, especially given the prevalence of this treatment. With more novel drugs coming to the market, continued surveillance and active reporting of adverse events is undoubtedly critical to help identify risk factors for this condition and to establish safety records.

Abstract No.: 207132

IL-3R α -STAT5B Signaling Drives M2 Macrophage Polarization and Choroidal Neovascularization

First Author: Changxuan **LIU**

Co-Author(s): Xiaoling **LIANG**

Purpose: IL-3R α -STAT5B signaling drives M2 macrophage polarization and choroidal neovascularization.

Methods: Human vitreous and fibrovascular membranes from nAMD and IMEM patients were analyzed (ELISA for IL-3; immunofluorescence for IL-3R α cell localization). In C57BL/6J mice, laser injury induced CNV. IL-3R α expression and M2 markers in RPE-choroid-sclera (RCS) were quantified by Western blot and flat-mount IF. Functional relevance was tested in macrophage-specific Il3ra conditional-knockout (CKO) mice. CNV burden was assessed by lesion area/thickness (IF, H&E, OCT) and vascular leakage (FFA). Phosphoproteomics (LC-MS/MS) compared RCS from CKO versus control CNV eyes to identify IL-3R α -dependent nodes, with emphasis on STAT5B Y699.

Results: Compared with IMEM, nAMD patients exhibited significantly higher vitreous IL-3, with IL-3R α co-localized to Iba1+ macrophages in fibrovascular membranes. In laser-induced CNV mice, IL-3R α and the M2 marker YM-1 were elevated in RCS complexes, and flat mount IF confirmed IL-3R α /Iba1+ co-localization within CNV lesions. CNV area and thickness were significantly reduced in Il3ra CKO mice, accompanied by diminished leakage on FFA and reduced YM-1/FIZZ1 expression. LC-MS/MS phosphoproteomics revealed globally decreased phosphorylation in Il3ra CKO CNV tissue. Integration with bioinformatics identified STAT5B phosphorylation at Tyr699 as a candidate mechanistic node. Together, these data implicate IL-3/IL-3R α signaling in macrophage M2 polarization and pathological angiogenesis.

Conclusions: IL-3/IL-3R α signaling promotes STAT5B Y699 phosphorylation, driving M2-like macrophage polarization that exacerbates CNV and vascular leakage. Targeting STAT5B phosphorylation could represent a promising therapy for neovascular AMD patients and potentially for other diseases where alternatively activated macrophages contribute to disease pathophysiology.

Abstract No.: 202232

Impact of Choroidal Characteristics on Treatment Response to Faricimab in Refractory Neovascular AMD and PCV

First Author: Yi-jie **PENG**

Co-Author(s): Yi-ting **HSIEH**, Chen-hua **LIN**

Purpose: To evaluate changes in choroidal parameters and their impact on treatment outcomes following intravitreal faricimab injection in patients with refractory neovascular age-related macular degeneration (nAMD) or polypoidal choroidal vasculopathy (PCV).

Methods: This retrospective study included 43 eyes from 43 patients with nAMD or PCV showing persistent activity despite ≥ 1 year of intravitreal aflibercept (2 mg) under a treat-and-extend regimen. All received a single faricimab injection. Best-corrected visual acuity (BCVA), central subfield thickness (CST), fluid status and choroidal parameters—subfoveal choroidal thickness (SFCT), total choroidal area (TCA), luminal area (LA), and choroidal vascularity index (CVI)—were evaluated by OCT at baseline and one-month post-injection. Associations between baseline choroidal parameters and treatment outcomes were analyzed.

Results: One-month post-faricimab injection, significant reductions were observed in CST (288 ± 64 to 246 ± 60 μm , $p < 0.001$), SFCT (222 ± 71 to 203 ± 68 μm , $p = 0.001$), TCA ($p = 0.001$), and LA ($p = 0.002$). There was a significant increase in the absence of subretinal fluid ($p < 0.001$) and retinal pigment epithelial detachment ($p = 0.025$). Multivariate regression analysis revealed thicker baseline SFCT correlated with poorer SRF resolution ($p = 0.044$), larger baseline LA correlated with less CST reduction ($p = 0.046$), and higher baseline CVI correlated significantly with less improvement in BCVA ($p = 0.001$).

Conclusions: Intravitreal faricimab achieved immediate anatomical improvement in refractory nAMD or PCV. Pachychoroid characteristics, including thicker SFCT, larger LA, and higher CVI, indicated poorer anatomical or visual outcomes, suggesting the distinct pachychoroid mechanisms in nAMD or PCV.

Abstract No.: 202233

Injection Only Approach for Aggressive ROP: Real-World Experience

First Author: Arup Krishna **CHOUDHURY**

Co-Author(s): Sarwar **ALAM**, Mahua **CHAKRABORTTY**, Quazi Sazzad **IFTEKHAR**, Mominul **ISLAM**, Mostafizur **RAHMAN**

Purpose: To present clinical outcomes of anti-vascular endothelial growth factor (anti-VEGF) monotherapy in aggressive retinopathy of prematurity (A-ROP), with emphasis on preserving functional retina and reducing long-term complications associated with laser therapy.

Methods: Two premature infants with A-ROP were treated exclusively with intravitreal anti-VEGF injection as the initial and sole therapy. Serial fundus examinations were performed to assess disease regression, vascular progression, recurrence, and anatomical stability. Functional implications of avoiding laser ablation, including potential preservation of visual fields and refractive outcomes, were considered.

Results: Both cases demonstrated rapid regression of plus disease and neovascularization following injection. Physiological peripheral vascularization continued without recurrence during follow-up. No ocular or systemic adverse events were observed. By avoiding laser, functional retina was preserved, which is expected to minimize the risk of long-term visual field restriction and high myopia. Although only two representative cases are detailed, these findings reflect a broader clinical trend in which anti-VEGF monotherapy is increasingly considered for selected infants with A-ROP.

Conclusions: Anti-VEGF monotherapy offers effective regression in A-ROP while maintaining functional retina and reducing the treatment burden of laser therapy. With vigilant follow-up, injection-only management may represent a promising pathway for optimizing both anatomical and functional outcomes in premature infants.

Abstract No.: 205711

Integrating Electroretinography and Genetic Diagnostics in the Assessment of Inherited Retinal Diseases - A Case Series

First Author: Prasan **WARNAKULA**

Co-Author(s): Vajira **DISSANAYAKE**, Thilina

MUNASINGHE, Rythmi **RAGUNATHAN**, Dushyantha **WARIYAPOLA**

Purpose: Inherited Retinal-Diseases (IRD) are rare ocular genetic disorders. Electroretinography (ERG) is essential for functional assessment, while genetic studies confirm diagnosis. We report a series comparing ERG findings with their Whole Exome Sequencing (WES) results to enhance the understanding of the genotype phenotype relationships.

Methods: Eight patients with suspected IRD underwent clinical evaluation, ERG testing, and WES analysis. ERG findings were correlated with identified genetic variants to refine diagnosis.

Results: There were 3 cases suspected with bestrophinopathies. One had a family history and consanguineous parents. ERG of all 3 cases showed RPE-photoreceptor interaction dysfunction with bilateral macular dysfunction. WES showed the following results: Case 1 – homozygous for BEST1c.140G>A (p.Arg47His). Case 2 – homozygous for BEST1c.685A>C(p.Lys229Gln). Case 3 – compound heterozygous for BEST1c.1060delT;(p.Trp354fs) and BE

ST1c.1210_1220delTACTACAGTGC(p.Tyr404fs). There were 2 cases suspected with Stargardt's disease. ERG of both cases indicated mild to moderate central macular dysfunction. WES showed the following results: Case 4 – heterozygous for ABCA4c.6088C>T(p.Arg2030*), Case 5 – compound heterozygous for ABCA4c.1937+1G>A and ABCA4c.5882G>A(p.Gly1961Glu). In Case 6 suspected of fundus albipunctatus, ERG showed generalized cone-rod function reduction, and WES showed a homozygous PLA2G5c.133G>T(p.Gly45Cys) associated with Fleck-Retina. In Case 7, although clinically suspected retinitis pigmentosa (RP), ERG was not suggestive of RP but showed macular dysfunction and WES showed a heterozygous PITPNM3c.374G>T(p.Cys125Phe) variant associated with Cone-Rod-Dystrophy-5(CORD5). In Case 8 suspected of cone dystrophy ERG showed cone-system dysfunction but WES didn't show any genetic finding.

Conclusions: This study highlights the role of combining genetic diagnostics with ERG for diagnosis and management of IRD, while facilitating genetic counselling and genotype prevention.

Abstract No.: 204512

International Validation and Applicability of the G-ROP Algorithm: A Systematic Review and Meta-analysis

First Author: Hsin Ho **CHANG**

Co-Author(s): Sheng Chu **CHI**

Purpose: The G-ROP algorithm, which incorporates postnatal weight gain as a screening trigger, has gained global traction. This study aimed to comprehensively evaluate its diagnostic performance across different ROP severities and identify sources of heterogeneity.

Methods: We conducted a systematic review and meta-analysis using PubMed, EMBASE, and Cochrane databases through September 2024. Studies applying G-ROP to predict type 1, type 2, treated, or any-stage ROP in preterm infants were included. Two reviewers independently extracted data and assessed quality using the QUADAS-2 tool.

Results: Twenty-three studies met inclusion criteria. For type 1 ROP, pooled sensitivity was 0.99 and specificity 0.34, with a diagnostic odds ratio (DOR) of 6.22 and area under the SROC curve (AUC) of 0.87. Type 2 ROP showed sensitivity 0.98, specificity 0.25, DOR 3.21, AUC 0.76. Treated ROP had sensitivity 0.99, specificity 0.30, DOR 8.84, AUC 0.80. For any-stage ROP, sensitivity was 0.87, specificity 0.45, DOR 5.88, AUC 0.78. Meta-regression revealed no significant influence from study region, gestational age, birth weight, or publication year.

Conclusions: G-ROP consistently demonstrated excellent sensitivity in detecting severe ROP. However, its modest specificity, particularly for milder disease, suggests potential over-screening—an important

consideration for implementation in resource-limited settings.

Abstract No.: 206095

Interpreting OCT in DME: Patterns and Biomarkers to Look for

First Author: Abdul HANNAN

Purpose: To teach general ophthalmologists the details of fine patterns in DME OCT.

Methods: A presentation highlighting major patterns and biomarkers in OCT of DME with their clinical significance. It will help young ophthalmologists and general ophthalmologists in better understanding the OCT of DME. It will also play a major role in the correct screening of the disease and ultimately better/quicker referral to a medical retina specialist.

Results: This presentation is a need for many young and general ophthalmologist who silently wish to learn these patterns to better understand the needs of their patients.

Conclusions: interpreting OCT in DME: Patterns and Biomarkers to look for.

Abstract No.: 207309

Intravitreal Anti-VEGF Therapy and Risk of Limb Complications in Patients With Diabetic Eye Disease

First Author: Brian TOY

Purpose: Intravitreal anti-vascular endothelial growth factor (VEGF) therapy is widely used to treat diabetic eye disease (DED), yet systemic VEGF suppression may impair peripheral wound healing. We sought to evaluate the risk of DFUs and LEAs associated with intravitreal anti-VEGF injections (IVI) in patients with DED and to compare risks among ranibizumab, aflibercept, and bevacizumab.

Methods: Retrospective cohort study of multicenter electronic health records network, including adults with DED (diabetic retinopathy or diabetic macular edema) who received ≥ 3 IVI compared to those who received ≤ 2 anti-VEGF injections (control group) during the study period. We assessed incidence of any LEAs, above-ankle LEAs, and DFUs following incident DED diagnosis. Cox proportional hazards analyses were used to estimate hazard ratios.

Results: Of 448,100 patients with DED, 35,269 received ≥ 3 injections and 412,831 received ≤ 2 injections. After matching, 34,070 patients remained in each group. IVI cohort was associated with increased risk of LEA (HR 1.49, 95% CI 1.33–1.68), above-ankle LEA (HR 1.31, 95% CI 1.08–1.59), and DFU (HR 1.36, 95% CI 1.30–1.42) compared with the control group. In high-risk subgroups, IVI was associated with increased risk of LEA in patients with PDR (HR 1.44, 95% CI 1.27–1.62), PAD (HR 1.35, 95% CI 1.12–1.56), ESRD (HR 2.06, 95%

CI 1.28–3.31), and DFU (HR 1.46, 95% CI 1.22–1.75). Risks were similar across anti-VEGF agents.

Conclusions: IVI therapy for DED was associated with increased risk of LEA, particularly with comorbid PDR, PAD, ESRD, or DFUs. These findings highlight the importance of monitoring for limb complications in patients undergoing intravitreal anti-VEGF treatment.

Abstract No.: 202352

Iris Metastasis as the Initial Presentation of Occult Lung Adenocarcinoma: A Case Report

First Author: Puvaneswary TANGGA RAJOO

Co-Author(s): Roslin Azni ABDUL AZIZ, Rajasudha SAWRI RAJAN

Purpose: To report a case where an iris metastasis was the inaugural sign of widely metastatic, stage IV lung adenocarcinoma, and to highlight the role of the ophthalmologist in diagnosing systemic malignancy.

Methods: A case report of a 70-year-old Chinese male, a passive smoker, who presented to the ophthalmology clinic with left eye redness and blurring of vision. He reported a concomitant dry cough. Ocular examination revealed counting finger vision, a well-circumscribed iris mass (7.0 mm x 5.7 mm), and secondary glaucoma. Systemic workup prompted by these findings included a chest examination, which revealed reduced breath sounds and dullness to percussion. This was investigated with chest X-ray and a confirmatory lung biopsy.

Results: Ocular findings were highly suggestive of a metastatic lesion. Chest X-ray revealed a well-defined opacity in the left mid-to-lower zone. Lung biopsy performed by the respiratory team confirmed the diagnosis of lung adenocarcinoma. A subsequent PET scan confirmed Stage IV disease. The iris metastasis was therefore the presenting sign of widespread metastatic illness. Following three cycles of systemic chemotherapy, regression of the iris mass was noted. However, the vision in the left eye remained poor.

Conclusions: An isolated iris mass can be the initial manifestation of an otherwise occult advanced malignancy, such as lung adenocarcinoma. It highlights the critical importance of a thorough systemic review in patients with atypical ocular masses, even in the absence of known cancer diagnosis. While chemotherapy can be effective in inducing regression of metastatic deposit, visual prognosis may remain poor if the disease is advanced at presentation.

Abstract No.: 202887**Isolated Cone Dystrophy With Secondary Macular Involvement Mimicking Optic Atrophy and Vascular Insult***First Author: Stephen SUDHAKAR*

Purpose: Cone dystrophy is a rare group of inherited retinal disorders primarily affecting cone photoreceptors. It may mimic optic neuropathies and vascular insults due to overlapping features such as pallor, visual loss, and macular changes. Early identification through multimodal imaging and electrophysiology is key to diagnosis and counseling.

Methods: A 24-year-old male presented with progressive, painless left eye vision loss. OD showed temporal pallor and granular changes; OS had HM vision, RAPD, waxy disc pallor, macular atrophy, and RPE changes—suggestive of bilateral retinal dystrophy mimicking optic neuropathy.

Results: This case mimics bilateral optic neuropathy and vascular occlusion. Presence of disc pallor, macular changes, and vascular narrowing may misleadingly suggest ischemic pathology. However, ERG revealed isolated cone dysfunction, a hallmark of cone dystrophy. Normal rod response ruled out rod-cone dystrophy.

Conclusions: Cone dystrophies can mimic acquired optic and retinal vascular pathologies. Multimodal imaging, electrophysiology are crucial for accurate diagnosis. Genetic counseling and family screening are essential.

Abstract No.: 201135**Juvenile Onset Vitelliform Maculopathy in Mitochondrial Encephalomyopathy, Lactic Acidosis and Stroke-Like Episodes (MELAS)***First Author: Zjen Pang MOI**Co-Author(s): Su Huan CHONG*

Purpose: MELAS, one of the commonest maternally inherited mitochondrial disorders, is associated with point mutation of m.3243A>G. The estimated prevalence is 18.4 per 100,000 and it predominantly affects muscles and nervous systems. We reported a rare case of juvenile vitelliform maculopathy in MELAS syndrome.

Methods: Case report.

Results: An 11-year-old boy with underlying MELAS syndrome presented with left eye painless blurring of vision for 1 month associated with left ptosis and photophobia. There is no family history of blindness. He has normal developmental milestones. His right eye visual acuity was 6/9 while left eye visual acuity was 6/12. He has left eye partial ptosis with normal extraocular movement. Fundus examination of both eyes showed yellowish vitelliform lesions over the macula. No retinal hemorrhages were noted. Bilateral

eyes optical coherence tomography (OCT) showed hyper-reflective subretinal materials with no evidence of choroidal neovascularization. He was diagnosed with bilateral eyes vitelliform maculopathy.

Conclusions: Juvenile onset vitelliform maculopathy is a retinal manifestation in MELAS, that has a visual implication, other than its common manifestation involving muscles and nervous systems. This condition needs proper surveillance as there is a risk of choroidal neovascularization.

Abstract No.: 201314**Long-Term Treatment Outcome of Laser Indirect Ophthalmoscopy in Type 1 Retinopathy of Prematurity***First Author: Navpreet KAUR**Co-Author(s): Deepti BHAGLANI, Praveen PANWAR, Arti SAREEN*

Purpose: To evaluate the structural and refractive outcomes of children aged 1-5 years who underwent laser photocoagulation for type 1 ROP (Retinopathy of prematurity).

Methods: A longitudinal observational study which included twenty-four children (48 eyes) treated with LIO (Laser indirect ophthalmoscopy) for Type 1 ROP between 2019 and 2023. Two follow-ups were conducted six months. These visits included detailed assessments of fixation pattern, ocular motility, presence of nystagmus, refractive status, narrowing of arcades, disc or macular drag, vitreous membranes, and tractional detachments. Axial length was calculated using contact A-scan ultrasound. Refractive outcome was assessed using cycloplegic retinoscopy.

Results: The mean gestational age and birth weight were 30.83 weeks and 1572.5 grams, respectively. Structural outcomes were favorable in 95.8% of eyes, with only two eyes showing nystagmus. At the first follow-up, 30 eyes (62.5%) had myopia (mean SE: -2.42 D), while 37.5% had hyperopia. By the second follow-up, the prevalence of myopia had increased markedly to 38 eyes (79.17%) with a mean spherical equivalent of -2.72 D. Axial lengths showed significant growth between the two follow-ups ($p < 0.001$), with mean values increasing from 20.47 mm to 21.74 mm.

Conclusions: LIO is a safe and effective modality for treating Type 1 ROP, demonstrating excellent structural outcomes and manageable refractive complications. However, a higher prevalence of myopia in aggressive and advanced ROP highlights the need for regular long-term follow-up to enable early detection and correction of refractive errors for optimal visual development.

Abstract No.: 204592
METTL3 Deacetylation Promotes Ferroptosis in RPE Cells in NaIO₃-Induced Dry Age-Related Macular Degeneration Model

First Author: Dongcheng **LIU**

Co-Author(s): Hongxia **LIAO**, Jingwen **LIU**, Ziling **LIU**, Yijie **LU**, Bo **QIN**

Purpose: Ferroptosis of retinal pigment epithelial (RPE) cells is one of the significant causes of dry age-related macular degeneration (AMD), but the mechanism remains unclear. The aim of this study was to investigate the role of METTL3 in RPE ferroptosis in AMD.

Methods: The ferroptosis of RPE cells was induced using NaIO₃. The expression and localization of METTL3 were monitored by immunofluorescence. siRNA targeting METTL3 was delivered by lentivirus transduction. mRNA m6A modification was identified by Methylated RNA Immunoprecipitation (MeRIP).

Results: We found that METTL3 translocated from the cytosol to the nucleus during ferroptosis in RPE cells. Upon screening, we identified SIRT1 as the primary acetyltransferase responsible for the acetylation of METTL3, leading to its translocation. Interestingly, inhibiting METTL3 and SIRT1 increased the growth of RPE cells, resulting in a significant decrease in ferroptosis.

Conclusions: Our study identifies an acetylation-dependent regulatory mechanism that determines the subcellular localization of METTL3. This finding may offer mechanistic insights for developing therapeutic strategies for the treatment of AMD.

Abstract No.: 202190
Management Dilemma in a Case of Coat's Disease Presenting With a Tumor-Like Macular Lesion

First Author: Michael Austin **SUA**

Co-Author(s): Jubaida **MANGONATO**, Rochelle **PILONES**, Jocelyn **SY**

Purpose: To describe the approach and management of case of Coats disease with a tumor-like macular lesion.

Methods: An 11-year-old male presented with gradual, painless loss of vision in the right eye over three years. Fundus examination revealed the classic fundus findings of Coats Disease such as retinal telangiectasia at the temporal periphery which was surrounded by extensive subretinal yellowish exudates, extending to the macula. However, there was note of a whitish tumor-like lesion in the macula similar to the appearance of a retinoblastoma lesion. Hence, retinoblastoma had to be ruled out prior to commencing treatment. The fellow eye was normal.

Results: B-scan ultrasonography, OCT of the macula, and fluorescein angiography along with cranial magnetic resonance imaging with Gadolinium contrast were done for further investigation. The information gathered from these diagnostic examinations were the basis for the approach to the management of this case which included focal laser photocoagulation and intravitreal anti-vascular endothelial growth factor injection.

Conclusions: The treatment of Coats Disease is straightforward and includes laser photocoagulation and intravitreal injection of anti-VEGF. However, when complicated by the presence of a tumor-like lesion, further investigation is warranted to rule out a malignancy. Multimodal imaging and a high clinical index of suspicion is crucial in arriving at a diagnosis and management approach.

Abstract No.: 203308
Mechanical Stretch Activates Pannexin1/P2X7-Dependent NLRP3 Inflammasome to Trigger RPE Pyroptosis and IL-1 β /IL-18-Driven Inflammation

First Author: Yuyan **LIU**

Co-Author(s): Yanhua **CHU**, Ailin **YAO**

Purpose: While inflammasomes are present in retinal pigment epithelial (RPE) cells, their specific role in retinal inflammation, particularly under mechanical stress, remains undefined. This study investigates the mechanosensitive activation of the NLRP3 inflammasome and its contribution to inflammatory responses.

Methods: ARPE-19 cells were subjected to biaxial cyclic mechanical stretching using a Flexcell® FX-6000 Tension System to establish a cellular strain model. Experimental groups were defined by stretch duration (8h, 14h, 24h at 21% surface area increase, SA), strain magnitude (21% SA vs. 10% SA for 14h), and pharmacological blockade (0.5h pretreatment with the Pannexin1 (Panx1) channel blocker or the P2X7 receptor, followed by 24h stretch at 21% SA). Key protein expression was analyzed via Western blotting (WB) and immunofluorescence (IF). Quantitative PCR (qPCR) assessed mRNA levels of key targets. IL-18 and IL-1 β secretion into the supernatant was measured by ELISA. Pyroptosis was evaluated via flow cytometry.

Results: Immunofluorescence analysis revealed that prolonged mechanical stretching progressively upregulated inflammasome-related gene and protein expression in RPE cells, with longer durations correlating to significantly elevated levels. Concurrently, extracellular secretion of IL-18 and IL-1 β exhibited a time-dependent increase in response to stretch duration. Crucially, pharmacological blockade of the Pannexin 1/P2X7 signaling pathway effectively inhibited NLRP3 inflammasome activation in RPE cells and markedly reduced IL-18 and IL-1 β release.

Conclusions: These findings identify the NLRP3 inflammasome as a key mechanosensor in RPE cells, driving retinal inflammation. This advances understanding of ocular mechanobiology and highlights Pannexin-1/P2X7R as a therapeutic target to mitigate mechanical stress-related retinal damage.

Abstract No.: 208571

Microvascular Abnormalities on OCT Angiography With Severity of Diabetic Retinopathy

First Author: Shubham **AGARWAL**

Co-Author(s): Sandeep **SAXENA**

Purpose: To evaluate microvascular abnormalities using OCT-Angiography software algorithms with the severity of Diabetic Retinopathy in patients with and without Diabetic Kidney Disease, and the correlation between serum creatinine levels and OCT parameters.

Methods: A total of 320 eyes (160 diabetic patients) were recruited in this tertiary care-based cross-sectional study. Patients were divided into groups of No DR, mild NPDR, moderate NPDR, severe NPDR, and PDR. Each group had non-DKD and DKD patients. Blood investigations, including serum creatinine and urea levels, and angiograms with macular vessel densities, Foveal vascular zone (FAZ), were done and analysed with statistical analysis.

Results: Superficial vessel density (SVD) decreased from 41.3% (No DR) to 25.56% (PDR), Deep vessel density (DVD) reduced from 55.08% (No DR) to 40.09% (PDR) ($p < 0.001$). FAZ enlarged significantly, from 0.27 mm² (No DR) to 0.56 mm² (PDR) ($p < 0.001$), indicating worsening capillary dropout. Additionally, a strong correlation was observed between worsening renal function and advanced DR stages. Patients with higher serum creatinine and urea levels showed significantly reduced vessel density and larger FAZ, suggesting shared microvascular pathology between diabetic nephropathy and retinopathy.

Conclusions: OCTA-based assessment of retinal microvascular changes provides valuable insights into DR progression and can act as an effective biomarker for DR and DKD. The study highlights that reduced vessel density and FAZ enlargement correlate strongly with both DR severity and declining kidney function, reinforcing the need for early screening, glycemic control, and integrated management of diabetic complications.

Abstract No.: 201313

More than Meets the Eye - A Case Report

First Author: Reuben **FOO**

Purpose: To describe a case report of a lady who presented with insidious bilateral blurring of vision and a life-changing diagnosis.

Methods: A 60-year-old Malay woman with impaired fasting glucose and hyperlipidemia presented with one year of progressive bilateral visual blurring, worse in the left eye. She had no systemic symptoms, history of cancer, family history of visual impairment, or exposure to traditional or illicit drugs.

Results: Visual acuity was 6/60 bilaterally, with a left grade 2 RAPD. Anterior segment showed mild nuclear sclerotic cataracts. Posterior segment examination revealed bilateral mottled retinas with normal discs. Visual fields showed dense bilateral losses. Retinal nerve fiber layer OCT was normal, but macular OCT demonstrated bilateral ellipsoid zone disruption. Electroretinography and visual evoked potentials indicated bilateral retinal dysfunction. Incidentally, she was noted to have scleral icterus. Her liver enzymes were markedly deranged and urgent referral to Gastroenterology was made. Further workup with CT scans revealed a head-of-pancreas adenocarcinoma and synchronous right breast invasive ductal carcinoma. Given the constellation of findings, cancer-associated-retinopathy was suspected. Eventually, antiretinal antibody testing returned positive for RAB6, enolase, and HSP60. She underwent a Whipple's procedure and right mastectomy with axillary clearance, followed by chemotherapy. She is pending ophthalmic management with corticosteroids.

Conclusions: This case highlights the importance of a holistic approach in Ophthalmology - and good Ophthalmologists should look beyond just the eyes. Careful observation of ocular clues such as scleral icterus can uncover paraneoplastic syndromes that lead to the diagnosis of otherwise occult, life-threatening malignancies.

Abstract No.: 207312

Multicolor Imaging Features of Age-Related Macular Degeneration and Polypoidal Choroidal Vasculopathy

First Author: Colin **TAN**

Purpose: To evaluate the accuracy of multicolour imaging compared to standard colour fundus photography (CFP) in differentiating AMD from normal eyes, and in detecting features of PCV.

Methods: In a prospective study of 50 consecutive patients presenting with PCV or AMD, standardized multimodal imaging (CFP, multicolour imaging, fluorescein, and indocyanine green angiography [ICGA]) was performed. PCV was diagnosed using specific diagnostic criteria, with ICGA as the gold standard. CFP and multicolor images were graded using standardized grading protocols to determine sensitivity, specificity, positive and negative predictive values (PPV and NPV).

Results: Polyps appeared as dark green oval lesions in 39 (88.6%) using the multicolour channel, while the branching vascular network (BVN) appeared as

mottled grey lesions in 16 (36.4%) using the infrared channel. Multicolor had superior specificity (73.9% vs. 52.2%) and NPV (94% vs. 85.7%) compared to CFP for detecting all types of AMD. The sensitivity was similar for both multicolor and CFP (97.7% vs. 97.4%). For the detection of PCV, multicolour had higher sensitivity (86.4% vs. 59.1%) and NPV (89.3% vs. 74.3%) compared to CFP. In contrast, the specificity (89.3% vs. 92.9%) and PPV (86.4% vs. 86.7%) were similar between the two.

Conclusions: Multicolour imaging is superior to CFP in differentiating AMD from normal eyes and detecting features of PCV. The presence of BVN on infrared imaging and dark green oval lesions should alert ophthalmologists to the presence of PCV.

Abstract No.: 206042

Multimodal Imaging for Elschnig Spots in Hypertensive Choroidopathy

First Author: Monalisa **PATI**

Co-Author(s): Udayasree **ORUGONDA**, Somy **PUROHIT**

Purpose: To report the significance of multimodal imaging in a patient having Elschnig spots in hypertensive choroidopathy.

Methods: A 35-year-old male presented with a vision of 20/20 OD and hand movements (HM) OS. His blood pressure was 180/110 mm Hg. Fundus evaluation revealed old non-arteritic anterior ischemic optic neuropathy (NAAION) OS, grade 2 (Keith, Wagener, and Barker classification) or mild (Wong and Mitchell classification) hypertensive retinopathy OU. There were multiple dot-like pigmented lesions surrounded by depigmented halos in the mid-periphery of the retina OU. OCT scan through these lesions revealed hyperreflective exudates involving the outer retinal layers and the retinal pigment epithelium (RPE). Fundus image, OCT, fundus fluorescein angiography, and fundus auto-fluorescence findings were typical of Elschnig spots of hypertensive choroidopathy. Elschnig spots represent changes in RPE resulting from nonperfused areas of choriocapillaris in hypertensive choroidopathy

Results: The patient was advised to consult a physician and to control systemic hypertension. On the 6-month follow-up, the fundus findings and the Elschnig spots remain the same.

Conclusions: Elschnig spots represent changes in RPE resulting from nonperfused areas of choriocapillaris in hypertensive choroidopathy. Multimodal retinal imaging helps in the diagnosis of this condition, which is associated with serious systemic hypertension.

Abstract No.: 204723

Multiple Intravitreal Dexamethasone Injections Are Safe in Central Serous Chorioretinopathy Treatment

First Author: Umesh **CHANDRA BEHERA**

Purpose: To study the safety and efficacy of multiple intravitreal dexamethasone (DEX) injections in central serous chorioretinopathy (CSC).

Methods: Eyes with chronic CSC treated with multiple DEX injections were monitored for change in subretinal fluid (SRF), visual alterations, and secondary glaucoma and cataract progression.

Results: Nine eyes of nine patients were injected with DEX at least twice. No signs of disease worsening were noted in any eye. A complete resolution of SRF was observed in 67% of cases, and a minimum of 20% reduction in SRF height was achieved in 89% of cases. The mean change in central macular thickness at the final follow-up was $148.4 \mu\text{m}$ ($p = 0.019$). Mean logMAR best corrected visual acuity (Snellen equivalent) at presentation improved from 0.46 ± 0.25 (20/60) to 0.21 ± 0.14 (20/30) after the first injection at 3 months but worsened to 0.38 ± 0.42 (20/50) after the second injection ($p=0.279$). Two patients developed cataracts, and four experienced an increase in intraocular pressure, which was medically controlled. Retreatment was performed after a mean interval of 5.5 ± 1.87 months.

Conclusions: This study demonstrates that multiple DEX injections do not exacerbate CSC and are efficacious but carry a higher risk of secondary glaucoma.

Abstract No.: 204459

Myopic Maculopathy Among Myopic Patients in a Tertiary Hospital in Bangladesh

First Author: Faouzia **SULTANA**

Co-Author(s): Wahid **ZAMAN**

Purpose: This study aims to determine the characteristics of myopic maculopathy among myopic patients, to identify and analyze specific risk factors associated with the development of myopic maculopathy in the Retinal Department at Ispahani Islamia Eye Institute and Hospital (IIEIH) in Bangladesh.

Methods: A cross-sectional analysis was conducted from January 2023 to June 2023 in the Retinal Department at Ispahani Islamia Eye Institute and Hospital (IIEIH). One hundred myopic patients diagnosed with myopic maculopathy were enrolled in this study as per the inclusion and exclusion criteria.

Results: A total of 100 patients of mean age 38 ± 12 years; 55% female, 45% male (age range 16-60 years), 35% were diagnosed with myopic maculopathy. The severity of myopic maculopathy was distributed as follows: 15% mild, 12% moderate, and 8% severe. Patients with severe myopic maculopathy had

significantly longer axial lengths (mean 27.8 ± 1.2 mm) compared to those with mild or no maculopathy (mean 26.1 ± 1.4 mm, $p < 0.05$). Visual acuity was significantly lower in patients with severe myopic maculopathy (mean LogMAR 0.6 ± 0.2) compared to those without maculopathy (mean Log MAR 0.2 ± 0.1 , $p < 0.01$). A mean spherical equivalent (SE) of -0.17 ± 2.11 diopters (D). The Generalized Estimating Equation (GEE) model revealed that myopic maculopathy was significantly linked to older age (with an odds ratio [OR] of 1.16 per year; 95% CI 1.13 to 1.19; $p < 0.001$) and more severe myopic SE (with an OR of 1.48 per -1 D; 95% CI 1.40 to 1.56; $p < 0.001$).

Conclusions: Myopic maculopathy is prevalent among myopic patients in the Retinal Department at Ispahani Islamia Eye Institute and Hospital (IIEIH) in Bangladesh, with a considerable proportion exhibiting moderate to severe stages. Longer axial length and poorer visual acuity are associated with higher severity of myopic maculopathy.

Abstract No.: 201081

NICU-Based Screening of Retinopathy of Prematurity in Dhaka City

First Author: Tariq Reza **ALI**

Co-Author(s): Ferdous Akhter **JOLLY**

Purpose: Bangladesh ranks seventh globally for preterm births, with 14.1% of live births occurring prematurely. While neonatal survival rates have improved, the incidence of retinopathy of prematurity (ROP)- a significant cause of childhood blindness has concurrently ascended. This study aimed to assess the prevalence, severity, and risk factors of ROP among preterm, low-birth-weight infants who were screened at different NICUS of Dhaka City.

Methods: A prospective cross-sectional study was conducted over one year in five tertiary care hospitals of Dhaka city. Infants with gestational age ≤ 35 weeks and/or birth weight ≤ 2000 gm were screened. After obtaining informed consent, indirect ophthalmoscopic examination was performed at bedside. Data on neonatal and maternal risk factors were collected and analyzed using SPSS version 25.

Results: Out of 350 infants screened, ROP was detected in 38.0%. Plus disease was present in 11.5%, pre-plus disease in 7.7%, and aggressive ROP in 23.1% of cases. Significant neonatal risk factors included low birth weight, prematurity, jaundice, sepsis, blood transfusion, and prolonged hospital stay. Among maternal risk factors, hypothyroidism and preeclampsia/eclampsia were significantly associated with ROP development. Multivariate analysis identified lower gestational age, neonatal jaundice, blood transfusion, and maternal preeclampsia as independent predictors.

Conclusions: The study identified a high prevalence of ROP among preterm, low-birth-weight infants in

Dhaka, with significant neonatal and maternal risk factors, highlighting the need for structured screening and early intervention to prevent vision impairments due to ROP.

Abstract No.: 202621

OCT Angiography Parameters Predict Chronic Kidney Disease Progression in Type 2 DM: A Two-Year Longitudinal Cohort Study

First Author: Qianhui **YANG**

Co-Author(s): Yueheng **HONG**, Bingyao **TAN**, Gavin **TAN SIEW WEI**

Purpose: To evaluate whether retinal and choriocapillaris vascular OCTA parameters can predict progression of chronic kidney disease (CKD) in patients with type 2 diabetes.

Methods: In 244 T2DM patients with baseline OCTA and 2-year follow-up, vessel and perfusion density, foveal avascular zone metrics, and choriocapillaris flow deficit were analyzed. Outcomes were (1) ≥ 3 CKD stage progression and (2) $\geq 30\%$ eGFR reduction or annual decline > 5 .

Results: Over 2 years, 11.1% progressed by ≥ 3 stages and 12.8% met the eGFR decline criterion. CKD stage progression was linked to lower superficial vessel density (OR=0.81, $p=0.03$), lower perfusion density (OR=0.77, $p=0.007$), and higher CC flow deficit (OR=1.001, $p=0.002$). OCTA metrics improved prediction (AUC=0.747).

Conclusions: Retinal microvascular alterations quantified by OCTA reflect systemic microvascular damage and may serve as non-invasive biomarkers for early prediction of CKD progression in T2DM. These findings support the potential role of OCTA in risk stratification and monitoring of diabetic kidney disease.

Abstract No.: 206384

OGG1 Modulates the Crosstalk of Microglia and Müller Cells in Degenerative Retinas via Alleviating Inflammatory Response and Oxidative Stress

First Author: Miao **LI**

Purpose: Oxidative stress and neuroglial-driven inflammation are crucial in the pathogenesis of retinal degeneration (RD). 8-hydroxyguanine DNA glycosylase 1 (OGG1), a key enzyme in repairing oxidative DNA damage via the base excision repair (BER) pathway, also regulates inflammatory responses.

Methods: Using the sodium iodate (NaIO₃)-induced oxidative stress model in C57BL/6J mice, we investigated the temporal dynamics of OGG1 expression and its functional role in RD.

Results: We observed a significant initial upregulation of OGG1 at the onset of RD, followed by a rapid decline

as photoreceptor degeneration progressed. OGG1 deficiency exacerbated DNA oxidative damage and impaired its repair capacity. Immunostaining revealed pronounced neuroglial activation in RD retinas, with microglial activation preceding Müller cell gliosis. Intravitreal delivery of exogenous OGG1 suppressed neuroglial activation, mitigated photoreceptor loss, and partially restored electroretinogram (ERG) responses. These protective effects were reversed by co-administration of TH5487, a potent and highly selective OGG1 inhibitor. In vitro assays demonstrated that OGG1 alleviates oxidative stress, preserves mitochondrial integrity in microglia, and subsequently modulates the gliotic response of Müller cells. Mechanistically, OGG1 deficiency accelerates RD progression by disrupting oxidative damage repair and amplifying neuroinflammatory cascades. Conversely, OGG1 supplementation coordinates retinal protection through a dual mechanism: directly repairing oxidative DNA lesions and indirectly modulating the neuroinflammatory microenvironment by suppressing microglia-driven inflammation and Müller cell gliosis.

Conclusions: These findings establish OGG1 as a central regulator linking oxidative DNA damage to neuroglial dysfunction in RD. Clinically, targeted OGG1 delivery represents a promising therapeutic strategy for degenerative retinopathies by concurrently addressing oxidative injury and neuroinflammation.

Abstract No.: 202448

Obstructive Sleep Apnea Syndrome-Associated Blood Pressure Fluctuations Combined With Simultaneous Central Retinal Vein and Artery Occlusion

First Author: Like XIE

Co-Author(s): Kaiming CHEN, Pin JU, Zhenzhen GU

Purpose: Central retinal vein occlusion (CRVO) and central retinal artery occlusion (CRAO) are serious eye blood vessel problems usually linked to heart health issues. In this case study, a patient with a diagnosis of obstructive sleep apnoea syndrome (OSAS) but no traditional thrombotic or atherosclerotic risk factors experienced a rare co-occurrence of CRVO and CRAO.

Methods: A formerly healthy 42-year-old male came with dark shadows in his right eye and acute-onset blurred vision. A thorough ophthalmic exam verified simultaneous CRVO and CRAO. Later polysomnography showed moderate hypoxaemia and severe OSAS. The patient received integrated traditional Chinese medicine, perfusion enhancement, and intraocular pressure lowering as part of multimodal therapy. With notable retinal oedema resolution, post-treatment visual acuity returned to 20/20.

Results: Especially in patients without conventional cardiovascular risks, this case implies OSAS might be a separate risk factor for combined CRVO and CRAO. Intermittent hypoxia, sympathetic overactivity,

and hypercoagulability are probably among the underlying mechanisms. Optimising management plans in idiopathic retinal vascular occlusions seems to depend on early OSAS screening. Moreover, this case shows the possible therapeutic benefit of combining pharmacological and conventional treatments in complicated ocular vascular disorders.

Conclusions: This case highlights that obstructive sleep apnoea syndrome (OSAS), through mechanisms like intermittent hypoxia, may be an independent risk factor for the rare co-occurrence of central retinal vein and artery occlusions (CRVO and CRAO), even in patients without traditional risk factors, and underscores the importance of early OSAS screening and a multimodal treatment approach.

Abstract No.: 205653

Ocular Effects of Bilateral Hypotony Secondary to Chronic Dehydration

First Author: Maria Katrina OZARAGA - LAGARNIA

Purpose: To present a case of a 15-year-old female admitted for severe dehydration, who presented with painless and progressive blurring of vision on both eyes for 2 weeks.

Methods: Ophthalmologic findings included significant visual acuity loss, with only up to counting fingers, JII on both eyes. Slit lamp examination showed signs of hypotony such as full thickness corneal folds. Intraocular pressure (IOP) was 0mmHg in both eyes, and fundus examination showed evidence of maculopathy – optic disc edema, tortuous retinal vessels, and macular folds. Further investigation led to the diagnosis of distal renal tubular acidosis. Aggressive correction of the hypovolemic state and electrolyte imbalance was initiated which led to the gradual improvement of visual acuity, intraocular pressure and other signs of hypotony.

Results: By the sixth day, visual acuity showed partial improvement, but bilateral posterior subcapsular cataracts developed and signs of chorioretinopathy remained. Optical coherence tomography (OCT) revealed foveal detachment in the right eye and retinal undulations in both eyes. By day 17, electrolyte levels were nearly corrected, with best corrected visual acuity of 20/20, J1+. Corneal folds resolved and IOP reached normal limits, but posterior lens opacity remained. Fundus examination showed improving maculopathy, which was confirmed by repeat OCT, showing no foveal detachment and minimal retinal pigment epithelium undulations. The patient was discharged with a regimen to manage her electrolyte imbalance.

Conclusions: This case emphasizes the importance of early recognition and management of ocular hypotony in the event of severe dehydration and electrolyte imbalance, highlighting the excellent visual prognosis with appropriate treatment.

Abstract No.: 203516**Ocular Manifestations in Neuronal Intranuclear Inclusion Disease (With Surgical Video)***First Author: Li ZHANG*

Purpose: Neuronal intranuclear inclusion disease (NIID) is a rare, slowly progressive, autosomal dominant neurodegenerative disorder. It presents with limb weakness, sensory disturbances, parkinsonism, autonomic dysfunction, dementia, and dystonia, alongside varying ocular manifestations. We report details the clinical features NIID with case initially presented with ocular symptoms.

Methods: A 56-year-old female who presented with sudden left eye visual acuity decline lasting one week. She reported a history of nyctalopia since young adulthood and mild limb tremor since her 30s. Further examination included multi-wavelength wide-field fundus photography, autofluorescence (FAF), OCT, visual field testing, ffERG, and genetic testing for the NOTCH2NLC gene via PCR and capillary electrophoresis.

Results: Multi-wavelength wide-field fundus photos appeared relatively normal. However, FAF revealed hypoautofluorescent areas in the posterior pole and around the optic disc, surrounded by a high FAF ring. OCT showed outer retinal thinning with near-total loss of the ellipsoid zone and interdigitation zone except in the fovea. A full-thickness macular hole was present in the left eye. Visual field testing demonstrated an enlarged blind spot. ffERG showed severely reduced scotopic and photopic responses. Genetic testing identified a pathogenic GGC repeat expansion (119 repeats) in the NOTCH2NLC gene. The macular hole was successfully closed following vitrectomy.

Conclusions: Ocular findings of NIID include nyctalopia, vision loss, peripapillary chorioretinal atrophy with abnormal FAF, ellipsoid zone disruption on OCT, enlarged blind spot or central scotoma on visual fields, and mildly-to-severely reduced ERG responses with implicit time delays. Early recognizing ocular manifestations is crucial for NIID.

Abstract No.: 202180**Outcome of Replacing Aflibercept With Bevacizumab in Choroidal Neovascular Diseases***First Author: Phasinee PUANGPRANG**Co-Author(s): Tharikarn SUJIRAKUL*

Purpose: Intravitreal anti-vascular endothelial growth factor (VEGF) therapy is the standard of care for choroidal neovascular diseases (CNV). In Thailand, bevacizumab is the first-line agent, with aflibercept reserved for nonresponders; however, recent budgetary restrictions have forced many patients who initially failed to respond to bevacizumab and were subsequently treated with aflibercept to revert back

to bevacizumab. This study evaluates anatomical and visual outcomes before and after sequential aflibercept and bevacizumab therapy in the same eyes of patients with CNV, including neovascular age-related macular degeneration (nAMD) and polypoidal choroidal vasculopathy (PCV).

Methods: In this retrospective cohort, 26 eyes with CNV received ≥ 3 aflibercept injections, followed by ≥ 3 bevacizumab injections. Treatment history, parameters at switching, and outcomes up to 12 weeks post-switch were analyzed. After each injection, central subfield thickness (CST) and subretinal fluid (SRF) were assessed by optical coherence tomography, while corrected visual acuity (VA) was converted to logMAR. Mixed-effect regression for repeated measures evaluated changes in CST, SRF, and VA across treatment phases.

Results: Diagnoses included PCV (84.62%) and nAMD (15.38%). Mean CST was 339.4 μm at switching and 340.4 μm after switching ($p = 0.315$). Mean VA remained stable at 0.841 and 0.865 logMAR ($p = 0.754$). SRF was present in 30.77% at switching and 19.23% post-switch ($p = 0.375$).

Conclusions: In this predominantly PCV cohort, switching back to bevacizumab preserved macular anatomy and visual function comparable to aflibercept. These findings support bevacizumab as an effective, economical alternative for CNV management in resource-limited settings. Longer-term studies are needed to confirm these findings.

Abstract No.: 207343**Outcomes, Efficacy and Retreatment Analysis of Faricimab in Retinal Vein Occlusion***First Author: Nishant Vijay RADKE**Co-Author(s): Ya CHAN, Snehal Nishant RADKE*

Purpose: To evaluate the real-world anatomical and functional outcomes, predictors of response, and retreatment intervals following Faricimab therapy in eyes with retinal vein occlusion (RVO).

Methods: This retrospective study included 18 eyes with RVO receiving Faricimab. Best-corrected visual acuity (BCVA, logMAR) and central retinal thickness (CRT, μm) were assessed pre-treatment and at final follow-up. Paired t-tests or Wilcoxon signed-rank tests were applied based on normality. Multiple linear regression evaluated predictors of ΔCRT and ΔBCVA , including baseline CRT, baseline BCVA, age, sex, and prior treatment status. Time to retreatment was analyzed using Kaplan–Meier survival curves.

Results: Faricimab significantly reduced CRT (mean $\Delta\text{CRT} = 212 \pm 26 \mu\text{m}$, $p = 0.0002$) and improved BCVA (median $\Delta\text{BCVA} = 0.268$ logMAR, $p = 0.0017$). Multiple regression revealed baseline CRT ($\beta = 0.868$, $p < 0.001$) and baseline BCVA ($\beta = 21.76$, $p = 0.039$) as independent predictors of anatomical and functional gains, respectively, whereas age, sex, and prior

treatment status were not significant. Kaplan–Meier analysis demonstrated a median retreatment-free interval of 67 days (95% CI: 40–81 days), with all eyes requiring retreatment by Day 110.

Conclusions: In this real-world cohort, Faricimab provides meaningful anatomical and functional improvement in RVO, with baseline CRT and BCVA predicting response. Retreatment intervals are variable but relatively short, highlighting the importance of individualized treatment planning. Prior treatment history did not significantly influence outcomes in this cohort.

Abstract No.: 201004

PTOSIS- a Rare Adverse Effect of Intravitreal Dexamethasone Implant

First Author: Mamta **KUMARI**

Co-Author(s): Prajakta **CHAUDHARY**, Priyanka **CHOUDHARI**, Devanshi **SHAH**, Uma **THAKUR**, Rajpal **USNALE**

Purpose: To report a rare adverse effect ptosis that happened weeks after Intravitreal dexamethasone implant.

Methods: A 34-year-old female presented to our clinic with complaints of drooping of the left eye's upper lid for 4 days. There was a history of an intravitreal dexamethasone implant procedure done 6 weeks back for non-infectious intermediate uveitis. The procedure was uneventful. No IOP spike was noted in the immediate or late postoperative period. The patient was being followed up regularly. Last follow-up was done 2 weeks back, where all parameters were normal.

Results: On examination, Visual Acuity was 20/20, N6 OU, and Intraocular pressure (IOP) was 14-15mmHg, respectively. Right eye complete examination was within normal limits. The left eye had mild Ptosis, which was not associated with restricted extraocular movements or mydriasis. The interpalpebral fissure was 2mm smaller than the right eye. MRD (marginal pupillary reflex) revealed 2mm of ptosis. Retinal examination showed dexamethasone implant in situ with no active vitritis. No other causative factor for ptosis was found in our patient. After 1 month of follow-up, the ptosis remained the same, neither improved nor deteriorated.

Conclusions: It is well established that steroids can cause muscle atrophy. Our case shows one of the rare side effect of intravitreal dexamethasone implant - ptosis, commonest being raised IOP and cataract formation. So far very few similar cases have been reported in literature. Ptosis in our case could be a result of the Levator palpebrae superioris (LPS) muscle atrophy. Other reasons mentioned in the literature are direct trauma to the muscle while injecting the implant and weakness of the supporting structure of LPS.

Abstract No.: 202197

PYGM Downregulates Necroptosis Signaling to Attenuate Sodium Iodate-Induced RPE Cell Degeneration

First Author: Yaqi **CHENG**

Co-Author(s): Meng **LI**, Shiqi **LING**, Huan **YU**

Purpose: Age-related macular degeneration (AMD) causes incurable vision loss in elderly individuals, and there is currently rare effective treatment for dry AMD. Necroptosis has attracted increasing attention in the context of AMD. This study aimed to reveal the mechanism of abnormal necroptosis induction in AMD.

Methods: Sodium iodate (SI) was used to establish in vitro and in vivo retinal pigment epithelium cell (RPE) degeneration models, which simulated dry AMD-like models. Phenotypes and classic markers of necroptosis were detected. RNA-seq was performed on the retinas of RPE- degeneration mice and combined with GSE29801 microarray data of human AMD retinal samples to identify key genes regulating necroptosis. Overexpression key gene in vivo and in vitro was performed to further validate its function in necroptosis and RPE degeneration.

Results: The necroptosis phenotypes and expression of necroptosis markers RIPK1, RIPK3, and MLKL was upregulated in both SI-treated ARPE-19 cells and the RPE layer of mice. Transcriptome data from SI treated mice and AMD patients revealed reduced expression of the PYGM gene is implicated in the regulation of necroptosis. Overexpression of PYGM in RPE cells and mice retina alleviated SI-induced RPE degeneration.

Conclusions: The research confirmed the PYGM participated in attenuating necroptosis in cell and animal models resembling dry AMD, providing a new perspective for exploring novel AMD treatment target.

Abstract No.: 203841

Pigmented Paravenous Chorioretinal Atrophy Following COVID-19 Infection With Vitreoretinal Interface Changes: Diagnostic and Imaging Insights

First Author: Mahmood **ALI**

Co-Author(s): Farah **AKHTAR**

Purpose: Pigmented Paravenous Chorioretinal atrophy (PPCRA) is a rare bilateral chorioretinal disorder characterized by perivenous pigment clumping and retinal pigment epithelium atrophy. Due to the presence of visual field defects and an altered RNFL thickness profile, its clinical presentation may sometimes lead to diagnostic uncertainty. Advances in ocular imaging have also revealed novel insights into vitreoretinal interface changes in PPCRA.

Methods: We report the case of a 26-year-old female with a five-year history of progressive painless visual decline, initially diagnosed as NTG. A comprehensive

clinical evaluation, followed by visual fields, optical coherence tomography, and fundus photography, was performed. The latest OCT scans of 2025 were compared with previous scans available in her record.

Results: Best-corrected visual acuity was 6/12 in the right eye and 6/6 in the left eye, with intraocular pressures of 17 and 16 mmHg, respectively, on latanoprost. Fundus examination revealed a cup-to-disc ratio of 0.6 bilaterally with mild peripapillary atrophy and visual field defects, which did not correspond to the RNFL pattern. Dilated fundus exam revealed characteristic perivenous pigment clumping and progressive RPE atrophy, establishing the diagnosis of PPCRA. Importantly, recent OCT revealed alterations at the vitreoretinal interface corresponding to PPCRA lesions. The patient also had a documented COVID-19 infection in 2020, coinciding with occurrence of ocular disease. Anti-glaucoma therapy was discontinued, and the patient was placed on observation.

Conclusions: This case emphasizes the importance of detailed clinical and careful interpretation of imaging investigations. The novel observation of vitreoretinal interface changes broadens understanding of PPCRA pathophysiology. The possible association with COVID-19 infection highlights immune-mediated mechanisms.

Abstract No.: 200874

Plasma Protein Mediation of the Association Between Blood Pressure and Retinal Vascular Occlusion

First Author: Chenxi **FU**

Purpose: To evaluate the associations of hypertension history, blood pressure (BP) levels and parameters with retinal vascular occlusion (RVAO) risk, and to identify potential mediating plasma proteins.

Methods: The cohort study utilized data from 439,057 UK Biobank participants. Multivariable Cox regression was employed to evaluate associations between incident RVAO and exposures: hypertension history (with stratification of control status and disease duration), hypertension stages (per 2017 guidelines), systolic BP (SBP), diastolic BP (DBP), mean arterial BP (MABP), and pulse pressure (PP). Mendelian randomization (MR) was subsequently used to assess causality and identify mediating plasma proteins.

Results: In observational analysis, hypertension history (uncontrolled and long/unknown duration), stage 1 hypertension, stage 2 hypertension, higher BP parameters (SBP, MABP, and PP) were associated with an increased risk of RVAO, while DBP showed no significant association. The MR analysis supported the causal relationships for hypertension history and SBP, but not for DBP. Six plasma proteins were identified as potential mediators for the hypertension history, with Secretory Leukocyte Peptidase Inhibitor (SLPI)

explaining the largest proportion of the effect (13.3%). Ankyrin Repeat and SOCS Box Containing 9 (ASB9) was found to mediate the effects for both hypertension history (3.56%) and SBP (4.31%) to RVAO.

Conclusions: Hypertension history and elevated SBP were significant risk factors for RVAO. Specific plasma proteins, notably SLPI and ASB9, may serve as mediators and represent potential targets for therapeutic intervention.

Abstract No.: 203807

Predictors of Response to Bevacizumab Monotherapy in Polypoidal Choroidal Vasculopathy: A 12-month Retrospective Study

First Author: Chinnapat **MONTRISUKSIRIKUN**

Co-Author(s): Nopasak **PHASUKKIJWATANA**, Supalert **PRAKHUNHUNGSIT**, Nuttawut **RODANANT**, Somanus **THOONGSUWAN**, Nida **WONGCHAI SUWAT**

Purpose: To identify baseline predictors of anatomical response after intravitreal bevacizumab in polypoidal choroidal vasculopathy (PCV) and to evaluate anatomical and visual outcomes over 12 months.

Methods: This retrospective study included 81 eyes with PCV treated with three consecutive monthly intravitreal bevacizumab injections. Patients were classified as good or poor responders based on optical coherence tomography (OCT) findings at month 3. Baseline demographic, clinical, and imaging parameters were compared between groups, and predictors of poor response were identified using multivariable regression. Visual acuity (VA), central retinal thickness (CRT), subretinal fluid (SRF), and pigment epithelial detachment (PED) height were analyzed within and between groups through month 12.

Results: Forty eyes (49.4%) were poor responders and 41 (50.6%) were good responders. Greater baseline SRF height and thinner SFCT were independent predictors of poor response (RR per 100 μ m: 1.27 and 0.71 respectively; AUC=0.79). Good responders showed significant VA improvement (0.64 ± 0.08 vs 0.48 ± 0.06 logMAR, $p < 0.001$) and CRT reduction (419.5 ± 24.3 vs 285.5 ± 14.1 μ m, $p < 0.001$) at month 3, and were maintained at month 12. Among good responders, 75% continued bevacizumab injections (non-switch group) and sustained favorable outcomes. In contrast, 86% of poor responders switched to other medications (switch group), achieving significant VA gain, CRT reduction, and further SRF with PED resolution by month 12. The non-switch group required fewer injections (5.8 ± 2.5 vs 7.8 ± 3.0 injections; $p < 0.001$) and achieved longer treatment intervals (11.7 ± 9.0 vs 7.8 ± 3.0 weeks; $p = 0.046$) than the switch group.

Conclusions: Approximately half of PCV eyes achieved a good response to bevacizumab monotherapy, with sustained visual and anatomical improvement. Baseline

SRF height and SFCT are key predictors of response. Early evaluation after three doses enables timely switching in poor responders, potentially long-term outcomes.

Abstract No.: 202412

Presence of Single Null Allele Mutations in EYS-Related Retinitis Pigmentosa May Be Associated With Early Onset Disease in Filipinos: A Case Series

First Author: Richard Braulio LABAO

Co-Author(s): Manuel Benjamin Iv IBAÑEZ, Tamilyn Chelsea LADDARAN, Marianne Grace NAVARRETE

Purpose: The eyes shut homolog (EYS) has been identified as the major gene for non-syndromic autosomal recessive retinitis pigmentosa (RP). Age of onset of EYS-related retinitis pigmentosa (EYS-RP) is variable from 13 to 50 years. Generally, the presence of two null alleles in EYS produce a more severe phenotype compared to those with only one null allele. In this case series, we describe Filipino patients with at least one frameshift mutation, and presenting with early onset RP.

Methods: This is a retrospective case series of 6 patients from unrelated families seen by the ocular geneticist of a tertiary medical center in the Philippines. Chart review was done of RP patients with genetic confirmation of EYS. Data included demographics, clinical history, age of onset, visual acuity, diagnostics, and genetic test results.

Results: Six Filipino patients were diagnosed with EYS-RP. The most common initial symptom was night blindness while age of onset ranged from 5-26 years old. All patients harbored at least one null allele mutation of the EYS gene. Exon deletion and allele localization at the C-terminus appear to produce earlier onset of initial symptoms.

Conclusions: Our case series show that the presence of at least one truncating mutation of EYS can produce an early onset phenotype of RP. The type and location of mutations produced also appear to influence onset of such phenotype.

Abstract No.: 201675

Prevalence of Retinopathy Among Patients With Prediabetes: A Descriptive Cross-Sectional Study in Nepal

First Author: Arjun SHRESTHA

Co-Author(s): Bijay KHATRI

Purpose: Prediabetes is a recognized intermediate state of dysglycemia that predisposes individuals to diabetes and its complications, possibly including retinopathy similar to diabetic retinopathy (DR). However, evidence on the prevalence of DR among prediabetic populations remains limited. The purpose of this study

is to examine the retinopathy characteristics of DR among patients with prediabetes at a tertiary-level Eye Hospital in Bhaktapur.

Methods: A cross-sectional study was conducted at CHEERS Hospital from January to April 2022 among patients aged ≥ 40 years with prediabetes. Prediabetes was defined using American diabetic association (ADA) criteria (impaired fasting glucose, impaired glucose tolerance, or HbA1c 5.7–6.4%). Sample size was calculated using a single population proportion formula ($n=140$). Retinal examinations were performed to assess for DR.

Results: A total of 131 participants were enrolled, with 92 (70.2%) aged 40–59 years and 39 (29.8%) aged ≥ 60 years. Diabetic retinopathy was detected in 7 patients (5.34%): 5 cases of mild non-proliferative DR and 2 cases of moderate non-proliferative DR. The remaining 124 participants (94.65%) had no evidence of DR.

Conclusions: Retinopathy was present in over 5% of prediabetic individuals, indicating that microvascular changes can occur before overt diabetes. Early retinal screening among prediabetic patients may be beneficial for timely detection and prevention of vision-threatening complications.

Abstract No.: 204048

Prohibitin 2 Mediates High Glucose-Induced Mitophagy in Retinal Pigment Epithelial Cells via the PINK1/Parkin Pathway

First Author: Xin CAO

Co-Author(s): Xiao-bo HUANG, Tian-yi LIU, Xiao-le WANG, Yong WANG, Dong-mei ZHANG, Tian-peng CHEN

Purpose: Mitophagy exerts a protective role in diabetic retinopathy (DR); however, its regulatory mechanisms remain incompletely understood. Although prohibitin 2 (PHB2), an inner mitochondrial membrane protein, is known to participate in mitophagy, its function in DR has not been elucidated. This study aimed to investigate whether PHB2 modulates high glucose-induced damage in retinal pigment epithelial cells (ARPE-19) through regulating mitophagy.

Methods: Bioinformatic analysis was performed using publicly available GEO datasets to identify key candidate genes associated with DR. A high glucose-induced injury model was established in ARPE-19 cells to validate PHB2 expression. To further explore its functional role, PHB2 was knocked down in ARPE-19 cells. The effects on mitophagy were assessed by measuring the expression of mitophagy-related proteins, including PINK1, Parkin, LC3II/I, and P62, using Western blotting. Cellular responses were evaluated via viability and apoptosis assays. Interactions between PHB2 and autophagy-related proteins were examined by co-immunoprecipitation (Co-IP).

Results: Bioinformatic analysis identified PHB2 as a hub gene in DR. High glucose disrupted tight junctions, induced mitochondrial pathway apoptosis, and activated mitophagy through the PINK1/Parkin signaling pathway in ARPE-19 cells. Pharmacological inhibition of mitophagy by 3-MA increased the expression of apoptotic proteins under high glucose conditions ($P < 0.05$). Knockdown of PHB2 markedly increased apoptosis, accompanied by upregulation of pro-apoptotic proteins and downregulation of anti-apoptotic proteins (all $P < 0.05$). Co-IP assays confirmed that high glucose significantly enhanced the interactions between PHB2 and LC3B, as well as between PHB2 and P62 (all $P < 0.05$).

Conclusions: This study is the first to demonstrate that PHB2 regulates mitophagy in retinal pigment epithelial cells by interacting with LC3 and P62, playing a protective role in high glucose-induced ARPE-19 cell damage.

Abstract No.: 201356

Pseudoxanthoma Elasticum: A Case Report and Systematic Review

First Author: Liu RUI

Purpose: we report a case of PXE and systematic review as well as the correlation between gene mutations and the disease.

Methods: A 45-year-old female presented with blurry vision and metamorphopsia in left eye for 20 days. Best corrected visual acuity was 15/60 in the left eye and 60/60 in the right eye. Fundus examination showed dark or reddish linear streaks radiating from the optic disc and extending into the macular area and the posterior pole in the left eye, representing Angioid Streaks. It is essentially a rupture in Bruch's membrane, which develops neovascularisation and leads to maculopathy or subretinal bleeding with visual decline or marked loss of vision. External examination showed yellow skin plaques on the lateral and posterior neck as well as prominent creases.

Results: Given ocular and skin disorders, The diagnosis of Angioid Streaks in PXE can be considered which was finally confirmed through Genetic testing and Pathologic examination of skin biopsy. In the treatment, she responded well to intravitreal ranibizumab injections and visual acuity improved to 40/60 during 2 years follow-up period.

Conclusions: Early recognition, intervention, and lifestyle adjustment of Pseudoxanthoma elasticum are important to reduce morbidity. Evaluation of underlying systemic disease and appropriate treatment are particularly necessary.

Abstract No.: 201002

Purtscher-Like Retinopathy Secondary to Hyaluronic Acid Embolization Syndrome: Unravelling Ocular Occlusive Vasculopathy Secondary to Breast Filler Injections

First Author: Rongkai TAN

Co-Author(s): Chui Yain CHEN, Rhuen Chiou CHOW, Chenshen LAM

Purpose: This report describes a rare case of bilateral eye Purtscher-like retinopathy secondary to hyaluronic acid embolization syndrome.

Methods: Case report.

Results: A 25-year-old lady presented with bilateral eyes sudden blurring of vision for one day. She had a history of breast filler injections with unauthorized hyaluronic acid by untrained and unlicensed personnel and was hospitalized due to hyaluronic acid embolization syndrome involving bilateral lungs. Snellen chart visual acuity in both eyes were 6/36. There was no relative afferent pupillary defect. Anterior segment examinations of bilateral eyes were unremarkable with normal intraocular pressures. Bilateral eyes fundus examinations revealed multiple Purtscher fleckens, cotton wool spots, Roth's spots, and retinal hemorrhages at the posterior pole. A decrease in haemoglobin level was observed alongside with an elevated serum D-dimer. Chest X-ray showed bilateral ground glass opacities, while computed tomography pulmonary angiogram demonstrated multifocal consolidation with ground glass opacities in both lung fields which represent diffuse alveolar hemorrhages. Intravenous methylprednisolone 500mg once daily was initiated for three days, and subsequently oral prednisolone 1mg/kg was given in tapering doses. Post-treatment, bilateral visual acuity improved to 6/9 with complete resolutions of Purtscher fleckens, cotton wool spots and retinal hemorrhages.

Conclusions: This case demonstrated that unauthorized and illegal breast filler injections can potentially cause a devastating impact on our vision, and social awareness should be raised. A detailed history taking is crucial in making a timely accurate diagnosis. The early initiation of high-dose steroids is vital for a good visual outcome.

Abstract No.: 205530

Quality of Life in Patients With Vision-Threatening vs. Non-Vision-Threatening Diabetic Retinopathy in South India: A Questionnaire-Based Cross-Sectional Study

First Author: Devika BHATTACHARYA

Co-Author(s): Kunal MANDLIK

Purpose: This cross-sectional study aimed to compare the Quality of Life (QoL) in patients with Vision Threatening Diabetic Retinopathy (VTDR) versus Non-Vision Threatening Diabetic Retinopathy (Non-

VTDR) in South India using the Indian Vision Function Questionnaire 33 (IND-VFQ33). Secondary objectives included comparing Activities of Daily Living (ADL), mobility, fear of falling (FoF), and mental status (Geriatric Depression Scale/Mini-Mental Scale) between the groups.

Methods: A total of 292 diabetic retinopathy patients were recruited at Aravind Eye Hospital, Pondicherry, and divided into two equal groups (n=146) for VTDR and Non-VTDR. Patients were assessed using validated tools, including the IND-VFQ33, ADL Questionnaire, Fear of Falling Questionnaire, Life Space Questionnaire, Geriatric Depression Scale (GDS), and Mini-Mental Scale (MMS). Statistical analyses included Student's t-test, Chi-square test, and Mann-Whitney U test.

Results: Significant differences were found in both Uncorrected Visual Acuity (UCVA) ($p=0.047$) and Best-Corrected Visual Acuity (BCVA) ($p=0.026$) between the groups. While overall IND-VFQ33 scores showed no significant difference in self-reported general functioning, psychosocial impact, or visual symptoms ($p>0.05$), a significant difference was observed in the ADL score ($p=0.013$). Surprisingly, Non-VTDR patients reported statistically greater difficulty in individual tasks such as managing money, using a telephone ($p=0.014$), and travelling beyond walking distance ($p<0.001$). Scores for Fear of Falling, GDS, and MMS were similar across both groups.

Conclusions: The study found no significant difference in the self-reported Vision Related Quality of Life as measured by the IND-VFQ33 between VTDR and Non-VTDR patients. However, the unexpected finding of Non-VTDR patients reporting greater ADL difficulty in specific tasks warrants further investigation into the subtle social and functional impacts of non-vision-threatening disease stages.

Abstract No.: 203428

Quantitative OCT Angiography of the Retinal Microvasculature and the Choriocapillaris in Central Serous Chorioretinopathy

First Author: Suphatar **KITCHAROEN**

Co-Author(s): Wongsiri **TAWEEBANJONGSIN**

Purpose: To describe choriocapillaris patterns in central serous chorioretinopathy (CSC) using quantitative optical coherence tomography angiography (OCTA) analysis.

Methods: Macular OCTA images (6×6 mm) were obtained using the RTVue-XR Avanti with AngioVue. Quantitative measurements of the superficial and deep retinal capillary plexus and the choriocapillaris (CC) were performed using en face projection images. Parameters included vessel density, fractal dimension, and the area and density of CC flow deficits.

Results: Forty-seven patients diagnosed with CSC (56 affected eyes, 38 unaffected fellow eyes) were

included. Abnormal OCTA features were observed in 87.5% of affected eyes and 36.8% of fellow eyes ($p < 0.001$). Dark areas occurred in 50.0% of affected vs. 21.1% of fellow eyes ($p = 0.005$); dark spots in 35.7% vs. 10.5% ($p = 0.008$); and abnormal vessels in 17.9% vs. 5.3% ($p = 0.114$). Affected eyes showed significantly lower CC flow deficit (mean difference -1.94 , $p = 0.019$) and CC flow area (mean difference -0.24 , $p < 0.001$) compared with fellow eyes. No significant differences were found in outer retinal flow area, subfoveal choroidal thickness, or choroidal vascularity index.

Conclusions: OCTA revealed that CSC eyes frequently exhibited dark areas and dark spots, accompanied by significantly lower CC flow deficit and reduced CC flow area compared with fellow eyes. These findings suggest that OCTA provides valuable insights into choriocapillaris alterations and the pathogenesis of CSC.

Abstract No.: 201993

Rare Case of Oguchi Disease

First Author: Ayush **SANGOLE**

Purpose: To show the characteristics of Oguchi disease.

Methods: Detailed evaluation of Oguchi disease with fundus photo before and after dark adaptation, OCT changes before and after dark adaptation.

Results: Oguchi disease shows, Mizuo Nakamura phenomenon also shows OCT before and after dark adaptation.

Conclusions: Oguchi disease is CSNB. Diagnosis – History; clinical findings; ERG findings. Counselling is important. Consanguineous marriage main cause of disease. Genetic testing (SAG gene / GRK1 gene).

Abstract No.: 200856

Real-Life Experience of Switching From Other Anti-VEGF Therapy to Faricimab in Patients With Refractory Neovascular Age-Related Macular Degeneration in a Short Time in China

First Author: Yaoyao **SUN**

Co-Author(s): Qi **HUIJUN**

Purpose: To evaluate the effectiveness and safety of Faricimab in patients with refractory neovascular AMD who switched from other anti-VEGF therapy in China in a short time.

Methods: We conducted a retrospective case series involving patients with refractory nAMD treated with faricimab from March 2024 to September 2024. Eligible patients were those who had suboptimal responses to prior anti-VEGF therapies. Key outcomes assessed included best-corrected visual acuity (BCVA), central macular thickness (CMT), and presence of retinal fluid. Safety data were obtained from medical records.

Results: 57 eyes with nAMD were included, having received an average of 11.08 ± 7.75 anti-VEGF injections before starting faricimab. After the switch, patients received an average of 1.97 ± 1.02 faricimab injections, with an average follow-up duration of 2.97 ± 1.03 months. A response in either BCVA or CMT was observed in 96.49% of patients. Significant improvements in BCVA were noted after 1 injection (0.12 ± 0.21), 2 injections (0.23 ± 0.27), and 3 injections (0.15 ± 0.19) compared to baseline (all $P < 0.05$). CMT was decreased significantly after each faricimab injection. Specifically, 48 patients (84.21%) gained BCVA improvement, and 40 patients (70.18%) achieved more than 20% CMT reduction at the final visit. The proportion of patients without intraocular and subretinal fluid was achieved by 29.82% after 1 injection and increased to 61.40% at the final visit. No reported cases of endophthalmitis, retinal vasculitis, or severe intraocular inflammatory events.

Conclusions: Faricimab shows promising effectiveness and safety for patients with refractory nAMD transitioning from anti-VEGF therapy in China.

Abstract No.: 206296

Real-World Anatomical and Functional Outcomes of Faricimab in Neovascular Age-Related Macular Degeneration

First Author: Nishant Vijay **RADKE**

Co-Author(s): Ya **CHAN**, Jiaying **LIU**, Snehal Nishant **RADKE**

Purpose: To evaluate real-world anatomical and functional responses to Faricimab in patients with neovascular age-related macular degeneration (nAMD) and to examine predictors of treatment response and inter-treatment intervals.

Methods: In this retrospective analysis, 19 eyes with nAMD were included. Visual acuity (VA, logMAR) and central retinal thickness (CRT, microns) were assessed at baseline and after treatment. Δ VA and Δ CRT were calculated. Wilcoxon signed-rank tests were used for within-group comparisons due to non-normal distribution of VA and inter-treatment interval data. Simple and multiple linear regression models assessed the influence of baseline CRT, baseline VA, age, sex, and prior treatment status on outcomes. Correlations between baseline characteristics and Δ CRT/ Δ VA were evaluated. Inter-treatment intervals (Tx1–Tx2 and Tx2–Tx3) were summarized using medians and IQR.

Results: Median Δ VA was 0.058 logMAR (IQR 0–0.161, $p = 0.105$), indicating a non-significant functional improvement. Median Δ CRT was 49 μ m (IQR 24–103, $p = 0.0002$), reflecting significant anatomical improvement. Multiple regression revealed baseline CRT as the sole significant predictor of Δ CRT ($\beta = 0.576$, $p = 0.001$), with higher baseline CRT associated with greater reduction; Δ VA was not predicted by any baseline factors ($p > 0.05$). Age showed very weak

correlations with Δ CRT ($R = 0.018$) and Δ VA ($R = 0.023$). Median inter-treatment intervals were 71 days (Tx1–Tx2) and 64 days (Tx2–Tx3, $p = 0.36$).

Conclusions: Faricimab provides significant anatomical improvements in nAMD, while functional gains are modest. Baseline CRT strongly predicts anatomical response, whereas functional outcomes are less influenced by baseline characteristics. Inter-treatment intervals varied, suggesting individualized retreatment planning may optimize outcomes in real-world practice.

Abstract No.: 201576

Real-World Efficacy of a Loading Phase With Intravitreal Faricimab in Refractory Neovascular Age-Related Macular Degeneration (nAMD) Patients in the Chinese Population

First Author: Panpan **YE**

Purpose: To investigate the real-world efficacy of faricimab in Chinese patients with previously treated refractory nAMD.

Methods: A prospective single-center study was conducted involving patients with refractory nAMD treated with a loading dose of 3 IVI of faricimab 6 mg/0.05 ml, administered every four weeks. All patients included in this study had previously received a minimum of 3 consecutive intravitreal injections of other anti-VEGF. Main outcome measures included best-corrected visual acuity (BCVA) and OCT outcomes at follow-up time for 3 months.

Results: Fifty-two eyes of 50 patients with previously treated refractory nAMD were included in this study. The BCVA (logMAR) improved from 0.86 ± 0.59 to 0.72 ± 0.55 at 3 months ($P < 0.05$). The central macular thickness (CMT) decreased significantly from 452.33 μ m to 335 μ m at 3 months ($P < 0.05$). The correlation analysis revealed that age, ellipsoid zone (EZ) discontinuity, baseline CMT, intraretinal fluid (IRF), scar, and subretinal hyperreflective material (SHRM) showed a positive correlation with the final BCVA ($P < 0.05$).

Conclusions: The real-world outcomes showed that faricimab could lead to significant improvements in BCVA and CMT, as well as reductions in retinal fluid in patients with previously anti-VEGF-treated refractory nAMD.

Abstract No.: 203409

Real-World Outcomes of Single-Dose Faricimab Treatment in Wet Age-Related Macular Degeneration

First Author: Huan **CHEN**

Co-Author(s): Youxin **CHEN**, Chan **WU**, Zhixuan **XIE**, Weihong **YU**, Xiao **ZHANG**

Purpose: Faricimab, a novel bispecific antibody targeting both VEGF-A and Ang-2, offers a new avenue

for the management of wet age-related macular degeneration (wAMD). This study aimed to evaluate the anatomical and functional outcomes of single-dose faricimab treatment in wAMD patients.

Methods: This real-world, observational study included 35 patients diagnosed with wAMD who received a single intravitreal injection of faricimab. Comprehensive ophthalmologic assessment, including best corrected visual acuity (BCVA), swept-source OCT (SS-OCT) and SS-OCTA imaging, was performed at baseline and post-treatment visit. Key endpoints included changes in central retinal thickness (CRT), resolution of intraretinal and/or subretinal fluid, reduction in pigment epithelial detachment (PED) and improvement in BCVA.

Results: All 35 patients completed the study follow-up period of 2 weeks to 12 weeks. SS-OCT imaging revealed a significant reduction in CRT (mean decrease=161.29 μ m, sample standard deviation (ssd)=255.31, $p<0.001$), with marked resolution of intraretinal and/or subretinal fluid in 51.6% of eyes. Among the 20 patients with intraretinal fluid, both fluid area (mean=15.72 mm², ssd=27.61 mm², $p=0.020$) and fluid volume (mean=1.22 mm³, ssd=1.51 mm³, $p=0.002$) were reduced. Significant decreases in PED parameters were also observed, including PED area (mean=3.70 mm², ssd=7.01 mm², $p=0.004$) and PED volume (mean=1.21 mm³, ssd=3.49 mm³, $p=0.047$). However, BCVA improvement was not statistically significant ($p>0.05$).

Conclusions: Faricimab demonstrated strong real-world efficacy in enhancing anatomical damage of wAMD eyes, suggesting its potential as a valuable treatment option. Yet, the single dosage showed insufficiency in improving patients' visual acuity, calling for further studies to establish long-term efficacy and optimal dosing strategies.

Abstract No.: 201312

Real-World Outcomes of Switching to Faricimab in Choroidal Neovascularization: 6-Month Results

First Author: Pornwalan KIRIYAPONG

Co-Author(s): Pisara MUNEESRI, Manachaya PRUKAJORN, Thansit SRISOMBUT, Tharikarn SUJIRAKUL, Thitiporn THONGBORISUT, Boontip TIPSURIYAPORN

Purpose: To evaluate the efficacy of intravitreal faricimab in patients with choroidal neovascularization (CNV)—including neovascular age-related macular degeneration (nAMD), polypoidal choroidal vasculopathy (PCV), and pachychoroid-associated macular neovascularization—who showed suboptimal or recalcitrant response to prior anti-vascular endothelial growth factor (anti-VEGF) therapy.

Methods: This retrospective case series included 30 patients who received ≥ 3 faricimab injections after

inadequate response to other anti-VEGF agents. Treatment history 6 months prior to switching and outcomes up to 6 months post-switch were reviewed. Data included best-corrected visual acuity (BCVA, logMAR), central subfield thickness (CST), presence of subretinal fluid (SRF), intraretinal fluid (IRF), and subretinal hemorrhage (SRH). Mixed-effects linear regression and McNemar's test for paired binary outcomes were used.

Results: Diagnoses included nAMD (46.7%), PCV (40.0%), and pachychoroid-associated macular neovascularization (16.7%). Median anti-VEGF injections in the prior 6 months were 4 (IQR 2–6), and median faricimab injections during 6-month follow-up were 4 (IQR 3–5). BCVA showed no significant change from baseline to month 6 (0.571 to 0.653 logMAR; $p=0.169$). CST significantly decreased from 365.6 μ m to 326.4 μ m (mean difference -39.2μ m; $p=0.031$). SRF resolved in 71% (12/17) at month 6 ($p<0.001$). IRF ($p=0.453$) and SRH show no significant changes.

Conclusions: Switching to faricimab did not improve BCVA at 6 months but produced significant anatomical benefits, particularly CST reduction and SRF resolution. Faricimab may be a treatment option for CNV patients with insufficient response to other anti-VEGF agents.

Abstract No.: 208284

Regulations and Functions of GATOR2 Complex—An mTORC1 Activator Linked to Nutrient Sensing

First Author: Siqi ZOU

Co-Author(s): Xiaoqiang XIAO

Purpose: The aim is to provide a theoretical basis and research direction for targeting the GATOR2-mTORC1 pathway in treating BRB-associated ophthalmological diseases.

Methods: This paper will systematically review the pathological significance of BRB abnormalities, the mechanism by which mTORC1 signaling affects vascular function, and the regulatory properties, molecular interactions, and evolutionary conservation of the GATOR2 complex.

Results: Well-developing blood system benefits the vision function, blood-retinal Barrier disorders cause many severe ocular diseases, mTORC1 signal controls the vessel functions and endothelial cells, GATOR2 complex is a crucial activator of mTORC1 activities.

Conclusions: The current study initially revealed the important role of the GATOR2-mTORC1 pathway in BRB regulation. However, the retinal cell-specific regulatory mechanism, pathway cross-network, and dynamic changes under pathological conditions still need further exploration. Future in-depth analysis of this pathway's molecular mechanism and development of small molecule drugs, gene therapy, and combination therapy strategies targeting GATOR2 are expected to

provide a new theoretical basis and clinical tools for preventing and treating BRB-associated ophthalmic diseases and ultimately improving patients' visual acuity prognosis.

Abstract No.: 204582

Replication of the Association Between Retinal Aging Clock Susceptibility Genes and Retinal Age Gap in Asian: The Nagahama Study

First Author: Masahiro MIYAKE

Co-Author(s): Yuta DOI, Yuki MORI, Kazuya MORINO, Akitaka TSUJIKAWA

Purpose: To replicate previously reported genetic associations for the retinal aging clock—quantified as the retinal age gap—in an East Asian population and to assess cross-ancestry consistency of effect directions and sizes.

Methods: Individuals who participated in both first and second visit of the Nagahama Study with gradable fundus photographs and genome-wide genotype data were included. A deep learning model fine-tuned on an independent subset (i.e. data from participants who attended only one of the two visits of the Nagahama Study) was used to estimate retinal age from color fundus photographs. We tested 13 previously reported lead variants; 7 were evaluable in our dataset (directly or as available leads). Linear regression models adjusted for standard covariates estimated SNP effects on the retinal age gap at the first visit. Statistical significance was set as Bonferroni-corrected $P = 0.0071$ ($0.05/7$). Secondary measures included directional concordance and effect-size correlation with discovery estimates.

Results: Age-prediction accuracy in the genetic cohort showed MAE = 3.00 (first visit) and 3.42 years (second visit). Of 13 variants to be replicated, 7 were testable. The lead variant rs17713879 (SH3YL1) replicated after multiple-testing correction ($\beta = -0.41$ years per effect allele, SE = 0.094, $P = 9.8 \times 10^{-6}$). After harmonizing effect directions, all 7/7 testable variants showed directional concordance with discovery findings (binomial $P = 0.0078$) and a strong cross-study effect-size correlation ($r = 0.93$).

Conclusions: In an East Asian population, we replicate the SH3YL1 association with the retinal age gap and observe consistent direction and magnitude across all testable discovery variants.

Abstract No.: 206807

Retinal Coloboma Mimicking Ocular Toxoplasmosis: A Case Report

First Author: Ren Jet PHANG

Co-Author(s): Shew Fei CHEE, Arjan DHILLON

Purpose: To describe a case of posterior segment retinal coloboma mimicking ocular toxoplasmosis and highlight the distinguishing clinical features.

Methods: Case Report

Results: A 12-year-old boy presented with a one-month history of perceived “sudden onset” blurred vision in the right eye. Best-corrected visual acuity was 6/60 in the right eye and 6/9 in the left eye. Fundus examination revealed an 8 mm, sharply demarcated inferonasal chorioretinal defect extending to the inferior macula. The vitreous was clear, there was no evidence of any retinal inflammation. Optical coherence tomography demonstrated a deep excavation with absence of retinal layers. Toxoplasma serology was negative, and the lesion remained stable on follow-up. The apparent “sudden” onset most likely represented the patient’s first awareness of longstanding poor vision rather than an acute event.

Conclusions: Posterior segment coloboma may mimic toxoplasmosis scars but is distinguished by its smooth margins, excavated contour, and absence of vitreous reaction and retinal inflammation. In contrast, toxoplasmosis scars typically appear irregular, pigmented, and associated with inflammatory changes. Accurate diagnosis prevents unnecessary antimicrobial treatment and emphasizes the importance of surveillance for complications such as retinal detachment. Careful history-taking and multimodal imaging are key to distinguishing congenital from acquired posterior segment lesions.

Abstract No.: 202357

Retinal and Choroidal Morphometric Analysis in the Fellow Eye of Unilateral Wet Age-Related Macular Degeneration Using Optical Coherence Tomography Angiography

First Author: Sudha RANABHAT

Co-Author(s): Priya BAJGAI, Kiran SHAKYA

Purpose: To determine the retinal and choroidal changes in patients with Unilateral wet age-related Macular Degeneration (AMD) and their fellow eyes.

Methods: Prospective, cross-sectional study that included 60 patients (120 eyes) with unilateral wet AMD and their fellow eyes, where optical coherence tomography angiography (OCTA) was used to access vessel density (VD), perfusion density (PD) and foveal avascular zone (FAZ) of superficial capillary, deep capillary plexus and choriocapillaries. Enhanced depth imaging optical coherence tomography was performed for accessing the choroid.

Results: Mean age was 73.9 ± 9.54 years (51-89). Mean visual acuity of wet AMD eyes was 1.28 ± 0.50 and fellow eyes was 0.75 ± 0.59 . Eighteen (30.6%) of fellow eyes had normal fundus, twenty-two (37.4%) had dry AMD and twenty (34%) had wet AMD. Pattern I choroidal neovascular membrane were in forty-five (75%), using OCTA based morphologic criteria, in wet AMD eye. Mean vessel density of wet AMD eye was $17.45 \pm 7.6\text{mm}$ and fellow eye was $18.8 \pm 9.45\text{mm}$. Mean perfusion density of wet AMD was $6.7 \pm 3.5\%$ and fellow eye was $7.07 \pm 3.8\%$. Mean FAZ area of wet AMD was $0.576 \pm 0.42\text{mm}^2$ and fellow eye was $0.424 \pm 0.19\text{mm}^2$. Significant association was not identified between VD, PD and FAZ of the two eyes but Sattler layer is significantly affected in eyes with wet AMD (p 0.05).

Conclusions: AMD can be frequently detected in the fellow eyes of wet AMD which could be potentiated by vascular insufficiency of the retinal and choroidal circulation, subsequently leading to its progression.

Abstract No.: 204159

Retinoblastoma Research Trends From 1980 to 2023: A 44-Year Bibliometric Study

First Author: Wang **YINING**

Purpose: Our objective is to analyze research trends in the RB field and compare contributions from different countries, institutions and authors.

Methods: We extracted all RB-related publications published from 1980 to 2023 from the Web of Science database and applied VOSviewer, R software, Bibliometrix software, Origin 2024 and CiteSpace to review the publication data, analyze the publication trends, and visualize the relevant data.

Results: A total of 4156 papers on RB were identified from 1980 to 2023. In 1980, only 13 papers were published, yet by 2023, 237 papers had been published. These publications were contributed by 351 research institutes from 68 countries/regions. The United States ranked first with 1662 papers, accounting for 39.99% of the total number of publications on RB research. A total of 539 RB research papers were published in China, ranking second. India, Canada and Germany ranked third, fourth and fifth, with 377, 277 and 221 publications, respectively. Thomas Jefferson University published the most research papers on RB, with 166 published papers, accounting for 3.99% of all publications. The top three journals contributing to this field were Invest Ophthalm Vis Sci, the British Journal of Ophthalmology and Ophthalmology. Liquid biopsy, intra-arterial chemotherapy and intravitreal chemotherapy are the most frequently used keywords in the field.

Conclusions: Many renowned research institutions and ophthalmologists have made important contributions to RB research and will continue to lead this research direction. Liquid biopsy, intra-arterial chemotherapy

and intravitreal chemotherapy are potential hotspots for RB research in the future.

Abstract No.: 200606

Rubeosis Iridis- Neovascularisation of Iris in a 56-Year-Old Male With CRVO

First Author: Arnav **SINGHAL**

Purpose: Neovascularisation of the iris is seen in a patient with CRVO a serious complication arising from retinal ischemia by blockage.

Methods: CRVO leads to poor blood flow in the retina, causing oxygen deprivation.

Results: Treatment with panretinal photocoagulation and anti-VEGF injections gives adequate treatment.

Conclusions: Rubeosis iridis and neovascular glaucoma can cause serious vision loss if treated inadequately.

Abstract No.: 205688

Sectorial X-linked Retinitis Pigmentosa With Tapetal-Like Reflex in a Male With RPGR Mutation

First Author: Patchrapa **WATTANAWINITCHAI**

Co-Author(s): Tharikarn **SUJIRAKUL**

Purpose: To report a rare case of sectorial retinitis pigmentosa (RP) with a tapetal-like reflex (TLR) in a male patient with RPGR-associated X-linked retinitis pigmentosa (XLRP).

Methods: A case report.

Results: A 9-year-old Thai boy presented with a three-year history of bilateral, painless, progressive blurred vision. He denied nyctalopia, photophobia, photopsia, and photoaversion. Family history included maternal childhood-onset nyctalopia and a maternal uncle reportedly blind by age 30. His best-corrected visual acuity was 20/50 bilaterally. Fundus examination showed bilateral TLR at the superior posterior pole, retinal pigment epithelium alteration along the inferior arcade, tessellated fundus, and arteriolar attenuation without bone spicule pigmentation. Fundus autofluorescence revealed bilateral arcuate lines of hyperautofluorescence with adjacent isoautofluorescent regions inferiorly. Spectral-domain optical coherence tomography showed outer retinal loss corresponding to the isoautofluorescent areas. Full-field electroretinography demonstrated reduced amplitudes and delayed implicit times, with rod responses more affected than cone responses. Genetic testing identified a hemizygous RPGR mutation (c.2405_2406del, p.E802Gfs*32), confirming the diagnosis of XLRP.

Conclusions: This case presented with sectorial RP and a TLR—features rarely observed in male probands with RPGR-associated XLRP. The presence of TLR may serve

as a clinical clue to underlying RPGR mutations, even in male patients.

Abstract No.: 207321

Severe Macular Edema in Central Retinal Vein Occlusion: A Case Series Evaluating the Efficacy of Anti-VEGF, Dexamethasone, and the Combination of Anti-VEGF and Dexamethasone Implant

First Author: Xiaohu YAN

Purpose: Severe macular edema in central retinal vein occlusion (CRVO) presents a significant clinical challenge, as it can lead to substantial retinal damage and severe visual impairment. The treatment and prognosis of severe macular edema (central retinal thickness (CRT) exceeding 1000 μm) in CRVO, which have significant implications for clinical management, have been rarely studied and reported.

Methods: We reported and analyzed the case series of 18 patients (18 eyes) diagnosed with severe macular edema (CRT $\geq 1000 \mu\text{m}$) in CRVO. Thirteen eyes (72.2%) were initially treated with anti-VEGF therapy, one eye (5.56%) initially received dexamethasone, and four eyes (22.22%) were initially treated with a combination of anti-VEGF and dexamethasone implant. Anterior segment examination, funduscopy, best-corrected visual acuity (BCVA), intraocular pressure (IOP), optical coherence tomography (OCT), scanning laser ophthalmoscopy (SLO) and fundus fluorescein angiography (FFA) were performed in the patients' medical evaluations.

Results: At 1-week post-initial treatment, initial anti-VEGF + dexamethasone combination therapy achieved rapid OCT-assessed macular edema resolution, while anti-VEGF monotherapy only induced partial resolution. During follow-up, the combination group had fewer treatments, less recurrent edema, and the highest visual improvement rate vs. the two monotherapy groups. Patients had stable IOP (mild elevation controlled by medication) with no other abnormalities, confirming the combination therapy's safety.

Conclusions: Initial treatment with anti-VEGF, Dexamethasone, and combination therapy has shown effective for severe macular edema (CRT $\geq 1000 \mu\text{m}$) in CRVO. Initiating combined treatment earlier might lead to better outcomes, warranting further prospective, randomized, large-scale and multicenter clinical trials.

Abstract No.: 204509

Short-Term Efficacy of Aflibercept 8 mg in Refractory Neovascular Age-Related Macular Degeneration: A Real-World Retrospective Case Series From Taiwan

First Author: Sheng Chu CHI

Co-Author(s): Hsin Ho CHANG, Shih-jen CHEN, Tai Chi LIN

Purpose: Aflibercept 8 mg is a novel agent for neovascular age-related macular degeneration (nAMD). This study evaluated its short-term efficacy in treatment-resistant cases.

Methods: This retrospective case series included patients with refractory nAMD treated with aflibercept 8 mg at Taipei Veterans General Hospital from October 2024 to April 2025. Primary outcomes were changes in best-corrected visual acuity (BCVA) and central macular thickness (CMT). Secondary outcomes included subretinal fluid (SRF), intraretinal fluid (IRF), and pigment epithelial detachment (PED) height. Nonparametric methods were used for analysis.

Results: This study included 12 eyes with refractory nAMD, 5 with refractory polypoidal choroidal vasculopathy (PCV), and 3 with refractory pachychoroid neovascularopathy (PNV), all treated with aflibercept 8 mg. Over a 3-month follow-up, no significant improvement in BCVA was observed, while CMT showed significant reductions at all time points. PED height also significantly decreased at the 1- and 3-month visits per Wilcoxon signed-rank test. Although SRF prevalence declined, the change was not statistically significant. A dry macula was achieved in 45% of eyes. Around half or more of the eyes showed a CMT reduction $>50 \mu\text{m}$, with proportions of 50.0%, 54.5%, and 57.1% at months 1, 2, and 3, respectively.

Conclusions: Aflibercept 8 mg demonstrated favorable anatomical outcomes in patients with refractory nAMD. Further studies are warranted to identify factors associated with treatment response and optimize patient selection.

Abstract No.: 208320

Short-Term Real-World Outcomes of Anti-Vascular Endothelial Growth Factor Therapy for Macular Edema Secondary to Diabetic Retinopathy and Retinal Vein Occlusion

First Author: Dawei SUN

Co-Author(s): Bo JIANG

Purpose: We aim to objectively evaluate real-world treatment outcomes in patients with macular oedema (ME) following the first injection of different anti-vascular endothelial growth factor (VEGF) agents, including faricimab, newly approved in China, and traditional ranibizumab, aflibercept, and conbercept.

Methods: This retrospective study included patients with diabetic macular oedema (DME) and retinal vein occlusion (RVO)-ME at the Second Affiliated Hospital of Harbin Medical University, all of whom were treatment naïve to anti-VEGF therapy. Changes in best-corrected visual acuity (BCVA) and central macular thickness (CMT) were evaluated one month after the initial injection.

Results: A total of 87 eyes (71 patients) with DME treated with anti-VEGF agents were included. Statistically significant improvements in BCVA and CMT were observed in all the injection groups. Although there was no significant difference in the changes in CMT and BCVA among the faricimab, ranibizumab, aflibercept, and conbercept groups, the mean reduction in CMT and improvement in BCVA were greater in the faricimab group, with the smallest mean increase in IOP among the four groups. Among the 58 eyes (57 patients) with RVO-ME, significant improvements in BCVA and CMT were observed in all the injection groups. There was no significant difference in the changes in CMT or BCVA among the four groups. And no significant ocular or systemic adverse events were observed in all groups.

Conclusions: Faricimab, similar to traditional ranibizumab, aflibercept, and conbercept, is an effective treatment for both DME and RVO-ME, with structural and functional benefits at 1 month after the first injection and favourable safety profile.

Abstract No.: 210342

Silent Macula in Waldenström Macroglobulinemia Complicated Retinopathy

First Author: Yunshan **MOU**

Co-Author(s): Yrongdi **YUAN**

Purpose: To report a case of Waldenström macroglobulinemia complicated retinopathy, where the symptoms were very similar to diabetic retinopathy, and to recommend that ophthalmologists pay attention to the diagnosis and treatment of Waldenström macroglobulinemia complicated retinopathy, especially to tell Waldenström macroglobulinemia complicated retinopathy and diabetic retinopathy apart.

Methods: Case review. Here we describe a case of a 64-year-old male individual who complained of bilateral gradual visual acuity decline for 5 months and was diagnosed with type 2 diabetes mellitus for over 6 years. Visual acuity with best correction measured 20/50 OD and 20/63 OS. Both eyes showed negative anterior segment. Dilated fundus exam was notable for retinal scattered hemorrhages and subretinal fluid in macular region of both eyes. Optical coherence tomography showed bilateral subretinal fluid accumulation with massive macular detachment (central macular thickness was 557 μm and 607 μm). Fluorescein fundus angiography shows there are scattered microaneurysms and hemorrhagic

hypofluorescence but there's no significant leakage in macular region during late phase. At first, he was diagnosed with diabetic retinopathy due his past medical history and typical fundus appearance. Nevertheless, we find the findings in fundus photography did not match with those in fluorescein fundus angiography. In other words, such severe macular serous detachment was discordant with no obvious macular leakage in fluorescein fundus angiography. Further inquiry into the patient's medical history uncovered a critical detail. He had been diagnosed with Waldenström macroglobulinemia for 3 months. He had completed 4 cycles of chemotherapy.

Results: Based on these findings, the patient was diagnosed with immunogammopathy maculopathy and non-proliferative diabetic retinopathy. Although an attending doctor proposed possible therapeutic options for the maculopathy, such as plasmapheresis or intravitreal anti-vascular endothelial growth factor (VEGF) injections, the patient refused any treatment and was lost to follow-up due to financial reasons.

Conclusions: Waldenström macroglobulinemia (WM) is a lymphoplasmacytic lymphoma characterized by the presence of monoclonal immunoglobulin M antibody. Patients with WM are at a higher risk of developing hyperviscosity retinopathy. Two main manifestations are serous macular detachment (also known as immunogammopathy maculopathy) and central retinal vein occlusion with typical fundus findings of optic disc oedema, intraretinal hemorrhage and oedema, and dilated and tortuous retinal veins. There are no recognized diagnostic criteria for Waldenström macroglobulinemia complicated retinopathy or immunogammopathy maculopathy. However, there's a unique feature in immunogammopathy maculopathy, which is described as a silent macula manifesting no fluorescein leakage in the macula. This crucial feature distinguishes immunogammopathy maculopathy from macular edema due to the breakdown of the blood-retinal barrier, as in diabetic macular edema, age-related macular degeneration, and uveitis. The mechanism of Waldenström macroglobulinemia complicated retinopathy remains unclear. Some studies suggested that disruption of retinal pigment epithelium pumping function caused by hyperglobulinemia creating an osmotic gradient and intraretinal oedema to infiltrate the subretinal space may play a main role in the development of serous macular detachment. To date, there has still been no recognized treatment for WM retinopathy. Patients with WM presenting with ocular symptoms often have a poor visual prognosis, and treatment remains challenging. Previous studies have proposed the use of intravitreal anti-VEGF agents to manage WM-associated macular serous detachment. In recent years, plasma exchange has been recognized as a first-line treatment for WM due to its ability to reduce IgM levels and alleviate intravascular hyperviscosity. Therefore, a combined approach of intravitreal anti-VEGF therapy and systemic

treatments (plasma exchange and chemotherapy) represents an effective strategy for managing WM-associated retinopathy.

Abstract No.: 200878

Single-Cell Transcriptomics Uncover Novel Biomarkers and Actionable Pathways for Pathological Angiogenesis in FEVR, Revealing Translational Opportunities

First Author: Huijuan XU

Purpose: Familial exudative vitreoretinopathy (FEVR) is a disorder of retinal blood vessel development characterized by impaired retinal angiogenesis. While FZD4 mutations are established genetic causes of FEVR, the molecular mechanisms underlying pathological neovascularization remain poorly understood.

Methods: CRISPR/Cas9 was used to generate the Fzd4M105V mouse model. Comprehensive vascular phenotyping entailed retinal wholemount imaging, analysis of hyaloid vessel regression, and immunohistochemical evaluation of the deep retinal vasculature. Flow cytometry sorting and single-cell RNA sequencing(scRNA-seq) were used to characterize the expression profiles of retinal endothelial cells (ECs) in mice.

Results: The FZD4M105V model recapitulated key FEVR features including retinal aneurysmal vessels in adult mice, developmental abnormalities in juveniles, impaired deep vascular formation, delayed hyaloid regression, vascular leakage, and reduced endothelial proliferation. ScRNA-seq revealed distinct transcriptional profiles in pathological EC clusters and tip cells. KEGG analysis revealed that the EC clusters were enriched in Focal adhesion, Rap1, PI3K-Akt, and Apelin signaling pathway, whereas Tip cells were enriched in the VEGF, Chemokine, NF-kappa B, and TNF signaling pathway. We further identified four novel candidate markers of pathological neovascularization : Ctss, Ccl4, Ccl3, and Apoe. Subsequent validation confirmed the upregulation of CTSS and CCL4 within neovascular lesions, supporting their function role in pathological angiogenesis.

Conclusions: We established a novel mouse model of pathological neovascularization with a missense mutation and elucidated the expression profiles of retinal ECs. The identified pathways and novel biomarkers—particularly CTSS and CCL4— provide new insights for further pathogenesis investigation of FEVR.

Abstract No.: 203926

Single-Cell and Spatial Transcriptomic Profiling Reveals Retinal Cell Type Dynamics in a Murine Model of RP1-Retinitis Pigmentosa

First Author: Fanfei LIU

Co-Author(s): Fang LU

Purpose: To investigate retinal cell type changes and underlying molecular mechanisms in RP1-retinitis pigmentosa using single-cell and spatial transcriptomic analyses in a murine model.

Methods: We performed single-cell RNA sequencing and spatial transcriptomics on retinas from RP1 gene knockout mice and C57BL/6 wild-type mice at postnatal day 21 and 1 year of age. Transcriptomic profiles of major retinal cell types were conducted to identify key gene expression changes and pathway alterations.

Results: RP1 gene knockout mice exhibited significant down regulation of genes associated with retinal development and visual signal transduction in rod, cone, and RPE cells at both postnatal day 21 and 1 year, with progressive worsening over time. Microglia and Müller cell subpopulations showed activation of inflammatory and apoptotic pathways, particularly prominent in 1-year-old RP1 gene knockout mice. Spatial transcriptomics confirmed region-specific alterations and cell type dynamics corresponding to disease progression.

Conclusions: Our study reveals that RP1-associated retinitis pigmentosa involves early and progressive dysfunction in photoreceptor and RPE cells, accompanied by marked activation of microglial and Müller glial cells. These findings highlight the pivotal role of immune and glial cell responses, particularly in late-stage disease, contributing to retinal degeneration in RP1-retinitis pigmentosa.

Abstract No.: 205876

Small Eye, Big Clues: Uncovering a Rare Case of Aicardi Syndrome in a Two-Month-Old Filipino Infant With Ocular and Neurologic Manifestations

First Author: Pauline Gabrielle LACSAMANA

Co-Author(s): Alvina Pauline SANTIAGO

Purpose: To report a rare neuro-ophthalmic case in a 2-month-old female infant presenting with early ocular signs leading to the diagnosis of Aicardi Syndrome.

Methods: A full clinical evaluation, ocular imaging, neuroimaging, electrophysiologic testing, and genetic workup were performed. The patient was born at term to a 33-year-old G1P0 mother after an otherwise unremarkable pregnancy, except for a third-trimester anomaly scan which showed multiple choroid plexus and subarachnoid cysts, absent corpus callosum, ventriculomegaly, and talipes equinovarus.

Results: At birth, the infant was noted to have difficulty opening the left eyelid. Ophthalmologic examination revealed a normal right eye (corneal diameter ~9 mm) and a smaller left eye with entropion, microcornea (4 mm), and microphthalmia. Fundus imaging (RetCam) showed peripheral chorioretinal lacunae and a large, irregular optic disc suggestive of coloboma. Visual evoked responses were absent in both eyes. Cranial ultrasound confirmed agenesis of the corpus callosum, ventriculomegaly, and cystic changes. Karyotyping showed a normal 46,XX pattern. At two months, the patient began experiencing 3–4 seizures per day, for which she was started on phenobarbital. Electroencephalogram revealed multifocal interictal epileptiform discharges.

Conclusions: This case demonstrates the early presentation of the classic triad of Aicardi Syndrome which are agenesis of the corpus callosum, chorioretinal lacunae, and infantile spasms. It highlights the critical role of ocular findings in prompting early diagnosis of this rare neurodevelopmental disorder. Despite a normal karyotype, the clinical triad and imaging findings support this unique and rarely-encountered diagnosis.

Abstract No.: 206891

Sorsby Fundus Dystrophy in an Asian Pedigree: Pathogenic TIMP3 p.Y191C Variant Impairs Metalloproteinase Homeostasis

First Author: Shenao DING

Purpose: SFD, an autosomal dominant retinopathy caused by variants in the TIMP3 gene, was investigated to elucidate the pathological impact of the TIMP3 p.Y191C variant and its underlying molecular mechanism.

Methods: A retrospective analysis of medical records from a family exhibiting clinical features consistent with SFD was conducted. Whole exome sequencing, bioinformatics analysis, Sanger sequencing, and co-segregation studies confirmed the presence of the disease-associated gene variant. ARPE-19 cell lines overexpressing the wild-type TIMP3 or subjected to RNA interference targeting TIMP3 were generated using lentiviral transfection.

Results: A heterozygous variant (TIMP3: NM_000362: Exon5: c.A572G/p.Y191C) was identified in seven family members. Fundus examinations revealed active or regressed bilateral choroidal neovascularization and disciform scarring. Bioinformatics analyses highlighted tyrosine 191 as an evolutionarily conserved residue across vertebrate TIMP homologs, with substitution by cysteine impairing TIMP3 function. Structural analysis demonstrated that the pathogenic variant residue at position 191 was smaller and more hydrophobic than its wild-type counterpart, and computational tools predicted reduced stability of the pathogenic variant TIMP3 protein. CO-IP confirmed TIMP3 interactions

with activated MMP2 and MMP9. The TIMP3 variant differentially impaired these interactions: binding to activated MMP9 was modestly reduced, while interaction with activated MMP2 was severely compromised. Functional assays indicated that the variant disrupted the MMP9 inhibitory activity and modified MMP2 intracellular localization.

Conclusions: This study identifies a rare pathogenic TIMP3 variant in an Asian family with SFD and demonstrates that the variant impairs TIMP3 function through altered MMP interactions and subcellular localization.

Abstract No.: 200603

Spontaneous Ocular Decompression Retinopathy: A Curious Case

First Author: Yi MON

Co-Author(s): Elizabeth LEONG, Thet NAING

Purpose: We describe a unique case of spontaneous ocular decompression retinopathy (ODR) presenting with corneal oedema, normal intra-ocular pressure (IOP), vitreous and retinal haemorrhages mimicking posterior uveitis.

Methods: A 53-year-old woman presented with a one-week history of redness, blurred vision, and mild discomfort in her left eye. Clinical assessment showed counting fingers visual acuity, conjunctival injection, corneal oedema, shallow anterior chamber, dilated pupil and IOP of 21mmHg. Fundus view was limited due to corneal oedema, but vitreous and retinal haemorrhages were visible. Gonioscopy showed narrow angles with inferotemporal peripheral anterior synechiae. Topical and systemic steroid therapy was commenced. Infective and autoimmune workup was unremarkable. Over subsequent days, corneal oedema and posterior segment haemorrhages resolved spontaneously, with no signs of vasculitis or chorioretinitis. Glaukomflecken, closed angles, and iris rupture on anterior segment optical coherence tomography confirmed a self-aborted angle closure attack with ODR. Steroid therapy was ceased. The patient underwent laser peripheral iridotomy followed by cataract surgery, with good visual recovery.

Results: ODR is not uncommon, but occurrence following spontaneous resolution of acute angle closure is rare. In this case, differentials based on initial presentation included posterior uveitis with vasculitis and atypical angle closure glaucoma, though the normal IOP and absence of pain made glaucoma less likely.

Conclusions: To our knowledge, this is the first reported case of ODR secondary to a spontaneously aborted angle closure attack mimicking posterior uveitis. Awareness of this presentation can guide accurate diagnosis and management, leading to favourable visual outcomes.

Abstract No.: 200646**Stargardt Disease in a Young Asian Female: A Case Report***First Author: Maria Christine DY**Co-Author(s): John Paul PANG*

Purpose: To report a clinically diagnosed case of Stargardt disease (STGD) in a young Asian female.

Methods: A 40-year old Filipino female came in for chronic progressive blurring of vision on both eyes with difficulty seeing at night. The medical, family, and social histories were unremarkable. At presentation, best corrected visual acuity (BCVA) was 20/60 and 20/70 on the right and left, respectively, with normal anterior segment findings. Fundus examination revealed symmetrical mottling of the macula with surrounding yellow retinal flecks at the level of the pigment epithelium. Macular optical coherence tomography (OCT) showed generalized thinning with localized disruption of the outer retinal bands while a characteristic dark choroid was evident on fluorescein angiography (FA).

Results: The patient was referred out for genetic counseling and electrophysiologic testing. She was then advised regular monitoring and to watch out for new onset ophthalmic complaints.

Conclusions: Stargardt disease is a common form of macular dystrophy with genotypic and phenotypic variation. OCT and FA among others are imaging tools to help confirm diagnosis and monitor disease progression. Symptoms usually appear with gradual photoreceptor loss. Because of the nature of STGD, patients should be prognosticated regarding visual outcomes. There is currently no known effective treatment so management is individualized while maximizing visual rehabilitation.

Abstract No.: 206992**Staring at the Sun: A Case of Bilateral Macular Telangiectasia With Unilateral Choroidal Neovascularization***First Author: Yi Huey LOW**Co-Author(s): Yi Lin CHUA, Hanizasurana HASHIM, Woan Shian SEE, Nazima SHADAHT ALI, Stella SINNAPPAN*

Purpose: To describe a rare presentation of bilateral Macular Telangiectasia (MacTel) complicated by unilateral choroidal neovascularization (CNV), emphasize the role of multimodal imaging, highlight early anti-VEGF treatment, and discuss the potential influence of chronic sun-gazing.

Methods: Case report.

Results: A 46-year-old woman presented with a 6-month history of progressive central scotoma in the left eye. She reported a lifelong habit of direct sun-gazing but had no other significant ocular or systemic

risk factors. Best-corrected visual acuity (VA) was 6/36 in both eyes. Anterior segment examination was unremarkable. Fundus examination revealed bilateral foveal pigmentary changes with a dull glistening reflex, and a parafoveal subretinal hemorrhage in the left eye. Optical coherence tomography (OCT) of the macula showed bilateral internal limiting membrane draping with focal ellipsoid zone disruption and the presence of a subretinal hyperreflective lesion in the left eye, consistent with a CNV complex. Intravitreal ranibizumab was administered to the left eye. At follow-up, the subretinal hemorrhage had resolved, and the CNV complex had regressed. Left VA improved to 6/24, and the patient reported symptomatic improvement.

Conclusions: This case underscores the importance of multimodal imaging in detecting CNV associated with MacTel and demonstrates the visual benefit of prompt anti-VEGF therapy. The unusual history of habitual sun-gazing raises intriguing questions about environmental or phototoxic influences on disease onset and progression.

Abstract No.: 201795**Starry Sky in A Girl's Eyes***First Author: Yee Jy CHAI*

Purpose: To report the management and outcome of a rare paediatric case of Vogt-Koyanagi-Harada Disease

Methods: Case Report

Results: A 7-year-old girl, previously without any medical illnesses, presented with blurred vision and eye redness of 1 week duration. Clinical examination revealed best corrected vision of 6/36 and features of panuveitis, including corneal keratoprecipitates, anterior chamber flare, optic disc swelling and multifocal choroiditis. OCT macula showed multiple intraretinal hyperreflective lesions without cystoid macular edema. Fundus fluorescein angiography showed hot disc with peripheral small vessels vasculitis and multifocal choroiditis. Systemic workup was unremarkable. The presence of poliosis and vitiligo led to the diagnosis of incomplete Vogt-Koyanagi-Harada Disease. She was started on high dose oral corticosteroids, and co-managed with paediatric rheumatology team. Vision was not improving and uveitis relapsed while on tapering dose of oral corticosteroids. She was then started on subcutaneous methotrexate injection and subsequently escalated to mycophenolate mofetil. Finally, the commencement of Adalimumab led to improvement of best corrected visual acuity, remission of ocular inflammation and tapering of oral corticosteroids.

Conclusions: VKH disease can be aggressive and potentially sight threatening in paediatric patients. Prompt diagnosis, close monitoring and rapid escalation of immunosuppression are imperative

in achieving prolonged remission and good visual outcome.

Abstract No.: 204309

Stem Cell-Derived Retinal Pigment Epithelium Transplants for Dry Age-Related Macular Degeneration: Balancing Benefits and Risks—a Systematic Review and Meta-Analysis

First Author: Jeffrey TSAI

Co-Author(s): Amna ANWAR

Purpose: Dry age-related macular degeneration (AMD) with geographic atrophy (GA) is a major cause of central vision loss. This systematic review and meta-analysis evaluate the efficacy and safety of stem cell-derived retinal pigment epithelium (RPE) transplantation as a regenerative treatment.

Methods: A comprehensive search of PubMed, Web of Science, Scopus, and ProQuest identified clinical trials published between 2015 and 2025. Eligible studies included patients with dry AMD/GA treated with stem cell-derived RPE transplantation. Outcomes extracted included best-corrected visual acuity (BCVA), anatomical integration, and adverse events. Pooled meta-analysis was performed to quantify functional improvements and safety outcomes across studies.

Results: Six clinical trials involving 45 patients were included. Meta-analysis showed a mean BCVA improvement of 11.8 ETDRS letters (95% CI: 11.4–12.3; $P < 0.001$), with 46.7% (95% CI: 32.1–61.8%; $P < 0.01$) achieving gains ≥ 5 letters. OCT and autofluorescence confirmed RPE engraftment. Adverse events occurred in 17.8% of patients, mainly transient inflammation or epiretinal membrane formation. No tumorigenesis, immune rejection, or severe ocular complications were reported during a mean follow-up of 24.8 months.

Conclusions: Stem cell-derived RPE transplantation demonstrates statistically significant visual improvement and a favourable short- to medium-term safety profile in advanced dry AMD. However, the limited sample size, study heterogeneity, and absence of randomized trials highlight the urgent need for larger, multicentre controlled studies with standardized protocols and long-term follow-up.

Abstract No.: 206072

Subthreshold Micro-pulse Yellow Laser Photocoagulation (577-nm) for Chronic Central Serous Chorioretinopathy

First Author: Bansari SORATHIYA

Co-Author(s): Anand RAJENDRAN

Purpose: To evaluate the short-term outcome of subthreshold micropulse yellow laser photocoagulation in treating chronic Central Serous Chorioretinopathy (CSCR).

Methods: A retrospective case series was conducted from May 2024 to July 2025 at Eye Hospital. 17 eyes of 15 patients with chronic or chronic recurrent CSCR were treated with subthreshold micropulse yellow laser (5% duty cycle, 50% reduced energy from micropulse test burn, 200 ms exposure time, 100 μ m spot size). Patients were followed for at least 4 months post-treatment.

Results: The mean age was 45.06 years. The average follow-up period post-treatment was 6 ± 4.88 months. Baseline best-corrected visual acuity (BCVA) was 0.35 ± 0.26 logMAR, improving to 0.18 ± 0.13 logMAR ($p = 0.0056$) at 2 months and 0.13 ± 0.14 logMAR ($p = 0.0026$) at final follow-up. Central macular thickness (CMT) reduced from 420.82 ± 216.57 μ m at baseline to 258.3 ± 69.75 μ m ($p = 0.0075$) at 2 months and 263.35 ± 92.47 μ m ($p = 0.015$) at final visit.

Conclusions: Subthreshold micropulse yellow laser therapy has shown promising short-term results in treating chronic CSCR without causing retinal damage. However, to better understand its effectiveness and safety, larger prospective, randomized, and comparative studies are needed.

Abstract No.: 206083

Successful Anti-VEGF Therapy in Myopic Choroidal Neovascularization: A Case Report

First Author: Nurita TRI WIJAYANTI

Co-Author(s): Ima YUSTIARINI

Purpose: To present a case of myopic choroidal neovascularization (mCNV) in a 41-year-old female patient, focusing on the clinical presentation, multimodal imaging findings, and treatment response following intravitreal aflibercept.

Methods: A case report of a 41-years-old female presenting with blurred vision and metamorphopsia on the left eye was conducted. Ophthalmic examination included best-corrected visual acuity (BCVA), slit-lamp biomicroscopy, and indirect ophthalmoscopy. Optical coherence tomography (OCT) was performed to evaluate structural abnormalities in the retinal layers associated with myopic choroidal neovascularization.

Results: Best-corrected visual acuity was 20/100. Fundus examination revealed peripapillary atrophy and lacquer cracks with a subfoveal grayish lesion suspicious for CNV. OCT showed subretinal hyperreflective material with subretinal fluids. The patient received intravitreal aflibercept according to a loading dose schedule. Over subsequent follow-up, OCT showed resolution of fluid and regression of the neovascular complex. Her BCVA improved to 20/20, with stable anatomical outcomes maintained throughout observation. No ocular or systemic adverse events were encountered during treatment.

Conclusions: mCNV is a serious complication of pathologic myopia and an important cause of vision

loss in middle-aged women but responds well to early anti-VEGF therapy. Early detection using multimodal imaging is essential to avoid irreversible central vision damage. Intravitreal aflibercept provided both functional and anatomical improvement in this case, underscoring its effectiveness as a first-line therapy for active mCNV.

Abstract No.: 205940

The Eye That Spoke for the Blood: Central Retinal Vein Occlusion in Acute Leukemia

First Author: Swati SAHU

Purpose: To present a rare case of central retinal vein occlusion (CRVO) with macular edema in a young patient with acute lymphocytic leukemia and to highlight the role of intravitreal ranibizumab in visual recovery.

Methods: A 19-year-old male with a history of acute lymphocytic leukaemia on chemotherapy for four months presented with sudden, painless blurring of vision in the left eye for eight days. On examination, best-corrected visual acuity was 6/6 in the right eye and 6/60 in the left eye. The left eye demonstrated a total color vision defect and grade 2 relative afferent pupillary defect. Fundus evaluation revealed disc edema, tortuous veins, and multiple flame-shaped hemorrhages with macular edema, while the right eye appeared normal. Optical coherence tomography (OCT) of the left eye showed subfoveal neurosensory detachment.

Results: A provisional diagnosis of CRVO with macular edema secondary to leukaemia was made. Although intravitreal anti-VEGF therapy was initially planned, the patient was lost to follow-up for two weeks, during which vision improved spontaneously to 6/12 with partial resolution of macular changes. Subsequently, he developed lower motor neuron facial palsy and was started on oral corticosteroids. Intravitreal ranibizumab was administered, resulting in rapid visual improvement to 6/6p within one week and complete resolution of macular edema on OCT. Despite favorable ocular outcomes, the patient later succumbed to systemic complications of leukemia.

Conclusions: CRVO may rarely complication occur in association with acute leukemia. Early recognition and timely intravitreal ranibizumab can restore functional vision, though systemic prognosis remains poor.

Abstract No.: 202543

The Role of Panretinal Laser Coagulation in Stabilizing the Course of Diabetic Retinopathy in Pregnant Women With Type 1 Diabetes

First Author: Natalia POMYTKINA

Co-Author(s): Evgenii SOROKIN

Purpose: To analyze the role of panretinal laser coagulation (PRLC) in stabilizing of diabetic retinopathy (DR) in pregnant women with type 1 diabetes.

Methods: Sixty-nine pregnant women with type 1 diabetes and DR were examined (average age 29.5 ± 4.5 years). The average HbA1c level was $7.1 \pm 1.3\%$. DR was detected in the pregestational period in 28% of patients and PRLC was performed. DR manifested itself during gestation in 72% of women. Proliferative DR was observed in 61% of patients, severe non-proliferative DR - in 23%, and non-proliferative DR - in 16%. Macular edema in both eyes was detected in 10 patients. Stable DR during gestation was observed in 29% of pregnant women, and progressive DR - in 71%. Examinations was conducted throughout pregnancy and after delivery.

Results: 75% of pregnant women in the subgroup of stable DR during gestation were patients who underwent PRLC before pregnancy. Pregnant women with progressive PDR and PPDR during gestation underwent PRLC, and in case of flat or focal macular edema – LCS in the macular area.

Conclusions: In 78% of patients with DR progression, PRLC during gestation allowed to stabilize the course of DR before delivery. In 11 of 49 patients (22%), despite PRLC, DR progressed after delivery, but their visual functions remained high in the late period. Laser treatment during gestation reduced the risk of severe complications of PDR.

Abstract No.: 204537

The White Patch That Wasn't Pathology: A Case of Myelinated Retinal Nerve Fiber Layer

First Author: Yunneke R. XAVERINA

Co-Author(s): Mercia CHRYSANTI

Purpose: The myelinated retinal nerve fiber layer (MRNFL) is a rare and mostly benign congenital anomaly in which the retinal nerve fibers anterior to the lamina cribosa have a myelin sheath. This case study aims to illustrate the accidental discovery of the MRNFL layer during routine examination.

Methods: A 19-year-old woman came to the clinic for a routine eye examination, without any specific complaints, wanting to know the condition of her eyes. The best corrected visual acuity of both eyes was 1.0 with normal intraocular pressure and anterior segment. During the fundus examination of her left eye, a white patchy lesion was found in the superior quadrant of the optic nerve. The lesion had feathery but well-defined

borders on the anterior surface of the retina. Optical Coherence Tomography (OCT) of the optic disc reveals a thickening of the retinal nerve fiber layer at the superior (347 μ m). The patient reported that she had never experienced any eye symptoms since childhood.

Results: Most cases of MRNFL are diagnosed incidentally in healthy individuals during routine fundoscopic examination. Although MRNFL is typically benign, it can be misinterpreted as one of several potentially serious conditions. The exact etiology and pathophysiology of MRNFL remain largely unknown. Although MRNFL lesions remain stable throughout life, progressive growth can occasionally lead to visual disturbance.

Conclusions: The MRNFL is a rare but benign retinal finding, but it still has the potential to progress and cause abnormalities. Therefore, regular follow-up is necessary to evaluate the disease's progression.

Abstract No.: 200562

The cGAS-STING Pathway-Dependent Sensing of NETs Exacerbates Pathological Retinal Angiogenesis

First Author: Dan **YAN**

Co-Author(s): Xuguang **SUN**

Purpose: To address the clinical challenge of inadequate response to anti-VEGF therapy in patients with ocular neovascular diseases, this study focuses on neutrophil extracellular traps (NETs) and cGAS-STING signaling axis. The aim is to elucidate their regulatory mechanisms in the formation of retinal neovascularization and to develop targeted therapeutic strategies accordingly.

Methods: An oxygen-induced retinopathy (OIR) model was established. Key pathways were screened through whole-transcriptome sequencing of the retina, and mechanisms were validated using a combination of Western blotting, qRT-PCR, and immunofluorescence staining of retina. Models induced by STING-/- and the STING agonist DMXAA were constructed. Single-cell transcriptome sequencing and bioinformatics analysis were utilized to dissect cell specificity.

Results: Transcriptome sequencing of the OIR model revealed that NETs-related signaling pathways are involved in the pathological process of ocular neovascularization. A significant accumulation of NETs-derived DNA was observed in the vitreous cavity of mice, leading to the activation of the cGAS-STING signaling pathway. Subsequent techniques, including immunofluorescence co-staining, single-cell sequencing analysis, and AAV-specific targeting of microglial gene expression, collectively identified microglia as the key cell type. Bioinformatics analysis, along with mRNA and protein level detections, further elucidated the detailed pathological process of upregulated mitogen-activated protein kinase (MAPK) signaling, cellular polarization,

and pro-inflammatory cytokine release following cGAS-STING activation in microglia.

Conclusions: This thesis innovatively elucidates the complex molecular mechanism by which NETs drive microglial inflammatory polarization through the cGAS-STING-MAPK axis, thereby accelerating the formation of ocular neovascularization.

Abstract No.: 201612

Treatment of Paediatric Coats' Disease With Combination Therapy of Intravitreal Aflibercept, Ozurdex, Cryotherapy and Laser

First Author: Teoh **HUEI YIN**

Co-Author(s): Crystal **CHEONG YIJING**, Manoharan **SHUNMUGAM**

Purpose: To evaluate the effectiveness of combined intravitreal Aflibercept, Ozurdex, cryotherapy and laser in Coats' disease in a 9-year-old paediatric.

Methods: A 9-year-old patient was referred for evaluation of Coats' disease in the right eye. Comprehensive imaging was performed, including optical coherence tomography (OCT), Optos ultra-widefield fundus photography, fluorescein angiography (FFA), B-scan ultrasonography, and examination under anesthesia (EUA).

Results: Imaging revealed fundus with telangiectatic vessels, extensive lipid exudation, capillary non-perfusion, and an exudative retinal detachment. The patient received intravitreal Aflibercept, followed by an Ozurdex implant, cryotherapy and laser applied to the affected areas. Post-treatment follow-up showed marked reduction in submacular exudation and subretinal fluid, with concurrent decrease in exudation activity, underscoring the role of combination therapy in addressing both vascular leakage and inflammation.

Conclusions: Early detection and multimodal imaging are crucial in pediatric Coats' disease. This case demonstrates that combination therapy not only reduces exudation but also plays a critical role in lowering subretinal fluid and inflammation, which are central to halting disease progression and preserving vision. Prompt referral and timely intervention may prevent long-term visual impairment in children with similar presentations.

Abstract No.: 205906

Tuberculosis or Not? Deciphering the Tuberculo-Sarcoid Spectrum

First Author: Rishika **RATHORE**

Co-Author(s): Atul **ARORA**, Vishali **GUPTA**

Purpose: To highlight the diagnostic challenges and long-term management of a complex case of granulomatous panuveitis with overlapping features of ocular tuberculosis and sarcoidosis.

Methods: A 21-year-old female presented with chronic left eye redness and pain. She had a history of mesenteric lymphadenopathy and was previously diagnosed with abdominal tuberculosis, for which she was initiated on anti-tubercular therapy (ATT) and corticosteroids. Ocular examination revealed anterior chamber inflammation with bilateral disc edema and small stromal granulomas detected on Indo Cyanin Green Angiography (ICGA) and Swept Source Optical Coherence Tomography (SS-OCT). Endoscopic Ultrasound (EUS)-guided FNAC of abdominal lymph nodes demonstrated granulomatous inflammation with necrosis, supporting a working diagnosis of ocular tuberculosis.

Results: Despite completing 9 months of ATT, clinical response was suboptimal. The patient was subsequently initiated on immunosuppressive therapy, leading to disease quiescence. Serial multimodal imaging (FFA, ICG, and OCT) confirmed sustained control. However, two years after tapering azathioprine, the patient experienced a recurrence of ocular inflammation along with parotid swelling. FNAC from the parotid gland revealed non-caseating epithelioid granulomas, favoring a diagnosis of sarcoidosis.

Conclusions: This case underscores the diagnostic complexity of distinguishing between ocular tuberculosis and sarcoidosis in endemic regions. It emphasizes the critical role of multimodal imaging, histopathological confirmation, and longitudinal follow-up in managing granulomatous panuveitis. The case raises pertinent questions: Are tuberculosis and sarcoidosis part of a continuous spectrum? Could tuberculosis serve as an immunological primer, leading to sarcoid-like manifestations elsewhere in the body?

Abstract No.: 201670

Twin Trouble After Toric: Bilateral SRH and Serous RD Managed With Anti-VEGF

First Author: Anugraha **BALAMURUGAN**

Co-Author(s): Shalini S K

Purpose: To report a rare case of bilateral subretinal hemorrhage (SRH) with serous retinal detachment and choroidal elevation post cataract surgery, managed successfully with intravitreal Razumab.

Methods: A 78-year-old male presented one week after toric IOL implantation with SRH, AV crossing changes, SRF and ILM folds in the right eye, and inferior SRH with serous RD, SRF and choroidal elevation in the left eye. Both eyes were treated with intravitreal Razumab.

Results: SRH and SRF in the right eye gradually resolved. Left eye SRH and serous RD resolved completely. Both eyes showed structural recovery within 2 months.

Conclusions: Bilateral SRH with serous RD and choroidal elevation post cataract surgery may respond

well to intravitreal anti-VEGF therapy. Timely diagnosis and intervention are critical for optimal outcomes.

Abstract No.: 201572

Two-Year Treatment Outcomes of Simultaneous Intravitreal Dexamethasone and Aflibercept on Diabetic Macular Edema

First Author: Tai-chi **LIN**

Co-Author(s): Sheng-chu **CHI**, Yu-chien **CHUNG**, Tsui-kang **HSU**, Hsin-wei **HUANG**, Yi-ming **HUANG**, Po-chen **TSENG**

Purpose: The aim of this study is to report 2-year follow-up data on patients with diabetic macular edema (DME) treated with simultaneous intravitreal dexamethasone (DEX) and aflibercept.

Methods: Multicenter, retrospective analysis of eyes with DME treated with simultaneous DEX implant and aflibercept injection. Main outcome measures were changes in best-corrected visual acuity (BCVA) and central retinal thickness (CRT) from baseline to 24 months. The secondary endpoint was the interval of retreatment.

Results: Two-year data were available for 52 of the 76 initially included eyes. Compared to baseline, significant improvements in mean BCVA and CRT were observed at 6, 12, 18, and 24 months. An average of 3.26 ± 1.70 intravitreal treatments was required, with a mean retreatment interval of 10.21 ± 6.35 months throughout the study period.

Conclusions: Simultaneous intravitreal DEX and aflibercept treatment resulted in sustained improvements in both visual and anatomical outcomes over a 24-month period. This combination therapy represents a valid treatment strategy and demonstrates synergistic efficacy in the management of DME.

Abstract No.: 206902

Unmasking Ocular Toxocariasis

First Author: Zhen Ning **LOW**

Co-Author(s): Yie Ping **CHIN**, Swee Ying **CHOO**, Lathalakshmi **THANGAVELU**

Purpose: To report a complex and diagnostically uncertain case of recurrent unilateral uveitis with persistent vitreous opacity.

Methods: Case report.

Results: A 25-year-old male presented with recurrent unilateral uveitis of the left eye. After an initial episode of anterior uveitis, he re-presented a year later with vision of 6/60 and dense inferotemporal vitreous condensation. He was initially treated for presumed ocular toxocariasis based on clinical features, with a transient response to oral Albendazole. Following a severe reactivation with vision reduced to counting fingers, a vitreous tap was culture-positive for *Bacillus cereus*, complicating the clinical picture. A diagnostic

vitrectomy was performed, intraoperatively revealing a yellowish subretinal lesion. While the bacterial growth was suspected to be a contaminant, the etiology of the primary disease—be it chronic toxocariasis, an atypical infection, or an inflammatory masquerade syndrome—remains unconfirmed. The patient was managed empirically with a combination of antimicrobial and anti-helminthic therapy. The vitritis slowly improved and vision recovered to 6/18, but a definitive diagnosis is awaited on the final histopathology report of the vitreous specimen.

Conclusions: This case highlights the profound diagnostic challenges in managing recurrent uveitis with persistent vitreous opacities. It underscores the critical, yet pending, role of histopathology in providing a final diagnosis and demonstrates the necessity for empiric, multi-pronged therapeutic approaches in the face of diagnostic uncertainty.

Abstract No.: 202509

Variations in the Clinical Characteristics of Geographic Atrophy Among Caucasians, Japanese Americans in Hawaii, and Japanese in Japan

First Author: Satoko **FUJIMOTO**

Co-Author(s): Ryo **KAWASAKI**, Gregg **KOKAME**, Kohji **NISHIDA**

Purpose: To evaluate differences in clinical characteristics of geographic atrophy (GA) among Caucasians (C-A), Japanese Americans in Hawaii (J-A), and Japanese in Japan (J-J).

Methods: Patients with GA were retrospectively recruited from institutions in Hawaii and Japan. GA areas were measured using 6×6 mm² near-infrared images. GA growth rates (GAGRs) were calculated for eyes followed >1 year. Multivariate analysis adjusted for age and sex.

Results: The study included 51 eyes of 36 C-A (58% men), 36 eyes of 26 J-A (35% men), and 38 eyes of 29 J-J (70% men). Bilateral GA was more common in C-A (72%) than in J-J (34%) but not different from J-A (50%). Mean GA area was larger in C-A (10.3 mm²) than in J-J (6.0 mm²), with J-A (8.8 mm²) not differing from either group. GA foci were more numerous in C-A (2.8) than in J-J (1.4) and J-A (1.9). Thirty-one eyes of 23 C-A, 25 eyes of 17 J-A, and 19 eyes of 15 J-J were followed. GAGRs was faster in C-A than J-J (2.2 vs 0.82 mm²/year, P<0.05; 0.35 vs 0.20 mm²/year, P=0.076) but not different from J-A (1.9 mm²/year, 0.34 mm²/year). No difference was observed between J-A and J-J.

Conclusions: GA characteristics differed between C-A and J-J but were comparable between J-A and others, suggesting contributions from ethnicity and environment.

Abstract No.: 201498

Varied Presentations of Semaglutide Induced Vision Loss

First Author: Shruti **MARU**

Purpose: Given the increasing use of semaglutide and the potential for serious ophthalmic complications, it is essential for ophthalmologists to be aware of these risks and to have a high index of suspicion for weight-loss therapies in these patients.

Methods: This case series aims to further explore the various presentations of semaglutide-related vision loss and to contribute to the growing body of evidence on this important topic.

Results: These cases underscore the importance of monitoring patients on GLP-1 receptor agonists for any signs of vision loss, especially those with vascular risk factors, and highlight the need for careful consideration of these medications in patients with a history of diabetes and other cardiovascular risk factors. The temporal association between semaglutide initiation and the onset of vision loss suggests a possible link between semaglutide use and ischemic neuropathy with vascular occlusion.

Conclusions: The temporal association between semaglutide initiation and the onset of macular edema, along with the spontaneous resolution after discontinuation, suggests that semaglutide may have exacerbated diabetic macular edema. This also highlights the need for caution when initiating GLP-1 analogs in patients with pre-existing diabetic retinopathy. Further research that includes ophthalmic risk factors or explores dose-dependent effects is necessary to determine a possible causal link between semaglutide and NAION.

Abstract No.: 203884

Very Late Onset Irvine-Gass Syndrome in Iris Claw IOL

First Author: Allbvi Enric **BASA**

Co-Author(s): Patrick **SANTIAGO**

Purpose: To report the second very late onset Irvine-Gass syndrome of 18-months post Iris-claw implantation, in a patient with Cystoid Macular Edema (CME) on Fluorescein Angiography (FA).

Methods: A Case report

Results: A 62 year-old pseudophakic non-diabetic male presented with central blurring of vision of the left eye despite best correction, presented with a visual acuity of 20/40 and 20/25 on pinhole. Iris-claw implantation done 18 months prior noted improvement of vision immediate post-operation. The iris-claw was well centered without iris damage. FA showed perifoveal leakage seen as hyper-fluorescence on late-phases with distinctive petaloid pattern. Ocular coherence tomography (OCT) of the macula showed hypo-

reflective cystic spaces in the outer retinal layers and thickening of the subfoveal area. With no clear cause for the petaloid hyper-fluorescence, intravitreal anti-vascular endothelial growth factor versus steroid implant injection was discussed. Consultation with the local retina society suggested a less invasive approach, hence trial with nepafenac thrice daily was started. After a month of treatment, vision improved to 20/25 and 20/20 (pinhole) with reduction of cystic spaces and subfoveal thickness on OCT. There was difficulty labeling the case as Irvin-Gass syndrome since most present within 3-6 months after cataract surgery and IOL implantation, not 18 months after. This is only the second case of very late onset in literature.

Conclusions: In pseudophakic patients with CME, late onset Irvine-Gass syndrome should be entertained even in extended post operative periods. High index of suspicion, and less invasive initial treatment with topical anti-inflammatory drops is prudent in these cases.

Abstract No.: 200860

Vision-Threatening Complications of Systemic Lupus Erythematosus in a 15-Year-Old Filipino Female: A Case Report

First Author: Francis Ezra **LAXAMANA**

Co-Author(s): Miriam **FERMIN**, Carlo **LADORES**

Purpose: To present a rare case of retrobulbar optic neuritis with simultaneous branch retinal artery occlusion (BRAO) in a pediatric patient with systemic lupus erythematosus (SLE), highlighting the importance of early recognition and prompt treatment of vision-threatening ocular complications.

Methods: A 15-year-old Filipino female with a known history of SLE under immunosuppressive therapy presented with sudden vision loss. Initial evaluation revealed no light perception in the right eye and 20/200 vision in the left eye. Optical coherence tomography, fluorescein angiography, and cranio-orbital MRI confirmed retrobulbar optic neuritis in the right eye and BRAO in the left eye. The patient was treated with high-dose intravenous methylprednisolone, followed by oral prednisone. Sectoral panretinal photocoagulation (PRP) was also performed on both eyes, targeting areas of capillary nonperfusion.

Results: Following three days of intravenous steroid therapy and continuation of immunosuppressants, the patient's vision in the right eye improved from no light perception to 20/80. The left eye remained stable at 20/200. Fundus changes were consistent with post-laser status and resolving ischemic damage. The patient is under regular ophthalmologic and rheumatologic follow-up with stable systemic parameters.

Conclusions: Retrobulbar optic neuritis and BRAO are rare but serious ocular manifestations of pediatric SLE. Prompt diagnosis and aggressive immunosuppressive

treatment can result in significant visual recovery. This case underscores the need for early detection and multidisciplinary management to preserve vision in lupus patients.

Abstract No.: 205304

Visual Outcomes of Central Retinal Artery Occlusion in Chiang Mai University Hospital: A 16-Year Retrospective Study

First Author: Teepaka **SANGTRAGUL**

Co-Author(s): Atitaya **APIVATTHAKAKUL**, Voraporn **CHAIKITMONGKOL**, Janejit **CHOOVUTHAYAKORN**, Paradee **KUNAVISARUT**, Onnisa **NANEGRUNGSUNK**, Direk **PATIKULSILA**, Pavinee **TANGKITCHOT**

Purpose: To evaluate the incidence, visual outcomes, and prognostic factors of central retinal artery occlusion (CRAO) in a tertiary center in Northern Thailand.

Methods: This retrospective observational study included 78 patients diagnosed with CRAO at Chiang Mai University Hospital between 2008 and 2024. Demographic, systemic, and ocular characteristics, treatment modalities, and follow-up visual acuity (VA) were analyzed. Patients were categorized into four groups: conservative standard therapy (CST), hyperbaric oxygen (HBO), intravenous recombinant tissue plasminogen activator (IVrTPA), and intra-arterial rTPA (IArTPA). Outcomes were assessed as mean best-corrected VA (logMAR), clinically meaningful visual improvement, and prognostic factors, including cilioretinal artery sparing.

Results: Mean age was 63.0 ± 14.9 years; 59.0% were male. Treatments included CST in 26, HBO in 44, IVrTPA in 1, and IArTPA in 7. Mean baseline VA was 2.43 ± 0.53 logMAR. At final follow-up, VA was 2.13 in CST, 2.18 in HBO, 1.84 in IArTPA, and 2.10 in IVrTPA. Clinically meaningful improvement occurred in 57.7% of CST, 43.2% of HBO, and 28.6% of IArTPA patients, with no significant differences between groups. Patients with cilioretinal artery sparing (9.0%) had significantly better final VA than those without (1.34 ± 0.93 vs 2.25 ± 0.70 logMAR, $p=0.011$). Only one patient (2.3%) developed neovascularization.

Conclusions: Most CRAO patients presented late, and treatment did not significantly change outcomes. Cilioretinal artery sparing was the strongest predictor of visual prognosis. Long-term Asian cohort data may aid in patient counseling and management.

Abstract No.: 206282

When Pregnancy Sparks Blindness: A Case of Recurrent Macular Toxoplasmosis

First Author: Sameera V V

Purpose: To report a rare case of recurrent macular toxoplasmosis triggered during pregnancy, leading

to irreversible central vision loss in a young woman, and to highlight the challenges of managing repeated macular relapses despite intravitreal and systemic therapy.

Methods: A 26-year-old woman developed her first episode of right-eye macular toxoplasmosis during pregnancy. She was treated promptly and monitored over subsequent three years. Despite timely intravitreal clindamycin injections during pregnancy and combined intravitreal + systemic medications for each relapse later, she experienced four recurrences, all affecting the macula. Clinical evaluation included hematological investigations, visual acuity assessment, fundus examination, and optical coherence tomography (OCT) and OCT- Angiography to document macular involvement and scarring.

Results: Each relapse responded transiently to intravitreal clindamycin and systemic therapy ; however, cumulative macular damage resulted in progressive vision decline. At the time of the latest follow-up, vision was reduced to counting fingers at 1 metre. Pregnancy-associated immune modulation may have contributed to the initial onset, while repeated relapses proved refractory to standard therapy.

Conclusions: Recurrent macular toxoplasmosis during or after pregnancy can lead to irreversible central vision loss. Timely intervention can control inflammation temporarily, but prevention of recurrence remains a critical unmet need. Vigilant monitoring and innovative strategies are essential to preserve vision in young patients.

Abstract No.: 206990

When Tumor Isn't Tumor: Posterior Nodular Scleritis as a Diagnostic Pitfall

First Author: Siti Zaitihani **HAMDAN**

Co-Author(s): Hanizasurana **HASHIM**, *Nazima Shadaht* **SHADAHT ALI**

Purpose: To illustrate a rare case of posterior nodular scleritis and challenges in making diagnoses and management

Methods: Case Report

Results: A 36-year-old healthy woman was referred from another center to rule out a choroidal tumor. She had a 3-week history of reduced vision, eye redness, and floaters in the right eye, without pain, trauma, or systemic symptoms. Examination showed visual acuity of 6/36, anterior chamber cells (2+), and a yellowish subretinal lesion at the temporal periphery measuring 6.5 × 12 mm, with shallow exudative retinal detachment. B-scan revealed a homogeneous hypoechoic lesion with a T-sign, and OCT demonstrated hyperechoic vitreous foci consistent with vitritis. Baseline blood tests were unremarkable. A presumptive diagnosis of choroidal granuloma secondary to ocular tuberculosis was made, and anti-tuberculosis therapy

was started, but TB Quantiferon later returned negative. After one week, the lesion enlarged with surface abscess formation, suggesting choroidal abscess secondary to endogenous endophthalmitis. Intravitreal antibiotics and intravenous therapy were ineffective, and vitreous culture was negative. Oral prednisolone (1 mg/kg) was initiated, leading to lesion regression within two weeks and recovery of vision to 6/9.

Conclusions: Posterior nodular scleritis is a «great masquerader», often mistaken for intraocular tumor and infection. Early recognition and steroid therapy is crucial in determining good visual outcome

Abstract No.: 206727

When the Eye Hints at Hematologic Collapse: A Case of Roth Spots and Subhyaloid Hemorrhage in Aplastic Anemia

First Author: Rahayu **OKTALIANI**

Co-Author(s): Grimaldi **IHSAN**, *Erwin* **ISKANDAR**, *Arief S* **KARTASASMITA**, *Rova* **VIRGANA**, *Made Indra* **WIDYANATHA**

Purpose: Aplastic anemia (AA) is a rare, life-threatening hematopoietic disorder that may present with ocular manifestations, including subhyaloid hemorrhage (SHH). When the macula is involved, SHH causes sudden, profound visual loss, and prolonged retinal contact with hemoglobin may result in photoreceptor toxicity and irreversible damage. Timely intervention is therefore critical.

Methods: Case report based on a detailed review of electronic health records and ophthalmic investigations.

Results: A 19-year-old boy with aplastic anemia presented with blurred vision in the left eye and bilateral subconjunctival hemorrhage. Visual acuity of 0.6 logMAR in the right eye and counting fingers in the left eye. Fundus examination revealed multiple Roth spots bilaterally and a large macular subhyaloid hemorrhage in the left eye. Nd:YAG laser hyaloidotomy achieved successful drainage, and with concurrent systemic transfusions support, visual acuity improved from counting fingers to 0.5 logMAR within one week.

Conclusions: This case illustrates how AA may manifest with Roth spots and macular SHH, posing a significant risk of vision loss. Nd:YAG laser hyaloidotomy provides a minimally invasive and effective approach for rapid visual rehabilitation, while systemic management remains indispensable to prevent recurrence. Multidisciplinary care is crucial to optimize both ocular and systemic outcomes.

Abstract No.: 203546**When the Worm Hides: Unmasking the Diagnostic and Therapeutic Challenges of Diffuse Unilateral Subacute Neuroretinitis***First Author: Nurnadia KAMARUDDIN**Co-Author(s): Hanizasurana HASHIM, Nazima SHADAHT ALI***Purpose:** To report three cases of diffuse unilateral subacute neuroretinitis (DUSN) in which diagnostic and therapeutic challenges were encountered.**Methods:** Case series.**Results:** All three patients were young and otherwise healthy individuals who presented with unilateral vision loss, without any history suggestive of nematode exposure. Two patients initially demonstrated severe posterior uveitis were empirically treated for infectious etiologies, while the third, who presented with vitritis and retinitis, received treatment for presumed ocular toxoplasmosis. In all cases, the diagnosis of DUSN was established later upon the evolution of neuroretinitis with a characteristic grey-white retinal lesion. All patients were successfully treated with a course of oral albendazole and focal laser photocoagulation directed at the nematode. Two patients achieved good final vision, whereas one had limited vision due to foveal atrophy.**Conclusions:** These cases highlight the diagnostic and therapeutic challenges of DUSN, where early presentations may mimic infectious uveitis. Recognition of evolving retinal features is essential for accurate diagnosis and timely treatment to preserve vision.

Retina (Surgical)

Abstract No.: 201048**125 Cases of Ocular Injury by Shotgun Pellet Managed at a Tertiary Eye Care Center***First Author: Shah Md Rajibul ISLAM**Co-Author(s): Mominul ISLAM, Omar JAFARULLAH, Lutfullahil KHABIR, Ehsanur REZA***Purpose:** Describe and evaluate the outcomes of ocular injuries by shotgun pellet.**Methods:** A prospective cross-sectional study, from July 2024 to February 2025 including 125 eyes of 122 individuals. They were followed up for six months. Necessary procedures were undertaken as indicated. Complete Ophthalmological examination was done.**Results:** The mean age was 22.5 ± 7.9 years (14–52 years). Majority 38 (30.4%) were in the age group of 19–23 years. Most common clinical features at presentation was vitreous hemorrhage in 117 (93.6%) followed by hyphema in 83 (66.4%). Majority 62 (49.6%) eyes had vitreous prolapse with or withoutuveal tissue in wound. 78 eyes (62.4%) presented with HM/PL vision. 02 (1.6%) presented with NPL. 102 (81.6%) presented with a visual acuity of worse than 6/60. Following six months, 83 (66.4%) had a visual acuity $< 6/60$. 42 (33.6%) had better than 6/60 and 10 (8%) had better than 6/18. 82 eyes (65.6%) were silicone oil filled. Corneal opacity developed in 53 (42.4%), macular scar in 74 (59.2%), PVR in 45 (26.2%) and glaucoma in 32 (25.6%) eyes. 52 (41.6%) remained aphakic. Entry wound was located between the limbus and 5 mm into the sclera in 52 (41.6%) eyes. Majority of the exit wound is located within the vascular arcade in the macular region (53.6%)**Conclusions:** Injuries with IOFB result in poor anatomical and functional outcome. Early vitreo-retinal intervention can result in anatomical success. The decision and timing of multiple procedures affect the outcome.**Abstract No.: 203848****A Case Report on Endogenous Endophthalmitis of a 5-Year-Old Patient in a Level III Hospital in Metro Manila, Philippines***First Author: Justine Mariz LIMQUECO**Co-Author(s): Paul APILADO, Francis Ezra LAXAMANA, Eric Nathaniel REYES, Jocelyn SY, Niccolo VALENCIA***Purpose:** This case report presents a 5 year old Filipino patient who initially manifested with white opacity on the right eye, was considered as congenital versus traumatic cataract, but eventually reassessed to have endogenous endophthalmitis.**Methods:** Early diagnosis and prompt surgical management are vital to address the patient's infected right eye manifestations. The patient underwent Pars Plana Vitrectomy with Lensectomy, Endolaser, Silicone Oil Insertion, and followed by Intravitreal Injection of Antibiotics (Ceftazidime, Vancomycin) to the right eye.**Results:** Infectious workup results revealed presence of Staphylococcus epidermidis in the vitreous aspirate from the affected eye and positive serum Toxocara IgG results. Patient was treated accordingly to target the two main etiological agents.**Conclusions:** Regular monitoring and follow up were advised in preparation for another surgery in the near future.**Abstract No.: 203236****A Case of Coats-Like Ocular Toxocariasi***First Author: Fang CHAI**Co-Author(s): Xiquan ZHAO***Purpose:** To report a case of coats-like ocular toxocariasi clinical feature and treatment.**Methods:** We present a case of ocular toxocariasi that occurred in a 22-year-old man misdiagnosed with coats disease. The patient underwent a full ophthalmic

examination, a complete blood count; blood chemistry tests for Toxocara immunoglobulin (Ig)G, Toxoplasma IgM, and Toxoplasma IgG; an assessment of total IgE levels; chest X-rays; measurements of angiotensin converting enzyme, antinuclear antibody, hepatitis B surface antigen antibody, and anti-hepatitis C virus antibody levels; and a questionnaire about eating habits and whether the patient had pets.

Results: The patients had a pets feeding history. The patient's left eye had a visual acuity of 0.3 and an intraocular pressure of 10 mmHg. Fundus examination showed a large amount of yellow-white submucosal exudation and exudative retinal detachment, epiretinal membrane traction macular edema, optic disc anterior membrane were all existed. Vitrectomy was performed. During the vitreous surgery, the vitreous body showed a thin gauze-like change, and the yellow-white granuloma was seen in the posterior pole. Through the intraoperative pressure, multiple granulation lesions were found in the peripheral retina. One week after vitrectomy, the retina was flat, the macular edema was reduced, and the visual acuity was increased to 0.5.

Conclusions: The history of pet feeding, gauze-like changes in the vitreous, and typical yellow-white granuloma are strong evidence for the diagnosis of ocular ascariasis. Detailed medical history inquiry, careful fundus examination, blood and intraocular fluid antibody monitoring, UBM examination can more accurately help our diagnosis, to avoid missed diagnosis and misdiagnosis.

Abstract No.: 203708

A Case of Spontaneous Detachment of Epiretinal Membrane

First Author: Bingqing CHEN

Purpose: During a routine follow-up examination of a young female patient with epiretinal membrane, we observed spontaneous detachment of the membrane, accompanied by improvements in her symptoms of vision decline and metamorphopsia.

Methods: The patient's condition was documented with optical coherence tomography and fundus photography.

Results: The fundus photography revealed a cord-like membranous structure attached at one end to the macular and floating at the other end within the vitreous cavity. The optical coherence tomography confirmed partial spontaneous detachment of the epiretinal membrane and a reduction in macular thickness compared to previous images.

Conclusions: Spontaneous detachment of the epiretinal membrane is a relatively rare occurrence. It may arise in some patients due to conditions such as posterior vitreous detachment, intraocular inflammation, or weak adhesion of the epiretinal membrane itself.

In younger patients with epiretinal membranes, spontaneous detachment is mostly associated with posterior vitreous detachment. In this case, we were fortunate to observe the process of spontaneous epiretinal membrane detachment, noting that partially detached membrane tissue was floating in the vitreous cavity.

Abstract No.: 201813

A Clinical Study of Selective Limiting Membrane Peeling During Pars Plana Vitrectomy in Patients With Proliferative Diabetic Retinopathy Complicated With Vitreous Hemorrhage

First Author: Gu YONGHAO

Purpose: To evaluate the outcomes of selective internal limiting membrane peeling (ILMP) in pars plana vitrectomy (PPV) for proliferative diabetic retinopathy (PDR) complicated with vitreous hemorrhage (VH).

Methods: A total of 105 patients diagnosed with VH caused by PDR were enrolled in the study. All participants exhibited hard exudation in the macular fovea at 500 μ m and/or vascular deformation in the macular area observed during PPV. They were randomly divided into two groups: The experimental group (55 patients) underwent PPV with ILMP, while the control group (50 patients) underwent PPV alone. All patients were followed up for 1 year.

Results: There was no significant difference in BCVA between the two groups within 1 year after surgery. But the CRT of the experimental group was significantly lower than that of the control group ($P < 0.05$). The number of HRF in the experimental group was significantly lower than that in the control group at each follow-up after surgery, and the integrity of ELM and EZ in the experimental group was higher at 6 months and 1 year after surgery. At 1 year after surgery, the incidence of DME and ERM in the experimental group was significantly lower than that in the control group.

Conclusions: For patients with PDR and VH, selective ILMP during PPV can effectively reduce postoperative CRT, reduce the number of postoperative HRF, reduce the incidence of DME and ERM, reduce anti-VEGF therapy, and promote the recovery of ELM and EZ without significant complications. However, selective ILMP does not show significant advantages in postoperative vision.

Abstract No.: 202458**A Double Trouble: An Uncommon Case of Retinal Detachment***First Author: Sudha RANABHAT**Co-Author(s): Kiran SHAKYA*

Purpose: Rhegmatogenous retinal detachment (RRD) is potentially a vision threatening disease and one of the major causes of legal blindness. Incidence of RRD ranges from 6.8 to 18.2 per 100,000 patients. Simultaneous bilateral RRD are rare with an annual incidence of 0.35/ 100,000 population

Methods: A sixteen-year male presented with sudden decreased vision in left eye (LE) for 5 days, was using -4 diopter glasses both eyes (BE) since 5 years. Unaided Logarithm of the Minimum Angle of Resolution (LOGMAR) visual acuity was 0.6 in right eye (RE) which was best correct to 0.0 and 1.0 in LE, not improving. Dilated posterior segment showed one clock hour retinal detachment (RD) in infero-temporal quadrant with horse shoe tear (HST) in RE and three quadrant RD with a hole in lattice at supero-temporal quadrant with PVR. Patient underwent RE scleral buckling with postoperative laser photocoagulation followed by LE scleral buckle. After two months, his RE best corrected LOGMAR vision was 0.2, in LE it was 1.0. Fundus examination in BE showed complete reattachment with dull foveal reflex in BE. Optical coherence tomography revealed minimal sub retinal fluid in RE and interdigitation and ellipsoid zone disorganization. His sibling, who was a myope had treatable peripheral retinal lesions in BE.

Results: Seven months post-surgery, the sub retinal fluid in RE is completely resolved and the best corrected LOGMAR visual acuity is 0.6 in RE and 0.8 in LE.

Conclusions: Myopic patients along with their siblings should have periodic dilated fundus examinations.

Abstract No.: 206962**Advancing Retinal Surgery Visualization: Initial Clinical Application of the Volk SOLR Lens in the Philippines***First Author: Vicente Lorenzo CABAUG**Co-Author(s): Kristine Joy CABAUG*

Purpose: To describe the initial clinical use of the Volk SOLR non-contact wide-angle viewing system in vitreoretinal surgery and highlight its optical design features and potential impact on intraoperative visualization.

Methods: A descriptive case series was initiated using the SOLR lens during vitreoretinal procedures. Key technical features—including an expanded condensing lens that delivers a shadow-free panoramic field, gravity-centered alignment through the Lens Positioning Unit (LPU), and microscope-specific twist-

lock mounting—were noted. Subjective surgeon observations regarding clarity, ergonomics, and integration into surgical workflow were recorded.

Results: Early intraoperative impressions demonstrated consistent wide-angle visualization, sharp optical clarity, and stable lens positioning across procedures. The lens mounting system allowed efficient setup with minimal adjustments. Observations were qualitative, reflecting preliminary use; quantitative surgical outcomes will be evaluated with further experience.

Conclusions: Initial clinical application of the Volk SOLR lens was feasible and well-tolerated in vitreoretinal surgery, providing enhanced visualization and ergonomic integration. While findings are preliminary, these observations support the potential of the SOLR system to augment surgical efficiency. Ongoing case accumulation will help establish its role in broader surgical practice.

Abstract No.: 200898**Bilateral Subconjunctival Hemorrhage in Ocular Rosacea: An Unusual Presentation***First Author: Ruchi SHRESTHA*

Purpose: To present an unusual case of bilateral subconjunctival hemorrhage in ocular rosacea

Methods: Case: A 45-year-old female presented with redness in both eyes while bathing and lifting heavy objects for 3 days. It was painless and associated with itching of both eyes. The redness was recurring on and off 3 episodes in 4 months and treated elsewhere previously. On examination there was sub conjunctival hemorrhage in the inferonasal part of right eye and temporal part of left eye. There was meibomian gland dysfunction in both upper eyelids with right upper lid chalazion. It was associated with maculopapular rash over the eyelids and face with prominence in cheek area for 3 months. Topical Ketorolac and ointment Tetracycline on eyelids was prescribed. Dermatology consultation was sent.

Results: The subconjunctival hemorrhage and chalazion resolved with decreased facial maculopapular rash on 2 weeks follow up. The patient was diagnosed with rosacea with ocular findings by the dermatologist. She was treated with retinol, lignocaine and prilocaine ointment and oral Montelukast. The patient has not developed recurrent subconjunctival hemorrhage on 3 months follow up but still has few cutaneous features under treatment.

Conclusions: Ocular rosacea is associated with 58% of cases with cutaneous lesions but the ocular component is often missed despite having mild to potentially vision threatening conditions. This case highlights that ocular rosacea should be considered in cases of recurrent subconjunctival hemorrhage.

Abstract No.: 201816

Binocular Metamorphopsia and Quality of Life Following Vitrectomy for Epiretinal Membrane

First Author: Yuka **ISHIKAWA**

Co-Author(s): Mayumi **KOBAYASHI**, Shohei **MORIKAWA**, Tetsuro **OSHIKA**, Yoshimi **SUGIURA**, Mizuki **TOMIOKA**

Purpose: To evaluate changes in binocular metamorphopsia and their association with vision-related quality of life (VR-QOL) before and after vitrectomy in patients with unilateral epiretinal membrane (ERM).

Methods: We analyzed 33 eyes of 33 patients (mean age, 70.3 ± 7.6 years) with unilateral ERM who underwent vitrectomy and completed a 6-month follow-up. VR-QOL was assessed using the Japanese version of the 25-Item National Eye Institute Visual Function Questionnaire (VFQ-25), which consists of 12 subscales and a composite score. Associations between VR-QOL and metamorphopsia (monocular and binocular), best-corrected visual acuity (BCVA), and ocular dominance were examined.

Results: The VFQ-25 composite score increased from 75.0 preoperatively to 79.7 postoperatively, without statistical significance ($P = 0.09$). Significant postoperative improvements were noted in "general vision" ($P = 0.015$) and "near activities" ($P = 0.007$). Preoperative composite scores were not significantly correlated with visual functions. In patients whose operated eye was the dominant eye (11 eyes, 33.3%), postoperative composite scores were significantly associated with postoperative binocular metamorphopsia ($P = 0.038$). Preoperative "mental health" was significantly correlated with preoperative binocular BCVA ($P = 0.009$), and postoperative "near activities" was significantly correlated with postoperative binocular metamorphopsia ($P = 0.023$).

Conclusions: In ERM patients, vitrectomy significantly improved VR-QOL in the subscales of general vision and near activities. When the operated eye was the dominant eye, postoperative VR-QOL was significantly associated with postoperative binocular metamorphopsia.

Abstract No.: 201639

Case Series of Pneumatic Cryoretinopexy for Rhegmatogenous Retinal Detachment (RRD) at Hospital Kuala Lumpur (HKL): A 2-Year Retrospective Review

First Author: Jason Allan Seng Soon **CHEAH**

Purpose: To report the indications, visual outcomes, and complications of pneumatic cryoretinopexy.

Methods: Case series.

Results: A total of 9 eyes from 9 patients, consisting of 6 females and 3 males with an age range of 49 to 70,

underwent pneumatic cryoretinopexy between 2023 and 2024 in HKL. Among the 9 patients, 4 patients (44.4%) had superior RRD, 3 patients (33.3%) had temporal RRD, 1 patient (11.1%) had inferior RRD, and 1 patient (11.1%) had nasal RRD. Of these, 5 patients (55.5%) had RRD with the macula off, and 4 patients (44.4%) had RRD with the macula on. Seven patients had a retinal tear, while 2 patients had more than 1 tear. One patient had tears spanning more than 1 clock hour. Among the 9 eyes, 3 eyes (33.3%) were pseudophakic. Seven out of 9 patients (77.8%) successfully achieved retinal reattachment within 1 month with improved visual acuity. Meanwhile, 2 patients (22.2%) failed to achieve retinal reattachment post-pneumatic cryoretinopexy, which required follow-up vitrectomy surgery. Seven patients (77.8%) achieved unaided visual acuity better than 6/24, while 2 patients (22.2%) achieved visual acuity of 6/120 post-pneumatic cryoretinopexy. There were no incidents of raised intraocular pressure (IOP) or cataract development within 1 month of the postoperative period.

Conclusions: Pneumatic cryoretinopexy is an effective surgical option for selected patients with uncomplicated RRD. However, it is crucial to emphasize strict positioning post-pneumatic cryoretinopexy to ensure treatment effectiveness and prevent retinal redetachment.

Abstract No.: 205547

Clinical Outcomes of Perfluorocarbon Liquid-Assisted Vitrectomy for Primary Macula-Off Rhegmatogenous Retinal Detachment in a Tertiary Ophthalmic Center in Northern Vietnam

First Author: Trung **NGUYENBA**

Co-Author(s): Xuan **LE THI KIM**, Anh **TUAN VU**

Purpose: The use of perfluorocarbon liquids (PFCLs) during vitrectomy has been advocated for stabilizing the retina and facilitating subretinal fluid drainage in macula-off rhegmatogenous retinal detachment (RRD). This study aimed to evaluate the anatomical and functional outcomes of PFCL-assisted pars plana vitrectomy in patients with primary macula-off RRD.

Methods: A retrospective review was performed on patients with primary macula-off RRD who underwent PFCL-assisted vitrectomy at a tertiary ophthalmic center in Northern Vietnam between August 2017 and August 2019. Clinical outcomes, including retinal reattachment rate, best-corrected visual acuity (BCVA), central visual field status, and postoperative complications, were assessed.

Results: Thirty-four eyes were included. At 3 months postoperatively, the retinal reattachment rate was 97.1% (33/34). Mean BCVA improved significantly from 2.13 ± 0.7 logMAR at baseline to 1.10 ± 0.6 logMAR ($p < 0.0001$). Central visual field testing demonstrated preservation in 76.5% of cases, while 23.5% exhibited

residual central scotomas. Postoperative complications were infrequent, comprising subretinal PFCL (n=1), anterior chamber PFCL (n=1), and epiretinal membrane formation (n=1). Early surgical intervention within 10 days of macular detachment correlated with improved anatomical and visual outcomes.

Conclusions: PFCL-assisted vitrectomy for macula-off RRD achieved high anatomical success and significant visual rehabilitation, while maintaining central visual field integrity. The technique offers a valuable alternative to posterior pole retinotomy in managing complex detachments.

Abstract No.: 201410

Comparative Evaluation of Residual Silicone Droplets Following Air-Fluid Exchange Versus Silicone Oil-Fluid Exchange During Silicone Oil Removal in Peshawar, Pakistan

First Author: Shafiq **TANVEER**

Purpose: To compare the efficacy of air-fluid exchange (AFX) versus silicone oil-fluid exchange (SO-FX) in minimizing residual silicone oil (SO) droplets, visual outcomes, and intraocular pressure (IOP) following SO removal.

Methods: This prospective quasi-experimental study included 55 eyes of 55 patients who underwent SO removal at a Teaching Hospital in Peshawar by an experienced Vitreoretinal (VR) surgeon, between September 2024 and February 2025. Patients were divided into AFX (n = 29) and SO-FX (n = 26) groups based on the surgical technique. Residual SO droplets were quantified using high-resolution B-scan ultrasonography and ImageJ software. Visual acuity and IOP were evaluated preoperatively and postoperatively. Statistical comparisons between groups were performed using t tests and chi-square tests, with $p < 0.05$ considered significant.

Results: The AFX group had significantly fewer residual SO droplets (75.41 ± 106.84 vs 241.85 ± 102.33 ; $p < 0.001$) and a lower silicone oil index (SOI) ($1.36\% \pm 1.24\%$ vs $3.82\% \pm 1.39\%$; $p < 0.001$). Visual improvement occurred in 82.8% of AFX eyes compared with 38.5% of SO-FX eyes ($p = 0.0007$). Elevated postoperative IOP (>21 mmHg) was observed in 84.6% of SO-FX eyes and 10.3% of AFX eyes. Higher SOI and droplet burden were significantly associated with raised IOP ($p < 0.001$).

Conclusions: Air-fluid exchange resulted in lower residual SO burden, greater visual improvement, and better IOP control compared with SO-FX, supporting its use as the preferred technique for SO removal.

Abstract No.: 201102

Complications Associated With Silicone Oil Tamponade Following Routine Pars Plana Vitrectomy for Rhegmatogenous Retinal Detachment

First Author: Shah Md Rajibul **ISLAM**

Co-Author(s): Mominul **ISLAM**, Omar **JAFARULLAH**, Lutfullahil **KHABIR**, Ehsanur **REZA**

Purpose: Outlining the complications related to silicone oil.

Methods: This multicenter cross-sectional observational study was done from September 2023 to December 2024. All the patients underwent pars plana vitrectomy + endolaser with silicone oil tamponade for rhegmatogenous retinal detachment. Follow-up was done up to six months. A complete ophthalmological examination was carried out pre- and postoperatively.

Results: Eighty-nine eyes of 89 subjects were analyzed. Mean age was 53 years (range 32 to 62 years). 60 (67.42%) eyes were phakic and the rest were pseudophakic (29 eyes, 32.58%). 07 patients developed keratopathy (7.87%), 09 patients developed retinal detachment (10.11%). SO migration to the anterior chamber occurred in 05 (5.62%). Emulsification of SO at six months occurred in 12 eyes (13.48%). Subconjunctival SO migration occurred in 08 eyes (8.98%). 25 patients (41.66%) developed lental opacity / cataract progression was noted. 23 (25.84%) patients developed ocular hypertension. IOP became normal following removal of silicone oil in 12 eyes (52.17%). 04 patients (4.49%) needed anti glaucoma medications for IOP control despite removal of silicone oil.

Conclusions: The complications associated with silicone oil in vitreoretinal surgery are typically transient and can be effectively managed through appropriate medical or surgical approaches, leading to favorable long-term outcomes for patients. The complications observed in our case series align with those documented in existing literature; however, extended follow-up is necessary to assess long-term complications accurately. The relatively low complication associated with silicone oil is outweighed by the advantages it provides.

Abstract No.: 202393

Densiron Xtra Heavy Silicon Oil in the Management of Complicated Retinal Detachments: Analysis on Anatomical and Functional Aspects and Complications

First Author: Sandeep **KUMAR**

Co-Author(s): Charu **GUPTA**, Daraius **SHROFF**

Purpose: To evaluate and discuss anatomical, functional, and post-operative complications of Densiron Xtra as an internal tamponade in patients with complicated retinal detachment.

Methods: A retrospective non-comparative observational study design of 19 eyes of 19 patients was carried out. Eyes with complicated RD and an inability to maintain position after surgery were included in the study. Densiron Xtra was used as an internal tamponade in all the subjects. Patients were evaluated for post-operative complications, intraocular pressure and BCVA at 1, 3 and 6 months. Patients were followed up for a period of one year post-Densiron Xtra removal

Results: The anatomic success rate was achieved in 89.4 % of cases with re-detachments encountered in 2 out of 19 patients. The mean BCVA at 3 and 6 months were Log 1.11 $\pm$ 0.3 and Log 0.94 $\pm$ 0.36 respectively. Mean IOP noted at the end of 1, 3 and 6 months was 16.46 $\pm$ 5.99 mm Hg, 16.14 $\pm$ 5.95 mm Hg and 16.24 $\pm$ 4.9 respectively, the final mean BCVA and IOP after 3 months of Densiron removal were noted to be Log 0.88 $\pm$ 0.34 and 16.24 $\pm$ 4.9 mm Hg. The most common complication noted in our study post Densiron Xtra injection was Epiretinal membrane 47.37%, followed by raised IOP in 26.32% of cases.

Conclusions: We suggest that Densiron xtra is a safe and effective temporary internal tamponade agent in cases of complicated inferior retinal detachment, as there were no major post-operative clinical complications after Densiron Xtra usage, and the risk of redetachment also decreased significantly.

Abstract No.: 205322

Early Intervention in Metallic Intraocular Foreign Body: Preventing Sight-Threatening Complications

First Author: Jia Hui **LEONG**

Co-Author(s): Jason Allan **CHEAH SENG SOON**, Swee Ying **CHOO**

Purpose: Intraocular foreign bodies (IOFBs) are common penetrating ocular injury that can occur in various intraocular levels. Visual outcomes ranges from mild impairment to profound loss. We report a case of metallic IOFB with preserved visual potential.

Methods: Case report

Results: A 38-year-old healthy male presented to Emergency Department complained of left eye foreign body sensation. He denied blurring of vision, floaters or flashes. A day prior, a metallic wire brush fragment entered his left eye during car cleaning without protective eyewear. Unaided visual acuity (VA) was 6/9 bilaterally with intraocular pressure of 12mmHg. Slit lamp examination revealed subconjunctival metallic foreign body 3.6mm from nasal limbus. Cornea and lens were clear, with no chemosis or phacodonesis. Fundus examination showed an IOFB approximately six-disc diameters nasal to optic disc, with the tip momentarily rubbing against the retinal surface during eye movement and localized commotio retinae. The

right eye was unremarkable. Pars plana vitrectomy with IOFB removal, endolaser and gas tamponade was performed under local anaesthesia. Intraoperatively, the entry site was identified at the ora serrata with multiple retinal tears and localized shallow detachment from IOFB contact. Intravitreal vancomycin and ceftazidime were administered prophylactically. He has uneventful recovery and excellent visual outcome, without developing endophthalmitis.

Conclusions: IOFB-related ocular trauma requires meticulous evaluation to localize foreign bodies and associated complications. Early surgical intervention is crucial in preventing sight-threatening sequelae and optimizing visual prognosis. Practice of protective eyewear is essential to minimize risk of intraocular trauma.

Abstract No.: 205334

Early Surgical Management of Complex Ocular Trauma With Intraocular Foreign Body, Traumatic Optic Neuropathy, Traumatic Cataract, and Carotid Cavernous Fistula: A Case Report

First Author: Ridha Agusta **FARHANI**

Co-Author(s): Arief **WILDAN**

Purpose: To report early surgical management of a complex ocular trauma case featuring intraocular foreign body (IOFB), traumatic optic neuropathy (TON), traumatic cataract, and carotid cavernous fistula (CCF) following a motor vehicle accident in a young adult.

Methods: Ophthalmic evaluation including visual acuity, intraocular pressure measurement, slit-lamp examination, pupillary reflex, fundus examination, ocular motility testing, and neuroimaging with computed tomography (CT), CT angiography, and digital subtraction angiography (DSA) was performed.

Results: An 18-year-old male presented with sudden bilateral vision loss. Visual acuity was hand movement in the right eye and no light perception in the left. The right eye showed an intraocular foreign body, traumatic cataract, diminished pupillary reflex, optic disc atrophy, and limited ocular motility. The left eye exhibited corkscrew conjunctival vessels, chemosis, relative afferent pupillary defect, and optic disc atrophy. CT confirmed an IOFB and orbital fractures in the right eye. CT angiography and DSA identified a high-flow left CCF. Surgical procedures included IOFB removal, pars plana vitrectomy, phacoemulsification, and lens implantation in the right eye, followed by endolaser and silicone oil tamponade. Embolization for CCF was scheduled.

Conclusions: Prompt diagnosis and multidisciplinary surgical management of IOFB, TON, traumatic cataract, and associated vascular injuries like CCF are crucial for improving visual prognosis in complex ocular trauma.

Abstract No.: 204786**Enhancing Retinal Laser Delivery in Training: A Clinical Fellow's Perspective on the Norlase Lynx Pattern Indirect Laser***First Author: Daniel Jose MENDOZA**Co-Author(s): Roberto Luis FRANCO, Carlo Antonino NASOL*

Purpose: To describe a clinical fellow's experience using the Norlase Lynx Laser during retinal interventions, and to highlight the advantages of its ergonomic and technical features from a trainee's perspective.

Methods: This descriptive report was conducted in a tertiary retina training center. The Norlase Lynx Laser was used in multiple scenarios, including intraoperative laser retinopexy during scleral buckling, pneumatic retinopexy, and retinopathy of prematurity (ROP) screening and treatment. Subjective feedback was collected on ergonomics, visualization, laser efficiency, and portability, with comparisons made to conventional wired LIO systems.

Results: The Norlase Lynx Laser significantly improved intraoperative ergonomics with its wireless, lightweight design allowing greater head mobility and improved access to the peripheral retina. Its pattern laser functionality enabled rapid and consistent application of laser retinopexy, proving especially advantageous in post-pneumatic retinopexy cases. More recently, the system was utilized in ROP screening and management, where the efficiency and speed of pattern laser delivery were particularly valuable given the limited cooperation of premature infants. Its portability and compact form factor further supported use in bedside settings and offer strong potential for deployment in far-flung areas, where access to conventional laser systems is often limited.

Conclusions: The Norlase Lynx Laser offers a game-changing experience in retinal laser delivery across both surgical and outpatient settings. Its cordless, compact design and pattern laser capability enhance maneuverability, reduce physical strain, and increase confidence in laser application. The device proves beneficial in training environments, where intuition and efficiency can significantly impact the learning curve and quality of patient care.

Abstract No.: 200331**Evaluation of Anxiety Using Hospital Anxiety Depression Scale in Patients With Advanced Diabetic Eye Disease***First Author: Daniel PHANG**Co-Author(s): Chee SHEW FEI*

Purpose: Advanced diabetic eye disease (ADED) is the debilitating sequelae of diabetic retinopathy (DR). It is a chronic disease and requires lifelong treatment. The mental health of patients with chronic disease was often affected. Recognising and addressing mental

health issues in patients with chronic diseases is crucial for optimising overall patient well-being.

Methods: A cross-sectional study was conducted involving ADED patients from Hospital Universiti Sains Malaysia (USM) and Hospital Sultanah Aminah from 1 May 2022 till December 2023. Diabetic patients with no DR were included as the control group. HADS was used to assess patients' anxiety.

Results: A total of 108 diabetic patients were included in this study. The percentage of ADED patients with anxiety based on the HADS score cut-off point of more than 8 was 64.8%. The mean HADS for anxiety (HADS-A) score was significantly higher in ADED (8.15, SD 4.42) than in no DR (4.15, SD 3.02) ($p < 0.001$). Foot amputation and severe to blindness visual impairment were the factors that significantly associated with anxiety. Another factor that was significantly associated with anxiety was living alone.

Conclusions: ADED is more susceptible to psychological stress due to visual impairment and chronic medical illness related to complications of DM. A holistic approach to the management of ADED patients should include a thorough evaluation of their mental health status and early referral for mental health care.

Abstract No.: 203019**Evolutionary Patterns and Research Hotspots in the Macular Hole Surgery***First Author: Haonan MA**Co-Author(s): Jie PENG, Peiquan ZHAO*

Purpose: Since 1991, a variety of surgical techniques and adjunctive procedures have been developed or applied to the treatment of macular holes (MHs), resulting in favorable anatomic and visual outcomes. However, there has been no study that systematically and comprehensively analyzes and summarizes these methods. This study explored research hotspots by reviewing publications in the field of MH surgery using bibliometric analysis.

Methods: Publications related to MH surgery before June 1, 2024, were downloaded from the Web of Science Core Collection database. Bibliometric analysis was employed to conduct performance analysis and hotspot investigation.

Results: The final retrieval of 3,726 relevant publications indicated a general increasing trend in the number of annual publications. The most influential authors were "HARITOGLOU C", "KAMPIK A", and "SMIDDY WE", while the leading countries were Japan, the USA, and China. University College London was the most productive institution. The journal RETINA led the way in the number of publications. Through co-occurrence, clustering analysis, and literature review, we identified three most popular topics: different surgical techniques, variants, adjunctive procedures,

and surgical decision-making of MH surgery; principles of surgical closure of MH; and dye-associated toxicity.

Conclusions: This study provided insights into the current status of research and future hotspots in the field of MH surgery from a global perspective. We systematically summarized and analyzed the evolution of surgical techniques and their intrinsic reasons over the last three decades, emphasizing the importance of conducting prospective or randomized studies in the future.

Abstract No.: 202602

Fixed-Interval Intravitreal Methotrexate in Silicone Oil with Reduced Frequency for Prevention of Proliferative Vitreoretinopathy

First Author: Xiaorong LI

Purpose: To evaluate the efficacy and safety of a novel fixed-interval intravitreal methotrexate (MTX) protocol for preventing recurrent retinal detachment (RD) in proliferative vitreoretinopathy (PVR) following primary repair surgery.

Methods: This retrospective study enrolled patients undergoing pars plana vitrectomy with silicone oil tamponade for non-traumatic RD complicated by PVR. 400 µg/0.1 mL MTX intravitreal was administered intraoperatively and at postoperative weeks 3, 6, and 9.

Results: The cohort comprised 13 patients undergoing vitrectomy for RD with PVR grade $\geq C1$. Single-operation anatomical success was achieved in 12(92.3%) of 13 eyes with one failure salvaged surgically. Best-corrected visual acuity improved significantly compared to baseline. Silicone oil removal proved feasible in 8 patients after a mean tamponade duration of 5.5 months. Central retinal thickness measurements revealed non-significant transient fluctuations during the 24-week. A mild epiretinal membrane was documented in one patient, without discernible impact on the retinal reattachment. Transient corneal epithelial edema manifested in an elderly patient. No additional complications detected.

Conclusions: The MTX regimen requiring fewer interventions manifested favorable anatomical efficacy and safety in patients with recurrent RD secondary to PVR.

Abstract No.: 205619

Formyl Peptide Receptor 1 Promotes Abnormal Neovascularization via Activating Microglia in Ischemic Retinopathy

First Author: Qiaoyan HUI

Purpose: Abnormal neovascularization is the major component of ischemic retinopathy. Inflammation is regarded as a critical promotor for neovascularization. Our previous study indicated Formyl peptide receptor 1 (FPR1) exacerbates retinal neovascularization by

aggravating inflammation. FPR1 has been proven to activate microglia which induces inflammation. Therefore, we set to explore whether the effect of FPR1 on neovascularization is dependent on the activation of microglia in ischemic retinopathy.

Methods: Impact of FPR1 on neovascularization was evaluated by quantifying retinal neovascular tufts in FPR1-deficient OIR mice, OIR mice treated with FPR1-neutralizing antibody/FPR1 agonist. Phenotype alteration of microglia was measured by retinal flat-mounting in FPR1+/+ and FPR1-/- OIR mice. Expression of inflammatory cytokines of microglia was assessed by real-time PCR after FPR1 neutralizing antibody/FPR1 agonist administration under hypoxia in vitro.

Results: Retinal pathologic neovascularization significantly decreased in FPR1 deficient and FPR1-antibody-treated OIR mice, and increased in FPR1 agonist-treated OIR mice. The number of retinal microglia decreased in FPR1-/- OIR mice. FPR1 neutralizing antibody downregulated pro-inflammatory factors in microglia after hypoxic stimuli. FPR1 agonist administration robustly increased expression of inflammatory cytokines of microglia following hypoxic stimuli.

Conclusions: In ischemic retinopathy, FPR1 aggravates abnormal neovascularization and enhances inflammation by modulating the activation of microglia.

Abstract No.: 203970

Four-Flanged Technique for Scleral Fixation of a Dislocated Four-Eyelet Intraocular Lens

First Author: Jaeyon WON

Purpose: To define and evaluate the short-term clinical outcomes of the four-flanged technique for scleral fixation of a dislocated four-eyelet intraocular lens (IOL).

Methods: Eleven eyes of 11 patients who underwent scleral fixation of dislocated four-eyelet intraocular lenses using a four-flanged technique were studied retrospectively. We measured the best-corrected visual acuity (BCVA), corneal endothelial cell density, intraocular pressure (IOP), spherical equivalent, astigmatism, IOL tilt and decentration, and postoperative complications.

Results: The BCVA was 0.25 ± 0.11 logarithm of the minimal angle of resolution (logMAR) before surgery and 0.14 ± 0.12 logMAR 6 months later ($p < 0.001$). The corneal endothelial cell count was $2,427 \pm 384$ and $2,367 \pm 298/\text{mm}^2$ before and after surgery, respectively ($p = 0.285$). The spherical equivalent was 6.02 ± 4.90 and 0.11 ± 0.36 before and after surgery, respectively. There was no significant difference in astigmatism before and after surgery. The mean IOL tilt and decentration were $2.44 \pm 1.68^\circ$ and 0.23 ± 0.09 mm, respectively. The refractive difference was 0.11 ± 0.24 diopters (D). Postoperative complications occurred

in one eye; one flange lay outside the scleral tunnel, triggering hyperemia and conjunctival inflammation.

Conclusions: The four-flanged scleral fixation technique for a dislocated four-eyelet IOL improved the BCVA but did not significantly affect corneal endothelial cell loss. The procedure significantly reduced postoperative IOL tilt, decentration, and astigmatism, and may be a useful alternative to scleral fixation of a dislocated four-eyelet IOL.

Abstract No.: 205438

From Gut to Globe: A Case Report of Traumatic Enterococcus faecalis Endophthalmitis With Intraocular Foreign Body

First Author: Mark Nathaniel **ARNALDO**

Co-Author(s): Roberto Luis **FRANCO**, Daniel Jose **MENDOZA**, Carlo Antonino **NASOL**

Purpose: Post-traumatic endophthalmitis is one of the consequences of ocular trauma that could lead to poor visual prognosis, and a retained intraocular foreign body (IOFB) can escalate its development. Enterococcus faecalis, a pathogen more commonly implicated in nosocomial infections, is rarely implicated in cases of ocular trauma, but is associated with worse visual outcomes. This paper aims to report a case of a 40-year-old male with findings of Enterococcus faecalis endophthalmitis following an IOFB injury and to discuss its epidemiology, pathogenicity, and management.

Methods: Clinical data were obtained through retrospective review of patient's medical records.

Results: A healthy 40 year old male patient consulted due to a 6-day history of right eye trauma from a metallic debris causing eye pain and blurring of vision initially treated with oral antibiotics and pain medications as prescribed by a general physician. On ophthalmologic examination and diagnostic evaluation with B-scan ultrasonography, an assessment of traumatic endophthalmitis probably secondary to metallic foreign body of the right eye, rule out retinal detachment was made. Pars plana vitrectomy with lensectomy, IOFB explantation, repair of retinal detachment and intravitreal injection of antibiotics was immediately performed with vitreous aspirate yielding heavy growth of Enterococcus faecalis. Post-operatively, he had a visual acuity of hand movement with notable development of ciliary shutdown and anterior segment neovascularization on succeeding follow-ups.

Conclusions: This case report highlights the need for an early combined medical and surgical management and microbial identification in cases of traumatic endophthalmitis to avoid irreversible visual impairment.

Abstract No.: 205629

From Remission to Aggression: High-Grade Transformation of Secondary Vitreoretinal Lymphoma Following Systemic Remission

First Author: Siddhartha **KAR**

Co-Author(s): Manmath **DAS**, Jogmaya **PATNAIK**, Reshma **SM**

Purpose: To report an uncommon case of low-grade to high-grade transformation in secondary vitreoretinal lymphoma (VRL), a rare and potentially fatal intraocular malignancy, following remission of the primary tumour with prior chemotherapy.

Methods: A 68-year-old male presented with bilateral visual loss of 7 days' duration. He had a history of stage 4 gastric follicular Non-Hodgkin lymphoma, which had transformed to diffuse large B-cell lymphoma and was treated with five cycles of Bendamustine-Rituximab, achieving remission. On presentation, BCVA was 6/12, N6 (OU). Examination revealed senile cataracts; funduscopy showed vitreous seeds, creamy white retinal infiltrates in both eyes, and sclerosed vessels (OS). Secondary VRL was suspected. Vitreous biopsy confirmed 30.55% mature clonal B-cells, CD20 positive. PET-CT revealed no systemic disease, so systemic chemotherapy was withheld. The patient was started on intravitreal Rituximab (1 mg/0.1 ml) twice every week. After 6 doses, retinal infiltrates regressed; however, after 10 doses, new peripapillary involvement appeared. CSF flow cytometry revealed abnormal clonal B cells, indicating CNS spread and transformation of VRL to a high-grade, chemotherapy-resistant form.

Results: The patient was diagnosed with secondary VRL with CNS involvement and planned for second-line chemotherapy with high-dose Methotrexate. Post-treatment vitreous fluid flow cytometry and PET-CT are scheduled.

Conclusions: 1. Till date intravitreal treatment regimens and the role of adjuvant systemic chemotherapy in secondary VRL remain undefined. 2. Our case demonstrated isolated intraocular spread from gastric B-cell lymphoma without systemic relapse. 3. Transformation of VRL into high-grade B-cell lymphoma can occur despite aggressive intraocular chemotherapy.

Abstract No.: 201444

Full Thickness Macular Hole With Retinal Detachment Secondary to Bartonella Hensalae Neuroretinitis

First Author: Yu Qian **HEONG**

Co-Author(s): Sheena Mary **ALEXANDER**, Jin Yi **YAP**

Purpose: To report a rare case of full thickness macular hole with retinal detachment secondary to Bartonella Hensalae neuroretinitis.

Methods: Case report

Results: A 32-year-old woman presented with blurring of vision in the right eye for 4 days. She had daily contact with cats. Visual acuity was counting fingers in the right eye and 6/6 in the left. A relative afferent pupillary defect was noted in the right eye. Fundus examination revealed a diffusely hyperemic optic disc with blurred margins in the right eye, macular and retina was attached during the examination. Left eye examination were normal. Serology testing showed elevated Bartonella Henselae IgG titers (1:64), supporting the diagnosis of cat scratch disease. A 6-week course of oral antibiotics was initiated. Three weeks later, fundus examination of the right eye revealed a large macular hole of more than 1500um with retinal detachment and foveal cyst. Optical coherence tomography confirmed a full-thickness macular hole with subretinal fluid. The patient underwent scleral buckle, trans-pars plana vitrectomy, internal limiting membrane peeling with flap, and oil tamponade in the right eye. Intraoperatively, a thick epiretinal membrane with full-thickness retinal folds, proliferative vitreoretinopathy membrane and a macular hole were observed, along with retinal detachment involving the macula and a foveal cyst.

Conclusions: Bartonella henselae neuroretinitis may rarely cause severe complications such as macular hole and retinal detachment. This case highlights the importance of awareness and close follow-up to prevent vision loss.

Abstract No.: 208371

How Common Is Pre-existing Posterior Vitreous Detachment in Vitreoretinal Surgeries?

First Author: Joy SEE LEUNG

Purpose: Posterior vitreous detachment (PVD) induction is an essential, yet risky procedure in any vitreoretinal surgery. Pre-operative assessment of completeness of PVD allows the surgeon to plan for the surgery and explain risks to patients appropriately.

Methods: This was a retrospective study of cases done by a single surgeon from July 2023 to July 2024. Only cases of primary vitrectomy were included. Pre-operative assessment of the presence of PVD was made by the surgeon using clinical exam (indirect ophthalmoscopy and slit-lamp biomicroscopy). It was compared with the intraoperative findings of PVD. Potential factors associated with its presence were explored.

Results: A total of 106 cases were included. 75 cases were operated for floaters, 23 for epiretinal membrane, 3 for vitreous haemorrhage, 2 for retinal detachment, 1 for macular hole and 1 for asteroid. PVD was observed preoperatively in 88 (83.8%) of the cases, and intraoperatively, it was found in 92 (87.6%) of them. The sensitivity of clinical diagnosis of the presence of PVD was 91.3%. Only 4 (4.5%) cases that

were labelled 'PVD-present' pre-operatively, eventually needed PVD induction during surgery ($p < 0.01$). There was no significant difference in need for PVD induction in phakic and pseudophakic patients ($p=0.12$), and across ages ($p=0.57$).

Conclusions: In summary, PVD was present in majority of the cases which reduced the need for risky PVD induction. Pre-operative clinical assessment to detect presence of PVD was a reliable method to detect the need for PVD-induction.

Abstract No.: 203392

In Eye With Coexisting Anterior Chamber Intraocular Lens and Posterior Chamber Intraocular Lens With Retinal Detachment, Both Lenses Must Go?

First Author: Pei Fang NEOH

Purpose: To illustrate a creative method to explant posteriorly dislocated posterior chamber intraocular lens (IOL) in an eye with coexisting anterior chamber IOL during retinal detachment (RD) repair surgery, leaving anterior chamber IOL in situ.

Methods: Case report.

Results: A 64-year-old man was referred from a private ophthalmologist for right eye (RE) rhegmatogenous RD with a posteriorly dislocated single-piece posterior chamber IOL. His RE visual acuity was hand movement (HM) with the presence of relative afferent pupillary defect (RAPD). Further examination of RE revealed an anterior chamber IOL in situ with iridodialysis 2 clock hours superiorly. Fundus examination showed total rhegmatogenous RD (proliferative vitreoretinopathy grade B) with multiple retinal breaks. He underwent emergency pars plana vitrectomy for the explantation of a dislocated IOL with retinal detachment repair. Heavy liquid was used to stabilise the detached retina and to protect the macula. Posterior chamber IOL anteriorized with micro-forceps to the plane between the anterior chamber IOL and the iris through the temporal corneal incision, leaving the anterior chamber IOL in situ. The cornea wound was sutured with Nylon 10/0, followed by RD repair, silicone oil (SO) tamponade, and peripheral iridectomy. Immediate postoperative VA was 6/60, and the retina was flat. 6 months later, removal of SO was performed, and he achieved VA 6/18 with no complications.

Conclusions: It is possible to explant a posteriorly dislocated IOL without explantation of the anterior chamber IOL, despite the need for anteriorization of the dislocated IOL to remove it through a corneal incision during complex RD surgery.

Abstract No.: 201859
Intraoperative Suprachoroidal Hemorrhage During Scleral-Fixated IOL (SFIOL) Implantation Using the Yamane Technique: A Case Report and Its Surgical Management

First Author: Clarissa LISTER

Co-Author(s): Stefenie, Cindy Prajna METTA, Sindy Boru SEMBIRING, Givenchy Angela WINARJO

Purpose: To highlight the necessity and technique of surgical drainage in managing severe suprachoroidal hemorrhage (SCH) and to illustrate how secondary complications can ultimately affect visual outcomes, even after the hemorrhage is resolved.

Methods: Case report of a 69-year-old male who developed a severe intraoperative SCH during pars plana vitrectomy combined with SFIOL implantation.

Results: A 69-year-old male with a history of eventful cataract surgery presented with a dropped nucleus in the right eye (OD). His initial visual acuity (VA) was hand movements. He underwent pars plana vitrectomy combined with sutureless scleral-fixated intraocular lens (SFIOL) implantation using the Yamane technique. While the IOL was successfully fixated, intraoperative SCH developed during final haptic manipulation. Initial management was conservative. However, two weeks postoperatively, the patient reported severe ocular pain. Despite controlled intraocular pressure (IOP) with medical therapy, the pain persisted. B-scan ultrasonography revealed kissing choroidal detachments, suggestive of appositional hemorrhagic choroidal detachment. Surgical drainage of the SCH was performed. One month after drainage, the SCH had completely resolved, and the IOL remained well centered. However, submacular fibrosis was noted, limiting the VA to 1/60.

Conclusions: Intraoperative SCH is a rare but severe complication of complex intraocular surgeries, including sutureless SFIOL implantation. Vessel trauma during haptic manipulation may be a contributing factor. Although initial conservative management is appropriate, persistent pain and ultrasound evidence of kissing choroidal detachments should prompt surgical intervention. Surgical intervention can successfully resolve the hemorrhage; however, the final visual outcome may be limited by secondary retinal complications.

Abstract No.: 205253
Long-Term Outcomes and Predictive Factors of Visual Recovery After Small-Gauge Vitrectomy for Infectious Endophthalmitis: A Decade of East Asian Data

First Author: Wen-jung LO

Co-Author(s): Chia-jen CHANG, Hung-ju CHEN, Yuan-shao CHENG, Shih-chao FENG, Chung-hao HSIAO

Purpose: To evaluate long-term visual outcomes and prognostic factors of pars plana vitrectomy (PPV) using small-gauge systems in exogenous endophthalmitis, based on a decade of real-world data from East Asia.

Methods: This single-center, retrospective cohort study analyzed 45 eyes undergoing pars plana vitrectomy for exogenous endophthalmitis at Taichung Veterans General Hospital from June 2014 to September 2024. Demographics, clinical features, microbiology, surgical data, and outcomes were reviewed. Multivariate logistic and linear regression identified prognostic factors, with visual outcomes depicted by Sankey diagrams and significant predictors illustrated by forest plots.

Results: The median final visual acuity (VA) improved significantly from logMAR 2.30 to 1.78 ($p = 0.004$). Visual improvement was achieved in 51.1% of cases, and 24.4% reached VA $\geq 20/40$. Multivariate analysis identified poor initial VA (OR 3.42, $p < 0.001$), culture positivity (OR 2.96, $p = 0.031$), and intraoperative retinal detachment (OR 4.18, $p = 0.008$) as predictors of worse outcomes, while 27-gauge PPV (OR 0.42, $p = 0.046$) and post-cataract etiology (OR 0.39, $p = 0.007$) were favorable factors. Sankey diagrams highlighted that more than half of patients progressed toward functional improvement, whereas forest plots confirmed independent prognostic factors.

Conclusions: Small-gauge PPV offers significant visual improvement for exogenous endophthalmitis, particularly in cases with favorable baseline vision and post-cataract etiology. Use of 27-gauge vitrectomy is associated with better outcomes. Prognostic factors such as poor initial vision, virulent infection, and retinal detachment should inform surgical decision-making and patient counseling.

Abstract No.: 201431
Macular Buckling Combined With Pars Plana Vitrectomy for Retinal Detachment Secondary to Myopic Macular Hole: Without Postoperative Facedown Positioning

First Author: Shida CHEN

Co-Author(s): Lin LU

Purpose: To evaluate the efficacy of macular buckling combined with pars plana vitrectomy (PPV) and air tamponade for treating retinal detachment secondary to myopic macular hole, without requiring postoperative facedown positioning.

Methods: Twenty eyes of 20 highly myopic patients with retinal detachment secondary to myopic macular hole were prospectively enrolled. All patients underwent macular buckling combined with PPV and air tamponade. No facedown positioning was required postoperatively. Best-corrected visual acuity (BCVA), axial length (AL), macular hole (MH) closure rate, and retinal reattachment rate were assessed.

Results: At 1 month postoperatively, retinal reattachment was achieved in 100% of eyes (20/20), and MH closure was achieved in 95% of eyes (19/20). Mean BCVA improved significantly from 1.53 ± 0.34 LogMAR preoperatively to 0.85 ± 0.16 LogMAR postoperatively. Mean AL decreased by 2.3 ± 0.3 mm.

Conclusions: Combined macular buckling, PPV, and air tamponade is an effective treatment for retinal detachment secondary to myopic macular hole, achieving high anatomical success rates without the need for postoperative facedown positioning.

Abstract No.: 207175

Massive Intraoperative Suprachoroidal Hemorrhage in Scleral Fixated Intraocular Lens (SFIOL) Surgery: A Surgical Catastrophe

First Author: Nur Rafidah **MOHAMED ALI**

Co-Author(s): Lim **YI WEN**

Purpose: To report a case of massive intraoperative suprachoroidal hemorrhage (SCH) during scleral-fixated intraocular lens (SFIOL) which was successfully treated with drainage sclerostomy and pars plana vitrectomy (PPV).

Methods: A 64-year-old gentleman with hypertension and diabetes mellitus underwent PPV and intraocular lens (IOL) explantation under local anaesthesia for a dislocated IOL. The procedure was initially uneventful until attempted SFIOL implantation, when the globe became tense, the lens repeatedly prolapsed, and persistent iris prolapse was observed. A sudden loss of red reflex suggested SCH. The procedure was abandoned, the corneal wound was sutured, and intravenous mannitol 20% was administered. Postoperative B-scan confirmed massive SCH involving all four quadrants with breakthrough vitreous hemorrhage (VH).

Results: Postoperatively, vision was reduced to perception of light. The patient was started on topical steroids, antibiotics, antiglaucoma medications, and cycloplegics. Two weeks later, he underwent drainage sclerostomy, PPV with silicone oil tamponade. Intraoperatively, massive SCH with VH and a flat retina were observed. At two weeks postoperatively, vision improved to counting fingers, intraocular pressure back to normal with minimal residual SCH at the superotemporal quadrant and a flat retina.

Conclusions: Suprachoroidal hemorrhage remains a rare but devastating intraoperative complication.

While general risk factors like advanced age and systemic hypertension are present, this case highlights that the complexity of SFIOL placement significantly increases the risk due to the necessity of intricate manipulation and resulting IOP fluctuations. Prompt recognition, rapid closure of surgical wounds, and intraoperative supportive measures are crucial to manage uncontrolled IOP, and achieve functional visual outcomes in high-risk eyes.

Abstract No.: 204702

Multimodal Imaging and Follow-Up of an 8-Month-Old Infant and a 4-Year-Old Child Diagnosed With Cavernous Hemangioma of the Retina

First Author: Jing **MA**

Co-Author(s): Hai **LU**

Purpose: To report 2 cases of cavernous hemangioma of the retina (CHR), with multimodal imaging of an 8-month-old infant and a 4-year-old child, including a live video of fluorescein angiography (FA) and their natural course.

Methods: Fundus examination and FA under general anesthesia, color Doppler imaging (CDI) were performed.

Results: In the 8-month-old boy, the fundus examination revealed a classic grape-like cluster of thin-walled saccular aneurysms in the nasal quadrant, without any preretinal fibrotic membranes on the surface of the tumor. FA showed a prominent delay of perfusion of the adjacent artery (but with a normal caliber), classic hypofluorescence within the main tumor mass in the early phase, and an unusual complete perfusion of the lesion in the late phase, possibly due to the supine position during the procedure. The CDI showed an irregular surface lesion with acoustic solidity, dotted blood flow signals, and no choroidal excavation. The 4-year-old showed similar manifestations to the first patient, but with a preretinal fibrotic membrane on the surface of the tumor, which showed progression during follow-up. Five years later, the girl suffered from a vitreous hemorrhage.

Conclusions: A progression of preretinal fibrotic membrane on the surface of the CHR can occur in younger patients, and may result in the occurrence of vitreous hemorrhage.

Abstract No.: 210178

Observation on the Efficacy of α -Lipoic Acid Capsules Combined With Conbercept Intravitreal Injection in the Treatment of Diabetic Macular Edema

First Author: Aolin **HAN**

Co-Author(s): Shuting **LI**

Purpose: To investigate the safety and efficacy of α -lipoic acid capsules combined with conbercept intravitreal injection in the treatment of diabetic macular edema.

Methods: A total of 123 patients with 123 eyes diagnosed with diabetic macular edema who visited our hospital from January 2023 to December 2023 were included in this study. Patients were divided into three groups based on treatment regimens: a placebo control group (n=37), a conbercept intravitreal injection group (IVC) (n=42), and a conbercept intravitreal injection combined with α -lipoic acid capsule treatment group (n=44). All patients in each group were followed up for 12 months, and changes in biological indicators such as best-corrected visual acuity (BCVA), central foveal thickness (CFT), microaneurysm (MA) count, superoxide dismutase (SOD) content in aqueous humor, ganglion cell layer (GCL) thickness, hard exudate (HE) area, and hemorrhage area were compared before and after treatment.

Results: In the IVC group and the combination therapy group, BCVA, CFT, and MA counts showed significant improvements at 6 and 12 months post-treatment compared to pre-treatment levels ($P < 0.05$). while the control group showed no significant changes before and after treatment ($P > 0.05$). The levels of superoxide dismutase (SOD) in the combined treatment group significantly increased at 6 and 12 months post-treatment compared to pre-treatment levels ($P < 0.05$), while the IVC group and the placebo control group showed no significant changes compared to pre-treatment levels ($P > 0.05$); the thickness of the ganglion cell layer in all three groups showed no significant improvement at 6 months and 12 months post-treatment compared to pre-treatment levels ($P > 0.05$); the area of hard exudates in all three groups improved at 6 months and 12 months post-treatment compared to pre-treatment levels, with statistically significant differences observed in the IVC group and combined therapy group compared to pre-treatment levels ($P < 0.05$); the hemorrhage area in all three groups improved at 6 and 12 months post-treatment compared to pre-treatment levels, with statistically significant differences observed ($P < 0.05$).

Conclusions: In addition to significantly improving visual acuity, reducing foveal thickness, decreasing the number of microaneurysms, and reducing hemorrhagic and hard exudative areas, the addition of α -lipoic acid capsules to conbercept therapy in patients with DME enhances overall efficacy and increases SOD levels

in the aqueous humor, making it worthy of clinical application.

Abstract No.: 206541

Occult Globe Rupture in a Filipino Male: Diagnostic Limitations of CT Imaging

First Author: Nadine Leigh **CHU**

Co-Author(s): Jubaida **MANGONATO**

Purpose: To report a case of posterior globe rupture following blunt trauma, initially undetected on CT, highlighting the limitations of imaging and the importance of maintaining a high index of suspicion when evaluating ocular trauma.

Methods: This case report describes the patient's clinical course, from examination and multimodal imaging with B-scan ultrasonography and CT, to intraoperative findings.

Results: A 48-year-old Filipino male sustained blunt trauma to the left brow from the broken end of a sickle knife. Initially asymptomatic aside from superficial injuries, he developed gradual blurring of vision in the left eye one day post-trauma. Ocular examination revealed a left brow laceration, minimal lid swelling, chemosis, and subconjunctival hemorrhage without conjunctival violation. Visual acuity was decreased in the left eye, with relative hypotony compared to the fellow eye, a deep anterior chamber, and hyphema. Initial CT imaging showed vitreous hemorrhage in the left eye but reported an intact globe. Due to progressive symptoms, further evaluation with B-scan ultrasonography revealed vitreous and suprachoroidal hemorrhage, retinal detachment, and a suspicious area of scleral discontinuity. The patient underwent surgical exploration, which revealed a 10 mm curvilinear, shelved scleral laceration located superonasally, confirming a posterior globe rupture.

Conclusions: Posterior globe rupture can evade detection on CT imaging, especially when sealed by adjacent tissues. In trauma cases with incongruent imaging and clinical findings, a high index of suspicion must be maintained. Early recognition, supported by multimodal imaging and timely surgical management, is crucial to preserving vision and optimizing outcomes in patients with occult globe injuries.

Abstract No.: 205525

Outcomes of Chandelier-Assisted Segmental Scleral Buckling Compared to Conventional Scleral Buckling for Primary Rhegmatogenous Retinal Detachment: A Comparative Retrospective Study

First Author: Shivani **CHHABRA**

Co-Author(s): Ashish **MARKAN**

Purpose: To compare the anatomical and functional outcomes, surgical duration, and complication rates

between chandelier-assisted segmental scleral buckling (SB) and conventional SB in the treatment of primary rhegmatogenous retinal detachment (RRD).

Methods: This retrospective comparative study included 19 phakic patients with primary RRD who underwent either conventional SB (Group 1, n=9) or chandelier-assisted segmental SB (Group 2, n=10). Patients were selected based on specific inclusion criteria including presence of anterior retinal breaks and PVR $\leq$ Grade C1. Group 1 underwent standard 360-degree SB with indirect ophthalmoscopy, while Group 2 underwent segmental SB with limited peritomy and chandelier-assisted wide-angle visualization under a surgical microscope. Primary outcomes included best-corrected visual acuity (BCVA) and anatomical reattachment at 1-year follow-up. Secondary outcomes included surgical duration and epiretinal membrane (ERM) formation.

Results: Both groups demonstrated successful retinal reattachment in all cases and significant improvement in BCVA at one year, with no statistically significant intergroup difference. Mean surgical duration was significantly shorter in the chandelier-assisted group (35.11 ± 21.22 minutes) compared to the conventional group (70.23 ± 23.22 minutes, $p < 0.05$). ERM formation was not significantly different between the groups, and no major intraoperative complications were noted.

Conclusions: Chandelier-assisted segmental SB is a safe and effective technique for managing selected cases of primary RRD. It offers comparable anatomical and visual outcomes to conventional SB, with the added advantages of reduced surgical time and improved intraoperative visualization.

Abstract No.: 207369

Pars Plana Lensectomy (PPL) and Sutured Scleral Fixated Intraocular Lens Implantation in Bilateral Microspherophakia: A Case Series of 3 Related Individuals

First Author: Abhimanyu **SHARMA**
Co-Author(s): Awaneesh **UPADHYAY**

Purpose: To report the clinical presentation, surgical management, and outcomes of bilateral microspherophakia in 3 first-degree cousins (6 eyes) managed with pars plana lensectomy and sutured scleral-fixated intraocular lenses (SFIOLs).

Methods: This retrospective case series included 3 related individuals presenting with bilateral high myopia and decreased vision secondary to isolated microspherophakia. Comprehensive ocular examination, including gonioscopy, A-scan biometry, and anterior segment OCT, was performed to evaluate anterior chamber depth, lens thickness, zonular integrity, and angle configuration. Systemic evaluation ruled out syndromic associations. All eyes underwent 25-gauge pars plana lensectomy with

anterior vitrectomy, followed by scleral fixation of an IOL using 9-0 polypropylene sutures. Postoperative outcomes included best-corrected visual acuity (BCVA), intraocular pressure (IOP), IOL centration, and complication rates over 12-month follow-up.

Results: Preoperative biometric data revealed significantly increased lens thickness and reduced equatorial diameter. All 3 patients had bilateral lenticular myopia with shallow anterior chamber depth. Postop refraction was P1: OD -0.75 @ 1500; OS -1.00D @200 P2: +1.00D @ 300; OS +1.75D @700, and P3: +1.50 @ 100; OS +3.5D @1300; all 6 eyes had well-centered IOL, deep, stable anterior chamber. No intraoperative complication occurred. Postop, no IOL dislocation, secondary glaucoma, or retinal detachment was observed. The familial clustering points toward a likely autosomal recessive inheritance pattern, although genetic confirmation was not obtained.

Conclusions: PPL combined with sutured SFIOL implantation offers a safe and effective solution with favorable anatomical and functional outcomes. This series underscores the importance of early detection, thorough biometric assessment, and tailored surgical intervention in managing hereditary lenticular anomalies.

Abstract No.: 204188

Pars Plana Vitrectomy Versus Scleral Buckle for Primary Rhegmatogenous Retinal Detachment: An Umbrella Review

First Author: Jeffrey **TSAI**
Co-Author(s): Amna **ANWAR**

Purpose: To synthesize and critically appraise evidence from systematic reviews and meta-analyses comparing pars plana vitrectomy (PPV) and scleral buckle (SB) for primary rhegmatogenous retinal detachment (RRD), with emphasis on anatomical outcomes, visual function, and complication profiles.

Methods: A comprehensive search of PubMed, Scopus, Web of Science, and ProQuest (2000–2024) identified systematic reviews and meta-analyses comparing PPV and SB in primary RRD. Reviews of combined procedures, complex RRD, or non-human studies were excluded. Eight eligible reviews encompassing >25,000 eyes were included. Outcomes were extracted on retinal reattachment, best-corrected visual acuity (BCVA), adverse events, and patient-reported measures.

Results: Both procedures achieved high anatomic success (>90%) with no significant difference in primary reattachment rates. Lens status was a key determinant: SB offered superior BCVA in phakic eyes by reducing postoperative cataract development, while PPV showed higher final reattachment success in pseudophakic and aphakic eyes. Complication profiles varied—SB was associated with greater risks of choroidal detachment,

hypotony, and diplopia, whereas PPV carried increased risks of cataract progression and iatrogenic retinal breaks. Quality-of-life analyses indicated better short-term recovery with SB, while PPV was advantageous in complex or pseudophakic cases.

Conclusions: Both PPV and SB remain validated options for primary RRD. Optimal surgical choice should be individualized, guided by lens status, patient age, and detachment complexity. This umbrella review highlights that personalized decision-making—rather than a universal approach—is essential to maximize anatomical and functional outcomes in RRD repair.

Abstract No.: 200140

Pars Plana Vitrectomy for Terson Syndrome Following Head Trauma

First Author: Umesh **BHAMMARKAR**

Purpose: The objective is to present the clinical progression and surgical results in a 24-year-old male with Terson syndrome following traumatic brain injury, characterized by dense vitreous and subhyaloid hemorrhage. This report emphasizes the importance of early vitrectomy and demonstrates the potential for visual recovery, even when complicated by traumatic optic neuropathy.

Methods: A 24-year-old male reported unilateral visual impairment following head trauma and subsequent left-sided craniotomy. The patient remained comatose for several days post-surgery. Upon regaining consciousness, visual acuity in the left eye was limited to hand movements, and B-scan revealed dense vitreous and subhyaloid hemorrhage. Pars plana vitrectomy was undertaken. Intraoperatively, optic disc pallor was observed, indicative of partial traumatic optic neuropathy.

Results: One week after vitrectomy, vision improved from hand movements to 2/60. At two months, the best-corrected visual acuity reached 6/36p. Despite restricted recovery due to optic nerve involvement, notable functional improvement occurred. The patient experienced subjective visual gain and better quality of life. The contralateral eye maintained normal anatomical and functional status during the entire follow-up period.

Conclusions: Terson syndrome following head trauma presents significant challenges in both diagnosis and management. Even with late presentation and associated optic nerve damage, pars plana vitrectomy may provide substantial visual recovery. Prompt identification, timely surgical treatment, and appropriate counseling regarding prognosis remain essential for optimal outcomes, particularly in young individuals with ocular hemorrhage secondary to trauma.

Abstract No.: 207421

Pneumatic Retinopexy – Revisit

First Author: Hong Nien **LEE**

Purpose: To highlight an effective and less traumatic method of pneumatic retinopexy.

Methods: Retrospective observational case study.

Results: A step-wise pneumatic retinopexy was carried out. Eleven patients who presented to our tertiary center, either directly or referred from district hospitals, have been treated with pneumatic retinopexy. All patients had a tear located within the superior 8 clock hours. Two of which had total retinal detachments. The patients had an intravitreal pure SF6 injection, followed by a steam-rolling maneuver. Laser retinopexy was performed in the subsequent day. 81.8% were successfully treated. Two patients were unsuccessful: one remained detached, and another had re-detachment a week later. Both underwent pars plana vitrectomy. All patients were satisfied and did not report any fear towards the procedure. The pain was tolerable.

Conclusions: The step-wise pneumatic retinopexy appeared acceptable by patients. The success rate in the first procedure reported at 81.8%. All patients appeared tolerable towards the procedure and none reported extreme pain.

Abstract No.: 206578

Post-traumatic Endophthalmitis Endophthalmitis After Firecracker Injury in a Six-Year-Old Boy

First Author: Sundaram **NATARAJAN**

Co-Author(s): Pac Cristina **PATRICIA**

Purpose: This report focuses on a 6 old child with left-eye post-traumatic endophthalmitis after a firecracker injury.

Methods: The patient presented 6 days after the firecracker injury. During the initial examination, corneal edema with an irregular anterior chamber and thick exudates covering the pupil were noted. Ultrasonography showed multiple mobile moderately reflective dots, membrane echoes in the vitreous cavity, and preretinal hemorrhage. The intervention consisted of urgent corneal tear repair, anterior chamber (AC) wash, lensectomy, and 23-G pars plana vitrectomy; the patient received intravitreal vancomycin and ceftazidime, followed by silicone-oil tamponade. Culture grew *Enterobacter cloacae* sensitive to piperacillin, gentamicin, and amikacin. After the surgery, treatment consisted of: intracameral piperacillin and dexamethasone, associated with IV antibiotics and topical treatment (fortified Vancomycin and Ceftazidime together with Atropine at first, followed by fortified Gentamicin and Ciprofloxacin).

Inflammation settled gradually with guarded visual prognosis; aphakia was present.

Results: Following surgical and medical intervention, intraocular inflammation gradually subsided. Microbiological culture identified *Enterobacter cloacae*, guiding targeted antibiotic therapy. The structural integrity of the globe was preserved, and no further signs of active infection were noted during follow-up. However, due to the severity of the initial trauma and the inflammatory response, visual recovery was limited. The patient remained aphakic with a guarded visual prognosis.

Conclusions: This case underscores the importance of urgent and intensive surgical and medical treatment in pediatric traumatic cases, firstly, to obtain ocular globe integrity and better control over the pronounced inflammatory phenomena associated with children and young people.

Abstract No.: 201157

Preserve the Plug: Operculum-Guided Macular Hole Surgery for Consistent Anatomical and Functional Success

First Author: Awaneesh **UPADHYAY**

Co-Author(s): Zakia **ANWER**, Deependra **SINGH**, Abhishek **UPADHYAYA**

Purpose: To evaluate the efficacy of operculum-guided posterior vitreous detachment (PVD) and operculum preservation as a biological scaffold in full-thickness macular hole (FTMH) surgery across different internal limiting membrane (ILM) peeling techniques.

Methods: Seven eyes of seven patients with FTMH and visible operculum underwent 25-gauge pars plana vitrectomy. Intraoperative planning involved mapping operculum location (nasal or temporal), and initiating PVD from the opposite edge to avoid traction on the operculum. Partial PVD was performed while deliberately sparing the operculum. Five eyes underwent conventional ILM peeling, and two eyes received an inverted-flap technique. Key variables analyzed included pre- and postoperative best-corrected visual acuity (BCVA), macular hole dimensions, operculum site/size, ellipsoid zone (EZ) and external limiting membrane (ELM) integrity, and central foveal thickness. Follow-up was performed at 1, 3, and 6 months.

Results: All seven eyes achieved type 1 anatomical closure. Mean BCVA improved from 0.85 logMAR (approx. 20/140) to 0.45 logMAR (approx. 20/50) at 3 months ($\Delta = 0.40$ logMAR). The mean minimum hole diameter was $302 \pm 48 \mu\text{m}$ (range: 250–380 μm), and base diameter averaged $950 \pm 110 \mu\text{m}$. Operculum location was temporal in 4 cases and nasal in 3; operculum diameter ranged from 180 to 300 μm . Visual outcomes and closure patterns were independent of operculum location or ILM technique. Restoration of

EZ and ELM correlated significantly with functional improvement.

Conclusions: Operculum-guided PVD with operculum preservation offers a reproducible and biologically sound scaffold for macular hole closure, enhancing structural integrity and functional outcomes.

Abstract No.: 201919

Presumed Sterile Cluster Endophthalmitis Following Intravitreal Triamcinolone Acetonide: A Rare Case Series

First Author: Bhumika **RATH**

Co-Author(s): Pratistha **RATH**, Nandakumar

Purpose: To describe the clinical presentation, diagnosis, and management of presumed sterile endophthalmitis following combined intravitreal triamcinolone acetonide and anti-vascular endothelial growth factor (VEGF) therapy in patients with chronic diabetic macular edema.

Methods: In a single operative theater setting, eight patients received intravitreal anti-VEGF injections and three patients received a combination of anti-VEGF (ranibizumab) with triamcinolone acetonide (Kenacort). All injections were performed under sterile precautions. Clinical presentation, microbiological findings, treatment, and outcomes were recorded.

Results: All three patients who received combined therapy developed sudden-onset symptoms of endophthalmitis within 24 hours post-injection, presenting with severe pain, redness, and marked vision loss. Initial visual acuity ranged from hand motion to perception of light. Clinical findings included lid and periorbital edema, severe conjunctival congestion, corneal edema with Descemet membrane folds, anterior chamber cells and flare, sluggish pupils, and dense vitreous inflammation. Vitreous tap and core vitrectomy with intravitreal vancomycin, ceftazidime, and dexamethasone were performed in two patients. Cultures from the vitreous, triamcinolone vial, and ranibizumab vial were negative for organisms. Final visual acuity improved to 6/9–6/12 in treated patients; one patient was lost to follow-up.

Conclusions: Presumed sterile endophthalmitis may occur after combined intravitreal triamcinolone and anti-VEGF injections. Early diagnosis, prompt vitrectomy, and intravitreal antibiotics with steroids are critical for favorable outcomes. The visual prognosis is generally good and depends largely on timely intervention and the status of the underlying retinal disease.

Abstract No.: 203197**Prognostic Factors for Visual Outcomes Following Macular Pucker Surgery: A Single-Center, Single-Surgeon Experience***First Author: Chenghao SUNG**Co-Author(s): Shu-chun KUO*

Purpose: To identify preoperative and postoperative factors associated with significant visual improvement following macular pucker surgery.

Methods: This retrospective single-center, single-surgeon study analyzed patients who underwent macular surgery between 2023 and 2024. Significant visual improvement was strictly defined as a gain of three or more lines on the Snellen chart. Collected variables included age, sex, systemic comorbidities, lens status, best-corrected visual acuity (BCVA), central macular thickness, OCT angiography (OCTA) vessel density, and serial microperimetry. Statistical analyses included paired t-tests, correlation analysis, chi-square tests, ROC analysis, and binary logistic regression.

Results: Fifty-six patients were included (mean age 66.2 ± 7.8 years). Significant improvements were observed in postoperative BCVA (mean logMAR change: -0.185, $p < 0.001$), macular thickness (-112 μm , $p < 0.001$), and microperimetry scores (mean gain: +3.86 dB, $p < 0.001$). Patients with prior cataract extraction were more likely to show significant visual gains ($p = 0.002$). Preoperative superficial vessel density was a strong predictor of postoperative improvement, with ROC analysis showing an AUC of 0.903 (95% CI: 0.768–1.000), and an optimal cutoff value of 41.8%.

Conclusions: Preoperative superficial capillary vessel density, prior lens extraction, and baseline visual acuity are key predictors of meaningful visual recovery following macular pucker surgery. Defining significant improvement as a Snellen gain of ≥ 3 lines allowed for more clinically relevant outcome stratification. These parameters may help guide patient selection and surgical decision-making.

Abstract No.: 205589**Real-World Outcomes of Enhanced Monofocal Intraocular Lens in Eyes With Retinal Diseases Undergoing Phacovitrectomy***First Author: Min SAGONG**Co-Author(s): Seongbin HEO, Seongyong JEONG*

Purpose: To evaluate the visual outcomes of a monofocal intraocular lens (IOL) with enhanced intermediate function (Tecnis Eyhance ICB00) compared with a conventional monofocal IOL (Tecnis PCB00) in eyes with various retinal diseases.

Methods: This retrospective comparative study included 300 eyes (200 Eyhance, 100 PCB00) from 300 patients. Indications for surgery were epiretinal

membrane (ERM, 70%), macular hole (MH, 8%), rhegmatogenous retinal detachment (RRD, 9%), vitreous hemorrhage (VH, 11%), and others (2%). Uncorrected distance (UDVA), intermediate (UIVA), near (UNVA), and corrected distance visual acuity (CDVA) were assessed at 1, 3, and 6 months postoperatively. Subgroup analyses were conducted according to disease characteristics.

Results: Baseline characteristics were comparable between the PCB00 and Eyhance groups. Overall, eyes implanted with Eyhance demonstrated significantly better UIVA at all postoperative visits. Subgroup analyses showed that eyes with ERM of stage 2 or 3 achieved superior UIVA with Eyhance, whereas stage 4 cases showed no advantage. In MH eyes, those with a minimum diameter $< 400 \mu\text{m}$ benefited from Eyhance, while larger holes showed no difference. In RRD, macula-on cases achieved better UIVA with Eyhance, but no significant benefit was observed in macula-off cases. For VH, non-proliferative diabetic retinopathy (non-PDR) cases showed improved UIVA with Eyhance, while proliferative (PDR) cases did not.

Conclusions: The enhanced monofocal IOL provided significant improvement in intermediate vision in eyes with milder retinal conditions, but offered no additional advantage in advanced disease. Careful patient selection is essential when considering Eyhance IOL implantation in patients with retinal pathology.

Abstract No.: 202289**Recurrent Delayed Fulminant Endophthalmitis With Occlusive Retinitis Post-vitrectomy***First Author: Bhuvan CHANANA*

Purpose: To describe a case of recurrent fulminant endophthalmitis accompanied by occlusive retinitis.

Methods: A 60-year-old male presented with loss of vision 7 days after phacoemulsification in his right eye. The vision was hand movements (HM). Slit lamp examination showed a hypopyon, and ultrasonography revealed vitreous exudates. Urgent vitrectomy was performed for endophthalmitis. His vision improved to 6/9. Five months post-surgery, he presented again with sudden visual deterioration to HM, with recurrent hypopyon and vitreous exudates. The patient underwent urgent surgery.

Results: The vitreous aspirate showed Staphylococcus Aureus as the infective organism. The 2nd surgery intra-operatively showed occlusive retinitis. Silicone oil was injected. After 2 weeks, the inflammation recovered significantly with reperfusion of retinal vessels, and vision improved to 6/12.

Conclusions: The present case is very unique as there was recurrent fulminant endophthalmitis, accompanied by occlusive retinitis. Timely intervention may salvage vision in some patients. Staphylococcus

Aureus has been reported to cause occlusive vasculitis, but recurrences have not been reported in literature.

Abstract No.: 203720

Retinal Pigment Epithelium (RPE) Tears: To Inject or Not?

First Author: Nikita **GUPTA**

Co-Author(s): Avnindra **GUPTA**, Panchmi **GUPTA**, Dinesh **TALWAR**, Lalit **VERMA**

Purpose: RPE tears, first described by Hoskin et al., occur due to a variety of conditions, with wet age-related macular degeneration (AMD) being the most common cause. Other etiologies include polypoidal choroidal vasculopathy (PCV), retinal angiomatous proliferation (RAP), central serous chorioretinopathy (CSC), angioid streaks, high myopia, and trauma. The incidence of RPE tears in the setting of anti-VEGF therapy is reported to be 10-12%, with a bilateral occurrence in 53% of cases. This paper evaluates whether continued anti-VEGF therapy is beneficial in eyes with RPE tears.

Methods: A retrospective observational study was conducted in five eyes of five patients with preexisting or acquired RPE tears. The patients underwent multimodal imaging, including optical coherence tomography (OCT) and fundus autofluorescence (FAF), to assess structural changes. All patients received intravitreal anti-VEGF therapy, and their response was evaluated over a minimum follow-up period of 12 months.

Results: Visual acuity improved in 40% of cases, remained stable in 20%, and worsened in 40%. These findings suggest that continued anti-VEGF therapy is beneficial for patients with active disease.

Conclusions: This study reinforces the role of continued anti-VEGF therapy in managing RPE tears, particularly in cases with persistent exudative changes. Baseline OCT measurements, such as PED height and GLD, are crucial in predicting the risk of RPE tears and guiding treatment decisions. While visual outcomes vary, a tailored approach with close follow-up is essential to optimize patient outcomes.

Abstract No.: 201082

Role of Autologous Platelet-Rich Plasma for Recurrent or Refractory Macular Hole in the Era of Various Flap Techniques: A Systematic Review and Meta-Analysis

First Author: Yoo-ri **CHUNG**

Co-Author(s): Chungwoon **KIM**, Hae Rang **KIM**, Jung Hoo **LEE**, Ji Hun **SONG**

Purpose: We investigated the effects of autologous platelet-rich plasma (PRP) application on treating recurrent or refractory full-thickness macular hole

(FTMH) in patients who already underwent vitrectomy and internal limiting membrane (ILM) peeling.

Methods: Databases including PubMed, EMBASE, and Cochrane Library were searched on April 10, 2025. Studies that investigated the effect of autologous PRP or whole blood application to treat the recurrent or refractory FTMH were included. The primary outcome was the closure rate with the procedure, and a meta-analysis of proportions was performed to estimate pooled response rates.

Results: Among preliminary identification of 26 studies, ten case series using autologous PRP only and four studies using autologous PRP/blood clot and additional flap or graft (retina, lens capsule, amniotic membrane, or residual ILM) were included for the meta-analysis. The overall pooled closure rate with autologous PRP application was 81% (95 CI: 71–87%), while the additional use of flap or graft showed 84% closure rate (95% CI: 66–93%) in cases presenting recurrent or refractory FTMH. The moderator variable was not statistically significant (QM=0.21, df=1, p=0.645), indicating no evidence of differences between groups. There were no adverse effects related to autologous PRP or whole blood application.

Conclusions: The use of autologous PRP alone was sufficient to achieve the closure of recurrent or refractory FTMH, without the need for the concurrent flap or graft technique.

Abstract No.: 202408

Sequential Bilateral Retinal Artery Occlusions With Promising Visual Prognosis in a Diabetic Patient: A Case Report and Literature Review

First Author: Ziyue **LI**

Co-Author(s): Ting **CHEN**, Ying **LI**

Purpose: Bilateral retinal artery occlusion (RAO) in patients with Type 2 diabetes mellitus is an extremely rare condition. Even with rigorous treatment, RAO often results in devastating visual impairment. A 50-year-old female with Type 2 diabetes mellitus was referred to our hospital. Notably, she developed bilateral RAO sequentially within a mere five-month period. This rapid progression of the disease in both eyes is of particular interest.

Methods: We conducted a comprehensive ophthalmic and systemic examination on this patient, including fundus photography, FFA, OCT, CTA, MRI, and DSA. We also observed the therapeutic effect of intra-arterial thrombolysis on this patient.

Results: Fundus examination confirmed branch retinal artery occlusion (BRAO) in her left eye and central retinal artery occlusion (CRAO) in her right eye. After timely intra-arterial thrombolysis, significant bilateral visual recovery was achieved. The patient's visual acuity in the left eye improved from 20/400 to 20/100 and in the right eye from 20/2000 to 20/33.3,

indicating the effectiveness of this treatment approach in this case. Further examinations also showed positive results: the cherry-red spot in the macula disappeared, FFA indicated improved retinal artery perfusion, and OCT revealed a certain degree of restoration in the retinal structure.

Conclusions: This case highlights that metabolic disorders, like hyperlipidemia and diabetes, can be considered high-risk factors for the development of RAO. Prompt and effective intervention, such as timely intra-arterial thrombolysis, as demonstrated in this case, is crucial for preserving patients' visual prognosis.

Abstract No.: 205974

Short-Term Treatment Outcomes of a Novel Technique of Combined Buckle and Scleral Imbrication for Complex Retinal Detachments

First Author: Subhadra **JALALI**

Co-Author(s): Akash **BELENJE**

Purpose: To report the short-term treatment outcomes of a novel technique of combined scleral buckle with modified scleral imbrication for predominantly childhood-onset retinal detachments with varying proportions of rhegmatogenous, exudative, and tractional components.

Methods: A retrospective analysis of 24 eyes operated on with the novel technique is reported. The surgical technique included modified scleral imbrication, combined with use of an encircling band with or without a buckle (tire). Additional procedures could include cryopexy, subretinal fluid drainage, paracentesis, or retinal laser. No vitrectomy procedures were done at the initial surgery.

Results: Age at time of surgery ranged from 3 months to 14 years (mean 6 years). Diagnosis included ROP (17 eyes), FEVR (4 eyes), and miscellaneous (3 eyes). eyes included rhegmatogenous with tractional and/or exudative component (13 eyes); progressive tractional detachment (7 eyes); tractional with exudative detachment (two eyes), and rhegmatogenous with abnormal vitreous adhesions (2 eyes). Retina showed complete attachment and no progression in 19 eyes (79%). Of the five eyes with incomplete resolution, one had successful vitrectomy surgery with oil, two eyes were inoperable, and two eyes had only partial reattachment. Postoperative visual acuity was stable or improved in six older children, where it could be recorded. No postoperative complication was noted at a mean follow-up of 12 months.

Conclusions: Every eye operated by this technique was extremely challenging. The novel technique provided a new way of managing these complex retinal detachments successfully with a single surgery, that otherwise would have required multiple procedures often with variable and unpredictable outcomes. Long-term outcomes are awaited.

Abstract No.: 204255

Study on the Correlation Between Visual Acuity and Image Characteristics of Optical Coherence Tomography in Macular Edema With Retinal Vein Occlusion

First Author: Liang **FU**

Co-Author(s): Zhi'he **FU**

Purpose: To observe the correlation between the characteristics of frequency domain optical coherence tomography (OCT) images and the initial visual acuity in patients with retinal vein occlusion and macular edema (RVO-ME).

Methods: Cross sectional study. From June 2017 to December 2019, 31 patients (11 eyes in 11 men and 20 eyes in 20 women) with RVO-ME were examined in Anxi Aier Eye Hospital, with an average age of (62.71 ± 11.32) years. All patients underwent BCVA, medical optometry, spectral domain OCT and other related examinations. Based on the OCT images, we analyzed the central thickness of retina (CST), intraretinal cyst (IRF), subretinal fluid (SRF), hyperreflexive focus (HF), external limiting membrane (ELM), ellipsoid zone (EZ), inter-junction zone (IZ), and quantified these imaging features with Image J software.

Results: In 31 eyes, the logMAR BCVA of branch retinal vein occlusion was 0.97 ± 0.39 , and the logMAR BCVA of central retinal vein occlusion was 1.32 ± 0.48 . The thickness of the macular fovea in branch retinal vein occlusion was $574.86 \pm 229.90 \mu\text{m}$, and the thickness of the macular fovea in central retinal vein occlusion was $800.47 \pm 367.91 \mu\text{m}$, the difference between these two groups had statistically significant ($P < 0.05$). In 5 of 31 eyes (16.1%), vitreo retinal traction (VMT) was found, and no pre-retinal membrane was found. Twenty-five eyes (80.6%) had hyperreflective spot lesions (HF). Thirty eyes (96.8%) had intraretinal cysts (IRF), and 13 eyes (41.9%) had subretinal fluid (SRF). Single-factor regression analysis found that central macular thickness (CMT), intraretinal cyst length (IRF), external limiting membrane (ELM) destruction, ellipsoid zone (EZ) destruction, and inter-junction zone (IZ) destruction were negatively correlated with vision. Multivariate regression analysis found that only external limiting membrane (ELM) damage was negatively correlated with vision.

Conclusions: The characteristics of the external limiting membrane in frequency domain OCT are related to the vision of patients with RVO-ME, these characteristics are more accurate in predicting vision.

Abstract No.: 206044

Successful Closure of a Recurrent Macular Hole With Intravitreal Dexamethasone Implant (Ozurdex)

First Author: Kiet Phang LING

Co-Author(s): Chin Sern CHAN, Choon Teng CHAN, Wee Min TEH, Wilson Jun Jie WONG

Purpose: Recurrence of macular hole (MH) after successful closure post-primary pars plana vitrectomy (PPV) and internal limiting membrane (ILM) peeling is uncommon and is typically attributed to persistent traction. We report an atypical case of a recurrent MH successfully treated with an intravitreal dexamethasone implant, implicating inflammation as a pathogenic mechanism.

Methods: A 51-year-old male presented with a full-thickness MH, which was successfully treated with standard PPV and ILM peeling, achieving initial anatomical closure. Two years later, the patient presented with recurrent MH. Given the absence of residual vitreomacular traction and well-executed initial ILM peeling, mechanical causes were deemed unlikely. A decision was made to treat the recurrence with an intravitreal injection of a sustained-release dexamethasone implant (Ozurdex) under the hypothesis of underlying subclinical inflammation causing the recurrence of the hole.

Results: Following the Ozurdex injection, sequential optical coherence tomography (OCT) imaging demonstrated progressive approximation of the hole edges and complete anatomical closure of the macular hole within 4 weeks. The patient's visual acuity improved correspondingly, and the hole remained closed at the 12 months follow-up.

Conclusions: This case demonstrates that intravitreal steroids can be an effective treatment for recurrent macular holes, particularly in cases where mechanical traction has been adequately addressed. It highlights the potential role of inflammation in the pathogenesis of recurrent MHs and suggests Ozurdex as a viable, less invasive therapeutic alternative to a second vitrectomy in selected patients.

Abstract No.: 206571

Surgical Approach in Case With Retinal Inflammatory Reaction After Ocular Trauma

First Author: Sundaram NATARAJAN

Co-Author(s): Pac Cristina PATRICIA

Purpose: This report focuses on an adult traumatic case complicated by a fibrous membrane tractioning the macula.

Methods: The patient, a 52-year-old male, first presented after being hit by a stone, with hemophthalmus, globe rupture with scleral tear, and multiple orbital fractures. The first intervention

consisted of wound exploration, scleral tear suturing with air injection. A few days later, lensectomy with posterior vitrectomy was performed, with drainage through retinotomy of the choroidal hemorrhage, emerging due to prolonged hypotony. After one month, a fibrous membrane extending from the disc to the temporal quadrant developed, tractioning the macula. Visual acuity dropped from 6/60 to counting fingers, and the Amsler grid test changed from showing wavy lines to a blurred chart, so surgical intervention was decided. Using 23G ports: silicone oil removal + membrane peeling under Brilliant Blue visualization + Perfluorocarbon injection + endolaser + fluid-gas exchange + injection of Densiron and 1000 CS + intravitreal triamcinolone injection.

Results: A stable, attached retina without traction was achieved. No complications developed during the first 6 months of monitoring. Subjectively, visual distortion decreased and objectively, visual acuity improved.

Conclusions: This case underscores the importance of considering retinal inflammatory reactions when treating post-traumatic cases. The incidence of these complications exceeds 30% of cases, with a higher risk in patients with open-globe trauma or those with vitreous hemorrhage or retinal breaks. The frequency is increased due to the release of retinal pigment epithelial (RPE) cells, glial cells, macrophages, and fibroblasts, which migrate into the vitreous and subretinal space.

Abstract No.: 206188

Surgical Dilemma in Pars Plana Vitrectomy for Rhegmatogenous Retinal Detachment With Choroidal Coloboma: A Rare Case Report

First Author: Rusydiana

Co-Author(s): Muhammad FIRMANSJAH, Dicky HERMAWAN, Luki INDRIASWATI, Yulia PRIMITASARI, Wimbo SASONO, Ima YUSTIARINI

Purpose: To report the surgical challenges and outcome of pars plana vitrectomy (PPV) for a rare case of rhegmatogenous retinal detachment (RRD) associated with choroidal coloboma in the last functional eye.

Methods: Case Report: An 18-year-old male presented with floaters and sudden vision loss in the right eye. Visual acuity was 1 meter counting fingers (CF) in the right eye and light perception in the left eye. Ocular findings included iris and lens colobomas, microphthalmia, microcornea, and macula-off RRD extending from 9 to 2 o'clock with an inferior choroidal coloboma. Based on these findings, a diagnosis of coloboma-related RRD in the last functional eye. Pars plana vitrectomy with endolaser and silicone oil tamponade was performed despite the guarded prognosis.

Results: Intraoperatively, a retinal break within the intercalary membrane near the macula was identified. The retina was successfully reattached, with immediate postoperative visual acuity of 1 meter CF. However, intraocular pressure (IOP) increased to 45 mmHg despite medical therapy. At the fourth postoperative week, partial silicone oil removal was performed, after which IOP stabilized. At the three-month follow-up, the retina remained attached, IOP was controlled, and visual acuity improved to 2-meter CF.

Conclusions: This case highlights the surgical dilemma of managing coloboma-related RRD in the last functional eye. While PPV with silicone oil tamponade achieved anatomical success, the postoperative course was challenging due to persistent IOP elevation, underscoring the importance of early recognition, timely intervention, and individualized long-term management.

Abstract No.: 203031

Surgical Outcome Evaluation of Very Large Full Thickness Macular Holes

First Author: Deepak **AGARWAL**

Purpose: To evaluate anatomical and functional outcomes of inverted ILM flap technique in very large full thickness macular holes (FTMH).

Methods: Retrospective, interventional case series. Consecutive cases of primary very large FTMH (defined as MLD > 650 microns) were included. Excluded cases- Secondary or traumatic macular holes, recurrent/failed MH, MH associated with RD. Detailed pre-operative evaluation including BCVA and OCT macula. Vitrectomy, ILM peeling and inverted ILM flap, FAX done. Tamponade with C3F8 or Silicone oil. Post-operative evaluation and OCT macula at 6 weeks. Statistical analysis: Student paired T test to compare pre-operative and post-operative BCVA.

Results: • 28 eyes were included. • Holes closed in 24 eyes (85.71%) • MLD was 745.10 ± 100.55 (Range 654-1020) • Statistical improvement was seen in Post-operative BCVA 0.80 ± 0.41 (P value <0.001) when compared to Pre-operative BCVA was 1.29 ± 0.41 . • Cases which remained open, MLD decreased and all showed BCVA improvement.

Conclusions: Closure rate of 85.71% is comparable to previous studies for very large FTMH. Statistically significant visual improvement was seen post-operatively. Author concludes that ILM peeling with inverted flap provides good surgical and functional outcome for very large FTMH. However, our data is small and needs further long term and larger studies. More traumatic and difficult surgeries like autologous retina transplant should be reserved for giant MH or recurrent/failed MHs.

Abstract No.: 206375

Surgical Outcomes of Submacular Hemorrhage With Massive Hemorrhagic PED in PCV

First Author: Xiaoyun **FANG**

Co-Author(s): Fang **ZHENG**

Purpose: To report the surgical outcomes of polypoidal choroidal vasculopathy (PCV) patients presenting with submacular hemorrhage accompanied by massive hemorrhagic pigment epithelial detachment (PED).

Methods: Four eyes with PCV-related submacular hemorrhage and massive hemorrhagic PED (area >50 disc diameter) were treated with pars plana vitrectomy (PPV), subretinal tissue plasminogen activator (tPA) injection via micro-needle, gas tamponade, and anti-VEGF therapy. In both eyes, additional tPA was injected beneath the PED.

Results: Postoperatively, all four eyes developed varying degrees of vitreous hemorrhage; one resolved spontaneously, while three required vitreous cavity lavage. In all cases, subretinal hemorrhage was displaced inferiorly, hemorrhagic PED completely regressed, and visual acuity improved. Fundus examination revealed retinal pigment epithelium (RPE) tears of varying sizes in each eye.

Conclusions: PPV with subretinal tPA injection, with or without sub-PED delivery, combined with gas tamponade and anti-VEGF therapy, can effectively displace subretinal hemorrhage inferiorly, promote rapid and complete regression of hemorrhagic PED, and improve visual outcomes. To our knowledge, this is the first report of such outcomes in PCV with massive hemorrhagic PED.

Abstract No.: 205426

The Effect of Perfluorocarbon Liquids in Surgery for Rhegmatogenous Retinal Detachment With Macular Detachment

First Author: Mayumi **KOBAYASHI**

Co-Author(s): Shohei **MORIKAWA**, Tomoya **MURAKAMI**, Tetsuro **OSHIKA**, Yoshimi **SUGIURA**, Mizuki **TOMIOKA**

Purpose: To evaluate the impact of perfluorocarbon liquid (PFCL) use in surgery for rhegmatogenous retinal detachment (RRD) with macular detachment.

Methods: This retrospective study included 68 eyes of 68 patients (mean age, 53.0 ± 16.0 years) with macula-off RRD who underwent primary surgery at the University of Tsukuba Hospital between April 2024 and March 2025, and were followed for at least 6 months postoperatively. Outcome measures included best-corrected visual acuity (BCVA), central foveal thickness (CFT), metamorphopsia, aniseikonia, and symptom duration. Metamorphopsia was assessed using M-CHARTS (mean of vertical and horizontal scores), and aniseikonia was evaluated with the New

Aniseikonia Test. Outcomes were compared between eyes with and without intraoperative PFCL use.

Results: BCVA significantly improved after surgery ($P < 0.001$). PFCL was used intraoperatively in 48 of 68 eyes (70.6%). There were no significant differences between the PFCL and non-PFCL groups in postoperative BCVA ($P = 0.591$), CFT ($P = 0.791$), metamorphopsia ($P = 0.223$), or aniseikonia ($P = 0.906$). Multivariate analysis revealed that only symptom duration was significantly associated with postoperative BCVA ($P < 0.001$), whereas age and tear location showed no association ($P = 0.430$ and $P = 0.503$, respectively).

Conclusions: In macula-off RRD, intraoperative PFCL use did not affect postoperative BCVA, CFT, metamorphopsia, or aniseikonia. Postoperative visual outcomes were associated with symptom duration.

Abstract No.: 205904

The Effect of Perfluorocarbon in Surgery for Macula-On Rhegmatogenous Retinal Detachment

First Author: Yoshimi **SUGIURA**

Co-Author(s): Mayumi **KOBAYASHI**, Shohei **MORIKAWA**, Tomoya **MURAKAMI**, Tetsuro **OSHIKA**, Mizuki **TOMIOKA**

Purpose: To investigate the effect of perfluorocarbon liquid (PFCL) use during vitrectomy for macula-on rhegmatogenous retinal detachment (RRD).

Methods: This retrospective study included 53 eyes of 53 patients with macula-on RRD who underwent primary pars plana vitrectomy at the University of Tsukuba Hospital between April 2024 and March 2025. Of 113 consecutive eyes with RRD, only those with a preoperative attached macula were analyzed. Patients were divided into PFCL and non-PFCL groups. Best-corrected visual acuity (BCVA, logMAR), central foveal thickness (CFT), metamorphopsia, and aniseikonia were evaluated preoperatively and at 6 months postoperatively. The influence of PFCL use on postoperative outcomes was compared between groups.

Results: Postoperative logMAR BCVA was -0.058 in the non-PFCL group and -0.026 in the PFCL group, with no significant difference between the two groups ($P = 0.087$). Postoperative CFT and changes in CFT from baseline were also comparable between the non-PFCL and PFCL groups ($P = 0.092$ and $P = 0.924$, respectively). Metamorphopsia scores were 0.11° in the non-PFCL group and 0.16° in the PFCL group, while aniseikonia values were -1.48% and 0.50%, respectively. There were no significant differences in these parameters between the two groups. ($P = 0.936$ and $P = 0.111$).

Conclusions: In vitrectomy for macula-on RRD, postoperative BCVA did not differ significantly between eyes treated with and without PFCL. Similarly, PFCL use had no significant impact on postoperative CFT,

metamorphopsia, or aniseikonia. These findings suggest that PFCL may be used as needed during macula-on RRD surgery without adversely affecting functional or anatomical outcomes.

Therapeutic Targets for Glaucoma: Comprehensive Proteome-Wide Mendelian Randomization and Colocalization Analyses

First Author: Jinbo **CHEN**

Purpose: Purpose: This study aimed to investigate the causal relationships between circulating plasma proteins and glaucoma, including its major subtypes and intraocular pressure (IOP), using large-scale genetic datasets.

Methods: Method: We conducted a proteome-wide two-sample Mendelian randomization (MR) analysis followed by Summary-data-based MR (SMR), heterogeneity in dependent instruments (HEIDI) testing, and Bayesian colocalization. Functional characterization was performed using Gene Ontology (GO), Kyoto Encyclopedia of Genes and Genomes (KEGG) enrichment, and GeneMANIA network analysis. Druggability of identified targets was evaluated via DrugBank and related databases.

Results: Result: A total of 26 proteins were associated with glaucoma and its subtypes, among which 21 were unique. Seventeen associations passed the HEIDI test, and 27 protein-disease associations showed strong evidence of colocalization ($PP.H4 \geq 0.8$). Notably, TEK, KIR3DL1, DSG2, SEMA6A, SDCBP2, NEO1, and LDLRAD4 were consistently supported across multiple analyses as potential therapeutic targets. Among them, TEK exhibited a significant association with primary open-angle glaucoma ($OR = 1.178$), while KIR3DL1 showed a protective effect against primary angle-closure glaucoma ($OR = 0.239$).

Conclusions: Conclusion: Our multi-method genetic analysis identified several plasma proteins with potential causal roles in glaucoma. The findings highlight TEK, KIR3DL1, DSG2, SEMA6A, SDCBP2, NEO1, and LDLRAD4 as promising translational targets for drug development, although further experimental validation is warranted.

Abstract No.: 207434

To Attach a Retinal Re-detachment of a Vitrectomized Eye With Pneumatic Retinopexy

First Author: Hong Nien **LEE**

Purpose: To demonstrate the efficacy of pneumatic retinopexy in treating a re-detached retina of a newly vitrectomized eye.

Methods: Case report.

Results: A 56-year-old man who presented with right macula-off rhegmatogenous retinal detachment with a full-thickness macular hole underwent pars plana vitrectomy with SF6 20%. On the 10th day, when the gas was almost fully reabsorbed, retina re-detachment was noted. Due to the limited access to surgery and fear of operation, the patient opted for pneumatic retinopexy. A step-wise approach was carried out. On day 2, the retina appeared attached. In the subsequent follow-ups, no retinal detachment was reported. OCT showed a fully attached retina with a closed retinal hole.

Conclusions: Pneumatic retinopexy demonstrated an effective approach in newly treated retinal re-detachment. However, careful selection of the patient is vital.

Abstract No.: 201517

Tranexamic vs Adrenaline for Intraoperative Hemostasis in PDR Vitrectomy: A Randomized Trial

First Author: Shishir **VERGHESE**

Co-Author(s): Priya **BASIAWMOIT**

Purpose: To compare the efficacy of intraocular tranexamic acid and adrenaline, both added to the infusion bottle individually, in achieving intraoperative hemostasis during pars plana vitrectomy for proliferative diabetic retinopathy (PDR)

Methods: This was a prospective, randomized controlled trial which enrolled patients undergoing vitrectomy for active PDR with vitreous hemorrhage or tractional retinal detachment. Participants were randomly assigned to receive either tranexamic acid (50mg/ml) or adrenaline (1:100,000) added to the infusion bottle. Intraoperative bleeding was graded using a standardized bleeding score, and the number of endodiathermy applications as well as IOP raises was recorded. Secondary outcomes included visibility score, postoperative vitreous hemorrhage, and visual acuity at 1 and 3 months. The evaluator was masked to the intervention group. Patients who received prior anti-VEGF were excluded from the study.

Results: A total of 40 eyes (20 in each group) were included. The intraoperative bleeding score was lower in the adrenaline group (1.3 ± 0.5) compared to the tranexamic group (2.1 ± 0.7 ; $p < 0.01$). The mean number of endodiathermy applications was also reduced in the adrenaline group (4.8 vs 7.3; $p < 0.01$). Surgical field visibility was similar in both groups. Mean operative time was shorter in the adrenaline group by 8 minutes ($p = 0.03$). Visual acuity gain at 1 month was comparable in both groups.

Conclusions: Adrenaline added to the infusion bottle during vitrectomy for PDR offers superior intraoperative hemostasis and reduced bleeding as compared to tranexamic acid. Its use may contribute

to reduced intraoperative bleeding, shorter operative times without increasing complication rates.

Abstract No.: 203168

Two Modified Pear Flower Petal-Shaped Internal Limiting Membrane Flap Techniques for Challenging Macular Holes: Double Inverted and Flap Repositioning

First Author: Hong **WU**

Co-Author(s): Yan **CHENG**, Zaoxia **LIU**, Han **SUN**, Xiaomeng **ZHANG**

Purpose: To present two innovative modifications of the pear flower petal-shaped inverted ILM (internal limiting membrane) flap technique—double inverted for EP (epiretinal proliferation) and flap repositioning for complex MH (macular holes)—and to evaluate their clinical value.

Methods: A retrospective analysis of patients with EP-associated MH and complex MH was performed. All cases underwent pars plana vitrectomy combined with either the double-inverted technique or the pear flower petal-shaped flap with repositioning technique. Surgical steps, anatomical closure, and functional recovery were assessed.

Results: Six eyes of six patients were treated with the novel techniques. All MH achieved successful closure within one week postoperatively. During follow-up, optical coherence tomography revealed well-restored foveal morphology and marked improvement in the continuity of the outer retinal layers. Best-corrected visual acuity improved significantly.

Conclusions: Both modified techniques achieved stable flap coverage and safe MH closure. The double-inverted technique preserved EP tissue to fill intraretinal defects while avoiding unintended trauma to the hole base and retinal pigment epithelium. The repositioning technique, while retaining the advantages of the original method, provided a safer approach. With flexible intraoperative adjustments, the repositioned ILM could serve as a rescue option in cases of reoperation or intraoperative flap rupture, displacement, or loss. These two modifications demonstrated flexibility, safety, and effectiveness in the management of challenging MH, ensuring both anatomical and functional recovery. They broaden surgical options and underscore the clinical value of innovation in MH surgery.

Abstract No.: 205692

Visual Outcomes Following Sutureless Scleral Fixated Intraocular Lens Implantation

First Author: Sumit RANDHIR SINGH

Co-Author(s): Santosh KUMAR, Ajit PODDAR, Ayush SINGH

Purpose: To study the anatomical and visual outcomes following sutureless scleral fixated intraocular lens (SFIOL) implantation using modified Yamane technique in eyes with aphakia, subluxated or dislocated crystalline lens / intraocular lens.

Methods: A total of 101 patients who underwent SFIOL implantation using modified Yamane technique with a minimum follow-up of 3 months were retrospectively analyzed. The surgical technique involved pars plana vitrectomy and implantation of a 3-piece intraocular lens. IOL haptics were positioned in scleral pockets after creating a flange using bipolar cautery. Demographic details, pre- and post-best corrected visual acuity (BCVA) at 1 week, 1 month, and 3 months were recorded. The primary outcome was a change in BCVA, whereas secondary outcomes included assessment of haptic position using anterior segment optical coherence tomography (AS-OCT), postoperative complications, and residual refractive error.

Results: Mean age of the study group was 57.6 ± 16.2 years and included 61 males (60%) and 40 females (40%). Mean duration from aphakia to SFIOL implantation was 6.3 ± 10.8 months. BCVA showed statistically significant improvement from 1.73 ± 0.74 logMAR at baseline to 0.50 ± 0.53 logMAR at last follow up visit ($p < 0.01$). Mean ($\pm$ SD) residual refractive error measured in spherical equivalent was -0.46 ± 0.80 diopters (D). AS-OCT was used to localize both haptics in scleral pockets and calculate the minimum distance of haptic from conjunctival/scleral surface (mean $\pm$ SD: $195 \pm 80 \mu\text{m}$). Most common early postoperative complication (< 6 weeks) was transient corneal edema (11 eyes, 11%), which resolved with medical management. The most common late postoperative complication was haptic exposure with overlying conjunctival erosion in 8 eyes (8%). Among these, two patients needed IOL repositioning, whereas one patient developed endophthalmitis, warranting PPV and intravitreal antibiotics.

Conclusions: Sutureless SFIOL implantation is a safe alternative in aphakic eyes with significant BCVA improvement over 3 months. AS-OCT, as a noninvasive modality, can be used to localize haptic position within scleral pockets and predict IOL-related complications such as haptic exposure.

A Comprehensive Evaluation of a Novel Method for Gene Therapy of Inherited Retinal Diseases Mediated by AAV

First Author: Wang LI

Co-Author(s): Baoyuan QU

Purpose: Adeno-associated virus (AAV) is extensively utilized as a gene therapy vector owing to its favorable safety profile and capacity to sustain persistent transgene expression. Nevertheless, during manufacturing, recombinant AAV (rAAV) production may inadvertently generate incompletely packaged vectors, replication-competent AAV (rcAAV), and process-related impurities, raising critical safety risks.

Methods: To address this, we introduce 3'-end-adaptor-ligation (EAL) library sequencing strategy, a novel methodology for AAV genome integrity quantification, designed to enable sensitive and quantitative detection of recombination events. The ELS workflow integrates next-generation sequencing (NGS) to systematically map and quantify genomic breakpoints across the AAV genome, thereby delivering a high-resolution evaluation of structural integrity.

Results: We rigorously validated ELS by analyzing rAAV vectors of diverse lengths produced under GMP-compliant manufacturing protocols. Compared to circular consensus sequencing (CCS) (84.58% integrity), ELS achieved a markedly enhanced intact genome rate ($93.63 \pm 0.15\%$), particularly for vectors approaching the 4.7-kb packaging limit. Our findings establish ELS as a robust platform for detecting heterogeneous rAAV recombination events with exceptional analytical sensitivity (limit of detection: 0.1% variant frequency) and specificity ($> 99.9\%$), providing transformative insights for quality-by-design (QbD) optimization and regulatory-compliant safety profiling of AAV-based therapeutics.

Conclusions: Together, our results clearly highlight the utility of ELS-seq in providing a comprehensive and accurate characterization of AAV genome integrity and structural diversity.

Abstract No.: 206687**A Novel High-Sensitivity Noninvasive Strain Sensor for Monitoring Ocular Pulse and Eye Movement***First Author: Shaoying TAN**Co-Author(s): Zengsheng WENG, Fangxin ZOU*

Purpose: This study aims to develop a novel high-sensitivity noninvasive strain sensor for monitoring both ocular pulse and eye movement.

Methods: A high-sensitivity, multidirectional pPen-on-paper (PoP) inks strain sensor was created using graphene oxide (GO) ink, which exhibits excellent dispersion properties for high-sensitivity multidirectional strain sensors. The sensor demonstrated the ability to capture tensile, compressive, and pressure signals. The gauge factors are 87.1 and 77.4 in sensing tensile and compressive deformations within the range of 1%, and 3.6×10^{-3} kPa $^{-1}$ in sensing pressure deformation within the range of 2 kPa to 5.5 kPa. The sensor maintained consistent sensitivity across different surfaces, indicating its reliability.

Results: By affixing the GO-based PoP strain sensor to the upper eyelid with removable adhesive tape, resistance signals were captured using a digital multimeter. The findings revealed a signal frequency similar to the respiratory rate, approximately between 0.1 Hz and 1 Hz. Subjects were instructed to rotate their eyes every 30 seconds, resulting in noticeable deviations in the signal from the baseline curve at the 30-second mark. Under static conditions, the signals exhibited a consistent pattern, while eye rotation induced observable perturbations in the original signal curves, indicative of rotational responses.

Conclusions: These findings highlight the capability of the straightforward GO-based PoP strain sensor to simultaneously monitor intrinsic ocular signals and ocular rotation dynamics. With further refinement in sensor deployment, there is potential to accurately determine the direction of ocular rotations.

Abstract No.: 204463**Engineered Nanovesicles Targeting Lactate-Sensitive Microglia Suppress Pathological Neovascularization in Proliferative Diabetic Retinopathy***First Author: Keyi ZOU**Co-Author(s): Jian YE*

Purpose: Proliferative diabetic retinopathy (PDR) is a leading cause of blindness. Elevated lactate has been linked to poor outcomes in PDR, yet its role in pathological neovascularization remains unclear. In our preliminary work, we identified a subset of lactate-responsive, MKI67-positive microglia in the retinas of patients with PDR. This study aimed to develop an

engineered nanovesicle system that targets these cells to inhibit neovascularization in PDR.

Methods: Clinical datasets from patients with diabetic retinopathy were analyzed to identify microRNAs associated with MKI67 expression. Bioinformatic screening and clinical filtering were used to select miRNAs predicted to regulate MKI67. In vitro, a human microglial cell model with enforced MKI67 expression was used to assess whether engineered exosomes could suppress MKI67 and modulate proliferation, migration, and angiogenic activity. For in vivo validation, the oxygen-induced retinopathy (OIR) mouse model was employed to evaluate the anti-neovascular effects of the engineered nanovesicles.

Results: miR-10 was predicted to efficiently target MKI67. Engineered exosomes derived from primary macrophages overexpressing miR-10 (miR-10-Mexo) markedly reduced MKI67 expression in MKI67-positive microglia in vitro, thereby limiting microglial proliferation and migration and diminishing pro-angiogenic effects. In the OIR model, treatment with miR-10-Mexo significantly reduced neovascular tuft formation and overall vascular density, and histopathology showed attenuated vascular leakage.

Conclusions: We developed an engineered nanovesicle therapy (miR-10-Mexo) that targets lactate-sensitive microglia to downregulate MKI67 and effectively suppress pathological retinal neovascularization in PDR. These findings propose a promising targeted strategy for PDR and highlight lactate-responsive microglia as therapeutic nodes in retinal neovascular disease.

Abstract No.: 201154**From Natural Compounds to Drug Candidates: Decoding Ginkgo Biloba's Therapeutic Potential in Diabetic Retinopathy Through Computational Drug Discovery***First Author: Salma FIRDAUS**Co-Author(s): Alif LAKSONO, Bellinda TAZKIRA, Ima YUSTIARINI*

Purpose: Despite clinical promise, bioactives of Ginkgo biloba (GB) remain an underexplored pool for novel therapies in diabetic retinopathy (DR). This study aims to decode GB bioactives and molecular mechanisms against DR, through network pharmacology and an in-silico approach to identify potential therapeutic candidates for drug development.

Methods: Bioactives from GB were screened for drug-likeness properties and mapped to DR-related target proteins. Network pharmacology was analyzed through protein-protein interactions (PPI). Gene ontology and Kyoto Encyclopedia of Genes and Genomes (GO-KEGG) enrichment were used to explore the underlying molecular mechanisms and pathways involved from GB's bioactives. Molecular docking was performed

using AutoDock, and molecular dynamics simulations were conducted in CABS 2.0.

Results: Through bioinformatic analysis, 30 bioactives met drug-likeness criteria such as β -sitosterol, Ginkgolide, Diosmetin, Cathecin, Linolenic acid, Biloblade, Luteolin-4 glucoside, and Isogopycrol. A total of 194 therapeutic target proteins were identified, with PPI refining core target proteins as EGFR, MMP9, TNF, AKT1, STAT3, PPARG, HIF1A, BCL2, and NFKB1. Molecular docking reveals β -sitosterol as having one of the strongest binding affinities (ΔG -10.38 kcal/mol), with a low inhibitory constant (10.74 nM), against EGFR. Molecular dynamics confirmed stable ligand-protein complexes with minimal residue fluctuations. GO-KEGG enrichment indicated AGE-RAGE signaling in diabetic complications as a key pathway mediating bioactives' potential to inhibit DR progression.

Conclusions: By mapping multi-target interactions and in-silico experiments, this study highlights several Ginkgo biloba bioactives as potential candidates for diabetic retinopathy therapies, bridging natural medicine and modern bioinformatics-driven drug discovery in tackling the growing burden of diabetic eye disease.

Abstract No.: 200139

In Vivo Inhibition of Latanoprost-Induced Iridal Hyperpigmentation Using α -Methyl-DL-Tyrosine in Rabbits: A Translational Experimental Study

First Author: Mahmood **ALI**

Co-Author(s): Waqar **AHMAD**, Farah **AKHTAR**, Muhammad **BILAL**, Muhammad **SADIQ**

Purpose: Latanoprost, a widely prescribed prostaglandin analogue for glaucoma, is associated with irreversible iridal hyperpigmentation, raising aesthetic and pharmacological concerns. This study explores the inhibitory effects of α -methyl-DL-tyrosine on latanoprost-induced iridal hyperpigmentation in a rabbit model.

Methods: Twelve rabbits were divided into four groups (Pink, Red, Blue, Green). Both eyes of Pink, Red, and Blue groups received daily topical latanoprost, followed by 0.5%, 1%, and 2% α -methyl-DL-tyrosine in the right eyes, respectively, for six months. The Green group served as a control and received only the inhibitor. Iridal pigmentation was evaluated through photographic comparison by masked observers, spectrophotometric melanin quantification, and histopathological analysis of excised irides.

Results: A significant increase in iridal pigmentation was observed in left eyes (latanoprost only), while right eyes (latanoprost + inhibitor) showed reduced pigmentation, particularly in the 2% group. In the Blue group, 93.33% of observers reported increased pigmentation in the left eye, and 73.33% noted a

decrease in the right eye. Spectrophotometric melanin analysis confirmed these findings: the Blue group's right eyes had significantly lower melanin content (9.56 ± 0.75 $\mu\text{g/g}$) than the left (13.73 ± 1.06 $\mu\text{g/g}$; $p=0.022$). Histopathology revealed no malignant changes or inflammation. Mild stromal pigmentation and free melanin were observed, but only in latanoprost-treated eyes.

Conclusions: Topical α -methyl-DL-tyrosine at a 2% concentration significantly inhibited latanoprost-induced iridal hyperpigmentation without inducing histopathological changes. These findings open promising translational avenues for adjunctive therapy in glaucoma patients concerned about ocular pigmentation, with potential pharmaceutical applications.

Abstract No.: 207830

Opsin-Mediated Acetylcholine Release From Skin Keratinocytes Modulates Solar Light-Induced Melanogenesis

First Author: Qiyun **WU**

Purpose: Clarify the role of opsin in regulating acetylcholine (ACh) release from skin keratinocytes and its subsequent effect on solar light-triggered melanogenesis.

Methods: 1. Identify opsin subtypes (OPN1SW, OPN2, OPN3, OPN5) in keratinocytes via PCR and Western blot. 2. Use siRNA to knockdown specific opsins and assess impacts on solar light-induced ACh release. 3. Investigate opsin-related signaling (Gq/PLC/TRPA1, Ca^{2+} mobilization) using inhibitors and fluo-4 AM imaging. 4. Evaluate melanogenesis in vitro (cocultures) and ex vivo (mouse skin) after opsin-mediated ACh release.

Results: 1. OPN2 is the key opsin subtype in keratinocytes, with upregulated expression during differentiation. 2. Solar light (UVA-dominant) activates OPN2, triggering Ca^{2+} mobilization via Gq/PLC/TRPA1 to induce ACh release. 3. OPN2 knockdown reduces solar light-induced ACh release by ~80%. 4. OPN2-mediated ACh release inhibits solar light-induced melanin production and tyrosinase expression.

Conclusions: Opsin (specifically OPN2) is a critical photoreceptor in skin keratinocytes, mediating solar light-induced ACh release to negatively regulate melanogenesis, highlighting its role in skin pigmentation control.

Abstract No.: 200784**SGLT2 Inhibition With Empagliflozin Attenuates Retinal Oxidative Stress and Damage in Diabetic Mice***First Author: Yutong XIA**Co-Author(s): Shen, Tong*

Purpose: This study aims to investigate the protective effects of SGLT2 inhibitor empagliflozin on retinal oxidative stress and damage in diabetic mice, exploring its potential therapeutic value in diabetic retinopathy.

Methods: The study utilized db/db diabetic mice treated with empagliflozin (25 mg/kg/day) for 8 weeks. Employing immunofluorescence, fluorescein angiography, and Western blot and related experimental techniques. Parameters assessed included blood glucose levels, retinal morphology, oxidative stress markers (DHE), activated gliosis and lipid peroxidation levels, retinal barrier function (ZO-1, Occludin). The Nrf2/HO-1 pathway was also evaluated.

Results: Empagliflozin significantly reduced blood glucose levels, decreased oxidative stress, alleviated activated gliosis and lipid peroxidation, and improved retinal barrier integrity. The drug also activated the Nrf2/HO-1 pathway, reducing oxidative stress and protecting retinal structure.

Conclusions: Empagliflozin, by inhibiting SGLT2, improving metabolic dysregulation, reducing oxidative stress and activating protective pathways, effectively attenuates diabetic retinopathy in mice, suggesting its potential as a therapeutic agent for early intervention in diabetic retinopathy.

Abstract No.: 207843**The Retina-Body Axis: Proteomic Mechanisms Linking Oculomics and Clinical Traits in an Aging Population***First Author: Wei ZHANG**Co-Author(s): Mingguang HE, Yu HUANG, Shunming LI, Jing LIU, Honghua YU*

Purpose: To elucidate phenotypic connections within the retina-body axis and identify the molecular mechanisms that mediate them.

Methods: We leveraged the homogeneous Canton 70s Alumni Cohort (N=258 females aged ~70 years) to minimize socio-demographic confounding factors. Relationships between oculomics (derived from fundus images) and clinical traits were analyzed at macro and micro levels. Plasma proteomics were integrated with oculomic/clinical data to elucidate underlying mechanisms. Associations were assessed using linear mixed-effects models, sparse canonical correlation analysis (sCCA), and permutational multivariate analysis of variance (PERMANOVA). Weighted gene co-expression network analysis (WGCNA) identified

proteomic modules linked to both oculomics and clinical features.

Results: A total of 116 significant associations existed between oculomics and clinical features ($p < 0.05$). sCCA revealed a key phenotypic retina-body axis driven by cup height (oculomic) and lymphocyte count (clinical; $r = 0.519$, $p = 0.013$). Aging differentially impacted retinal features in clinical subgroups (e.g., altered arterial tortuosity density trajectories in dyslipidemia; p for interaction = 1.99×10^{-2}). WGCNA identified proteomic modules co-associated with oculomics and clinical features, with 57 key proteins overlapping between key modules (e.g., Sex hormone-binding globulin, Rheumatoid factor RF-IP4, Fibulin-1).

Conclusions: This study establishes phenotypic and molecular connections underlying the retina-body axis in an aging female cohort. Oculomics were linked to a range of clinical traits, including inflammation, hematological parameters, blood lipid profiles, renal/liver function, and disease status. Circulating proteins emerged as potential mechanistic mediators bridging retina and systemic health. Integrating oculomics with proteomics advances the discovery of clinically relevant biomarkers for early detection and monitoring of systemic diseases.

Abstract No.: 200478**Utility of Thyroid Stimulating Immunoglobulin Assays for Thyroid Eye Disease Diagnosis and Grading: Systematic Review and Meta-Analysis***First Author: Yuk Lam CHONG**Co-Author(s): Kam Lung CHONG, Ka Hei LAI, Charmaine LAU, Chi Pui PANG, Chee Yung THAM*

Purpose: Thyroid stimulating immunoglobulin (TSI) is pivotal in thyroid eye disease (TED) pathogenesis and serves as a biomarker for TED activity and severity. This study evaluated the diagnostic accuracy of TSI assays for TED diagnosis, activity, and severity grading.

Methods: Original studies in patients with TED examined with TSI assays with clinical diagnosis (Ocular signs, radiological imaging, European Group on Graves' Orbitopathy [EUGOGO] guidelines, or clinical activity score as reference standards) were eligible. PubMed, Embase, CENTRAL, Web of Science, and Scopus were searched. Meta-analyses were performed using a hierarchical random-effects model. Risk of bias and applicability concerns were assessed by QUADAS-2.

Results: Thirteen studies (1,887 TED patients) were included. For TED diagnosis against all controls, pooled sensitivity was 0.89 (95%CI:0.78–0.95), specificity 0.87 (95%CI:0.60–0.97), and AUC 0.94. For active and moderate-to-severe/severe TED, sensitivity was 0.97 (95%CI:0.84–0.99) & 0.99 (95%CI:0.85–1.00), specificity was 0.33 (95%CI:0.11–0.66) & 0.18, (95%CI:0.08–0.36), AUC 0.85 & 0.62, respectively. In Fagan plot analysis for

TED, active, and moderate-to-severe/severe diagnoses, post-positive probabilities were 63%, 32%, and 29%, while post-negative probabilities were 3%, 3%, and 1%, respectively. Nine studies had high risk of bias in patient selection domain and there were no concerns regarding applicability.

Conclusions: TSI assays exhibit excellent diagnostic performance for TED diagnosis and superior accuracy for grading activity than severity. However, low specificity in disease classifications indicates higher likelihood of misclassification.

Abstract No.: 208555

A Gain-of-Interaction Mechanism of AFG3L2 F175S Mutation Misguides PHB2-Dependent OXA1L Degradation in Dominant Optic Atrophy

First Author: Xiuxiu **JIN**

Co-Author(s): Lei **BO**

Purpose: Dominant optic atrophy (DOA) is a mitochondrial neurodegenerative disorder often caused by mutations in AFG3L2, a key m-AAA protease subunit that maintains mitochondrial protein homeostasis. Beyond DOA, AFG3L2 mutations are implicated in a spectrum of other neurodegenerative diseases, underscoring its critical role in neuronal maintenance. This study aims to confirm the pathogenic role of the AFG3L2 F175S mutation in DOA and elucidate its mechanism in disrupting mitochondrial morphology and function.

Methods: AFG3L2F174S/+ mice (orthologous to human F175S) were generated via CRISPR/Cas9 and phenotyped using optical coherence tomography, histopathology, and visual evoked potentials. Mitochondrial morphology, respiration function, reactive oxygen species (ROS), and membrane potential were analyzed in vivo and in vitro. Proteomic profiling, co-immunoprecipitation, and AlphaFold 3-based modeling identified aberrant protein interactions. Functional validation included immunofluorescence, blue native polyacrylamide gel electrophoresis (BN-PAGE), and rescue experiments with OXA1L overexpression. Molecular docking and long-timescale molecular dynamics simulations were used to define the tripartite AFG3L2-PHB2-OXA1L complex.

Results: AFG3L2F174S/+ mice exhibited retinal ganglion cell loss, reduced retinal thickness, and impaired visual nerve conduction. Abnormal mitochondrial morphology and elevated ROS were observed in the retinas of AFG3L2F174S/+ mice as well as AFG3L2F175S/+ human cells. Proteomic, co-IP, and structural analyses revealed that the F175S mutation enhanced AFG3L2-PHB2 binding by 41-fold, promoting

aberrant recruitment and degradation of OXA1L. This disrupted oxidative phosphorylation and mitochondrial membrane potential. Molecular dynamics simulations identified a stepwise mechanism in which PHB2 docks OXA1L and delivers it to the mutant protease core. OXA1L overexpression restored oxidative phosphorylation capacity, while PHB2 depletion abolished mutant-induced OXA1L destabilization, confirming PHB2's role as a substrate-recruitment scaffold.

Conclusions: We establish AFG3L2 F175S as a pathogenic driver of DOA via PHB2-mediated proteotoxic degradation of OXA1L, directly linking mitochondrial proteostasis failure to optic neuropathy. The AFG3L2-PHB2-OXA1L axis provides a mechanism framework for optic neuropathies and positions OXA1L stabilization as a potential therapeutic target to preserve mitochondrial function in DOA.

Abstract No.: 205558

An Eye Nutraceutical Formulation Effect on Functional Vision Profile in High Myopia: A Pilot Clinical Trial

First Author: Ling **LU**

Co-Author(s): Bo-yie **CHEN**, Wen-bin **CHEN**, Jui-hsin **HUNG**, Tzu-ying **SUN**

Purpose: High myopia leads to various visual challenges that can significantly affect comfort and quality of life if left unmanaged. Corrective lenses are not fully effective in slowing retinal dysfunction, so nutraceutical supplements are often used to support eye function in those affected.

Methods: This study evaluates a nutraceutical formulation rich in L-Arginine, Lutein, Zeaxanthin, Astaxanthin, and Zinc gluconate to improve vision performance in individuals with myopia. A comparative analysis of functional vision improvement in individuals with high myopia versus those with low myopia.

Results: An 8-week clinical trial was conducted with 35 individuals diagnosed with myopia, consisting of 16 participants with low myopia and 19 with high myopia. After consuming the nutraceutical formulation under bright exam conditions, the percentage of individuals in the low myopia group with distance BCVA improvements increased by 18.8% (the log MAR change over 0.1), compared to a 42.1% increase in the high myopia group. Under dim conditions, the low myopia group experienced a 12.5% increase, and the high myopia group experienced a 15.8% increase. Particularly under dim conditions, the high myopia group experienced a 42.1% increase in visual contrast sensitivity function (the AUC change over 20). In contrast, the low myopia group showed only a 6.2% increase.

Conclusions: These findings suggest that this nutraceutical formulation may enhance retinal function

and improve visual performance in high myopia. A functional vision analysis highlights the key differences between the results of high myopia and low myopia, emphasizing the need for tailored nutraceutical treatment approaches.

Abstract No.: 208233

Association of GJD2 Polymorphisms With Myopia: A Systematic Review and Meta-Analysis

First Author: Sharon Shui Wan YEUNG

Co-Author(s): Li Jia CHEN, Yuelan GAO, Jason C. YAM

Purpose: To determine the association between GJD2 polymorphisms and myopia, as well as to summarize the published evidence on the hypothesized mechanisms of GJD2 that confer susceptibility to myopia development.

Methods: Literature search was conducted on PubMed, Cochrane Library, and Embase. The study was performed under the Preferred Reporting Items for Systematic Review and Meta-Analyses Statement PRISMA guidelines. The Newcastle-Ottawa Scale (NOS) and funnel plots were utilized for quality and publication bias assessment. Meta-analysis for pooled odds ratios with fixed or random effect models, with 95% confidence intervals, was presented with forest plots. Heterogeneities were quantified by Cochrane Q test and I² test. Subgroup analysis was performed to investigate heterogeneity. Sensitivity analysis was done to determine the robustness and reliability of pooled results. All statistical analyses were performed by the RevMan (ver. 5.4) software.

Results: A total of 16 studies were included for qualitative synthesis, and a total of 9268 subjects from 9 studies were included in the meta-analysis. Statistically significant associations were observed between rs524952 and myopia as well as high myopia. A dose-response relationship in the effect of risk allelic dosage was also detected.

Conclusions: Our present data suggested a significant association between GJD2 polymorphisms and myopia. GJD2 plays a role in the retinal signaling pathway, which may influence axial length elongation, and GJD2 polymorphisms potentially confer risk to myopia by altered gene expression.

Abstract No.: 202594

Clinical Application of EEG-ML Integration Models in the Diagnosis and Treatment Outcome Prediction of Amblyopia

First Author: Qiuying LI

Co-Author(s): Lei FENG, Yunsu HE, Jinrong LI, Xuan QIU, Yun WEN, Zixuan XU, Qingqing YE, Wentong YU, Yudan ZHONG, Yusong ZHOU

Purpose: Traditional psychophysical metrics have limited value in predicting perceptual learning (PL) efficacy in amblyopia. Electroencephalography (EEG) objectively evaluates neural activity, while machine learning (ML) enables high-dimensional data analysis. This study developed an EEG-ML Integration Model (EMIM) to assist amblyopia diagnosis and predict PL outcomes.

Methods: EEG data and visual function metrics (e.g., visual acuity, contrast sensitivity, and stereopsis) were collected from 176 children with amblyopia (98 anisometropic and 78 deprivation) and 22 healthy controls, all recruited from Zhongshan Ophthalmic Center, Sun Yat-sen University. Resting-state EEG and steady-state visual evoked potentials (SSVEPs) were recorded with a 64-channel EEG system. In the amblyopia cohort, 140 participants completed a 14-day monocular perceptual learning program using a cutoff spatial frequency task, followed by a 3-month follow-up. Machine learning algorithms were applied to (1) classify amblyopia versus controls based on EEG features, including resting-state alpha peak activity and SSVEP small-world network properties, and (2) predict PL outcomes by stratifying patients into responder and non-responder groups to identify EEG biomarkers of treatment efficacy.

Results: For diagnostic classification, the EMIM model based on SSVEP features achieved an accuracy of 99.32% (AUC = 0.99) in classifying amblyopia and healthy controls. For treatment outcome prediction, the EEG-based model classified patients into responder and non-responder groups with 85.71% accuracy (AUC = 0.92). Compared with unimodal models, a multimodal ML model combining EEG features with visual function measures further improved predictive performance.

Conclusions: EMIM provides an objective, reliable tool for amblyopia diagnosis and PL outcome prediction, supporting precision diagnosis and individualized therapy.

Abstract No.: 207792

Clinical and Genetic Findings in a Chinese Family of Autosomal Recessive Retinitis Pigmentosa Associated With Compound Heterozygous Mutations in NMNAT1

First Author: Yuen Ting HO

Co-Author(s): Li Jia CHEN, Jason C. YAM, Jun YU

Purpose: To investigate the phenotypic association between compound heterozygous NMNAT1 mutations and autosomal recessive retinitis pigmentosa (ARRP) in a Chinese family.

Methods: After identifying two NMNAT1 mutations in the proband by panel-based next-generation sequencing (NGS), her family members (n=4), 50 unrelated patients with different inherited retinal dystrophies (IRD), and 100 healthy control subjects were recruited for comprehensive ophthalmic examinations and screening for NMNAT1 mutations using panel-based NGS or direct Sanger sequencing.

Results: The proband carrying the two heterozygous NMNAT1 mutations, c.196C>T (p.Arg66Trp) and c.710G>A (p.Arg237His), was presented with profound visual impairment and typical RP fundus abnormalities. The proband's two sisters and both parents carried one of the two mutations, but they did not exhibit any RP signs or symptoms. The two mutations were not detected in the 50 unrelated IRD patients nor in 100 healthy control subjects.

Conclusions: This study revealed a novel combination of compound heterozygous mutations in NMNAT1, c.196C>T (p.Arg66Trp) and c.710G>A (p.Arg237His), that can cause ARRP. Neither mutation alone caused RP, suggesting that they lead to loss of function of the gene.

Abstract No.: 202133

Cortical Functional Abnormalities in Binocular Hidden Deprivation Amblyopia

First Author: Zixuan XU

Co-Author(s): Lei FENG, Yunsi HE, Jinrong LI, Qiuying LI, Xuan QIU, Qingqing YE, Wentong YU, Junpeng YUAN, Yudan ZHONG, Yusong ZHOU

Purpose: Previous studies suggested that inherited retinal dystrophies (IRDs) and idiopathic congenital nystagmus (ICN), may cause binocular hidden deprivation amblyopia, affecting visual cortex development and visual function. This study investigated cortical functional abnormalities in BHDA patients, including IRDs and ICN.

Methods: Twenty-one patients with IRDs or ICN, 21 with binocular deprivation amblyopia (BDA), 18 with binocular refractive amblyopia (BRA), and 21 age-matched healthy controls underwent ophthalmic examinations including refraction, refraction, best-corrected visual acuity, contrast sensitivity, stereopsis,

and resting-state EEG. Power spectral density (PSD) across frontal, parietal, temporal, occipital regions in delta, theta, alpha, beta bands and source-level functional connectivity (FC) using Phase Locking Value were analyzed.

Results: All amblyopia groups showed significantly reduced visual function compared to healthy controls, with no subgroup differences. Regional PSD analysis revealed decreased delta-band PSD in left and right frontal and temporal regions in BDA; decreased alpha-band PSD in left frontal, central frontal, and left temporal regions in BHDA; and decreased beta-band PSD in left temporal region in BRA. Source-level FC analysis identified pars opercularis and right rostral middle frontal gyrus as commonly affected regions. BHDA showed intra-hemispheric alterations primarily in frontal, parietal, occipital cortices; BDA exhibited fewer but stronger cross-hemispheric alterations; BRA demonstrated widespread moderate-strength changes involving frontal, cingulate, occipital cortices.

Conclusions: IRDs and ICN patients exhibited both visual and cortical abnormalities during the critical period. Visual impairment may result from hidden deprivation amblyopia and structural abnormalities.

Abstract No.: 205599

Effect of Light Barrier and Type of Refractive Error on the Performance of a Portable Wavefront Aberrometer-Based Auto Refractometer

First Author: Maneck NICHOLSON

Co-Author(s): Shonraj BALLAE, Jyothi DAMANI, Ritik GUPTA

Purpose: Accurate and accessible autorefractors are essential for refractive error assessment, particularly in resource-limited settings. This study evaluates the accuracy and reliability of Instaref R20 with a light barrier (Instaref R20 LB) compared to a tabletop autorefractor (AR) and subjective refraction (SR) in an adult population.

Methods: A prospective study was conducted at a tertiary eye institute in Mumbai, enrolling 200 adults (mean age: 44.33 ± 13.97 years). All the participants underwent a comprehensive eye examination including objective refraction, subjective acceptance, anterior and posterior segment evaluation. Non-cycloplegic refraction was assessed using Instaref R20, Instaref R20 LB, AR, and SR. Agreement between methods was analysed using Bland-Altman plots, assessing power vector components (M, J0, J45). Statistical comparisons were performed using the Wilcoxon signed-rank test.

Results: Instaref R20 LB demonstrated strong agreement with SR (M: 0.10D, p = 0.13; J0: -0.05D, p = 0.05; J45: 0.01D, p = 0.44), while Instaref R20 showed slight variance (M: 0.17D, p < 0.001). Agreement within ±0.50D of SR was 64.64% (M), 85.35% (J0),

and 89.39% (J45). Under bright illumination, Instaref R20 failed to capture readings in six cases, whereas Instaref R20 LB obtained stable measurements in all participants, demonstrating superior reliability in bright environments. Subgroup analysis showed higher accuracy in myopic eyes, while AR exhibited significant deviations in hyperopes.

Conclusions: The Instaref R20 LB improves measurement accuracy and reliability, particularly under bright illumination. Its strong agreement with SR and portable design make it a viable tool for refractive error assessment in resource-constrained settings.

Abstract No.: 200833

Epidemiological Trends and Risk Factor Analysis Reveal the Changing Landscape of Cataracts in an Aging Global Population

First Author: Tianyu **WANG**

Co-Author(s): Wuliang **LI**, Yinan **WU**, Xiaoping **XU**

Purpose: To analyze global cataract burden trends and associated risk factors from 1990-2021, and to predict future development patterns.

Methods: Based on the Global Burden of Disease (GBD) 2021 data, we analyzed cataract prevalence, disability-adjusted life years (DALYs), and age-standardized rates across 204 countries and territories. We examined temporal trends, geographical variations, and associations with socio-demographic index (SDI). Future trends were projected using Bayesian Age-Period-Cohort (BAPC) modeling.

Results: Global cataract cases increased by 137.58% from 42.33 million to 100.57 million during 1990-2021, while age-standardized prevalence remained stable (EAPC: 0.21). DALYs increased from 3.42 to 6.55 million, though DALY rates decreased (EAPC: -0.48). Middle SDI regions showed the highest burden in 2021 (35.87 million cases). South Asia consistently demonstrated the highest regional burden, while East Asia showed the most significant growth (247.16%). Women experienced a higher cataract burden, primarily due to longer life expectancy and higher metabolic disease incidence. Major risk factors included metabolic risks (27.60%), elevated fasting plasma glucose (23.75%), and air pollution (20.00%).

Conclusions: While population aging and increased life expectancy continue to drive global cataract burden, significant regional disparities persist. Middle-income regions face dual challenges of aging populations and limited healthcare resources. Targeted interventions are needed to improve healthcare accessibility and address socioeconomic inequalities.

Abstract No.: 201390

Extending Treatment Duration in Perceptual Learning for Amblyopia

First Author: Yusong **ZHOU**

Co-Author(s): Yunsi **HE**, Jinrong **LI**, Qiuying **LI**, Yangfei **PANG**, Xuan **QIU**, Zixuan **XU**, Ying **YAO**, Qingqing **YE**, Wentong **YU**, Yudan **ZHONG**

Purpose: This study evaluated whether extending the duration of perceptual learning (PL) could yield sustained therapeutic benefits in amblyopia management.

Methods: A total of 100 patients had completed 6 months of PL based on the lateral masking paradigm. Ninety-three participants had at least one follow-up assessment at either 3 or 6 months in addition to baseline data and were included in the analysis. Missing data was handled using multiple imputation by chained equations. Longitudinal changes in visual function—including best-corrected visual acuity (BCVA), contrast sensitivity function (CSF), and stereopsis—were evaluated using a linear mixed-effects model. To identify factors associated with improvements in BCVA and area under the log CSF (AULCSF), multivariable linear regression models were constructed.

Results: A total of 93 participants were enrolled, with a mean age of 15.3 ± 8.3 years. Among them, 8 patients had isoametropic amblyopia, 63 had anisometropic amblyopia, 12 had strabismic amblyopia, 1 had deprivation amblyopia, and 9 had mixed amblyopia. Analysis revealed significant and sustained improvements in both BCVA and AULCSF. Stereopsis also improved following 3 months of PL training. Further extension of the training duration did not result in additional significant gains in stereopsis. Initial baseline visual function and history of occlusion therapy were the primary factors associated with the improvement of BCVA and AULCSF.

Conclusions: PL treatment can improve the visual function of amblyopia patients. However, considering the potential ceiling effect, a 6-month treatment period may represent an optimal duration.

Abstract No.: 207778

Genetic and Health Lifestyle for Diabetic Retinopathy and Long-Term Risk of Incident Dementia Subtypes

First Author: Li Jia **CHEN**

Co-Author(s): Yuelan **GAO**, Clement C. **THAM**, Jianmin **XU**, Jason C. **YAM**

Purpose: This study aims to investigate the effects of diabetic retinopathy (DR) on dementia subtypes and their underlying genetic mechanisms, and to evaluate the potential protective role of a healthy lifestyle.

Methods: Data from over 350,000 UK Biobank participants were analyzed to assess associations

between DR and dementia subtypes. Cross-trait genetic analyses identified shared loci and enriched pathways. A polygenic risk score (PRS) for DR and a healthy lifestyle score (HLS) were used to examine their interactions on dementia risk. MRI data were analyzed to assess lifestyle effects on neuroimaging phenotypes in high genetic risk individuals.

Results: Over a median 12.40-year follow-up, 6,039 cases developed dementia. DR was associated with increased vascular dementia (VaD; HR = 2.31, $P < 0.001$) and Alzheimer's disease dementia (ADD; HR = 1.52, $P = 0.028$) risk. Cross-trait analyses identified 21 shared loci, with 19q13.32 showing colocalization for both DR-ADD and DR-VaD. Gene-level analyses identified 62 pleiotropic genes, including APOE, TOMM40, FTO, and TCF7L2, enriched in metabolic and vascular pathways. High DR PRS and unfavorable lifestyle increased VaD and ADD risk, while HLS attenuated genetic susceptibility to VaD ($P = 0.001$). Higher DR PRS and lower HLS were associated with greater white matter hyperintensity, with minimal gray matter or hippocampal differences.

Conclusions: DR increases the risk of dementia, particularly VaD and ADD, potentially via metabolic and vascular pathways involving APOE, TOMM40, FTO, and TCF7L2. Genetic susceptibility to DR elevates later-life dementia risk, which can be mitigated by an early healthy lifestyle, particularly for vascular-related dementia.

Abstract No.: 200826

Global, Regional, and National Burden of Glaucoma From 1990 to 2021: A Cross-Sectional Study

First Author: Xiaoping **XU**

Co-Author(s): Yuanbo **LIANG**, Xianyao **PENG**, Tianyu **WANG**

Purpose: To provide an assessment of the prevalence, and disability-adjusted life years (DALYs) associated with glaucoma from 1990 to 2021.

Methods: In this cross-sectional study, epidemiologic data were gathered from the Global Burden of Disease (GBD) 2021 in 204 countries and 21 regions.

Results: In 2021, the global number of glaucoma cases were 7.59 million (95% uncertainty intervals [UI], 6.52-8.92). From 1990 to 2021, glaucoma cases surged by 86.33% (95% uncertainty interval [UI], 79.33%-93.60%); Glaucoma-associated DALYs increased from (0.47 million; 95% UI, 0.32-0.65) to (0.76 million; 95% UI, 0.53-1.05); The prevalence rate decreased from 116.29 (95% UI, 100.81-136.30) to 90.12 (95% UI, 77.78-105.49) per 100 000 population; The glaucoma-associated DALYs rate declined from 13.37 (95% UI, 9.36-18.50) to 9.05 (95% UI, 6.29-12.46) per 100 000 population. Among the 5 sociodemographic index (SDI) regions, the middle SDI region had the highest number

of glaucoma-associated DALYs in 2021. Regionally, Southern Asia had the largest decrease in prevalence rate (EAPC, -1.44, 95% UI, -1.56 to -1.32). Among 204 countries, Iran (Islamic Republic of) had the highest rate of glaucoma-associated prevalence (457.25 per 100 000 population, 95% UI, 396.38-532.10), Botswana had the highest rate of glaucoma-associated DALYs (62.24 per 100 000 population, 95% UI, 42.30-89.43).

Conclusions: Although global prevalence and DALYs rates have decreased, the burden in low SDI and middle SDI regions remains high. These data provide useful references for policy makers to strengthen the management strategies.

Abstract No.: 202616

Hyperuricemia Leads to Inflammation and Apoptosis of Retinal Ganglion Cells by Activating NF- κ B Signaling Pathway

First Author: Danyi **QIN**

Co-Author(s): Jiaoyue **HU**, Zuguo **LIU**

Purpose: To investigate the effect of hyperuricemia (HUA) to retinal ganglion cells (RGCs) and explore its possible mechanism.

Methods: A HUA-like mouse model was established by daily intraperitoneal injections of potassium oxonate and a high-purine diet for 2 and 4 weeks. Body weight, intraocular pressure (IOP), and serum uric acid (UA) levels were measured. Retinal structure and function were assessed using fundus photography, optical coherence tomography (OCT), and electroretinography (ERG). Histological staining and molecular analyses were performed to evaluate retinal changes. Additionally, primary retinal neurons (PRNs) were isolated to simulate RGCs in vitro, enabling a comprehensive assessment of UA-induced cellular alterations.

Results: A decrease in body weight and an increase in IOP and serum UA levels were found in the modeling mice. White deposits were observed in the vitreous and retina, along with thinning of the inner retinal layer and RGC loss. The modeling mice also showed retinal functional impairment, presented as a significant decrease in photopic negative response (PhNR) amplitudes. Increased levels of inflammatory and apoptotic factors were detected in the retinas of the modeling mice. In vitro, HUA led to decreased cell viability and synaptic connections, increased inflammatory and apoptotic levels of PRNs. Activation of the NF- κ B pathway was identified as a key mechanistic driver.

Conclusions: These findings demonstrated that HUA could induce structural and functional damage to RGCs via apoptosis and inflammatory processes, highlighting the importance of retinal health monitoring in HUA patients.

Abstract No.: 202579**Study on the Mechanisms Related to Retinal Aging in Mice Exposed to Blue Light Irradiation***First Author: Feng KE**Co-Author(s): Hu JIAOYUE, Wei MINGYAN, Chen QIAN, Liu ZUGUO*

Purpose: To investigate the effects of blue light exposure on the structure and function of the mouse retina and to reveal the potential molecular mechanisms underlying the induction of age-related retinal lesions from multiple dimensions, including cellular senescence, neuroinflammation, and fibrosis.

Methods: Male C57BL/6J mice were randomized to control or blue-light groups. Experimental mice received 1% atropine to maintain mydriasis and were exposed to 460 nm blue light (1102.83 ± 89.31 lux) for 16 h/day; controls received atropine without blue light. Assessments at 1, 2, 3, and 4 weeks included fundus photography, FFA, and OCT, followed by enucleation for HE and immunofluorescence (fibronectin, vimentin, α -SMA, collagen I, Iba1) and Western blot of retina and RPE/choroid (Iba1, GFAP, α -SMA, vimentin, p53, p21).

Results: With increasing blue-light exposure, fundus imaging showed mottled RPE changes, and OCT revealed progressive ONL/IS—OS thinning with thickening of the RPE/Bruch's complex. HE confirmed photoreceptor thinning, disorganization, and irregular RPE, while IF showed increased fibronectin, collagen I, vimentin, and α -SMA in the subretinal space/RPE, consistent with fibrosis and EMT. Western blots demonstrated upregulated p53/p21, elevated Iba1 (microglial activation), and a time-dependent rise in vimentin (all $P < 0.05$), aligning with imaging and histology.

Conclusions: Under sustained atropine-induced mydriasis, daily 16-hour blue-light exposure elicited AMD-like retinal aging changes in mice—photoreceptor loss, RPE dysfunction, subretinal fibrosis, and chronic inflammation. These effects likely arise from the blue light-driven activation of the p53/p21 senescence pathway in retinal cells, leading to microglial and Müller cell-mediated neuroinflammation and RPE EMT, which promotes subretinal fibrosis.

Abstract No.: 209774**The Impact of Defocus and Vision Therapy on Progressive Myopia in Children***First Author: Qiwen CHEN*

Purpose: Background: Progressive myopia, especially in children, is a significant concern due to its potential to lead to severe vision impairment. LJM, a 7-year-old boy, presented with a complaint of rapid myopia progression despite wearing single vision glasses for 1.5 years. His medical history included a family history of high myopia on his father's side. After switching to

defocus lenses, he experienced symptoms such as near double vision, eye strain, and headaches, leading to a referral to our clinic.

Methods: Case Summary: LJM's refractive history showed an increase in myopia from June 2022 to May 2023. His unaided visual acuity was poor, and manifest refraction after cycloplegia confirmed a significant myopia with astigmatism. He exhibited signs of external heterophoria for both distance and near, along with insufficient accommodation and convergence, and poor accommodative facility. The diagnosis included exophoria, accommodative and convergence insufficiency, and progressive myopia.

Results: The treatment plan involved strong defocus spectacles to control myopia progression, prisms to alleviate symptoms of double vision and visual fatigue, and vision training to improve oculomotor skills. A new prescription was provided with defocus lenses and prisms, along with specific lens options to optimize peripheral defocus and central optical zone size.

Conclusions: Discussion: After three months, LJM's myopia and axial length showed a slight progression, but his symptoms improved with home-based vision training. At the six-month mark, the decision was made to remove the prisms and replace the glasses, reflecting the dynamic nature of myopia management in children. The axial length changes were minimal, indicating a potential stabilizing effect of the intervention.

Abstract No.: 205159**Tumour Angiogenesis in Retinoblastoma Is Regulated by Growth Hormone-Releasing Hormone Receptor***First Author: Ivan KONG**Co-Author(s): Wai Kit CHU, Chi Pui PANG, Clement C. THAM, Jason Cheuk-sing YAM, Linbin ZHOU*

Purpose: To elucidate the role of the growth hormone-releasing hormone receptor (GHRH-R) in regulating angiogenesis in retinoblastoma (RB).

Methods: Y79 RB cells were used as an in vitro model. The GHRH-R agonist MR-409 and antagonist MIA-602 were applied to stimulate or inhibit GHRH-R signalling, respectively. Western blotting assessed protein expression of angiogenesis-related targets, including vascular endothelial growth factor (VEGF) and protein kinase B (AKT). Immunofluorescence staining detected intracellular VEGF, qPCR measured VEGF-A, VEGF-C, and VEGF-D mRNA levels, and ELISA quantified secreted VEGF in culture media.

Results: MR-409 increased VEGF and AKT protein levels in Y79 cells in a dose-dependent manner, whereas MIA-602 decreased VEGF protein expression. Immunofluorescence confirmed VEGF expression in Y79 cells. VEGF-A, VEGF-C, and VEGF-D mRNA levels were upregulated by MR-409 and downregulated by MIA-602 in a dose-dependent manner. ELISA showed

increased VEGF secretion following MR-409 treatment, while MIA-602 reduced VEGF release into the culture medium.

Conclusions: GHRH-R signalling promotes angiogenesis in retinoblastoma by increasing VEGF expression and activating downstream effectors such as AKT. Pharmacologic antagonism with MIA-602 suppresses these proangiogenic signals, supporting GHRH-R as a potential therapeutic target to modulate tumour angiogenesis in RB.

Augmented Intelligence, Human-In-The-Loop Learning and Multimodal Comprehensive Glaucoma AI

First Author: Prasanna Vekatesh RAMESH

Purpose: To introduce the development of the first multimodal, explainable AI system for glaucoma diagnostics that seamlessly integrates augmented intelligence, human-in-the-loop learning, and cutting-edge imaging technologies, offering a cost-effective, clinically interpretable solution suitable for both neophytes and seasoned clinicians.

Methods: A neural network-based AI model was trained on curated, highly labeled multimodal datasets. Human-in-the-loop supervision refined predictions, addressed the black-box phenomenon, and provided actionable insights. The system leveraged multiple imaging modalities, including Fundus photography, AS-OCT, Scheimpflug, Anterior, and UBM, incorporating strategies for both big data and small data utilization.

Results: The AI system demonstrated robust diagnostic accuracy across all modalities. Integration of human-guided feedback enhanced reliability, interpretability, and clinician confidence, rendering the predictions transparent and actionable for routine practice.

Conclusions: By synergizing human expertise with a multimodal AI framework, this innovative platform provides a comprehensive, explainable, and next-generation glaucoma diagnostic tool. It empowers clinicians, from neophytes to experts, with cutting-edge decision support, potentially improving patient outcomes and advancing the standard of ophthalmic care.

Abstract No.: 201717

Breakthrough Innovations in Corneal and Refractive Surgery: Enhancing Vision and Patient Outcomes

*First Author: Bharat GURNANI
Co-Author(s): Kirandeep KAUR*

Purpose: To provide an overview of the most significant advancements in corneal care over the past 2–3

years, highlighting innovations that have transformed diagnostic and therapeutic practices.

Methods: A narrative review of recent literature and clinical innovations was undertaken, focusing on surgical techniques, diagnostic modalities, regenerative strategies, and technological integration in corneal disease management.

Results: Recent years have seen a paradigm shift in corneal care. Surgical innovations such as corneal allogenic intrastromal ring segments, ultrathin Descemet stripping endothelial keratoplasty (DSEK), Descemet membrane endothelial keratoplasty (DMEK), and selective endothelial ectomy for Peters anomaly have improved visual outcomes and reduced complications. Advances in cross-linking, including C3R for ultrathin corneas, have expanded therapeutic options for keratoconus. Diagnostic evolution includes refined modalities and the application of artificial intelligence to enhance corneal imaging accuracy. In infectious keratitis, progress in Pythium diagnosis and management has significantly improved recognition and outcomes. Regenerative approaches, including cultured endothelial cells, bioengineered corneal tissue, and biosynthetic corneas, are bridging gaps in donor availability and eye banking practices, while innovations in graft utilization ensure more effective tissue use. The emergence of smart contact lenses and biosensors has further expanded the role of the cornea as both a therapeutic and diagnostic interface.

Conclusions: The convergence of surgical refinement, regenerative medicine, AI-based diagnostics, and bioengineering has redefined corneal care. These advancements not only enhance patient outcomes but also expand therapeutic horizons, offering hope for previously untreatable conditions.

Abstract No.: 205059

Build Your Own Artificial Intelligence Software – for FREE! To Diagnose Retinal Diseases

First Author: Anju KURIAKOSE

Purpose: Artificial Intelligence (AI) can revolutionize healthcare, but clinicians often find it inaccessible. This study shows how to build a free, no-code AI to detect retinal diseases from fundus photographs.

Methods: Retinal fundus images were divided into training and test sets. Using Google's free Teachable Machine, an AI algorithm was trained on the training

images and then validated on the test images. Accuracy was measured as the proportion of correctly classified photos.

Results: The AI detected retinal diseases with 80–99% accuracy, depending on the test images. Once trained, it classified new fundus photos within seconds, without requiring any programming skills.

Conclusions: Teachable Machine allows clinicians to quickly create free, no-code AI models for retinal disease detection. These models are fast, accurate, and accessible, empowering healthcare professionals to experiment with machine learning and bring AI into clinical practice.

Abstract No.: 205374

Crafting Tomorrow's Vision: My Innovation Story in the World of Ophthalmology

First Author: Shivam **GUPTA**

Co-Author(s): Devendra **MAHESHWARI**, Nimrita **NAGDEV**, Madhavi **PILLAI**

Purpose: to ignite the fire of innovation in all ophthalmologists.

Methods: From the moment I first looked through an ophthalmoscope, I was captivated by the intricate world of the human eye, yet equally struck by the unmet needs in patient care. This initial fascination quickly evolved into a burning desire to do more than just treat; it became a quest to innovate. My journey has been one of relentless curiosity, transforming observed challenges in the clinic into fertile ground for new solutions. From late nights spent sketching designs and poring over research papers to collaborating with brilliant minds across disciplines, each step has been fueled by the profound impact I've witnessed: restoring sight, improving lives, and pushing the boundaries of what's possible in ophthalmology.

Results: Video Synopsis: This narrative traces my path from its inception, detailing the challenges I overcame and the triumphs that ultimately benefited countless lives.

Conclusions: Every challenge is an invitation to create, every unmet need a spark for discovery. Through innovation, we don't just build devices or develop techniques — we build hope. The future of ophthalmology belongs to those who dare to imagine differently. Let's keep transforming today's limitations into tomorrow's breakthroughs.

Abstract No.: 201836

Innovations and Recent Advances in Pediatric Ophthalmology: Transforming Eye Care for Children

First Author: Kirandeep **KAUR**

Co-Author(s): Bharat **GURNANI**

Purpose: To summarize recent innovations and advances in pediatric ophthalmology that are transforming diagnosis, treatment, and outcomes in childhood eye diseases.

Methods: A comprehensive review of contemporary literature and clinical developments in pediatric ophthalmology was undertaken, focusing on diagnostic modalities, surgical techniques, therapeutic innovations, and future directions.

Results: The past few years have witnessed remarkable progress in pediatric ophthalmology. Cutting-edge diagnostic tools, including advanced imaging systems and artificial intelligence-driven platforms, are enabling earlier and more accurate detection of pediatric eye diseases. Surgical advancements such as microinvasive glaucoma surgery (MIGS) are expanding treatment options for childhood glaucoma, while refinements in congenital cataract surgery and postoperative rehabilitation continue to improve visual outcomes. In pediatric retina, significant progress has been made in retinopathy of prematurity (ROP) screening and management, alongside the emergence of gene therapy for inherited retinal diseases. Novel approaches to amblyopia therapy, including digital platforms and interactive treatment methods, are reshaping management strategies. Telemedicine has broadened access to pediatric vision care, particularly in underserved populations. Emerging treatments for pediatric uveitis and the integration of bioengineered solutions underscore the field's dynamic innovation.

Conclusions: Innovations in diagnostics, surgical techniques, therapeutics, and digital health are revolutionizing pediatric ophthalmology. These advances not only address current clinical challenges but also create new opportunities for improving children's eye health. Continued multidisciplinary collaboration and research are essential to translate these breakthroughs into sustained improvements in clinical practice and patient outcomes.

Abstract No.: 202477

One Tap for a Brighter World

First Author: Megha **G**

Purpose: Our video aims to throw light on how the visually impaired use smartphones and various smart phone apps that are available to help them.

Methods: Our video shows how smartphone can become the most powerful tool for the blind. It also shows various apps that can help the visually impaired.

The App store (for iOS) and Google play store (for Android phones) were searched with various keywords. WE have described few of the most popular and easy to use apps.

Results: The available apps can be broadly divided as 1) Eye drop reminders 2) Patient education 3) Testing apps 4) Apps for the visually disabled. However, the video mainly focuses on the last segment.

Conclusions: The apps for blind people especially those incorporating Artificial Intelligence (AI) can help them not only in their day-to-day activities but also to achieve greater heights. Knowledge about these accessibility features and apps can help us educate our blind patients live better. With smart phones being handy and used by everyone these days, helping our patients lead a brighter life is just "One tap away"!

Abstract No.: 201488

Ophthalmopreneur: An Ophthalmic Entrepreneur Innovating and Making Our Practice Easy

First Author: Neeraj ISRANI

Purpose: Entrepreneurship is the process of starting, managing, and growing a business, often involving innovation, risk-taking, and the creation of new products or services. We, as ophthalmologists, are great clinicians but have the brains of entrepreneurs since we come across so many day-to-day issues in our surgeries and clinical practice. What if we Ophthalmologists innovated against the day to day problems?

Methods: This video brings to light 3 problems in our day to day Surgical and Clinical practice and how we tackle them by innovating right from blue print to 3d Printing and making a marketable device and sharing it with our Ophthalmologists to make their life easy.

Results: We innovated the following devices: 1) slit lamp-assisted toric marker; 2) Autodrop: A Bluetooth-enabled application-based eye drop to improve compliance in patients; 3) Headzy: A novel Head Device Universal to Evert OT table to make the patient experience comfortable during ophthalmic surgery; 4) Inverse chopper.

Conclusions: Every ophthalmologist has an innovator and an entrepreneur within them. Innovate to survive.

Abstract No.: 201503

Universal Integrated Electronic Eyedrop Sleeve: A Novel Compliance Monitoring System in Glaucoma

First Author: Shruti MARU

Co-Author(s): Neeraj ISRANI

Purpose: Is there a potential role for the use of alerts or reminders at drop-taking times, using smart-

phone-enabled technologies? Purpose is to integrate technology that can register a successful drop delivery to the eye and communicate this information to both patients and providers.

Methods: Innovation and hospital based prospective study for validation. To check the efficacy of the device using a validated questionnaire before & after the use of the device. We conducted 86 eyes of 74 pts among Post operative patients and used a semi-structured questionnaire to assess patient-reported problems and adherence to medications. This is the questionnaire including demographics, cause of noncompliance, number of medications, duration of treatment etc.

Results: We compared the compliance rate before & after the use of the device and found significant improvement.

Conclusions: This innovative device emphasizes the importance of compliance and improves patient adherence.

3 Innovations on a Mission for Vision

First Author: Nivean M

Co-Author(s): Sridhar BARATAN, Sujatha MOHAN, Mohan RAJAN

Purpose: Management of an opacified PCIOL using 3 novel techniques for safe explantation of the opacified IOL followed by implantation of scleral supported intraocular lens.

Methods: A clear corneal incision was made, and opacified foldable PCIOL was brought to the anterior chamber with the bag. It was cut into multiple pieces with the novel high-frequency intraocular lens cutter attached to the phaco probe (innovation 1) and explanted through the 2.8 mm incision main port without distorting /extending the wound. The 23 G trochar is used as an AC maintainer at 7 o'clock (innovation 2). Using a 23G cutter through the side port, anterior vitrectomy is performed. The scleral-supported intraocular lens is planned using the CM T flex scleral-supported intraocular lens, a novel innovation for aphakia (innovation 3). It is a single-piece hydrophilic acrylic intraocular lens with 10-degree angulation and specialized T-shaped haptics.

Results: The post-operative BCVA in the right eye improved to 6/12, N10 in the first post-operative week. The cornea was clear, and the CM Tflex IOL was stable.

Conclusions: Severe opacification of the posterior chamber IOL causes vision loss. This can be effectively managed with the combination of the above innovative techniques to minimize the incision size and a well-stabilized scleral-supported intraocular lens.

Abstract No.: 204744

Anxiety- a Silent Battle, Anxiety Reduction in Cataract Patients

First Author: Kunal MANDLIK

Co-Author(s): Devika BHATTACHARYA

Purpose: Anxiety is one of the main reasons for a patient's uncooperativeness, leading to intraoperative complications. This video addresses the patient's anxiety during cataract surgery.

Methods: We performed a pilot study of 'Music therapy,' a randomized trial regarding the efficacy of intravenous midazolam. We assessed the role of 'Mediclowns' and a pre-operative counseling session describing a patient's surgical experience.

Results: We found that all these methods efficiently reduced the patient's anxiety.

Conclusions: All the above-mentioned methods of anxiety reduction helped in achieving good intraoperative cooperation for better safety and visual outcomes.

Abstract No.: 205496

Beyond the Scalpel: The Hidden Theatre of Cataract Surgery

First Author: Pradipta CHOWDHURY

Co-Author(s): Prakash CHOWDHURY

Purpose: To illuminate the indispensable yet often invisible roles of multidisciplinary theatre staff in cataract surgery, highlighting how their early-morning preparation, precision, and teamwork underpin surgical success and patient safety.

Methods: This short film employed direct observation and cinematic documentation of a full cataract surgery theatre workflow. Filming began at 07:00 with scrub nurses preparing intraocular lenses (IOLs) and phacoemulsification tips, and continued through the contributions of porters, floating nurses, cleaners, and sterile services technicians. Audio-visual storytelling combined natural theatre sounds with reflective staff monologues, capturing both technical processes and emotional perspectives.

Results: The film demonstrates that what patients perceive as a surgeon's single act of operating at 09:00 is in fact the culmination of coordinated efforts from a wider, often unrecognised team. Scrub nurses ensured sterility and readiness, porters provided comfort and logistical support, floating nurses prepared machines and medications, cleaners maintained infection control, and sterile services technicians sustained safety

beyond surgical hours. Together, these roles create the foundation for high-quality outcomes and patient trust.

Conclusions: Cataract surgery is not solely a surgeon's achievement but the collective product of dedicated theatre staff. By honouring their unseen contributions, this film reframes surgical success as a shared triumph, encouraging recognition, morale, and education for future ophthalmic care models.

Abstract No.: 202362

Enhancing Patient Safety: The Critical Role of Hand Hygiene in Eyecare

First Author: Samina ZAMINDAR

Purpose: Hospital-acquired infections affect 1 in 10 patients worldwide. In eye hospitals, hand hygiene is the cornerstone of infection control, lowering risks in both OPD and OR. However, resources to build HH awareness remain limited. Our work focuses on strengthening protocols by highlighting scientific evidence and addressing barriers to care.

Methods: The video covers essential hand hygiene practices—hand wash, hand rub, surgical scrub, and glove use—while addressing barriers like time, sink placement, and skin irritation with practical solutions. Using demonstrations, real scenarios, and myth-busting, it ensures clarity. It also highlights the key role of infection control nurses in audits and training to sustain protocols. The abstract can be presented as a 7-minute video or a poster.

Results: This video is the first standardised training tool for eye hospitals worldwide, improving hand hygiene practices. Early feedback shows greater awareness and compliance. Clear demonstrations reinforce correct techniques, while adoption of alcohol-based hand rubs and regular audits strengthen adherence, reducing cross-contamination and enhancing patient safety.

Conclusions: A structured hand hygiene program strengthens infection control in eye hospitals, supporting quality and accessible care. Ongoing education, readily available supplies, and regular audits drive lasting behavioural change. This initiative aligns with global efforts to reduce HAIs, enhance patient safety, and reinforce best practices in eye care.

Abstract No.: 203878

Greening the Ophthalmic Care

First Author: Megha G

Purpose: The video aims to summarize few tips to reduce our carbon emissions while providing ophthalmic care to our patients. Be it out patient department, or operating theatre or setting up local vision centres.

Methods: Climate change is the biggest public health threat of our time. And healthcare, surprisingly, is part of the problem. Our video shows few tips on

how we can be more sustainable in eye care without compromising the vision or patients' health.

Results: Various simple changes we suggest in the outpatient department (OPD), ophthalmic theatre (OT), and setting local vision centres not only help our patients, but also are better for the environment and more economical. We have summarised 10 tips each in OPD and OT, and a few points on decreasing transportation carbon emissions.

Conclusions: The planet needs care, too. And the beauty is — in caring for it, we improve our own systems. Less waste. Lower cost. Better access. By following few simple modifications brings about huge impact. Healthier people. Healthier planet. It is already late because there is no Planet B.

Abstract No.: 203449

Minimally Invasive Glaucoma Surgery in 3D Printed & Mixed Reality

First Author: John Davis **AKKARA**

Purpose: To develop 3D printed and Virtual Models of Minimally Invasive Glaucoma Surgery Instruments and Implants; and to open source these designs.

Methods: The authors used Free and Open Source Software FreeCAD to design 3D models of Kahook Dual Blade, iStent inject, iStent W, Aurolab Aqueous Drainage Implant, 3DGDD and other Glaucoma Drainage Devices. These were open sourced and shared on National Institute of Health (NIH) 3D Exchange portal and also on Thingiverse. These designs were also 3D printed and utilized for teaching junior surgeons as well as for patient education. In addition, Augmented reality apps like Merge Object Viewer were used to visualize these 3D models in Mixed Reality on smartphone as well as on Virtual Reality headsets.

Results: Various MIGS surgical instruments and implants were 3D modelled and 3D printed. These were open sourced and shared with other ophthalmologists and enthusiasts around the world. 3D printed instruments were used to train junior surgeons and for patient education. Augmented reality models were used for teaching purposes as well. This greatly improved access to these around the world.

Conclusions: 3D Open Source Designs can be a gamechanger in ophthalmic pedagogy. The authors 3D models helped to democratize free and low cost access to Minimally Invasive Glaucoma Surgery (MIGS) teaching resources for Wetlabs and Drylabs. MIGS instruments and implants, Glaucoma Drainage Devices and other surgical instruments can be easily shared for free worldwide in the virtual world.

Abstract No.: 206786

Optic Nerve Crushed by a Cerebral Time Bomb: Sudden Monocular Vision Loss From a Giant Intracranial Aneurysm

First Author: Virna.m.shah

Co-Author(s): P.sangavi **SAMRITHA SELVI**

Purpose: To describe a rare presentation of sudden, painless monocular vision loss caused by compressive optic neuropathy from an unruptured giant intracranial aneurysm and to highlight the critical role of prompt neuro-ophthalmic recognition and urgent intervention.

Methods: Single-patient case report with comprehensive neuro-ophthalmic examination, multimodal neuroimaging, and endovascular treatment. Clinical findings, imaging characteristics, and visual outcomes were documented and analyzed.

Results: A 49-year-old female presented with progressive, painless loss of vision in the right eye. Examination revealed a Grade III relative afferent pupillary defect. Best Corrected Visual Acuity (BCVA) was HM, and Fundus examination revealed a Pale disc (Primary Optic Atrophy). After thorough history taking, detailed Neuro-Ophthalmic examination, High-resolution magnetic resonance angiography was done and identified a wide-necked saccular aneurysm of the supraclinoid internal carotid artery exerting direct mass effect on the pre-chiasmatic segment of the optic nerve. Emergency Interventional Radiologist (IR) referral was done, where Digital Subtraction Angiography (DSA) and balloon occlusion test were done for further management.

Conclusions: Unruptured intracranial aneurysm should be considered in the differential diagnosis of sudden, unexplained monocular vision loss. Immediate neuroimaging and urgent endovascular or microsurgical management are essential to prevent irreversible optic neuropathy and avert life-threatening rupture.

Abstract No.: 207234

Simplifying Retinal Laser Procedures: An Interactive Tutorial for Novice Ophthalmologists

First Author: Debolina **DEB**

Co-Author(s): Dhruval, Joshmitha, Priethikka

Purpose: This tutorial addresses challenges faced by novice ophthalmologists in mastering retinal laser procedures.

Methods: Using a custom mobile adaptor attached to slit lamp lasers, it demonstrates real-time laser application across various pathologies, including pan-retinal photocoagulation for PDR, barricade laser around a horseshoe tear, focal laser for microaneurysms, and grid laser for macular oedema. It also introduces the subthreshold micropulse laser for

CSCR, highlighting its scarless approach and technical nuances.

Results: The visual guidance enhances understanding of laser parameters, focusing, and burn configuration, aiding skill acquisition. This stepwise method allows trainees to grasp procedural details, build confidence, and facilitate in-depth discussions on best practices.

Conclusions: The tutorial serves as an effective educational tool for ophthalmology residents, retina fellows, and general ophthalmologists, bridging the gap between theory and practice in retinal laser therapy.

Abstract No.: 204580

Teaching Complex Lens and Graft Management During Descemet's Stripping Endothelial Keratoplasty

First Author: Karan BHATIA

Purpose: To provide an educational video resource for ophthalmology trainees and anterior segment surgeons, highlighting practical strategies for managing intra-operative complications during DSEK.

Methods: A teaching video was developed using challenging DSEK cases. Demonstrated scenarios include donor preparation complications, intraocular bleeding, and graft handling difficulties in eyes with prior trabeculectomy, glaucoma drainage devices, complicated cataract surgery with vitreous prolapse, retro-lental fluid, and failed corneal grafts. Lens-related challenges such as subluxation, dislocation, posterior capsular rupture, aphakia, broken IOLs, and vitreous prolapse are addressed. Step-by-step secondary IOL implantation using iris claw and scleral-fixated IOLs (SFIOLs) is shown. Annotations and narrated surgical pearls enhance the educational value.

Results: The cases demonstrate reproducible intra-operative modifications that minimize complications, ensure stable IOL fixation, and promote graft adherence. Structured narration and clear teaching points improve understanding and knowledge transfer.

Conclusions: This video is designed as a teaching tool, emphasizing surgical pearls, decision-making, and complication management in DSEK. It aims to strengthen surgical education and improve outcomes in complex corneal transplantation scenarios.

Abstract No.: 203443

Through the Lens- an Ophthalmologist's Journey Through Residency

*First Author: Kusha
Co-Author(s): Vinisha*

Purpose: To highlight the spectrum of eye diseases encountered during residency.

Methods: A video-based narrative compiled from clinical cases encountered during residency. Ethical

considerations: patient identity protected, educational purpose only. Structured presentation: case visuals + short descriptions + key learnings.

Results: Showcases the variety of ophthalmic pathologies and their management.

Conclusions: Ophthalmology residency offers vast exposure to diverse cases, from routine to rare. Every case contributes uniquely to the growth of a doctor, academically and emotionally. Continuous learning, compassion, and innovation are essential to excel in this specialty

Abstract No.: 207328

Twist in Tale

First Author: Shreya SARAOGI

Co-Author(s): Ravi Krishna KANARADI, Naren SHETTY

Purpose: How to navigate through a challenging case of stuck haptic & tilted IOL.

Methods: Surgical Video.

Results: Optic in bag.

Conclusions: Safe surgery.

Abstract No.: 205086

Vision for Change: A Journey Towards Sustainability in Ophthalmology

First Author: Yee Ling WONG

Purpose: -

Methods: -

Results: -

Conclusions: This short film follows a young ophthalmologist's unexpected journey into the world of sustainability. What begins as a routine writing opportunity evolves into a deep personal and professional transformation. Through self-reflection, scientific inquiry, and global collaboration, the narrator uncovers the environmental impact of eye care. From measuring surgical waste to leading international research, the story highlights the urgent need for sustainable practices in ophthalmology—not just environmentally, but also in addressing the growing burden on ophthalmic services and associated financial costs. It calls for conscious change, one small action at a time. Vision for Change is both a personal testimony and a call to action for the future of eye health.

Cataract

Abstract No.: 203085

A Beginner's Extracapsular Cataract Extraction (ECCE) Using the Continuous Curvilinear Capsulorhexis Technique

First Author: Sophia SAQUILAYAN

Co-Author(s): Levi SAN BUENAVENTURA

Purpose: To present a case of a hypermature cataract; To present a surgical video on extracapsular cataract extraction using a continuous curvilinear capsulorhexis; To present the postoperative outcomes; To discuss intraoperative considerations of doing a continuous curvilinear capsulorhexis during an ECCE; To present learning points from the extracapsular cataract extraction procedure.

Methods: A continuous curvilinear capsulorhexis was done on an ECCE procedure.

Results: The mature cataract was extracted, and the patient was implanted with a Monofocal Foldable Intraocular Lens. Patient's VA post-op day 1 was 20/20. 2 weeks post-op, the patient's VA was stable, and the astigmatism was -0.75 cylinder.

Conclusions: One of my key learning points is the importance of creating a larger diameter rhexis when performing a CCC in ECCE, ideally around 6.5 to 7.5 millimeters, to make nucleus delivery easier. Doing ECCE with CCC also provides good training in rhexis control, which is essential before moving on to phacoemulsification, where smaller and tighter rhexis sizes are required. Another takeaway is to always prioritize safety over speed—a slightly irregular CCC that is completed safely is far better than risking complications by forcing perfection. Finally, it's important to anticipate possible intraoperative issues such as a run-out tear, zonular dialysis, or wound leak, and to manage these calmly and systematically when they occur.

Abstract No.: 207273

A Promising Tale of "TORIC Scleral Fixated Intraocular Lenses"

First Author: Nagesha CK

Co-Author(s): Rohitha NAYAK, Naren SHETTY

Purpose: To demonstrate the surgical technique of fixing toric intraocular lenses. To evaluate its efficiency and outcomes in terms of IOL positioning and visual outcomes.

Methods: Patients with significant astigmatism and a compromised capsular bag or an absent capsular bag are selected for scleral fixation of toric IOL. Different lenses are fixed to the sclera with the modified ab externo method using 9-0 polypropylene sutures or Gore-Tex sutures. The technique of ideal

lens positioning, including adequate vaulting and centration, is demonstrated in the video.

Results: Video shows the case of Alcon single-piece toric IOL implantation in the eye with no capsular bag. IOL fixed with sutures at the desired axis, resulting in postoperative uncorrected visual acuity of 6/6. Another case is the scleral fixation of ENVISTA toric IOL with Gortex sutures, wherein the astigmatism of 2.5D was neutralised post-surgery. None has early or late postoperative complications.

Conclusions: Scleral fixation of toric IOLs is an alternative method for correcting corneal astigmatism when capsular support is absent. Furthermore, the technique can be expanded to toric multifocal IOLs.

Abstract No.: 203208

A Routine Case of Extracapsular Cataract Extraction

First Author: Mary Claudette ARCELLANA

Purpose: To present a routine case of extracapsular cataract extraction.

Methods: A 9–12 mm triplanar limbal incision was made to access the anterior chamber. An envelope technique anterior capsulotomy was performed to open the front part of the lens capsule. The lens nucleus was gently expressed out of the capsular bag using pressure and viscoelastic substances. Residual cortical material was aspirated using an irrigation/aspiration (I/A) system. Iris prolapse was noted during I/A and was carefully repositioned and ensured balance between irrigation and aspiration. A posterior chamber intraocular lens was inserted into the remaining capsular bag. The large incision was closed using nylon 6-0 suture. Intracameral and topical antibiotics and anti-inflammatory drops were given.

Results: Day 1 post-operative result yielded a visual acuity of 20/80 from hand movement with good light projection on the right eye. Intraocular pressure (IOP) was increased by 26 mmHg, hence oral IOP lowering agent was given. 1 week post-operatively, visual acuity improved to 20/40 with normal IOP. And on 3 weeks post-operatively, visual acuity improved to 20/20 with a refraction of -1.25Dsph = -0.50 Dcyl X 112.

Conclusions: Creating precise incisional planes is essential to prevent intraoperative iris prolapse. Thorough aspiration of viscoelastic material is important to reduce the risk of postoperative intraocular pressure elevation. Additionally, consistent practice in suturing techniques is strongly recommended to ensure optimal surgical outcomes.

Abstract No.: 202581

A Stepwise Approach to Intraocular Lens Exchange in a Case of Severe Glistening-Induced Opacification

First Author: Vinit TANWAR

Purpose: To demonstrate a systematic surgical technique for intraocular lens (IOL) exchange in a patient with severe, visually significant opacification due to glistening, emphasizing methods that ensure capsular bag integrity and facilitate safe IOL explantation.

Methods: This surgical video case report details the management of a 65-year-old patient presenting with progressive visual decline 15 years after primary cataract surgery. The technique involved using an ophthalmic viscosurgical device (OVD) to protect the endothelium and expand the capsular bag. Careful viscodissection was performed to separate the opacified IOL from capsular adhesions. The IOL was then mobilized into the anterior chamber, bisected into two halves, and explanted atraumatically through a clear corneal incision.

Results: The severely opacified IOL was successfully removed without compromising the integrity of the original capsular bag. No posterior capsular rupture or vitreous prolapse occurred. A new one-piece hydrophobic acrylic IOL was subsequently implanted into the stable, intact capsular bag, achieving excellent centration and stability at the conclusion of the surgery.

Conclusions: Late-onset IOL opacification from severe glistening presents a significant surgical challenge. A meticulous, stepwise approach featuring thorough viscodissection is crucial for successful explantation while preserving the capsular bag. This technique allows for stable in-the-bag reimplantation, maximizing the potential for a safe and effective visual outcome.

Abstract No.: 202950

A Very Difficult Unusual Case of Cataract

First Author: Neha DHOLAKIA

Purpose: A once-in-a-lifetime case of severe ankylosing spondylitis – refused by many NLEST PT, lost vision – had to be done by someone – neck bent more than 90 degrees.

Methods: Adapting to the head position for the keratometer – a scan – operating microscope, we managed to get the cataract out and implant an IOL.

Results: Patient got functional vision as he has choroiditis scars, but was able to watch TV and read his mobile.

Conclusions: The only way out is through.

Abstract No.: 204018

Application of Dual-Expandable Devices in Small-Pupil Hard-Nucleus Cataract Surgery: A Case Report

First Author: Yuanfei ZHU

Purpose: To report a successful surgical approach for cataract extraction in a high-risk eye with small pupils, dense nuclear sclerosis, and poorly controlled diabetes, using combined mechanical pupil expansion and pre-chopping techniques.

Methods: A 71-year-old male with progressive visual decline in the right eye and a history of diabetic mellitus with optimal glycemic control underwent phacoemulsification. Preoperative evaluation revealed severe lens opacity and poor fundus visibility. Surgical strategies included pupil expansion with an iris retractor, capsular staining, and nucleus fragmentation using a pre-chopping device under stable fluidics control.

Results: The surgery was completed without complications such as posterior capsule rupture or nucleus drop. On postoperative day one, uncorrected visual acuity improved to 0.8. The pupil and iris were well-positioned, and corneal clarity was maintained.

Conclusions: The combined use of mechanical pupil expansion and advanced nucleus fragmentation techniques can effectively mitigate surgical risks and achieve favorable outcomes in complex cataracts with small pupils and hard nuclei.

Abstract No.: 204185

Back Stab Chopping in Cataract Surgery

First Author: Reena SINGH

Purpose: In cataract surgery, the chopping of the nucleus is one of the crucial steps and has a steep learning curve. However, various methods and instruments have been used to make it simple and safe, but still, this is the most difficult step of the entire surgery. In this video we can observe how we can safely hold and chop the nucleus with optimal use of instruments in different scenarios of cataract.

Methods: After good hydro separation and superficial cortical clearance, the nucleus is centrally or para-centrally impaled, then the nucleus is lifted up in a bag with a probe and a blunt chopper from behind. The chopper helps in lifting and fixing the nucleus so that impaling of the nucleus with the probe can be assured. Then, the chopper is used for the first backstab, and the nucleus pieces are chopped in one or multiple steps with rotation. This method works well both in normal and various scenarios, like poorly dilating pupil, uveitis, post-transplant, and corneal opacities, oil-filled eyes, soft nucleus, hypermature cataracts with excess mobility. Care should be taken in the form of good hydro separations and rotation before chopping, the

exposed phaco tip length should be controlled, and in cases with shallow anterior chamber and endothelial compromise, use good coverage of visco-dispersive.

Results: This method does not require special instruments or a chopper in most cases. Also, the chop stab is in control, away from the posterior capsule and directly visible even in a small pupil.

Conclusions: This can be a safe alternative method in both normal and difficult cases with an easy learning curve.

Abstract No.: 205732

Back Where It Belongs: The Challenge of Adjusting a Malpositioned CTR During Cataract Surgery

First Author: Muhammad **SAAD**

Purpose: This case highlights a challenging intraoperative scenario where significant zonular weakness (3 clock hours of dialysis) required Capsular Tension Ring (CTR) placement for the first time in my surgical career. The case became tricky when the CTR partially dislocated into the ciliary sulcus, causing iris traction instead of fully expanding in the capsular bag.

Methods: A patient with a visually significant cataract underwent phacoemulsification, during which 3 clock hours of zonular dialysis were identified. A CTR was introduced, but its trailing end engaged the ciliary sulcus, causing iris traction. Using micro-instruments, it was successfully repositioned into the capsular bag.

Results: The CTR restored capsular stability, and a posterior chamber IOL was implanted securely. Postoperative assessment showed a well-centered IOL, and visual acuity improved to 20/25 at one month.

Conclusions: This case underscores the importance of anticipating and managing intraoperative complications in the presence of zonular weakness. Although initial CTR malposition created iris traction, careful recognition and prompt micro-instrument repositioning allowed successful stabilization of the capsular bag. Ultimately, the procedure resulted in a well-centered posterior chamber IOL and good postoperative visual recovery, reinforcing the value of vigilance, adaptability, and surgical skill when using a CTR for the first time.

Abstract No.: 205143

Breaking Through the Clouds – Completing an Abandoned Cataract Surgery With Compromised Clarity

First Author: Madhu **UDDARAJU**
Co-Author(s): Shanthi **PENMATSA**

Purpose: The Video demonstrates how an abandoned case of cataract surgery with intraoperative DM detachment was managed with successful IOL implantation and DM reattachment.

Methods: DM was identified, and capsulorhexis was completed, phaco was done carefully avoiding the DM flaps, and IOL was implanted, DM was reattached with air tamponade.

Results: The patient had 20/40 BCVA, and DM remained well attached.

Conclusions: Careful intraoperative identification of DM with trypan blue and controlled phaco can preserve the DM and functionally reattach instead of rushing for a lamellar transplantation.

Abstract No.: 203058

Broken Chopper, Unbroken Surgery: Completion of Phacoemulsification Despite Instrument Failure

First Author: James Michael **JACOMINA**
Co-Author(s): Robert Edward **ANG**

Purpose: To present an unusual intraoperative complication during routine phacoemulsification until completion.

Methods: A 40-year-old patient with an N03/NC3 nuclear cataract underwent phacoemulsification. During nucleus removal, the tip of the surgical chopper broke off, and a fragment dislodged onto the iris surface. Intraoperative management and continuation of surgery are described.

Results: The broken chopper fragment was carefully retrieved using McPherson forceps without additional iris or endothelial trauma. A replacement instrument was introduced, and phacoemulsification was completed uneventfully. The postoperative course was stable with good visual recovery.

Conclusions: Instrument breakage, though rare, can occur even in routine cataract surgery. Prompt recognition and careful retrieval of intraocular foreign bodies allow safe continuation of the procedure and excellent surgical outcomes.

Abstract No.: 202349

CMT- FLEX Foldable SFIOL for Aphakia – Sutureless and Glueless Technique

First Author: Vineeth B **BHIMSHETTY**
Co-Author(s): Vijaylaxmi **B**

Purpose: To report a new foldable, hydrophilic, scleral fixated intraocular lens (IOL) design (CM T Flex) for managing aphakia (absence of lens) following complicated cataract surgery.

Methods: A 60-year-old female with secondary aphakia after cataract surgery; vision was hand movements, improving with pinhole to 6/9. Preoperative evaluation (biometry, keratometry, etc.) was done. Two partial-thickness, limbal-based scleral tunnels were made (2.5×3.5 mm), 180° apart. Sclerotomies at 1.5 mm from limbus under those flaps using 23G needle. Inserted

CM T Flex (foldable, hydrophilic, with T-shaped haptics) through a 2.8 mm clear corneal incision. The special T shaped haptics are externalized via the sclerotomies, under scleral flap of the scleral tunnel. The exteriorised T haptics get automatically covered by the scleral flap without need for suture or glue.

Results: Postoperative outcome was good: vision improved to 6/6 (P) at one month. IOL centration was stable; no major complications in this case.

Conclusions: The CM T Flex IOL is promising for aphakia, where in-the-bag IOL placement is not possible. Because of its design (T haptics, no need for suturing or tucking of haptics), surgery is easier, less time-consuming, and less traumatic.

Abstract No.: 200792

Cataract Precision in the Open Sky: Surgical Secrets for Keratoplasty Cases

First Author: Bhupesh SINGH

Co-Author(s): Neha BHARTI

Purpose: To demonstrate challenging case scenarios of open sky cataract surgery.

Methods: This video showcases real-life surgical cases of open sky cataract surgery highlighting use of surgical adjuncts for small pupil and vitreous pressure management. Strategic planning for IOL placement, variability in surgical sequence based on intraoperative findings. Tips and tricks to safely navigate these complex scenarios will also be covered.

Results: This video will ensure that the audience will have a better understanding of open sky cataract surgery.

Conclusions: This video will showcase all the possible challenges and solution to it.

Abstract No.: 200490

Cataract Surgery Post-Trabeculectomy: "A Tale of Two Blebs"

First Author: Zia PRADHAN

Co-Author(s): Sathi DEVI, Sujani SHROFF

Purpose: Cataract surgery in an eye which has previously undergone trabeculectomy requires meticulous planning in the pre-op, intra-op and post-operative period. This video highlights strategies for cataract surgery post-trabeculectomy.

Methods: The video demonstrates the ideal timing of phacoemulsification, pre-operative biometry planning, intra-op steps and post-op bleb care to ensure visual rehabilitation as well as good post-op intraocular pressure (IOP) control in eyes which have undergone previous trabeculectomy.

Results: Preferably defer phacoemulsification for at least 6 months following trabeculectomy. Pay attention to the pre-op biometry which can be erroneous in

eyes with low IOP. Intra-operative steps to prevent bleb failure include placing incisions at least 1 clock-hour from the bleb, avoiding iris manipulation, and a thorough cortical and viscoelastic clean-up. Post-operatively, the IOP and bleb should be monitored carefully and the bleb may be modulated with intensive steroids, needling and anti-metabolites if required.

Conclusions: The health of the bleb must be considered at every point during the cataract management and this video demonstrates the maneuvers deemed to improve bleb survival.

Abstract No.: 206064

Cataract Surgery in a Case of Neovascular Glaucoma Secondary to Central Retinal Vein Occlusion: Surgical Management and Intraoperative Challenges

First Author: Isabel Mara CAPARROS

Co-Author(s): Alexander Joseph REYES

Purpose: To present a complex case of neovascular glaucoma secondary to central retinal vein occlusion, highlighting the surgical approach and intraoperative challenges encountered during phacoemulsification.

Methods: The patient underwent a trabeculectomy a few months prior and was eventually scheduled for cataract surgery due to progressive lens opacification. Due to poor pupillary dilation and extensive posterior synechiae, synechiolysis, stretching of the pupil, and iris hooks were used intraoperatively to facilitate safe phacoemulsification with a monofocal posterior capsule intraocular lens implant.

Results: The cataract surgery was technically challenging due to a small, non-dilating pupil and compromised anterior segment visualization. The use of iris hooks allowed for a controlled capsulorhexis and safe lens removal. Postoperative recovery was uneventful, with improved visual acuity and stable intraocular pressure.

Conclusions: Management of more complex cataracts may necessitate a multidisciplinary approach. This case illustrates the importance of surgical planning, flexibility in technique, and the use of adjunctive devices such as iris hooks to manage intraoperative complexity. The video aims to provide educational insight into the nuances of handling such challenging anterior segment cases.

Abstract No.: 202661

Cataract Surgery in a Post-Traumatic Corneal Perforation Repair Case: Surgical Challenges and Outcomes

First Author: Vinit TANWAR

Purpose: To demonstrate a tailored surgical approach for phacoemulsification in an eye with a history of extensive traumatic corneal perforation repair. This

case highlights strategies for managing challenges like corneal scarring, posterior synechiae, and altered anterior chamber dynamics to achieve a safe and effective visual outcome.

Methods: This surgical video case report details cataract surgery in a 54-year-old male, 3 months after primary repair of a traumatic limbal-to-limbal corneal perforation. A superior 2.2 mm clear corneal incision was carefully placed to navigate the scar-induced irregular curvature. Viscoelastic was used for synechiolysis. Phacoemulsification was performed using low fluidic parameters (low aspiration flow rate and vacuum) to maintain anterior chamber stability. A foldable IOL was implanted, and the main wound was secured with 10-0 nylon sutures.

Results: Despite challenges from corneal scarring and posterior synechiae, the surgery was completed without intraoperative complications. The capsulorhexis was successfully performed, and the traumatic cataract was entirely removed. The foldable intraocular lens was securely implanted in the capsular bag. The patient experienced an uneventful postoperative recovery, achieving an optimal best-corrected visual acuity and satisfactory visual function.

Conclusions: Phacoemulsification after major corneal trauma repair is challenging but feasible. Success hinges on careful preoperative planning, adaptive surgical techniques including modified fluidics, and meticulous handling of intraocular structures. A planned, stepwise approach can lead to excellent visual rehabilitation even in severely traumatized eyes.

Abstract No.: 205251

Cliffhanger Rescue: Salvaging a Subluxated IOL in a Complex Pediatric Case

First Author: Sonam **YANGZES**

Co-Author(s): Savleen **KAUR**

Purpose: To demonstrate the surgical management of a subluxated intraocular lens (IOL) in a pediatric pseudophakic, post-vitrectomy eye with inferior zonular loss.

Methods: A 10-year-old boy with a decentered IOL was referred after two failed attempts at optic capture. Intraoperatively, the fibrosed anterior capsule stretched unpredictably—due to high pediatric capsular elasticity—causing the IOL to nearly dislocate.

Results: The IOL was rescued in time and successfully fixated using the Yamane intrascleral technique. Pupilloplasty was performed to restore a functional pupil.

Conclusions: This case emphasizes the importance of anticipating pediatric capsular behavior, surgical adaptability, and composure in complex secondary IOL fixation.

Abstract No.: 206271

Conquering IOL Fractures

First Author: Lional Raj **DANIEL RAJ PONNIAH**

Purpose: To evaluate and produce a video compilation of common and less common intraoperative damages to the IOL, their aetiology, and the lessons on how to prevent or manage such occurrences.

Methods: This video is a compilation of case series featuring damaged IOL haptics and optics, some requiring exchanges, and others that could be retained without sequelae. The science behind managing fractured IOL situations depends on the site of damage and whether the damaged fragments are dislocated.

Results: This video would be of educational value for the anterior segment surgeons in understanding intraoperative damaged IOL circumstances. How to recognize such surprises early and ways to avoid them and get things right are highlighted.

Conclusions: Cataract surgeons may exhibit the art of decision-making in such intraoperative stressed circumstances.

Abstract No.: 204381

Continuous Curvilinear Capsulorhexis for Intumescent Cataracts

First Author: Vladimir **NIKITIN**

Purpose: How else to reduce the risk of developing the «Argentine Flag» syndrome?

Methods: The author's methodology is presented.

Results: Reducing the risk of complications.

Conclusions: The video presents a method for the controlled formation of anterior continuous circular capsulorhexis in swelling cataracts based on a pathogenetic approach related to the formation of a single volume of liquid lens masses in the anterior subcapsular space, as well as changes in the biomechanical properties of the lens capsule at the site of the primary puncture (increasing its strength, changing the vector of tension of the anterior capsule in the central sections, local profile changes) due to the effect of diathermocoagulation.

Abstract No.: 206024

Couching in Exceptional Situations

First Author: Monalisa **PATI**

Co-Author(s): Somy **PUROHIT**, Shiva **SAHOO**

Purpose: To report the surgical technique and outcome of couching of the hard mature cataractous lens in an eye with microphthalmos, microcornea, and irido-fundal coloboma.

Methods: A 35-year-old male presented with OU microphthalmos, microcornea, and irido-fundal coloboma, OD hypermature hard cataract, and OS

PCIOL. The vision was HM OD and PL+ OS. The corneal diameter was 7 mm OU. Anticipating difficulty in the cataract removal via the anterior or posterior approach, couching of the cataractous lens was done to make the visual axis clear and give some ambulatory vision to the patient

Results: Postoperatively, the IOP was 9 mm Hg OU; there was no inflammation, and the patient had ambulatory vision of CF 4 meters with +5D lens OD.

Conclusions: Couching is an ancient technique and can be useful in special situations like extreme microphthalmos and microcornea, where conventional cataract removal by the anterior or posterior route is risky. However, a close follow-up is needed to look for inflammation and an IOP rise.

Abstract No.: 204930

Cracking the Hard Cataract With Argentinian Flag

*First Author: Faria Tilat **TIMA***

*Co-Author(s): Tanvir **AHMED***

Purpose: To report a clinical case where the Argentinian Flag Sign occurred during cataract surgery in patients with white cataract & to discuss intraoperative findings, management strategies & postoperative outcomes.

Methods: Case report: video presentation.

Results: Tear occurred immediately after puncturing the anterior capsule due to increased intralenticular pressure, producing the characteristic blue-white-blue pattern of the Argentinian Flag Sign.

Conclusions: The Argentinian Flag Sign is a notable risk during capsulorhexis in white intumescent cataracts due to elevated intralenticular pressure. Key preventative measures include: the use of Trypan blue for capsule visualization, decompression of liquefied cortex before CCC, and starting with a small capsulorhexis. Early recognition and prompt modification of surgical strategy can lead to successful outcomes despite intraoperative complications.

Abstract No.: 201083

Donut Technique for Dense Leathery Cataract: A Bidirectional Grooving in Phacoemulsification

First Author: Sukoto

Purpose: To demonstrate the effectiveness and safety of a bidirectional grooving method, termed the Donut Technique, in managing dense leathery cataracts during phacoemulsification.

Methods: This video presents a surgical case of a patient with a dense leathery cataract. The initial central groove was performed using a phaco handpiece to create a dome-shaped trench. Once sufficiently deep, the nucleus was inverted within the capsular

bag, and a second groove was created from the opposite side, forming a donut-like through channel. The nucleus was then fragmented and emulsified with reducing pressure on the capsule and zonules.

Results: This technique facilitates complete nuclear segmentation of the dense leathery cataracts with improved phaco efficiency and minimal use of ultrasonic energy. There were no intraoperative complications. Corneal clarity was maintained, and postoperative visual acuity improved significantly.

Conclusions: The Donut Technique offers a practical and effective solution for tackling dense leathery cataracts. By reducing pressure on intraocular structures and optimizing energy delivery, it enhances surgical safety and outcomes in challenging phacoemulsification cases.

Abstract No.: 205990

Double Argentina Flag Sign: What's Next?

*First Author: Vishakha **WADIBHASME***

*Co-Author(s): Yogesh **JIBHAKATE***

Purpose: The video highlights the management of white mature cataract in case of complication of running of rhexis in the form of Argentina flag sign in an easy and simple way.

Methods: Side port entry is made, and dye is injected. Wash done, and after injecting viscoelastic, the main incision is made. With the help of 26-gauge needle cystitome, the rhexis is made, and the Argentine flag sign suddenly appeared. The chamber was again formed with visco and tried to complete rhexis, but again the Argentina flag sign appeared, visco was injected, and the rhexis was completed by the can opener technique. With the help of a Simcoe cannula, loose cortical matter is aspirated, and the nucleus is rotated. Phacoemulsification of cataract is done by the woodcutter technique. The phaco probe is advanced from the periphery beyond the centre of the nucleus on one side, and from the opposite side, the chopper is advanced towards the probe, and a crack is made. The nucleus is divided into two halves. Each half is divided into 2 to 3 pieces, and the nucleus is aspirated gradually with the help of a dialer. The lens is loaded in the cartridge, and with the help of the irrigation and aspiration cannula, the cortex is removed. Lens is implanted in the bag under hydration, and visco is aspirated with the help of an aspiration cannula. The ports are hydrated, and the chamber is well-formed.

Results: Easy, effective, and simple management of complicated white mature cataract surgery done with clear cornea and lens in bag implantation.

Conclusions: If there is an Argentina flag sign, do not panic, but form chamber and complete rhexis. The rest of the steps can be done easily.

Abstract No.: 201049**Double Chopper Technique in Soft Immature Cataracts: Overcoming Nuclear Division Challenges***First Author: Sukoto*

Purpose: To evaluate a phacoemulsification technique using a double-chopper approach for soft immature cataracts, designed to address the difficulty of nuclear division with conventional methods such as stop-and-chop or direct chop, while minimizing phaco energy use and reducing the risk of posterior capsular rupture.

Methods: Soft immature cataracts with full nuclear mobility after hydrodissection were managed using two choppers inserted through the main and side ports. Before phaco tip engagement, the choppers were advanced toward each other to mechanically cleave the nucleus along its central plane. Additional splitting was performed to divide the nucleus into smaller fragments, which were then emulsified and aspirated with the phaco tip. Cortical material was removed with the irrigation/aspiration (IA) probe, followed by intraocular lens implantation and final IA for viscoelastic removal.

Results: In cases of soft immature cataracts, where conventional chopping techniques often failed to achieve complete nuclear cleavage, the double chopper method enabled consistent and controlled fragmentation. This approach significantly reduced phaco energy use, preserved capsular bag integrity, minimized zonular stress, and avoided posterior capsular rupture.

Conclusions: The double chopper technique is a safe, effective, and energy-efficient strategy for managing soft immature cataracts. By enabling precise mechanical fragmentation when standard methods are less effective, it improves surgical control, reduces intraocular trauma, and enhances safety during phacoemulsification.

Abstract No.: 202939**Dual Purpose Tip -to Slice IOLs and to Chop Hard Cataracts With Ultrasonic Power***First Author: Neha DHOLAKIA**Co-Author(s): Pankaj LANDE*

Purpose: To easily explant IOLs without opening – closing Sizzors, without twisting and stretching the wound or extending it. To easily cut hard cataracts using the ultrasonic power of your existing phaco machine.

Methods: The special tip is attached to the phaco probe and smartly uses the ultrasonic power of the machine to slice IOLs and cut through hard cataracts.

Results: Clear corneas the next day with happy patients – no Siate keratitis, no Descemets detachment.

Conclusions: A very novel and ingenious way to tackle difficult situations in cataract surgery.

Abstract No.: 203213**Extracapsular Cataract Extraction of a Beginning Ophthalmologist***First Author: Amado Miguel LAVALLE*

Purpose: To extract a hypermature cataract in a 65-year-old male.

Methods: Extracapsular cataract extraction with posterior chamber intraocular lens implantation.

Results: Vision restored to 20/20 1 day postoperative.

Conclusions: As a starting ophthalmologist, it is important to hone not just your clinical skills but also your surgical skills.

Abstract No.: 207109**Finding the Key to the Keyhole - Cataract Surgery in Iridolenticular Coloboma***First Author: Sameer CHAUDHARY**Co-Author(s): Prasanna RAMESH, Madhu SHEKHAR*

Purpose: To outline the anatomic challenges of cataract surgery in iridolenticular coloboma and to demonstrate effective management using manual small-incision cataract surgery (MSICS) and phacoemulsification.

Methods: Video-based educational overview describing ocular coloboma (iris/retina/choroid) arising from embryonic fissure non-closure, the frequent early cataract, and key surgical hurdles—microcornea, miotic pupil, and zonular deficiency—followed by step-by-step demonstrations of MSICS and phaco approaches.

Results: The video illustrates the safe completion of cataract extraction in colobomatous eyes using both MSICS and phacoemulsification, emphasizing technique selection and maneuvers tailored to anatomic constraints.

Conclusions: Although cataract surgery in iridolenticular coloboma is technically demanding, careful planning and appropriately chosen MSICS or phaco techniques enable effective and safe management.

Abstract No.: 204473**Flanged Rescue: Intraocular Refixation of a Subluxated Scleral-Fixated Single-Piece Foldable Lens With Eyelets at the Optic-Haptic Junction***First Author: Bobbie Marie SANTOS**Co-Author(s): Romeo DELA CRUZ*

Purpose: Subluxation of a scleral-fixated intraocular lens (IOL) presents a complex surgical challenge. This surgical video demonstrates intraocular refixation using flanged 6-0 polypropylene for a subluxated,

transscleral-sutured, single-piece foldable IOL with eyelets at the optic-haptic junction, following 10-0 polypropylene suture breakage.

Methods: A 35-year-old male presented with blurred vision nine years after scleral fixation of an enVista® MX60 IOL (Bausch and Lomb, Inc.) using 10-0 polypropylene. Best-corrected visual acuity (BCVA) with aphakic correction was 20/70. Slit lamp examination showed corectopia, poor dilation, IOL subluxation, and prolapsed vitreous. Under retrobulbar anesthesia, anterior vitrectomy was performed. The subluxated IOL was retrieved, and the broken 10-0 suture trimmed. Using a 30-gauge needle, tangential sclerostomies were created 2.5 mm posterior to the limbus. A 6-0 polypropylene suture was threaded through the IOL eyelets and externalized. Flanges were created using low-temperature cautery and buried in the sclera. Both eyelets were secured to prevent future dislocation.

Results: The IOL was successfully repositioned and stabilized. At one-month follow-up, BCVA improved to 20/40 with no ocular complaints. All four flanges remained covered, with no conjunctival erosion or IOL tilt.

Conclusions: Flanged 6-0 polypropylene for IOL refixation offers a practical, durable, and minimally traumatic alternative to IOL exchange for subluxated lenses. Symmetric suture placement and precise tension control are essential for optimal centration and long-term stability. This video highlights the reproducibility and clinical value of the technique in complex secondary IOL cases.

Abstract No.: 204117

From Clouded Lens to Unexpected Persistence: A Success Story of Surprise PFV

First Author: Gaurav BHARTI
 Co-Author(s): Garvita DABAS

Purpose: This is a teaching surgical video of a routine planned cataract surgery where a PFV was surprisingly encountered and managed intra-operatively.

Methods: This surgical video begins as a routine phacoemulsification in a patient with a visually significant cataract. Intra-operatively, a previously undiagnosed persistent fetal vasculature (PFV) was encountered. Following successful nucleus and cortex removal, posterior capsular polishing was attempted, but unfortunately, it precipitated focal intraoperative hemorrhage, attributable to the vascular remnant. The procedure was modified accordingly, and a three-piece posterior chamber intraocular lens was implanted without further complication.

Results: Postoperatively, the patient demonstrated a marked improvement in visual acuity.

Conclusions: This highlights both the surgical challenges and the importance of intra-operative

adaptability in managing cataract cases complicated by PFV.

Abstract No.: 201398

Glued Intraocular Lens in Surgical Aphakia

First Author: Sashwanthi MOHAN

Purpose: To demonstrate the effectiveness of the glued intraocular lens (IOL) technique for secondary IOL implantation in a patient with surgical aphakia following complicated cataract surgery.

Methods: This is a video-based case presentation of a 60-year-old female who developed surgical aphakia following a complicated small-incision cataract surgery (SICS). The primary surgery was complicated by a large posterior capsule rupture, which precluded primary intraocular lens (IOL) implantation. An anterior vitrectomy was also performed. Postoperatively, the patient developed a non-resolving vitreous hemorrhage, leading to persistent visual impairment. Six weeks after the initial surgery, a secondary IOL was implanted using the glued IOL technique, along with removal of the vitreous hemorrhage via pars plana vitrectomy.

Results: The glued IOL remained well-centered and stable intraoperatively and during postoperative follow-up. Visual rehabilitation was achieved without additional complications.

Conclusions: The glued IOL technique provides a reliable and effective method for secondary IOL implantation in cases of surgical aphakia with inadequate capsular support, minimizing complications associated with other fixation methods.

Abstract No.: 207239

Gupta Ring: A Cost-Effective Solution for Small Pupil Cataract Surgery

First Author: Komal PRIYA

Purpose: «Gupta Ring» refers to a pupil expansion device used in cataract surgery. It is a single-use, square-shaped plastic ring that helps surgeons in widening the iris to improve their field of view.

Methods: The Gupta ring is a specialized pupil expansion device used in cataract surgery to ensure safety and efficiency. It has four scrolls that engage the pupillary margin, mechanically dilating the iris to create a wide, stable pupil. Its biplanar design, with scrolls placed separately from the main ring, allows easy insertion and removal.

Results: The Gupta ring requires a disposable injector for insertion. The average surgical time when using a Gupta ring is comparable to procedures using a B-HEX ring, and both are significantly faster than procedures using iris retractors, which require additional incisions.

Conclusions: The Gupta ring is a safe and effective pupil expansion device for small-pupil cataract surgery. It provides good intraoperative visualization and leads to favorable postoperative results, with no significant differences in visual acuity or corneal health compared to other rings. Comparison of pupil expansion devices in a small pupil - LWW. In our study, in more than 50% of cases, the cause of a small pupil was idiopathic/senile. Among nonidiopathic causes, PXF was the most common association. Lippincott Comparison of pupil expansion devices in small pupil phacoemulsification - PubMed, Jul 1, 2024 — Intraoperatively, sphincter tear was seen in two eyes in the iris retractors group and one eye in the Gupta ring group. In the B-HEX ring group, only two flanges. National Institutes of Health (NIH) | (.gov)

Abstract No.: 207054

Haptic Heartbreak – Crunch Time With Pacman

First Author: Sameer CHAUDHARY

Co-Author(s): Prasanna RAMESH, Madhu SHEKHAR

Purpose: To report the management of a dense posterior polar cataract complicated by intraoperative intraocular lens (IOL) haptic break and to illustrate the Pacman technique for safe IOL explantation and exchange.

Methods: Video case report. After meticulous cataract surgery tailored for posterior polar cataract, the trailing haptic was noted to be broken during IOL implantation. The implanted IOL was explanted using the Pacman technique, and a new IOL was inserted.

Results: The IOL was successfully and safely explanted with the Pacman technique and replaced with a fresh lens, allowing completion of surgery with an excellent surgical outcome.

Conclusions: When properly executed, the Pacman technique is a safe and effective method for IOL explantation in the event of intraoperative haptic failure, facilitating favorable outcomes.

Abstract No.: 205588

IOL Scaffold

First Author: Sudhank BHARTI

Purpose: High power and vacuum required for the last piece emulsification in a hard cataract can lead to a surge and posterior capsule rupture. Implanting the desired IOL behind the quadrant before its management saves the posterior capsule, and this IOL scaffold remains in place.

Methods: At the stage where the last nuclear piece is left to be managed, viscoelastic is injected behind this piece, IOL is injected behind it in the bag, and the piece is emulsified. The IOL is left in the bag.

Results: Implantation of IOL in the bag behind the last quadrant acts as a permanent scaffold, provides safety for the posterior capsule during any surge or shallowing of the anterior chamber, and remains implanted, thereby reducing surgical time.

Conclusions: A permanent scaffold in the form of a desired IOL implanted need not be explanted, providing a safe, high-power, high-vacuum phacoemulsification in a grade 4+ nucleus, reducing surgical time and giving peace of mind to the surgeon.

Abstract No.: 204101

Intumescent Cataract Case: PHACO or MSICS?

First Author: Reiley Mark UDASCO

Purpose: As an ophthalmology resident trainee in a developing country, I believe manual small incision cataract surgery (SICS) still has a niche of its own, especially for areas where phacoemulsification machines are not readily available, or to provide a procedure that is safe and cost-efficient with comparable post-operative outcomes.

Methods: Temporal conjunctival peritomy done, 7mm straight partial thickness scleral incision with blade 15. Side port incision using 15 15-degree knife with staining of the capsule with trypan blue, & insertion of viscoelastic. continuation of the creation of a funnel-shaped scleral tunnel using a crescent knife up to the limbus. A keratome is inserted into the tunnel of the anterior chamber and extended in a funnel shape. Decompression using a cystotome was done, but a run-out tear occurred, and the patient was able to recover and complete capsulorrhexis. Anteriorization of the cataract was successfully delivered with irrigation and aspiration. Insertion of the IOL placed in the bag and the scleral tunnel wound was noted not to leak; however, 1 suture was placed for safety.

Results: Patient followed up the following day and claimed significant visual improvement; visual acuity pre-operatively was hand movement, and now best corrected visual acuity at 20/30 with irrelevant surgically induced astigmatism. On slit lamp examination, the scleral tunnel was noted not to leak, the cornea was clear centrally with minimal Descemet's membrane fold temporally near the main incision, and the anterior chamber was deep with +1 gr. cells, and the intraocular lens is seen in place.

Conclusions: As an ophthalmologist in a developing country, MSICS is an essential skill to have.

Abstract No.: 203641

Iris Claw Single Pass Technique

First Author: Tigor SITORUS

Purpose: To present an innovative approach to managing aphakia using a retropupillary iris claw lens.

Methods: Using simple instruments, an iris claw lens implantation can be made easy without the need to switch hands. This leads to shorter procedure duration and faster learning curve, which finally improves patients' comfort.

Results: Among the surgeries that were performed using this technique, a rounder pupil and better iris claw lens centration are common findings because haptic positions and movements are much more controlled throughout the surgery.

Conclusions: This technique helps shorten the duration of surgery and promises better post-op results.

Abstract No.: 206567

Leaving It Behind: Haptic Amputation in IOL Exchange

First Author: Abhinav SINSINWAR

Purpose: Demonstrating the technique of IOL exchange in case of a stuck haptic. Key intraoperative decision-making, surgical technique, and postoperative result is shown.

Methods: In this surgical video, we present a case of intraocular lens (IOL) exchange performed due to a significant refractive surprise. Intraoperatively, one of the IOL haptics was found to be densely fibrosed and adherent to the capsular bag, posing a high risk of capsular rupture if forcibly removed. To minimize intraocular trauma and preserve capsular integrity, a decision was made to amputate the haptic and leave it in situ. The remainder of the IOL was safely explanted and replaced with a new lens in the sulcus.

Results: IOL exchange was successfully performed, resulting in the achievement of full visual potential. This case highlights a practical and safe surgical strategy when encountering fibrotic haptic fixation during IOL exchange.

Conclusions: The video aims to provide cataract surgeons with insights into managing complex IOL exchanges with haptic amputation where complete explantation is not feasible or safe.

Abstract No.: 206492

Make Your Trab Safe – a Poetic Journey Through the Art and Science of Trabeculectomy

First Author: Zia MAZHRY

Co-Author(s): Laiba ASIF MAZHRY, Abdullah MAZHRY

Purpose: To present a novel educational approach that integrates poetry with surgical video in order to enhance the understanding, retention, and appreciation of safe trabeculectomy technique.

Methods: An original English poem, written by Prof. Mazhry (the Poet Ophthalmologist), was structured to parallel each critical step of trabeculectomy surgery.

Live surgical footage was synchronized with couplets that emphasize both the technical details (e.g., flap design, suture placement, bleb formation) and the philosophical principles (gentleness, patience, respect for tissues). This fusion of art and science was developed as an innovative teaching tool for glaucoma surgeons and trainees.

Results: The poetic narration reinforced key surgical principles, improving clarity and engagement when compared with standard didactic commentary. Early feedback from ophthalmologists and trainees indicated that the lyrical format facilitated recall of surgical steps, highlighted the importance of precision, and fostered reflection on the surgeon's role in balancing technique with compassion.

Conclusions: Blending surgical science with poetic art provides a memorable and humanistic method for teaching trabeculectomy. "Make Your Trab Safe" illustrates that surgical excellence is not derived from blades alone, but from knowledge, humility, and the care our hands impart. This creative approach may enrich glaucoma surgical education in diverse learning environments.

Abstract No.: 205999

Management of Brown Cataract

First Author: Vishakha WADIBHASME

Co-Author(s): Yogesh JIBHAKATE

Purpose: Phacoemulsification technique in hard leathery cataract.

Methods: Side port entry is made. Viscoelastic is injected, and three planar main incisions are made. With the help of a 26-gauge needle, cystitome rhexis is made. The chamber is formed with visco, and the rhexis is completed by the can opener technique. Phacoemulsification of cataract is done by the woodcutter technique. Phaco probe is advanced from periphery beyond the centre of nucleus on one side and from opposite side chopper is advanced towards the probe and crack is made nucleus is divided into two halves. As the nucleus is hard leathery, complete separation till the posterior plate is difficult. With the probe and chopper the nucleus is divided into multiple pieces. The nucleus pieces are held at the centre in the iris plane so that the ultrasonic energy of the probe does not damage the endothelium of the cornea nor the posterior capsule. Cohevisc is injected above and below the nucleus pieces whenever required. The nucleus is aspirated gradually with the help of a dialer. The lens is loaded in the cartridge. With the help of irrigation and an aspiration cannula, the cortex is removed. Lens is implanted in the bag under hydration, and visco is aspirated with the help of an aspiration cannula. The ports are hydrated, and the chamber is well-formed.

Results: A clear cornea with IOL in the bag implantation without any complication.

Conclusions: If there is a Brown cataract, do not panic. Make multiple pieces, use proper viscoelastic form, chamber, and steps, and they can be done easily. At the end of surgery, we get a clean, clear cornea and a good visual outcome.

Abstract No.: 201382

Management of Posterior Dislocated Cataract Without Using a Fragmatome

First Author: Chi Lik AU

Purpose: Our surgical video aims to demonstrate the surgical methods and technical skills used for managing a case of posterior dislocated nuclear sclerosis (NS) cataract lens by 25-gauge vitrectomy and clear corneal phacoemulsification, but without using a fragmatome.

Methods: A 63-year-old man presented with blurring of vision of few weeks, and examinations found left eye posterior dislocation of cataract lens. There was no trauma or syndromic features detected, right eye was NS+ without phacodonesis. Totally sutureless combined 25-gauge pars plana vitrectomy (25GPPV) with Yamane scleral fixated intraocular lens (IOL) was planned. Fragmatome was not prepared.

Results: Three 25GPPV sclerostomies and one single superior clear corneal wound (by 2.75mm keratome) were opened. Dispersive ophthalmic viscosurgical device was injected to coat the corneal endothelium. Core vitrectomy followed by posterior vitreous detachment induction were performed. Perfluorocarbon heavy liquid was injected to protect the posterior pole. Vitreous cutter pierced through the cataract lens capsule, aspirated the cataract and brought it forward to the anterior chamber (AC). Phacoemulsification was then performed in AC with active posterior infusion. No corneal paracentesis wound was created. Residual small cataract fragments dropped posteriorly upon phacoemulsification were removed by vitreous cutter at low cut rate. Foldable 3-piece IOL (AR40e) was injected through the corneal wound, 30-gauge thin walled needles were used to complete Yamane scleral fixated IOL at 3, 9 o'clock.

Conclusions: Surgical treatment of posterior dislocation of entire cataract lens could be challenging. Although without any capsular support, it can be managed totally sutureless by 25GPPV without using the fragmatome.

Abstract No.: 201402

Membranectomy in a Pseudophakic Eye With Occlusio Pupillae

First Author: Shams NOMAN

Purpose: To present the procedure and result

Methods: Membranectomy was done through a side port incision. A 360-degree synechiolysis was

done. A hole is produced in the membrane. Then a membranectomy was done with venus scissors. Remnant of the membrane was removed through visco expression.

Results: Preoperative visual acuity was 3/60. Postoperatively, it was 6/18. No posterior synechiae. Moderate inflammation in the immediate post op period. Finally, after one month, visual acuity was 6/9 with no inflammation.

Conclusions: Membranectomy is a good option in case of occlusio pupillae where laser capsulotomy usually fails.

Abstract No.: 205928

Mission Vision

First Author: Shreya SARAOGI

Co-Author(s): Ravi Krishna KANARADI, Naren SHETTY

Purpose: To show how to navigate through a challenging case.

Methods: Surgical video.

Results: Successful phaco surgery.

Conclusions: Prevention is better than cure.

Abstract No.: 204511

Navigating the Narrow: A Video Guide to Small Pupil Handling in SICS

First Author: Nilesh KUMAR

Purpose: To present an algorithmic, stepwise approach for managing small pupils during manual small-incision cataract surgery (SICS), balancing safety, efficiency, and tissue preservation.

Methods: A sequential escalation protocol was demonstrated through surgical video footage: 1. Intracameral mydriatics as the initial, minimally invasive step. 2. Mechanical stretch pupilloplasty using blunt instruments for controlled expansion. 3. Selective sphincterotomies for persistent miosis, enabling enlargement at the cost of iris integrity. 4. Iris hooks to provide stable retraction and chamber maintenance. 5. BOCTA technique for the most challenging cases, facilitating safe nucleus delivery and intraocular maneuvers through a small pupil without aggressive tissue trauma.

Results: Each technique provided incremental pupil expansion, ensuring adequate exposure for safe cataract extraction. The structured algorithm allowed a smooth transition between methods depending on intraoperative response. BOCTA proved particularly effective in maintaining chamber stability and minimizing iris damage in difficult scenarios.

Conclusions: This "video bouquet" offers cataract surgeons a practical guide to small pupil management in SICS. By adopting a stepwise, resource-conscious

strategy, surgeons can ensure safe, predictable outcomes while minimizing complications and preserving iris integrity.

Abstract No.: 207172

Needle Over Nucleus: Safe Decompression of Morgagnian Cataracts Using a 30G Needle

First Author: Abhinav SINSINWAR

Purpose: To demonstrate a simple and safe technique for decompression of Morgagnian cataracts using a 30-gauge needle to aspirate liquefied cortex prior to capsulorhexis.

Methods: A video-based case demonstration highlights the use of a 30G needle introduced through a paracentesis to aspirate the liquefied cortex, thereby reducing intracapsular pressure before initiating capsulorhexis. Stepwise narration covers entry site selection, aspiration dynamics, anterior chamber maintenance, and subsequent nucleus management.

Results: Controlled decompression was achieved with improved red reflex and visualization. Capsulorhexis was completed without extension, and nucleus management proceeded safely with preserved capsular integrity.

Conclusions: The 30G needle decompression technique is a valuable maneuver in managing Morgagnian cataracts. It enhances safety by reducing the risk of capsular tear, facilitating capsulorhexis, and improving surgical control in hypermature lenses.

Abstract No.: 207135

Phaco Surgery After RK With Zonular Instability

First Author: Abhinav SINSINWAR

Purpose: To demonstrate surgical challenges and techniques for safe phacoemulsification in a patient with prior radial keratotomy (RK) and coexistent zonular weakness.

Methods: A case of visually significant cataract in a post-RK eye with zonular instability was managed with careful incision planning between RK scars, capsular support using a capsular tension ring, and low-fluidics phacoemulsification with a chopping technique. Intraoperative modifications and strategies to minimize stress on the cornea and zonules were highlighted.

Results: Phacoemulsification was successfully completed with stable IOL implantation in the capsular bag. The postoperative course was uneventful with a well-centered IOL, stable capsular bag, and satisfactory visual recovery.

Conclusions: Phacoemulsification in post-RK eyes with zonular instability poses significant surgical challenges. Proper incision placement, zonular support devices, and low-stress phaco techniques are key to achieving

safe outcomes and good visual rehabilitation in such complex cases.

Abstract No.: 206131

Phaco Tips Compilation

First Author: Abdul HANNAN

Purpose: to teach small tips in each step of phacoemulsification surgery, which would help young surgeons benefit.

Methods: The video includes a compilation of 13 phaco tips across all steps of a conventional phaco surgery, which would help improve a young cataract surgeon's performance manifold.

Results: Each tip is recorded and chosen to help a beginner surgeon perform better.

Conclusions: Many/Most of the content of an international conference is focused on subspecialty level cases where young surgeon don't get their needs met. This video and its contents are made to focus on the training and learning objectives of young cataract surgeons who find it difficult to find something that actually helps them in real life.

Abstract No.: 202650

Phacoemulsification in a Complex Case of Operated Corneal Perforation, Adherent Leukoma, and Posterior Polar Cataract

First Author: Vinit TANWAR

Purpose: To demonstrate a tailored surgical approach for managing phacoemulsification in a high-risk eye with adherent leukoma and posterior polar cataract. The purpose is to highlight specific techniques designed to mitigate the compounded risks of zonular weakness and posterior capsular rupture (PCR).

Methods: This surgical video case report details the phacoemulsification technique in a patient with multiple ocular comorbidities. The surgical plan centered on minimizing capsular stress. Key steps included a controlled capsulorhexis, use of a low-infusion system (low bottle height and aspiration flow rate), and meticulous nucleus management. For cortex removal, a "flower petal" technique was employed, carefully stripping cortex circumferentially from the periphery inward while leaving the central cortex until last. The anterior chamber was consistently maintained with viscoelastic.

Results: Through the application of these specialized techniques, the posterior capsule remained intact throughout the procedure, and no zonular dialysis occurred. The nucleus and cortex were completely removed without complication. A stable, in-the-bag intraocular lens implantation was successfully achieved. The surgical approach effectively navigated the pre-existing complexities, leading to an uneventful procedure and a positive surgical outcome.

Conclusions: Successful phacoemulsification in eyes with adherent leukoma and posterior polar cataract requires a proactive strategy focused on capsular protection. Low-infusion fluidics and the flower petal cortex removal method are essential tools to prevent posterior capsular rupture and ensure a safe outcome in these challenging cases.

Abstract No.: 203629

Polar Eclipse: Managing a Posterior Polar Cataract With Posterior Capsulorrhexis and In-the-Bag IOL With No Vitreous Loss

First Author: Nikolai Thadeus MAPPATAO

Co-Author(s): Robert William KING

Purpose: To describe a surgical approach for a suspicious Grade III posterior polar cataract that achieves controlled posterior capsulorrhexis while preserving the anterior hyaloid and preventing vitreous loss.

Methods: A 28-year-old with Grade III posterior polar cataract and dense central nuclear opacity underwent phacoemulsification under lowflow, lowvacuum settings with careful viscoelastic use to maintain anterior chamber stability. A 5.0–5.5 mm continuous curvilinear capsulorrhexis was created. Hydrodelineation was performed without hydrodissection or nucleus rotation. The endonucleus was gently prolapsed into the central safe zone and emulsified in a controlled fashion. Epinucleus and cortex were separated via viscodissection. The dense central plaque was managed with a planned posterior capsulorrhexis: the posterior capsule was punctured with a 27-gauge needle, immediately followed by dispersive OVD injection into the Berger space to tamponade the vitreous. The rhexis was completed with microUtrata forceps under constant chamber maintenance with OVD. A one-piece posterior chamber IOL was implanted directly in the bag deliberately avoiding irrigation and aspiration behind the IOL. Carbachol and a preservative-free antibiotic were given intracamerally.

Results: The procedure was completed without vitreous prolapse or anterior hyaloid breach. Postoperatively, the posterior capsulorrhexis was stable, the IOL was well-centered, and the anterior hyaloid remained intact. At day 7, BCVA was 20/50, limited by probable sensory deprivation amblyopia.

Conclusions: Planned posterior continuous curvilinear capsulorrhexis, meticulous anterior chamber control, and OVD-assisted vitreous tamponade allow safe removal of posterior polar cataracts while preserving anterior hyaloid integrity and preventing vitreous loss.

Abstract No.: 204711

Posterior Polar Cataract With Posterior Capsular Rupture and a Twisted 3-piece IOL Haptic Way to Go

First Author: Vineeth B BHIMSHETTY

Co-Author(s): Vijaylaxmi B

Purpose: To demonstrate the management of PCR with handling the twisted IOL haptic with ease.

Methods: This is a case of posterior polar cataract that underwent phacoemulsification with PCR. There was no vitreous disturbance, hence the 3-piece IOL was injected. The surgeon noted trail haptic twisting at the end of the injection, which led to IOL decentration. Haptic Recoiling and then centration of the IOL were done meticulously.

Results: Well-centered 3 Piece IOL.

Conclusions: Early identification of the twisted haptic and the role of bimanual use of microforceps to recoil and center the IOL to gain a good vision outcome postoperatively.

Abstract No.: 203659

Saving a Radialized Capsulorrhexis in a Case of an Intumescent Cataract

First Author: Darren Anthony KHOW

Co-Author(s): Ma.Isabela Therese ARAGON

Purpose: To show the intraoperative management of an intumescent white cataract with a radialized capsulorrhexis.

Methods: Video presentation.

Results: This is the case of a sixty-four-year-old female with an intumescent white cataract, wherein phacoemulsification was done. Needle decompression was done to equalize the pressure between the anterior chamber and the capsular bag. During the creation of the capsulorrhexis, there was note of radialization superotemporally not reaching the equator. Tearing force with a single, sharp pull toward the center was used to rescue the radialized capsulorrhexis. It was noted that the capsulorrhexis was still complete and curvilinear. Careful phacoemulsification with minimal rotation of the nucleus was done. A single piece, acrylic intraocular lens was placed in the capsular bag with the haptics pointing away from the area of the radialized capsulorrhexis. Viscoelastic and retained cortical material were aspirated carefully, and the case was completed without further complication.

Conclusions: Adequate decompression of the capsular bag, as well as early recognition of potential capsulorrhexis radialization, is imperative in preventing intraoperative complications.

Abstract No.: 200482

Second Chances: Visual Rehabilitation in a Surgically Compromised Eye

First Author: Zain KHATIB

Purpose: To demonstrate the visual rehabilitation of a post-cataract surgical eye with high regular astigmatism secondary to old keratoconus and a posterior capsular rent (PCR), using a customized toric piggyback intraocular lens (IOL).

Methods: A 62-year-old male presented with long-standing poor vision in the right eye, 15 years post-cataract surgery. Uncorrected visual acuity (UCVA) was 6/60, improving to 6/9 with high cylindrical correction. Autorefraction and corneal tomography revealed corneal astigmatism >12 D, while subjective refraction revealed a significantly lower cylindrical power. Slit-lamp examination showed a suspected PCR, confirmed on anterior segment OCT, with the existing IOL in-the-bag. After confirming adequate sulcus space, a customized toric piggyback IOL (Sulcofix, Care Group) was planned based on subjective refraction. Manual toric axis marking was performed with digital verification (iToric app). The lens was inserted using a soft-shell technique and aligned precisely with preoperative markings. Postoperative outcomes were documented with slit-lamp imaging, autorefraction, and OCT.

Results: Day 1 autorefraction showed a residual 7 D cylinder, raising concerns about undercorrection. However, by 1 week, the patient achieved 6/9 unaided vision with subjective satisfaction, despite persistent high cylinder on autoref. Toric alignment was confirmed to be accurate on slit-lamp imaging and OCT showed good vault with no IOL-IOL contact.

Conclusions: Customized toric piggyback IOLs are a viable option for visually significant residual astigmatism in post-keratoconic eyes with PCR. Subjective refraction may be a more reliable guide than topography in such complex optical systems.

Abstract No.: 200339

Shaky Eyes, Soft Cataracts: A Surgical Challenge

First Author: Muhammad Fadhil RAHMADIANSYAH

Purpose: This video highlights practical techniques and key intraoperative strategies for performing safe and effective phacoemulsification in uncooperative patients with soft cataracts. The findings are intended to assist novice surgeons in overcoming common challenges encountered in such complex surgical cases.

Methods: We present a case of a soft cataract in a patient with poor cooperation during surgery. The video demonstrates the use of a scleral fixation ring to stabilize the globe and facilitate a controlled capsulorrhexis. A flip and chop technique is used for

efficient nucleus disassembly and aspiration. Each surgical step is annotated to emphasize decision-making and technical adjustments made in real time.

Results: The scleral fixation ring significantly improved control of eye movement, enabling a safe and efficient surgical procedure. The flip and chop technique allowed successful nucleus removal without complications. Postoperative visual recovery was favorable.

Conclusions: Phacoemulsification in uncooperative patients with soft cataracts can be safely managed with appropriate stabilization techniques and simplified nucleus removal strategies. This video provides a practical visual guide for beginner surgeons facing similar intraoperative challenges.

Abstract No.: 200235

Shaky but Salvageable: Polypropylene Suture Technique for Capsular Support

First Author: Yong Zheng WAI

Co-Author(s): Nurhayati ABDUL KADIR, Wai Seng CHIANG

Purpose: To describe a technique using a polypropylene 6-0 suture fashioned into an implantable capsular hook for stabilizing a shaky capsular bag, particularly when a capsular tension segment (CTS) is unavailable.

Methods: Two patients presented with cataract and phacodonesis. Phacoemulsification was performed, followed by the implantation of a capsular tension ring and a customized implantable capsular hook created from polypropylene suture to anchor the capsular bag. A single-piece intraocular lens was implanted within the bag. Unlike the CTS technique, this method does not require the creation of a scleral flap.

Results: At one week post-operatively, both patients achieved uncorrected distance visual acuity of at least 6/9. No pseudophacodonesis was observed.

Conclusions: The polypropylene 6-0 suture is an affordable, accessible, and effective alternative for capsular bag stabilization in the absence of a CTS. This technique eliminates the need for scleral flap creation, simplifying the procedure while achieving favorable early visual outcomes.

Abstract No.: 203201

Stratified Phacoemulsification: Unveiling the Novel Separation Technique

First Author: Tushya OM PARKASH

Co-Author(s): Rohit OM PARKASH

Purpose: To evaluate the efficacy of the stratified phacoemulsification technique in challenging situations.

Methods: Stratified phacoemulsification was employed, wherein, following mechanical delineation,

the nucleus was split into inner and outer layers. Inner nuclear emulsification was followed by outer layer emulsification. Stratified emulsification was used in Morgagnian cataracts, posterior polar cataracts, and hard cataracts. Stratified emulsification was done in five eyes of Morgagnian cataracts, twenty-six eyes of posterior polar cataracts, and fifty patients with hard cataracts.

Results: Stratified emulsification was successfully carried out in five cases of Morgagnian cataracts. In our series of twenty-six patients with posterior polar cataracts, posterior capsular rupture occurred in one case, which showed pre-existing dehiscence with a moth-eaten appearance on Anterior Segment Optical Coherence Tomography. In 50 cases of hard cataracts, the endothelial cell loss was 7.62 % with no significant change in central corneal thickness.

Conclusions: The addition of stratified emulsification to the surgeon's armamentarium provides the option of doing emulsification in layers with the outer layer acting as a shield to protect the posterior capsule in challenging situations.

Abstract No.: 203888

Successful Implantation of a Multifocal Toric Intraocular Len (IOL) Following Perfect Posterior Capsular Rupture in Polar Cataract

First Author: Kiet Phang LING

Co-Author(s): Chin Sern CHAN, Choon Teng CHAN, Wee Min TEH, Wilson Jun Jie WONG

Purpose: Posterior capsular rupture (PCR) is a serious complication of phacoemulsification cataract surgery that traditionally precludes the implantation of premium intraocular lenses, such as multifocal toric, due to instability and decentration risks. This case demonstrates that certain type of posterior capsular rupture may not be an absolute contraindication for multifocal toric intraocular lens.

Methods: A case of posterior polar cataract underwent phacoemulsification surgery, which was complicated by posterior capsular rent. Notably, the rupture had a unique perfect vertical, linear tear. Despite the complication, due to the calculated toric IOL axis located at horizontally, a multifocal toric IOL was successfully implanted in the capsular bag and oriented on the horizontal axis as plan.

Results: The IOL was stable postoperatively, with no evidence of decentration or tilt. The patient achieved uncorrected distance visual acuity of 6/6; near acuity of N6 and reported satisfactory quality of vision.

Conclusions: This case illustrates that the morphology of PCR is a critical factor in surgical decision making. A stable, linear rent may provide sufficient support for a premium IOL, allowing the surgeon to still achieve the planned refractive outcome. It highlights that advanced

surgical skill and meticulous assessment of the capsule can expand option even in complex cases.

Abstract No.: 201143

Surgical Nightmares: IOL Complications

First Author: Prakash Kumar CHOWDHURY

Co-Author(s): Pradipta CHOWDHURY

Purpose: To present a concise, high-yield video guide demonstrating rare and complex intraoperative intraocular lens (IOL) complications and their surgical management.

Methods: A series of challenging cataract surgery cases were recorded, highlighting scenarios such as IOL shoot, stuck IOL, kissing IOLs, IOL flip, abnormal haptic opening, optic crack, haptic break, and optic fracture. Each case was edited to emphasize key intraoperative steps, difficulties encountered, and the surgical maneuvers required for safe resolution.

Results: The video demonstrates effective surgical strategies for resolving diverse IOL complications, underscoring principles of safe manipulation, controlled intraocular handling, and decision-making during high-risk situations. Techniques shown include controlled viscoelastic use, micro-instrument assisted maneuvers, and eventual IOL exchange. Collectively, these cases provide practical insight into minimizing surgical trauma, preventing escalation of complications, and preserving visual outcomes.

Conclusions: This video serves as a high-yield educational resource for cataract surgeons, enhancing preparedness for rare IOL complications and promoting optimal patient care.

Abstract No.: 200347

Surviving Continuous Curvilinear Capsulorhexis (CCC) in Your First White Cataract Cases

First Author: Muhammad Fadhil RAHMADIANSYAH

Purpose: To demonstrate key preventive strategies and intraoperative tips for safely performing CCC in white cataract cases, especially for beginner surgeons.

Methods: This surgical video showcases a step-by-step approach in managing high-risk white cataracts. Key elements include ensuring a fully dilated pupil, generous use of cohesive OVD, and proper anterior capsule staining with trypan blue. Capsule decompression is performed to prevent the Argentine flag sign. When the capsular tear begins to escape, gentle redirection can help regain control. If the tear extends peripherally, a new flap is created and CCC is continued in the opposite direction. After successful CCC, the procedure continues with the flip and chop phacoemulsification technique to reduce zonular stress and prevent further capsular tear extension.

Results: Most cases achieved successful CCC with minimal complications. Adapting technique in real-time, especially in managing tear direction and choosing appropriate phacoemulsification strategy, helped optimize safety and control.

Conclusions: White cataracts pose unique challenges in CCC for beginners. With proper preparation, visualization, and adaptability, including the use of flip and chop post-CCC, surgeons can safely manage these high-risk cases. This video provides a practical guide to surviving and succeeding in early white cataract surgeries.

Abstract No.: 206447

Sutureless Fixation of the Capsular Bag: Russian Tie Technique

*First Author: Vitaly **POTEMKIN***

*Co-Author(s): Shohida **BABAEVA***

Purpose: Demonstration of video cases with a new method of sutureless capsular bag fixation.

Methods: Three cases of weak zonules (two with IOL dislocation, one with lens subluxation).

Results: In all three cases, the IOL was centered 6 months after surgery. There were intra-ir postoperative complications.

Conclusions: The method of sutureless capsular bag fixation provides stable positioning for the IOL.

Abstract No.: 205727

The Flanged Innovation: Advancing Aphakia Management With the Yamane Technique

First Author: Gnanambiga M

*Co-Author(s): Rajesh **SINHA***

Purpose: To present the step-by-step surgical demonstration of the Yamane flanged scleral fixation technique for intraocular lens implantation in aphakic eyes with inadequate capsular support and to evaluate short-term visual and anatomical outcomes.

Methods: A 53-year-old aphakic patient with a history of complicated cataract surgery with compromised capsular support presented to our tertiary eye centre. After comprehensive preoperative evaluation, scleral fixation of a three-piece intraocular lens using the Yamane technique was performed under peribulbar anaesthesia. Two transconjunctival sclerotomies were created 180 degrees apart. Once a three-piece intraocular lens was implanted, leading and trailing haptics were sequentially docked using the double needle technique, externalized, flanged using low-temperature cautery, and secured within scleral tunnels. The entire procedure was recorded in high resolution. Postoperative evaluation at 1 month included best corrected visual acuity, intraocular lens stability, and complications assessment.

Results: At 1 month, the patient achieved the best corrected visual acuity of 0.3 log MAR. The intraocular lens remained well-centred and stable with no observed intra-operative or postoperative complications. Surgical video analysis confirmed precise tunnel creation and secure flange fixation, contributing to favourable visual and anatomical outcomes.

Conclusions: The Yamane technique offers a safe, efficient, and minimally invasive solution for secondary intraocular lens fixation in aphakic patients with compromised capsular support, delivering excellent visual rehabilitation and anatomical stability with minimal complications. High-definition surgical video with key intra-operative annotations enhances understanding of technical nuances, serving as a key educational tool for emerging ophthalmic surgeons.

Abstract No.: 201160

The Flip Side: Managing an Upside-Down Intraocular Lens

*First Author: Yu Ting Tina **SHEN***

Purpose: To present a case of an upside-down intraocular lens (IOL) identified intraoperatively, and to describe the in situ IOL flip technique as a safe and efficient corrective manoeuvre.

Methods: A patient undergoing combined phacoemulsification with IOL implantation, pars plana vitrectomy, and membrane peel was noted intraoperatively to have the IOL inserted upside down. Instead of explantation and reinsertion, an in situ flip technique was employed. This involved controlled rotation of the IOL within the capsular bag, restoring correct orientation without excessive manipulation or wound enlargement.

Results: Intraoperative recognition of the upside-down IOL was facilitated by optic and haptic configuration cues. The in situ flip was successfully performed, achieving correct IOL orientation swiftly. This avoided potential complications of IOL explantation such as endothelial trauma, capsular compromise, and wound distortion. Postoperatively, the patient achieved outcome with a stable, well-centered IOL.

Conclusions: Upside-down IOL insertion is a rare occurrence that requires prompt recognition. The in situ flip technique offers a simple, efficient, and safe method to correct IOL orientation intraoperatively, minimizing surgical trauma and preserving capsular integrity. This case highlights the importance of surgical vigilance and demonstrates a practical approach to managing this intraoperative challenge.

Abstract No.: 207299**The Zonule Cliffhanger—Classic Moves, Safe Landing***First Author: Sneha G V**Co-Author(s): Sri Ganesh*

Purpose: To demonstrate the complication management of Intraoperative zonular dehiscence (ZD).

Methods: Routine cataract surgery in a patient was faced with Intraoperative zonular dehiscence. Management included the use of CTR, CTS, and Iris Hooks.

Results: The ZD was finally managed by going back to the basics - thorough anterior vitrectomy. This emphasizes the role of Anterior Vitrectomy in complication management.

Conclusions: ZD can be a simple complication to manage by taking a stepwise approach by starting from the basics.

Abstract No.: 204715**Tight Aperture, Clear Future: Phacoemulsification in Uveitic Cataract With Small Pupil***First Author: James Michael JACOMINA**Co-Author(s): Robert Edward ANG*

Purpose: To present the surgical management of a dense uveitic cataract with posterior synechiae and a small pupil without the use of iris hooks.

Methods: A patient with chronic uveitis and a brunescant cataract presented with hand motion vision. Intraoperatively, posterior synechiae were initially dissected using a balanced salt solution (BSS) cannula, followed by mechanical synechiolysis with a spatula and eventual fine cutting with Vannas scissors. The pupil was mechanically stretched to achieve functional dilation without adjunctive pupil expansion devices. Standard phacoemulsification was then performed.

Results: Phacoemulsification was completed successfully without intraoperative complications. No iris hooks or expansion rings were required. A posterior chamber intraocular lens was implanted in the capsular bag. Postoperatively, the patient's vision improved to 20/40 with stable intraocular pressure and a quiet anterior chamber.

Conclusions: Careful synechiolysis and mechanical pupil stretching can enable safe phacoemulsification in uveitic cataracts with small pupils, even without pupil expansion devices and can produce favorable outcomes.

Abstract No.: 206821**Tjokro's Pass and Switch (PAS) Technique: A Novel Technique for Iris-Claw Lens Implantation***First Author: Ludwig Melino TJOKROVONCO*

Purpose: Several studies mentioned that retropupillary iris-claw lens implantation is a safer, faster, and easier procedure than prepupillary implantation. However, retropupillary iris-claw implantation is not without complications. The most common complications are pupil ovalization and haptic disenclavation. By using the standard technique, we often encounter some difficulties, especially in the second haptic enclavation. Based on these findings, I propose a new modified technique for retropupillary iris-claw lens implantation: the Pass and Switch technique.

Methods: Both iris-claw lens haptics are brought posteriorly and then slightly elevated so that we can visualize the lens shadow behind the iris. This will allow us to ensure the exact enclavation location at 180-degree opposite. Various instruments that can be used for enclavation, such as an enclavator needle, a cystotome, or a hydrodissection cannula. When the enclavation process is complete, the remaining viscoelastic can be flushed away and the main incision can be closed. The surgical procedure is complete.

Results: The most important key to this technique is hand stability when switching the forceps grip from one hand to the other to avoid loosening the IOL grip or pulling the first haptic enclavation. A total of 32 cases have been performed using this modified technique with no complications up to 9 months of follow-up.

Conclusions: This technique promises better lens centration, precise enclavation to produce a round pupil, reduced risk of disenclavation, and faster procedure duration. In addition, more stable intraoperative intraocular pressure in patients with vitrectomized eyes compared to the standard technique.

Abstract No.: 202633**Unexpected Posterior Capsular Rupture During Final Viscoelastic Aspiration After Intraocular Lens Implantation***First Author: Vinit TANWAR*

Purpose: To demonstrate a case of an unexpected posterior capsular rupture (PCR) occurring during the final, seemingly benign stage of viscoelastic removal after successful IOL implantation. This report highlights the subtle intraoperative signs and the management of a stable, vitreous-free rupture.

Methods: This surgical video case report involves a 62-year-old patient undergoing routine cataract surgery. After uneventful phacoemulsification and in-the-bag IOL implantation, a subtle fluid dynamic

change was noted during final viscoelastic aspiration. Suspicion of a PCR was confirmed post-aspiration by injecting an air bubble and hydrating the main wound, which revealed a small superior capsular defect. The integrity of the anterior hyaloid face was carefully assessed.

Results: A small, stable posterior capsular rupture was identified without any associated vitreous prolapse. The single-piece intraocular lens remained well-centered and secure within the capsular bag. Due to the stable nature of the complication and absence of vitreous, an anterior vitrectomy was not required. The surgery was concluded, and the patient was managed conservatively with a postoperative course of topical and oral steroids and antibiotics.

Conclusions: Posterior capsular rupture can occur at any step of cataract surgery, including viscoelastic removal. Surgeon vigilance for subtle signs is crucial for early detection. When a PCR is identified and confirmed to be stable without vitreous prolapse, a conservative approach can be safely adopted, preserving the excellent outcome of an otherwise successful surgery.

Abstract No.: 201558

Unique Techniques for Intraoperative Release of Adherent Haptic to Optic in IOL After Injecting in the Capsular Bag

First Author: Harshavardhan PATIL

Purpose: Ideally, after IOL insertion. It unfolds in the capsular bag immediately within a few seconds. But sometimes. The haptic gets adherent to the optic. And does not open even after more than 2 minutes.

Methods: So presenting unique techniques to unfold such adherent haptics to optics. First, by the capillarity method. By placing an irrigation canula on one side and an aspiration canula on the other side. And increase aspiration. The resulting fluid wave. Will dislodge the haptic by capillarity action. Second is nudging the haptic with a sharp needle or MVR. Or dialer. To release the haptic.

Results: With the above techniques, the adherent haptic unfolds easily.

Conclusions: Such unique techniques save the day. For the surgeon.

Abstract No.: 201709

Walking on Thin Ice: Navigating Posterior Polar Cataracts

*First Author: Pauline Gabrielle LACSAMANA
 Co-Author(s): Reginald Robert TAN*

Purpose: To demonstrate a safe and effective phacoemulsification technique for managing a posterior polar cataract, emphasizing strategies to

prevent posterior capsular rupture and highlighting intraoperative pearls for successful surgical outcomes.

Methods: This video demonstrates the phacoemulsification of a posterior polar cataract with emphasis on techniques to minimize posterior capsule stress. A continuous curvilinear capsulorhexis was performed, followed by hydrodelineation only, avoiding hydrodissection. Nuclear rotation was omitted to prevent capsular stress. The nucleus was carefully debulked and anteriorized, allowing supracapsular emulsification using low phaco parameters. Capsular bag inflation was maintained throughout the case with cohesive viscoelastic to prevent chamber collapse. Care was taken to fill the anterior chamber with viscoelastic before withdrawing the phaco tip, to avoid sudden decompression and potential posterior capsule rupture. Cortical removal was performed with low vacuum and gentle aspiration, avoiding traction on the capsule. A foldable intraocular lens was implanted in the bag, and the case was completed without complications. This approach highlights key safety modifications in managing posterior polar cataracts.

Results: The procedure was successfully completed without posterior capsule rupture or vitreous loss. Chamber stability was maintained throughout by careful viscoelastic use and controlled phacoemulsification parameters. The posterior capsule remained intact, and a foldable intraocular lens was implanted securely within the capsular bag. Postoperative recovery was unremarkable, with the patient achieving best-corrected visual acuity of 20/25 on postoperative day 1.

Conclusions: This case highlights the effectiveness of a no rotation, no hydrodissection approach, combined with chamber stability techniques, in safely managing posterior polar cataracts.

Abstract No.: 206174

When Endothelial Safety Guides Technique: Phacoemulsification in One Eye, MSICS in the Fellow Eye

*First Author: Anselmo David ULTRA
 Co-Author(s): Keshia Lourdes DUYONGCO-LENON,
 Alexander Joseph REYES*

Purpose: To present an instructional video on manual small incision cataract surgery (MSICS), framed within a case where significant endothelial cell loss after phacoemulsification in the fellow eye guided the decision to perform MSICS, highlighting both surgical technique and endothelial preservation.

Methods: A 74-year-old female with hypertension presented with bilateral visual decline. Preoperative best corrected visual acuity was 20/125 in both eyes. Slit-lamp examination revealed dense nuclear sclerotic cataracts (LOCS III NO4NC4C1P1). Specular microscopy showed endothelial cell counts of 2080 cells/mm²

(right) and 2116 cells/mm² (left). Phacoemulsification with intraocular lens implantation was performed in the left eye. At 1 month, the endothelial count had dropped to 1188 cells/mm², prompting the choice of MSICS for the right eye to minimize endothelial risk. The case was performed by a resident in a training setting under supervision. The surgical video demonstrates key MSICS steps, including tunnel construction, nucleus delivery, and wound closure.

Results: After phacoemulsification, the left eye achieved uncorrected visual acuity (UCVA) of 20/25, but the endothelial cell count decreased to 1188 cells/mm². The right eye achieved UCVA of 20/20 following MSICS, with a postoperative endothelial cell count of 1959 cells/mm², reflecting minimal loss. Both eyes remained clear with stable intraocular pressures and no complications.

Conclusions: This video demonstrates MSICS as both a teachable surgical technique and an endothelial-sparing alternative in cataract surgery. Beyond excellent visual outcomes, the case underscores that endothelial status should guide surgical planning, and MSICS remains a valuable option—particularly in patients with borderline corneal endothelium and in training settings.

Abstract No.: 201703

When the Cannula Pops: Managing an Argentinian Flag Sign With Supracapsular Phacoemulsification

First Author: Pauline Gabrielle **LACSAMANA**

Purpose: To demonstrate the surgical management of a nucleocortical cataract complicated by an anterior capsular tear and early Argentinian flag sign following cannula ejection, highlighting the importance of tailored techniques such as anteriorization of lens nucleus and supracapsular phacoemulsification to achieve a successful outcome.

Methods: This case involves a mature nucleocortical cataract complicated by a sudden anterior capsular nick resulting from inadvertent cannula ejection during viscoelastic injection. Early features of an Argentinian flag sign were then observed. A bent needle cystotome was utilized to fashion a flap from the tear, allowing re-initiation and completion of the capsulorrhexis with Utrata forceps. Hydrodissection was intentionally avoided to prevent further capsular extension. Instead, hydrodelineation was carefully performed, and the nucleus was mechanically anteriorized using a chopper. Supracapsular phacoemulsification was carried out in the anterior chamber, reducing stress on the compromised capsular bag. A foldable intraocular lens was successfully implanted within the capsular bag, with gentle rotation of the trailing haptic to achieve proper positioning and stability.

Results: The capsulorrhexis was successfully completed despite the initial tear, and phacoemulsification was performed without further capsular extension. The IOL was securely placed within the bag, and no intraoperative or postoperative complications were observed.

Conclusions: Even in the presence of an anterior capsular tear and early Argentinian flag sign, meticulous surgical planning and techniques—particularly careful instrument handling, judicious use of ophthalmic viscosurgical device, avoidance of hydrodissection, and the application of supracapsular phacoemulsification, are critical in preserving capsular integrity and achieving a successful surgical outcome.

Abstract No.: 205035

Where Did It Come From? Appearance of Primary IOL During Planned Secondary IOL Surgery

First Author: Harshavardhan **PATIL**

Purpose: The purpose is to highlight the importance of proper anterior vitrectomy and preoperative indirect ophthalmoscopy in locating a fallen primary IOL in the vitreous.

Methods: An Aphakic patient was posted for secondary IOL after 3 months of the primary surgery. Intraoperatively, during anterior vitrectomy, a PMMA IOL suddenly pops out from the vitreous base. Ideally, 3 3-port pars plana vitrectomy has to be done. Levitated the IOL into the anterior chamber. And place a secondary iol. But since the IOL came close to the posterior capsule anteriorly. I decided to dial it out by the Two Dialer Technique into the anterior chamber. Removed all tractional vitreous strands around the IOL. After a proper Anterior vitrectomy. Placed SAME IOL in sulcus. Patient is doing well postoperatively. With bcva of 6/6,n6. In conclusion, a proper anterior vitrectomy helps you in bringing the hidden IOL from the vitreous base. Which can be placed in the sulcus if good capsular support is present. Not ideal if IOL is in mid-vitreous or on the retina. Again highlights the importance of proper indirect ophthalmoscopy preoperatively to locate any IOL. And not relying solely on patient history.

Results: IOL could be retrieved through the posterior capsule rent site. And the same IOL was placed in the sulcus. So, proper anterior vitrectomy not only helped retrieve the same IOL, but also saved the patient a huge sum of money for pars plana vitrectomy and scleral-fixated IOL.

Conclusions: A good result was obtained by proper anterior vitrectomy, and postoperatively, the patient is doing well after 1 year of surgery, again highlighting the importance of proper anterior vitrectomy.

Cornea, Dry Eyes, External Eye Diseases and Eye Banking

Abstract No.: 205714

A Novel Graft Substitute Post Pterygium Surgery Using Platelet-Rich Fibrin Graft -From Blood to the Membrane

First Author: Lipi MITTAL

Co-Author(s): Sunil KHANDELWAL, Vatsalya VENKATRAMAN

Purpose: Pterygium is a common ocular surface disease that arises from the degenerated conjunctiva and underlying tenon's capsule, resulting from abnormal fibrovascular proliferation of cells. There are many approaches for its treatment post-ptyrygium excision, ranging from bare sclera, conjunctival closure, conjunctival autograft, and amniotic membrane transplantation. The main concern following its excision remains recurrence, which varies widely within these methods. Although no gold standard technique is defined to prevent its recurrence, conjunctival autografts remain the preferred choice of ocular reconstruction post-excision. After thoroughly reviewing the literature, we present a novel method using a Platelet-rich fibrin membrane as an autologous, biocompatible graft that can be sutured or secured with fibrin glue for ocular reconstruction post-primary pterygium surgery.

Methods: The patient underwent pterygium excision with platelet-rich fibrin membrane grafting, which was prepared using the patient's own blood sample from the antecubital vein. The sample was centrifuged, and a PRF membrane was procured using aseptic precautions and compressed into a flat membrane and secured using fibrin glue.

Results: Although the rate of recurrence is yet to be established, the healing process in such cases is impressive.

Conclusions: Although the rate of recurrence is yet to be established, the healing process in such cases is impressive.

Abstract No.: 204505

Botropase Breakthrough: A Cost-Effective Game Changer in Pterygium Graft Fixation

First Author: Nilesh KUMAR

Purpose: To demonstrate the BOT-Graft technique, a novel method using Botropase (hemocoagulase) for sutureless fixation of conjunctival autograft and amniotic membrane following pterygium excision, aimed at reducing operative time, enhancing patient comfort, and minimizing complications.

Methods: Following meticulous subconjunctival dissection and pterygiorhexis, three variations of the technique were performed: (1) Conjunctival autograft harvested from the superior conjunctiva. (2) Amniotic membrane graft placement. (3) Rotational conjunctival graft. In all cases, Botropase drops were instilled beneath the graft to achieve adhesion. Grafts were ironed into position, and excess fluid was absorbed via capillary action.

Results: Secure graft fixation was achieved without the need for sutures or fibrin glue. The technique demonstrated reduced operative time, improved patient comfort, and avoidance of complications such as subconjunctival hemorrhage, granuloma, or graft retraction. Cosmetic outcomes were excellent across cases.

Conclusions: The BOT-Graft technique represents a safe, efficient, and cost-effective alternative for conjunctival or amniotic membrane graft fixation in pterygium surgery. Its ease of use and affordability make it highly suitable for high-volume ophthalmic practice.

Abstract No.: 206401

Crescent-Shaped DMEK for the Management of Corneal Endothelial Decompensation With Adherent Leukoma

First Author: Xu MAN

Co-Author(s): Jie BAI, Ling LI, Shaowei LI, Chang LIU, Fangqi LV, Lin ZHAO

Purpose: To demonstrate the feasibility and efficacy of a novel, customized crescent-shaped Descemet Membrane Endothelial Keratoplasty (DMEK) in a case of corneal endothelial decompensation complicated by a peripheral adherent leukoma, where a conventional circular DMEK graft was not feasible due to the small available donor area.

Methods: A 67-year-old male presented with a 6-year history of blurred vision in his right eye. The diagnosis was adherent leukoma and corneal endothelial decompensation. His preoperative uncorrected visual acuity (UCVA) was Hand Motion (HM) at 1 meter. Due to the location of the leukoma, using a standard circular donor graft would result in overlapping the pathological area, leading to poor outcomes. Therefore, a customized crescent-shaped DMEK graft was designed and transplanted to exclusively cover the clear optical zone and avoid the adherent leukoma.

Results: The crescent-shaped DMEK procedure was performed successfully. At the 6-month postoperative follow-up, the patient's vision improved significantly. The uncorrected visual acuity (UCVA) improved to 0.15, and the best-corrected visual acuity (BCVA) reached 0.25.

Conclusions: This case illustrates that a customized crescent-shaped DMEK is a viable and effective

surgical technique for treating corneal endothelial failure in complex cases with peripheral corneal opacities or adhesions. This approach allows for targeted endothelial transplantation while avoiding compromised areas, thereby expanding the indications for DMEK surgery and improving visual outcomes in otherwise challenging cases.

Abstract No.: 200195

DMEK Plan a (Always Works) Plan B (Backup Graft Not Needed) – a Step-by-Step Guide to Achieving a Good DMEK Graft During Donor Preparation

First Author: Ronak SOLANKI

Purpose: Most surgeons' transition from DSEK to DMEK surgery is hindered by the fact that the beginner DMEK surgeon is most worried about what if the donor tissue is not prepared well and does not achieve the desired result. By following certain steps right from the mounting of the DMEK tissue to loading it before inserting it into the host, one can confidently achieve donor tissue that is always viable for use.

Methods: We describe a wet lab training model with surgical review, where, with enough practice and disciplined following of the steps, one can avoid excessive manipulations of the donor tissue and prepare a good and viable tissue for insertion during DMEK surgery for better outcomes and success.

Results: DMEK tissue preparation training in the wet lab made the transition to actual surgery easier and avoided the need for a backup graft in the first few cases for the surgeon, especially in the scenario where finding good quality optical grade tissue is difficult, and it is not justified to waste precious tissue which could have been used for another deserving patient who needed a corneal transplant.

Conclusions: A wet lab training on discarded tissues by following the step-by-step guide as described, along with a surgical video review, will be very helpful for the beginner DMEK surgeon to transition confidently to DMEK surgeries without the need for a backup tissue and fear of not achieving a good Donor Graft preparation. Managing complications like radial tears, etc, can also be practiced.

Abstract No.: 201457

Doughnut Refractive Lenticule Transplantation for Advanced Keratoconus: Visual, Tomographic, and Biomechanical Outcomes in a Prospective Study

First Author: Zaman SHAH

Purpose: To evaluate the clinical efficacy, safety, and biomechanical effects of Doughnut Refractive Lenticule Transplantation (DRLT) in advanced keratoconus over 16 months.

Methods: This prospective interventional study included 41 eyes of 40 patients (ages 11–32) with advanced keratoconus, with or without vernal keratoconjunctivitis, conducted at Health Net Hospital, Peshawar (IRB No: HNH/IRB/2024/07). Donor globe-derived doughnut lenticules were fashioned into doughnut-shaped segments and implanted into femtosecond laser-created stromal pockets. Outcomes assessed over 16 months included distance corrected visual acuity (DCVA), corneal tomography, and anterior segment OCT.

Results: DCVA improved from logMAR 1.00 ± 0.20 to 0.30 ± 0.15 ($p < 0.001$), with 30% achieving logMAR 0.18 or better. Mean K1 decreased from 52.19 ± 5.38 D to 50.98 ± 5.62 D, K2 from 60.46 ± 6.27 D to 55.29 ± 6.19 D ($p = 0.0021$), and Kmax from 70.07 ± 9.72 D to 62.90 ± 7.76 D ($p < 0.001$). Topographic astigmatism reduced from 8.27 ± 3.50 D to 4.81 ± 2.55 D ($p < 0.001$). The thinnest corneal thickness increased from 410.33 ± 39.23 μ m to 443.33 ± 80.68 μ m. Posterior keratometry decreased significantly, and the Belin ABCD staging showed marked improvement (D value from 31.00 ± 4.51 to 14.52 ± 2.05 ; $p < 0.0001$). Pachymetric indices and CTSP improved, while ARTmax decreased, reflecting biomechanical stabilization.

Conclusions: DRLT is a safe and effective option for advanced keratoconus, offering sustained visual, thickness, and biomechanical improvements.

Abstract No.: 200950

Excision of Ocular Surface Squamous Neoplasia by No Touch Technique

First Author: Purnima RAJKARNIKAR SHAPIT

Purpose: To demonstrate the proper method of excision biopsy of ocular surface squamous neoplasia lesions.

Methods: After a peribulbar block and draping, a wire speculum is placed. Margin of the lesion is identified with a microscope. A 4mm of normal-looking conjunctiva is marked away from the margin of the lesion all around limbus to limbus using a bipolar cautery tip, as marking with a pen may be washed away. A microsponge dipped in 99% alcohol is applied at 2mm of clear cornea from the edge of the lesion for 40 seconds in order to loosen the epithelium of the cornea, and the corneal epithelium is scraped towards the limbus using a crescent knife. The marked conjunctiva is excised up to the limbus using Westcott scissors. The lesion is excised in toto using the crescent knife and placed in a premarked filter paper, air-dried, and sent to the pathologist after fixing it with formalin. The ocular surface is flushed with normal saline. The instruments and gloves of the surgeon are changed. Double freeze-thaw cryotherapy is done at the edges of the excised conjunctiva and the base of the lesion at the limbus. An amniotic membrane is placed over

the bare sclera using the tissue glue to fix it. Speculum removed and eye padded.

Results: Changing of gloves and instruments is believed to avoid contamination from the tumor cells to the remaining ocular surface. Application of cryotherapy prevents the recurrence of the lesion in case the margin of the excised tissue shows dysplasia.

Conclusions: Proper technique of excision of ocular surface tumors provides a complete cure and prevents recurrences.

Abstract No.: 208948

Innovation in the Excision of Conjunctival Cysts

First Author: Dahu WANG

Co-Author(s): Yuyan ZHANG

Purpose: This video describes a case of successfully removing the cyst wall of a conjunctival cyst through a 2 mm incision with a 1 ml syringe needle.

Methods: A 65-year-old male presented to our department complaining of foreign body sensation in the right eye for 1 month. Upon examination, a transparent cystic dilatation was observed at the outer canthus of the right eye, with a clear boundary, approximately 10 mm*6 mm in size, which could move with the bulbar conjunctiva. The surrounding conjunctiva was congested. No other obvious abnormalities were found. Then, a clinical diagnosis of conjunctival cyst was made in the right eye. The treatment included the instillation of 0.5% levofloxacin eye drops to prevent infection, followed by the instillation of 0.4% oxybuprocaine eye drops three times. After the anesthesia took effect, a 2 mm incision was made at the highest point of the cyst with a 1 ml syringe needle (outer diameter of 0.45mm) under the slit lamp. Then, the cyst and the conjunctival epithelium around the incision were separated with the needle. Subsequently, the cyst was punctured, and then gently squeezed to make part of the cyst wall protrude from the incision. Finally, the complete cyst wall was removed with the needle.

Results: Postoperatively, the foreign body sensation in the right eye disappeared, and there was no recurrence of the conjunctival cyst during the 6-month follow-up.

Conclusions: The novel technique is simple and effective for treating conjunctival cysts in the clinic, which can provide a new insight for clinical practice.

Abstract No.: 204862

Intraoperative Pitfalls in Endothelial Keratoplasty: The Beginner's Perspective

First Author: Madhuvanthi MOHAN

Co-Author(s): Sujatha MOHAN

Purpose: To analyze the most common intraoperative complications encountered by a novice surgeon during endothelial keratoplasty (EK).

Methods: Eighteen Descemet's stripping endothelial keratoplasty (DSEK) and 2 Descemet's membrane endothelial keratoplasty (DMEK) cases were performed by a single novice corneal surgeon. Complications recorded included graft orientation errors, graft folds, difficult insertion, tissue loss, intraoperative endothelial touch, and anterior chamber instability. Surgical rescue steps are shown for the beginner corneal surgeon.

Results: In DMEK cases, the most frequent intraoperative complication was graft scrolling and orientation error, followed by unscrolling difficulty. In DSAEK, difficult graft insertion and graft folds predominated.

Conclusions: Early intraoperative complications in EK are common but predictable. Structured training, careful preoperative graft preparation, and stepwise intraoperative strategies can enable beginners to navigate the learning curve safely and achieve favourable visual outcomes

Abstract No.: 201712

Managing Corneal Melt: Keratoprosthesis Removal and Tectonic Penetrating Keratoplasty in Ocular Stevens-Johnson Syndrome

First Author: Pauline Gabrielle LACSAMANA

Co-Author(s): Reginald Robert TAN

Purpose: This video demonstrates the surgical technique for explantation of a keratoprosthesis with simultaneous tectonic penetrating keratoplasty (PKP) in a patient with Stevens-Johnson Syndrome (SJS), addressing the challenges of severe ocular surface disease and corneal melt, and highlighting strategies to restore globe integrity.

Methods: A previously placed temporary tarsorrhaphy was released to expose the globe. After ocular surface assessment, a Flieringa ring was sutured to the sclera for globe stabilization. The keratoprosthesis was carefully dissected and explanted, preserving viable host tissue. A donor corneal button was placed and anchored with four cardinal 10-0 nylon sutures, followed by interrupted sutures to complete the closure. Knots were rotated and buried to minimize irritation. The anterior chamber was reformed, and the wound was checked for watertightness. A partial tarsorrhaphy was reapplied to protect the graft postoperatively.

Results: The procedure was completed without complication. The graft was tectonically stable, the anterior chamber was well-formed, and the globe maintained structural integrity. Follow-up showed a clear graft without leak or infection. While visual recovery was limited by underlying ocular disease, the globe was anatomically preserved, and corneal melt progression halted.

Conclusions: Keratoprosthesis explantation with simultaneous tectonic penetrating keratoplasty is a viable globe-saving procedure in cases of corneal melt and graft failure, particularly in high-risk ocular surface disease such as Stevens-Johnson Syndrome. Timely surgical intervention, combined with globe stabilization using a Flieringa ring and postoperative surface protection with tarsorrhaphy, can successfully restore structural integrity and preserve the eye for future rehabilitation.

Abstract No.: 202649

Manual DSEK in Beginner Corneal Surgeons

First Author: Madhuvanthi **MOHAN**

Co-Author(s): Sujatha **MOHAN**

Purpose: Descemet Stripping Endothelial Keratoplasty (DSEK) is one of the preferred surgical techniques for combatting endothelial disorders owing to its faster recovery, reduced rejection rates, and superior visual outcomes compared to penetrating keratoplasty. However, for beginner corneal surgeons, the steep learning curve and intraoperative technical challenges can be intimidating especially while doing manual DSEK. This video aims to demystify DSEK by providing a comprehensive, step-by-step approach tailored for early-career surgeons.

Methods: The DSEK technique is broken down into logically sequenced, reproducible steps—from donor preparation and host bed creation to graft insertion, unfolding, and centration. Emphasis is placed on key decision points and intraoperative tips to avoid common pitfalls. Steps are discussed in practical detail to enhance surgical confidence and reproducibility. In addition to the surgical technique, the video also talks about pearls on patient selection, preoperative planning, and postoperative care to ensure optimal outcomes and long-term graft survival.

Results: Corneal surgeons in training or just beginning their practice will be equipped with a simplified yet safe roadmap to initiate their DSEK journey, with particular attention to reducing endothelial cell loss and improving graft attachment rates.

Conclusions: This structured yet accessible approach aims to promote greater adoption of endothelial keratoplasty in training programs and enhance surgical self-sufficiency in resource-limited settings.

Abstract No.: 202607

Nick, Loop and Pull Technique of Corneal Suture Removal

First Author: Vinit **TANWAR**

Purpose: To describe a novel, stepwise technique for removing buried or vascularized corneal sutures. The goal is to minimize common complications such as epithelial defects, wound dehiscence, and patient discomfort by avoiding traction on the overlying epithelium and preventing exposed suture from being dragged through the cornea.

Methods: This prospective case series evaluated a technique performed on 20 eyes. Under topical anesthesia at a slit lamp or operating microscope, a 26-gauge hypodermic needle is used to cleanly cut one end of an interrupted suture flush with the corneal surface. The needle tip is then inserted under the opposite end of the suture to gently lift and extricate the superficial segment from the overlying epithelium without disrupting it. The suture is then grasped at its base with forceps and removed. Epithelial integrity was assessed with fluorescein dye.

Results: The technique was successfully performed in all 20 eyes. Immediate application of fluorescein dye demonstrated significantly less epithelial disruption compared to the linear defects characteristic of conventional methods. Patients reported minimal postoperative discomfort. No instances of wound dehiscence, broken sutures, or persistent epithelial defects were observed. The technique was found to be simple and easily reproducible by trainees.

Conclusions: This stepwise approach is a safe, simple, and effective technique for corneal suture removal. It is particularly advantageous for deeply buried or vascularized sutures, significantly reducing the risk of iatrogenic epithelial trauma and wound complications. This method improves patient safety and comfort and can be readily adopted.

Abstract No.: 207324

Real-Time iOCT Guided Technique for Surgical Management of Acute Hydrops in Advanced Keratoconus

First Author: Anshika **LUTHRA SHARMA**

Co-Author(s): Gaurav **LUTHRA**

Purpose: This video demonstrates an intraoperative OCT-guided technique for managing acute corneal hydrops in keratoconus using partial-thickness stromal compression sutures and intracameral 14% perfluoropropane.

Methods: A 15-year-old girl presented with advanced keratoconus secondary to VKC and sudden diminution of vision in the right eye. She was diagnosed with acute hydrops in the right eye, and iOCT-guided surgical intervention was planned for the same.

Results: Real-time iOCT is used to localize the maximal stromal cleft and Descemet membrane tear. Radial, partial-thickness compression sutures are placed to approximate stromal lamellae and reduce edema. As edema begins to resolve intraoperatively, any loosened sutures are replaced to maintain optimal stromal apposition. This is followed by injecting non-expansile 14% C3F8 into the anterior chamber for internal tamponade and promotion of Descemet membrane reattachment. Using iOCT ensures precise suture depth and real-time evaluation of corneal structural changes.

Conclusions: This technique resulted in rapid symptom relief, resolution of edema within 2–3 weeks, and improved visual outcomes. It offers a safe, reproducible alternative that may defer or reduce the need for keratoplasty in advanced keratoconus.

Abstract No.: 207297

Repair of a Damaged Cornea Caused by Failed Keratorefractive Lenticule Extraction (KLEX) Surgery Using a Post-KLEX Donor Cornea

First Author: Shaowei LI

Co-Author(s): Jie BAI, Zexia DOU, Ling LI, Chang LIU, Lin ZHAO

Purpose: To report a case of lamellar keratoplasty (LKP) utilizing a corneal donor who had previously undergone keratorefractive lenticule extraction (KLEX) surgery.

Methods: A 30-year-old female patient with -4.0 D myopia suffered corneal stromal damage and severe visual impairment due to failure to remove the lenticule during KLEX surgery. Subsequently, she attained favorable therapeutic outcomes after femtosecond laser-assisted LKP with a cornea from a post-KLEX donor whose preoperative refraction was -6.5 D. An 8.5 mm lamellar graft was prepared using a femtosecond laser, the recipient bed was prepared using an 8.0 mm vacuum trephine, and the tissue was manually removed.

Results: The patient was in good condition at 18 months postoperatively, with an uncorrected distance visual acuity of 6/20 and corrected distance visual acuity of 20/20 with -1.5 DC, and a spherical equivalent of -0.75 D.

Conclusions: Post-KLEX donor corneas can be used in patients with myopia, although the refractive power of the donor graft may be partially compromised.

Abstract No.: 207354

Restoring Sight Against Odds: A Case of Down Syndrome With Bilateral Advanced Keratoconus With Hydrops and Intumescent Cataracts

First Author: Srishti KHULLAR

Co-Author(s): Vijay KUMAR

Purpose: To highlight the challenges and outcomes of managing bilateral corneal hydrops with cataracts in a patient with Down syndrome, where cooperation, anesthesia risks, and ocular pathology complicate surgical decision-making.

Methods: A 27-year-old male with Down syndrome presented with progressive bilateral vision loss and frequent falls. Examination under anesthesia confirmed bilateral corneal hydrops with cataracts secondary to keratoconus. A staged approach was planned: Stage 1: Bilateral intracameral SF6 injection for Descemet's membrane reattachment and corneal deturgescence; Stage 2 (after 4 weeks)—Left eye: Phacoemulsification with IOL implantation; Right eye: Triple Procedure (penetrating keratoplasty, cataract extraction, and IOL implantation) performed in a single sitting to minimize anesthetic exposure.

Results: Surgical challenges included poor cooperation, eye rubbing, difficulty in IOL power calculation, and postoperative compliance. Despite these, both procedures were successfully completed, and intraocular lenses were placed in the capsular bag. At six months, the patient achieved ambulatory vision (20/200) with improved independence and no evidence of graft failure or rejection.

Conclusions: A staged, tailored surgical strategy can restore useful vision in complex cases of Down syndrome with bilateral corneal hydrops and cataracts. This case underscores the importance of careful planning, minimizing anesthesia risk, and adapting intraoperative and postoperative management to patient-specific challenges.

Abstract No.: 207230

Salvaging a Ruptured Graft in DMEK Surgery by Sequential Implantation and In-Situ Apposition: A Clever Technical Modification

First Author: Ling LI

Co-Author(s): Jie BAI, Zexia DOU, Shaowei LI, Chang LIU, Lin ZHAO

Purpose: To demonstrate an innovative technique for managing an unintended rupture of the DMEK graft into two unequal parts.

Methods: A 36-year-old male with Fuchs' endothelial corneal dystrophy and corneal decompensation in the right eye. Preoperative best-corrected visual acuity was unmeasurable, with a central corneal thickness of 661µm and an endothelial cell density of

462 cells/mm². During graft preparation, the donor tissue accidentally ruptured into two unequal parts (approximately 5/6 and 1/6). Instead of aborting the procedure, we employed a sequential implantation technique. The larger graft (5/6) was first implanted, positioned, and allowed to adhere for 5 minutes under an air bubble. After partial air removal confirmed its stability, the smaller graft (1/6) was implanted and meticulously manipulated to achieve near-perfect in-situ apposition with the edges of the larger graft. A final air bubble was injected to secure the composite graft.

Results: The surgery was successfully completed. On postoperative 6mon, the patient's corrected visual acuity improved to 0.5, with an intraocular pressure of 12mmHg. Significant corneal clearance and stable graft attachment were observed.

Conclusions: Graft rupture during DMEK is not a terminal event. The demonstrated technique of sequential implantation and in-situ apposition is an effective, reliable, and innovative solution that successfully utilizes the ruptured graft, avoids donor tissue waste, and achieves favorable visual outcomes. This technique is worthy of dissemination among corneal surgeons.

Abstract No.: 205863

Shave Excision of Corneal Pyogenic Granuloma in a Stevens-Johnson Syndrome Patient

First Author: Inderjeet **KAUR**

Purpose: This video highlights the management of a rare presentation of corneal pyogenic granuloma occurring in a compromised ocular surface, emphasizing the role of iOCT in surgical planning & intraoperative decision making.

Methods: iOCT(intraoperative optical coherence tomography) guided surgical shave excision of corneal pyogenic granuloma.

Results: iOCT-guided surgical shave excision of corneal granuloma is a useful technique.

Conclusions: This video highlights the management of a rare presentation of corneal pyogenic granuloma occurring in a compromised ocular surface, emphasizing the role of iOCT in surgical planning & intraoperative decision making.

Abstract No.: 207944

Simplified DMEK Graft Preparation With Basic Instruments in Resource-Limited Settings

First Author: Tulika **CHAUHAN**

Co-Author(s): Surveen Kaur **ARNEJA**, Joanna **WASIELICA-POSLEDNIK**

Purpose: To describe a safe and cost-effective technique of Descemet Membrane Endothelial Keratoplasty (DMEK) graft preparation using basic surgical instruments in settings where specialized marking devices are unavailable.

Methods: Donor corneas suitable for endothelial transplantation were utilized. Standard instruments, including a trephine and fine forceps, were employed for Descemet membrane separation and staining. Orientation marks were created with readily available tools instead of advanced equipment. The technique was documented on video and evaluated for feasibility, reproducibility, and graft integrity.

Results: All grafts were prepared successfully using only basic instruments. Orientation marks were consistently visible intraoperatively, facilitating graft unfolding and positioning. No perforations occurred, and tissue loss was minimal. The procedure was reproducible with a short learning curve.

Conclusions: DMEK graft preparation can be effectively performed using simple instruments without the need for costly equipment. This technique increases the accessibility of DMEK in resource-limited countries such as India and supports the wider adoption of endothelial keratoplasty.

Abstract No.: 203459

Sublimbal Orbital Fat Transposition for Corneal Defects Associated With Neurotrophic Keratopathy

First Author: Vera **PROKOPCHUK**

Co-Author(s): Vitaly **POTEMKIN**

Purpose: The persistence of corneal ulcers in neurotrophic keratopathy (NTK), a condition stemming from corneal denervation, presents a significant therapeutic challenge. Given the diverse causes of NTK and the lack of a single etiological cure, current treatments focus on pathogenetic mechanisms, such as technically demanding corneal neurotization or the use of recombinant nerve growth factor. To address this, we propose a novel surgical approach: the transposition of orbital fat beneath a scleral flap. The proposed technique leverages the unique properties of orbital adipose tissue, specifically its mixed embryological background and its abundance of stem cells and neurotrophic factors, to promote healing.

Methods: Sublimbal Orbital Fat Transposition (S-LOFT) was proposed for the treatment of persistent NTK. The

study presented clinical outcomes for three patients with refractory NTK of various etiologies, who had not responded to conventional therapies such as lubricants, bandage contact lenses, autologous serum, and tarsorrhaphy. In one complex case, S-LOFT was combined with tectonic keratoplasty and tarsorrhaphy.

Results: S-LOFT ensured complete healing of therapy-resistant ulcers, with epithelialization progressing from the graft site. Outcomes included reduced edema, scar formation, and long-term stability without recurrence. Even in severe cases, it provided immediate tectonic support and promoted stromal recovery.

Conclusions: S-LOFT technique presents a new and effective pathogenetic treatment strategy for severe and resistant forms of neurotrophic keratopathy. The procedure can be used both as a standalone intervention and in combination with other surgical methods for complex cases.

Abstract No.: 204848

Three Corneas in One: The Battle Symphony

First Author: Tushar GROVER

Co-Author(s): Nishanth MADHIVANAN

Purpose: “Three Corneas in One: The Battle Symphony” chronicles the challenging 6-year surgical journey of a single eye through three sequential ophthalmic procedures.

Methods: A 45-year-old woman presented with advanced Macular Dystrophy, initially managed with Deep Anterior Lamellar Keratoplasty (DALK). She later developed cataract, managed by phacoemulsification with Toric IOL implantation. Eventually, endothelial decompensation—a rare complication of Macular Dystrophy—occurred. To preserve the astigmatic correction provided by the Toric IOL, Descemet’s Stripping Automated Endothelial Keratoplasty (DSAEK) was chosen over Penetrating Keratoplasty.

Results: The choice of DSAEK addressed this rare complication while preserving the IOL’s astigmatic correction, leading to an excellent and stable visual outcome.

Conclusions: This video highlights strategic decision-making and surgical finesse, showcasing the patient’s resilient journey through multiple challenges to achieve a stable, excellent visual outcome.

Abstract No.: 201169

Three Novel Topical Transamin Application Techniques in Achieving Ocular Surface Haemostasis

First Author: Julia CHAN

Purpose: Prompt haemostasis is essential when conducting ocular surface surgeries. Preoperative Subcutaneous and subconjunctival injection has been reported in the literature. The video aims at reporting

3 distinct techniques in achieving haemostasis in ocular surface surgeries intraoperatively.

Methods: Three video excerpts demonstrated intraoperative topical transamin in achieving haemostasis. The first video demonstrated a cotton bud presoaked with transamin being applied to the scleral bleeding site through direct pressure during keratolimbal allograft surgery. The second video showed a cotton bud being nudged between the conjunctiva and the sclera for a direct pressure effect, then being soaked with transamin with a cannula during pterygium surgery. The third video demonstrated multiple sponge spears, with handles cut prior, being inserted into the subconjunctival space, followed by transamin injection to achieve haemostasis during pterygium surgery.

Results: With the combined physical (direct pressure) and chemical (transamin) effect, haemostasis has been achieved efficiently. The first method provides direct visualization, allowing immediate supplementary diathermy if necessary. The advantages of the second method are 1) efficient against focal bleeding, 2) frees the hands of the surgeon while awaiting haemostasis, and 3) the retained cotton bud handle prevents loss in the subconjunctival space. The third method is efficient against relatively extensive bleeding with a more extensive contact site, but care has to be taken to prevent any loss of sponges during retrieval.

Conclusions: The three topical transamin application methods are effective against ocular surface bleeding.

Abstract No.: 204202

Triple Procedures - Challenges During Lens Management

First Author: Karan BHATIA

Purpose: To illustrate surgical techniques and intraoperative strategies for managing lens-related challenges during keratoplasty, serving as a practical teaching resource for corneal surgeons.

Methods: This video compiles real-world cases of penetrating keratoplasty (PK) and Descemet’s Stripping Endothelial Keratoplasty (DSEK) performed with concurrent cataract extraction and intraocular lens (IOL) implantation. Complex scenarios demonstrated include:

- Capsulorhexis extension and positive posterior pressure during PK
- Decentered IOL with pre-existing posterior capsular rent
- Subluxated mature cataract and healed perforated ulcer post-radial keratotomy
- Failed therapeutic PK with cataract
- Lens subluxation/dislocation, broken IOL, aphakia, and vitreous prolapse

Techniques for secondary IOL implantation — including iris-claw and scleral-fixated intraocular lenses (SFIOLs) — are also highlighted.

Results: The video demonstrates surgical pearls, intraoperative modifications, and complication management with clear annotations and narration.

Emphasis is placed on structured decision-making and adaptability to ensure safe outcomes in complex anterior segment reconstruction.

Conclusions: Keratoplasty combined with cataract and IOL surgery presents unique intraoperative challenges. This teaching video provides a structured educational framework for cornea surgeons to enhance surgical confidence and outcomes in demanding cases.

Abstract No.: 202495

Winning the Battle in Infectious Keratitis

First Author: Rania ZAKI

Purpose: To demonstrate the effectiveness of a dual surgical approach in managing bilateral infectious keratitis, utilizing Deep Anterior Lamellar Keratoplasty (DALK) in one eye and Penetrating Keratoplasty (PKP) in the other.

Methods: This video presents a challenging case study of a patient with bilateral infectious keratitis who underwent DALK in one eye and PKP in the other. The surgical techniques, postoperative care, and outcomes were analyzed and compared.

Results: The patient showed significant improvement in visual acuity and corneal clarity in both eyes. The DALK procedure preserved the host's endothelium, reducing rejection risk, while the PKP procedure provided effective treatment for advanced keratitis. The dual approach allowed for tailored treatment and optimal outcomes. After 2 months, BCVA reaches 0.3 in OD and 0.2 in OS. Six months later, bilateral phacoemulsification and PCIOL were done, and BCVA improved to 1.0 in OD and 0.8 in OS.

Conclusions: The combination of DALK and PK offers a promising solution for managing bilateral infectious keratitis, allowing for personalized treatment and improved visual outcomes.

Glaucoma

Abstract No.: 206693

A (b-Interno Trabeculotomy), B (Lue Dye Injection), C (As-oCt) for MIGS for Minimally Invasive Glaucoma Surgery

First Author: Nimrita NAGDEV

Co-Author(s): Devendra MAHESHWARI, Madhavi PILLAI, Shivam GUPTA

Purpose: To demonstrate the efficacy of minimally invasive glaucoma surgeries (MIGS) in restoring aqueous outflow, while highlighting the role of intraoperative blue dye in visualizing outflow pathways and collector channels, and the complementary use of anterior segment OCT (AS-OCT) in assessing postoperative anatomical and functional outcomes.

Methods: This video demonstrates various ab-interno MIGS procedures, including Tanito microhook trabeculotomy, Gonioscopy-Assisted Transluminal Trabeculotomy (GATT), Bent Ab-interno Needle Goniectomy (BANG), and Kahook Dual Blade (KDB) trabeculotomy. Intraoperative blue dye was injected to visualize aqueous outflow pathways and collateral vessels in real time. Postoperative anatomical and functional changes were evaluated using anterior segment OCT (AS-OCT) to document surgical outcomes and correlate structural alterations with enhanced outflow.

Results: Blue dye provided clear intraoperative visualization of aqueous outflow and collateral vessels, with downstream blanching of episcleral veins suggestive of collector channel patency. AS-OCT imaging enabled a detailed assessment of surgical sites, confirming anatomical alterations consistent with improved outflow. These findings enhanced intraoperative precision and provided objective postoperative documentation of success.

Conclusions: The combined use of intraoperative blue dye and AS-OCT offers valuable insights into the mechanisms by which MIGS procedures restore aqueous outflow. This integrated approach not only improves surgical precision and intraoperative guidance but also facilitates postoperative evaluation, ultimately contributing to optimized outcomes and management in glaucoma surgery.

Abstract No.: 205689

Ahmed ClearPath in Port-Wine Stain Glaucoma: Successful Conservative Approach to Late Hypotony

First Author: Umair QIDWAI

Purpose: To present a rare case of port-wine stain-related glaucoma managed with an Ahmed ClearPath implant, complicated by late hypotony—a feared outcome after tube shunt surgery—and to highlight how successful conservative (non-surgical) management avoided reoperation and restored stability.

Methods: We report a single illustrative case of port-wine stain-related glaucoma managed with an Ahmed ClearPath implant. Clinical records, intraocular pressure (IOP) measurements, optic nerve status, and postoperative course were reviewed. Particular attention was given to the onset, evaluation, and conservative management of late hypotony. Conservative measures—including adjustment of topical therapy, close monitoring, and supportive management—were employed, and outcomes were documented over follow-up.

Results: Following Ahmed ClearPath implantation, the patient initially achieved good IOP control. Several months later, late hypotony developed, presenting

with decreased IOP and mild choroidal changes. Conservative management—including cessation of aqueous suppressants, close monitoring, and supportive measures—led to gradual resolution of hypotony without further surgical intervention. The eye stabilized with acceptable IOP, preserved optic nerve status, and satisfactory visual function at follow-up.

Conclusions: Late hypotony is a recognized complication after glaucoma drainage implants, but not all cases require surgical intervention. This case demonstrates that with careful monitoring and timely conservative measures, even complex eyes such as those with port-wine stain-related glaucoma can achieve stable outcomes without reoperation.

Abstract No.: 201624

Ahmed Valve Implantation With Partial Tube Ligation in a Pediatric Patient With Secondary Open Angle Glaucoma From Sturge-Weber Syndrome

*First Author: George Michael **SOSUAN***

*Co-Author(s): Alyssa Louise **PEJANA-PAULINO***

Purpose: To demonstrate the surgical technique of Ahmed valve implantation with partial tube ligation in a pediatric patient with Sturge-Weber Syndrome (SWS) and severe secondary open-angle glaucoma, aiming to reduce the risk of early postoperative hypotony.

Methods: This surgical video illustrates the implantation of an Ahmed FP7 glaucoma drainage device in a pediatric eye, with a key modification, which is the partial ligation of the tube using 7-0 Vicryl to restrict early aqueous flow. The procedure is shown in its entirety. Initial steps include peritomy, positioning of the plate 8 mm posterior to the limbus, and scleral fixation of the plate with 10-0 Nylon. Partial occlusion is achieved by inserting a 5-0 Prolene suture into the tube lumen, followed by ligation with 7-0 Vicryl. The tube is trimmed bevel-up, inserted through a 23-gauge needle tract into the anterior chamber, and secured with a mattress suture. Conjunctival closure is completed with multiple 10-0 Nylon sutures.

Results: The surgical video provides clear visualization of critical steps, highlighting modification of surgical techniques tailored to pediatric patients with high episcleral venous pressure. No intraoperative complications occurred. Postoperative IOP was stable without early hypotony, and the eye maintained a well-formed anterior chamber.

Conclusions: Ahmed valve implantation with partial tube ligation is a safe and effective surgical modification for managing refractory pediatric glaucoma in patients with SWS. This technique minimizes early hypotony risk while maintaining the long-term pressure-lowering benefits of the drainage device.

Abstract No.: 207368

Bleb Rescue Surgeries – a Video Collection

*First Author: Dewang **ANGMO***

*Co-Author(s): Anuja **PATIL**, Tanuj **DADA***

Purpose: To describe our modifications of the various bleb rescue surgeries in different scenarios post glaucoma filtering surgery and glaucoma drainage device insertion.

Methods: Data of all patients undergoing various bleb rescue surgeries post glaucoma filtering surgery and glaucoma drainage device insertion were collected, including demographic details, IOP, number of glaucoma medications, bleb clinical photos, bleb ASOCT at baseline and on follow-ups. The various bleb rescue surgeries done were iOCT guided bleb needling, conservative management with oral doxycycline, bleb repair/ bleb sparing epithelial exchange (BSEX) for leaking/sweating blebs, modified maumenee technique in dysfunctional filtering blebs, pedicle conjunctival graft for bleb repair, conjunctival autograft for tube exposure, modified BSEX - two layered closure in paediatric bleb leak, tenons patch graft for dysfunctional blebs with scleral fistula, leaking trab blebs post abandoned cataract surgery.

Results: This is a video bouquet demonstrating our technique of bleb rescue operations with the various modifications incorporated in different clinical scenarios – a tailor-made approach showcasing clinical picture, case description, surgical technique, postoperative clinical picture, and ASOCT showing the bleb function. The surgical outcomes of various bleb rescue procedures had good anatomical outcomes – aesthetic appearance and functional outcomes in terms of IOP control. The bleb rescue operations are modifications of traditional surgeries documented in literature as they are associated with an increase in IOP/ bleb failure postoperatively.

Conclusions: Our technique of bleb rescue surgeries has shown good anatomical as well as functional outcomes.

Abstract No.: 207181

Clinical Applications of Aqueous Angiography

*First Author: Anuja **PATIL***

*Co-Author(s): Dewang **ANGMO**, Nitika **BERI**, Tanuj **DADA***

Purpose: To explore the clinical utility of Aqueous Angiography (AA) in assessing functional aqueous humor outflow (AHO) pathways and to evaluate its role in guiding and optimizing minimally invasive glaucoma surgeries (MIGS), particularly trabecular cutting MIGS, in both high-flow and low-flow regions.

Methods: A video-based demonstration of AA-guided MIGS procedures and their usefulness in: - To identify

high- and low-flow regions of AHO in real-time. - Guide trabecular MIGS procedures based on AA findings. - Evaluate cases of failed MIGS with recurrent intraocular pressure (IOP) elevation. - Assess intraoperative functionality and patency of MIGS implants or incisions, with the potential for immediate surgical revision.

Results: AA successfully identified variable AHO patterns intraoperatively. MIGS performed in low-flow regions guided by AA showed improved functional outflow. In cases of failed MIGS, AA revealed fibrosis and closure of previously functional outflow channels. Intraoperative AA enabled real-time confirmation of stent patency or surgical incision functionality, allowing intraoperative adjustments when needed.

Conclusions: Aqueous Angiography is a valuable intraoperative tool for visualizing AHO dynamics and guiding MIGS procedures. Its application enhances surgical precision, improves postoperative outcomes, and provides a novel opportunity to revise or optimize procedures in real time. Integration of AA into MIGS protocols could significantly refine current glaucoma surgical strategies.

Abstract No.: 201405

Combined Trabeculectomy and MSICS Surgery in a Complicated Case

*First Author: Shams **NOMAN***

Purpose: To show my own technic of doing the surgery.

Methods: After doing a peritomy, a triangular half-thickness scleral flap was done, and a little extension was fashioned at its base. After entry to the ac, 360-degree synechiolysis was done. After removing lens by visco expression, ac was washed. Deep blocked was removed and surgical pi was done. A single suture was given on the scleral flap apex. Peritomy was closed with 8/0 vicryl.

Results: Preoperative IOP was 35 mmHg, and vision was 3/60. Postoperative vision was 6/9 after one month. IOP was 14 mm Hg with one medication.

Conclusions: Manual sics plus trabeculectomy is a good technic managing complicated cataract with secondary glaucoma.

Abstract No.: 201916

Conjunctival Patch Graft for Overfiltration Management in Neovascular Glaucoma Surgery: A Resource-Limited Approach to Post-Trabeculectomy Complications

*First Author: Patricia Abigail **LIM- TANJUTCO**
 Co-Author(s): Irene **FELARCA**, James Paul **GOMEZ**,
 Maria Imelda **YAP- VELOSO***

Purpose: To report the successful use of a conjunctival patch graft in managing persistent overfiltration and

leakage following trabeculectomy in a patient with advanced neovascular glaucoma (NVG).

Methods: A 74-year-old female with NVG secondary to central retinal vein occlusion (CRVO) underwent trabeculectomy in the right eye due to financial limitations precluding a glaucoma drainage device. She had a history of pseudophakia, drusen, and sensory exotropia. Preoperative anti-VEGF was administered. Surgery was uncomplicated except for a thin scleral flap. On postoperative day 7, the patient developed vision loss (light perception), hypotony (IOP 3 mmHg), kissing choroidals, and a shallow anterior chamber. She underwent external drainage of the choroidals with trabeculectomy revision.

Results: Intraoperatively, overfiltration was observed with aqueous gushing at the scleral flap and multiple scleral buttonholes. Suturing failed to achieve a watertight seal. Conventional grafts (scleral or amniotic) were unavailable. A conjunctival patch graft was used as an alternative barrier. Postoperatively, the patient achieved controlled IOP, a stable anterior chamber, and a functioning bleb without leakage. No recurrence of choroidal effusions was observed, and the patient remained stable during follow-up.

Conclusions: This case demonstrates that conjunctival patch grafting can be an effective alternative for sealing persistent scleral leakage after trabeculectomy, particularly in resource-limited settings where standard graft materials are unavailable. Its successful use highlights the importance of adaptability in surgical management and provides an additional option for clinicians facing similar challenges.

Abstract No.: 203505

Dual Benefit: Combined Phacoemulsification and Goniotomy in a Patient With a Prior Filtering Bleb

*First Author: Ajita **SASIDHARAN**
 Co-Author(s): Srujana **LINGALA***

Purpose: To report the synergistic effect of combined phacoemulsification and goniotomy in a patient with cataract and advanced primary open-angle glaucoma (POAG) with a prior functioning filtering bleb, which did not control intraocular pressure adequately.

Methods: A 74-year-old man with a history of undergoing trabeculectomy with mitomycin C 15 years earlier in his left eye, presented with a visually significant cataract with vision of counting fingers close to face and inadequately controlled intraocular pressure (IOP) of 22 mm of hg despite maximal topical therapy (travoprost, dorzolamide, and timolol) to which he was gradually becoming intolerant. He underwent combined phacoemulsification and goniotomy.

Results: The procedure resulted in visual rehabilitation(6/6) and reduced IOP to 12 mm of

Hg without the need for additional antiglaucoma medications (AGM).

Conclusions: Combined phacoemulsification and goniotomy is an effective surgical option in patients with coexisting cataract and elevated IOP. In this patient, this procedure gave the dual benefit of improved vision and IOP control, preserving the function of the original filtering procedure. This reduces the burden of topical medications and also prevents ocular surface disease caused by long-term usage of multiple AGMs.

Abstract No.: 201403

Fight Against a Monstar

*First Author: Shams **NOMAN***

Purpose: To present a complicated cataract surgery in a case of ice syndrome and manage high pressure with a non-valved AADI implant.

Methods: It was a maltreated and misdiagnosed case of ICE syndrome with cataract, with a visual acuity of HM and IOP of 46 mmHg. I did only cataract surgery in such a complicated case after the injection of mannitol. After cataract surgery, her IOP was raised to 50 mmHg, and the patient developed bullous keratopathy. IOP was not controlled by hyperosmotic or other anti-glaucoma medications. I underwent AADI implantation to reduce IOP.

Results: Postoperative IOP was 20 mmHg without medications, and visual acuity was improved to 6/36.

Conclusions: Reducing IOP by any means is an important factor in a case of ICE syndrome to prevent further glaucomatous damage.

Abstract No.: 206716

From Closure to Control: Breaking Barriers in Angle-Closure Glaucoma With MIGS

*First Author: Devendra **MAHESHWARI***

*Co-Author(s): Shivam **GUPTA**, Nimrita **NAGDEV**, Madhavi **PILLAI***

Purpose: To demonstrate the evolving role of minimally invasive glaucoma surgery (MIGS) as an adjunct and alternative in the management of primary angle-closure glaucoma (PACG), highlighting hybrid approaches, surgical pearls, and case-based outcomes.

Methods: A video-based presentation of PACG cases undergoing combined strategies such as phacoemulsification with goniosynechiolysis, gonioscopy-assisted transluminal trabeculotomy (GATT), Tanito microhook trabeculotomy, and newer goniotomy techniques. Key steps, anatomical challenges, and intraoperative video-assisted modifications are demonstrated

Results: MIGS procedures in carefully selected PACG eyes facilitated improved angle visualization and

outflow enhancement, with a reduction in intraocular pressure and medication burden. Surgical pearls and hacks are shared to address scenarios such as extensive peripheral anterior synechiae, narrow angles, and eyes with failed prior filtration surgery

Conclusions: MIGS is no longer confined to mild-to-moderate open-angle glaucoma. With refined patient selection and hybrid surgical strategies, MIGS can play a pivotal role in breaking traditional barriers of PACG management and offer a forward-looking alternative to filtration surgeries.

Abstract No.: 206359

Management of Dislocated IOL and Refractory IOP in Pseudoexfoliation Glaucoma Using a Double Loop Fixation and Tube Shunt

*First Author: Ping **HUANG***

*Co-Author(s): Reza **RAZEGHINEJAD***

Purpose: To demonstrate the combined surgical technique of IOL fixation using a double loop fixation method, glaucoma tube shunt implantation in a patient with pseudoexfoliation glaucoma and a dislocated IOL.

Methods: A 90-year-old female with a long history of pseudoexfoliation glaucoma presented with a dislocated IOL and uncontrolled intraocular pressure (IOP) of 40 mmHg despite treatment with five classes of glaucoma medications. Preoperative best-corrected visual acuity (BCVA) was 20/200. The surgical procedure included repositioning of the dislocated IOL using a double loop fixation technique, implantation of a glaucoma drainage device, and creation of a scleral window to prevent choroidal effusion, given advanced age and high preoperative IOP.

Results: Postoperatively, BCVA improved to 20/40, and IOP stabilized in the mid-teens with 2 glaucoma medications. The IOL remained well-entered, with a deep anterior chamber and appropriately positioned tube.

Conclusions: In this high-risk case, the combined surgical approach successfully restored visual acuity, stabilized the dislocated IOL, and achieved significant IOP reduction without complications.

Abstract No.: 204983

Managing Primary Congenital Glaucoma With 360° Ab-Externo Suture Trabeculotomy

*First Author: Aleena **ESPINOSA***

Purpose: To demonstrate the surgical technique and clinical outcomes of 360° ab-externo suture trabeculotomy in the management of primary congenital glaucoma (PCG).

Methods: This video presents a case of a 2-year-old with PCG who underwent 360° ab-externo suture

trabeculotomy. A limbal-based conjunctival flap was created, followed by a superficial scleral flap, then a vertical incision on the scleral bed to expose Schlemm's canal. A 5-0 polypropylene suture was threaded circumferentially through the canal and withdrawn to complete a 360° trabeculotomy. Intraoperative steps, anatomical landmarks, and key surgical tips are illustrated. Postoperative IOP, visual acuity, and corneal clarity.

Results: The procedure achieved successful 360° catheterization and trabeculotomy in the case presented. Postoperative IOP significantly decreased from preoperative levels and remained stable over follow-up. Corneal haziness resolved, with a notable decrease in Haab striae opacity. Hyphema was noted, but no other major intraoperative or postoperative complications, such as infection or suture misdirection, were observed.

Conclusions: 360° ab-externo suture trabeculotomy is a safe, cheap, and effective surgical option for primary congenital glaucoma. It offers complete angle access, leading to sustained IOP control and anatomical recovery. This technique is particularly advantageous in settings where microcatheter-assisted procedures may not be available.

Abstract No.: 205310

Mastering the Angle- Embark on the Journey of Transformation From Phacoemulsification to MIGS

First Author: Madhavi PILLAI

Co-Author(s): Shivam GUPTA, Devendra MAHESHWARI

Purpose: With the rise of Minimally Invasive Glaucoma Surgery (MIGS), it is imperative to expand our skillset and have multiple options in our armamentarium.

Methods: This video charts the path from traditional phacoemulsification to angle-based glaucoma surgery, highlighting the transition. This video-assisted skill transfer introduces the principles of angle anatomy, visualization techniques, and MIGS procedures—such as BANG, GATT, KDB goniotomy, iStent, and Tanito microhook trabeculotomy—that can be seamlessly integrated in a stepwise manner.

Results: Through case demonstrations and practical tips, attendees will gain confidence in identifying surgical candidates and executing angle procedures with precision, and tips and tricks to shorten the learning curve.

Conclusions: Mastering the art of intraoperative gonioscopy has become inevitable and it is imperative for novice glaucoma surgeons to add this skillset to their armour.

Abstract No.: 206275

Minimally Invasive Tube-Hybrids

First Author: Christopher WAY

Co-Author(s): Dan LINDFIELD

Purpose: We attempted to surgically manage a patient with refractory uveitic glaucoma using novel surgical approaches.

Methods: A 91-year-old Afro-Caribbean patient with uveitic glaucoma required surgical intervention.

Results: We describe the combined insertion of an Ahmed Clearpath in a novel minimally invasive technique, combined with a Preserflo insertion as a primary procedure.

Conclusions: To our knowledge, this is the first time the Ahmed Clearpath has been utilised in a hybrid procedure. The patient sustained a drop-free intraocular pressure of 10 postoperatively. We look to summarise novel minimally invasive hybrid approaches in a case series.

Abstract No.: 204985

Preserflo™ MicroShunt Insertion With Intraluminal Ripcord Suture Combined With Phacoemulsification in a Patient With Primary Open-Angle Glaucoma and Mature Cataract

First Author: Aleena ESPINOSA

Purpose: To demonstrate the surgical technique and early outcomes of Preserflo MicroShunt implantation with an intraluminal ripcord suture combined with phacoemulsification in a patient with advanced primary open-angle glaucoma (POAG) and visually significant mature cataract.

Methods: This video presents the step-by-step technique in a 70-year-old male with uncontrolled POAG and dense cataract. Initial conjunctival peritomy and scleral marking and incisions were first performed superiorly. Standard phacoemulsification and intraocular lens implantation were then performed through a temporal clear corneal incision. This was followed by the implantation of the Preserflo™ MicroShunt in the superotemporal quadrant, followed by sub-Tenon's mitomycin-C injection. A 9-0 Nylon suture was anchored at the clear cornea as a releasable suture and the other end was placed intraluminally as a ripcord to provide early postoperative flow modulation. The technique for secure placement, tension control, and ripcord anchoring is demonstrated. Postoperative IOP, visual acuity, and bleb morphology were monitored.

Results: The combined procedure was completed without intraoperative complications. The ripcord suture allowed controlled aqueous outflow in the immediate postoperative period, minimizing hypotony risk. At early follow-up, intraocular pressure was

significantly reduced, the bleb was well-formed and diffuse, and the patient achieved good visual recovery. No adverse events such as shallow anterior chamber, hypotony, or device malposition were observed.

Conclusions: Preserflo MicroShunt insertion with an intraluminal ripcord suture is a viable technique to enhance early postoperative safety. When combined with phacoemulsification, it offers a safe and effective option for managing coexisting POAG and cataract.

Abstract No.: 204954

Surgical Management of a Rare Bilateral Glaucoma in a Pediatric Patient With Sturge-Weber Syndrome

First Author: Edlyn **NARAVAL**

Co-Author(s): Jose Maria **MARTINEZ**

Purpose: To present the challenging surgical management of glaucoma in Sturge-Weber syndrome.

Methods: Ahmed's glaucoma valve tube, parked underneath the conjunctiva, was repositioned in the anterior chamber with prophylactic scleral windows in the right eye, followed by fibrous capsule and ingrowth removal. Preserflo microshunt with intraluminal stent using Nylon 9-0 with prophylactic scleral windows in the left eye.

Results: The IOP in both eyes was successfully lowered within normal limits.

Conclusions: The management of glaucoma in Sturge-Weber syndrome is very challenging. Medical treatment often fails to control intraocular pressure, thus requiring surgical intervention with high-risk, serious complications. In rare cases, the glaucoma can be bilateral, even if the cutaneous angioma is hemifacial, hence regular monitoring of both eyes is recommended.

Abstract No.: 201404

Tanito Microhook Internal Trabeculotomy

First Author: Shams **NOMAN**

Purpose: To present this MIGS technique and its result.

Methods: Hook was introduced to rupture the trabecular meshwork to make a direct opening of Schlemm's canal to the anterior chamber. Thus, it decreases the resistance to outflow and decreases IOP through this procedure.

Results: In this video, two surgeries were shown. One in POAG, where, after cataract surgery, I did internal trabeculotomy with a Tanito microhook. Postoperative IOP was reduced to 12 mm Hg in both eyes from preoperative 25/30 mmHg. In juvenile glaucoma, the result was also good

Conclusions: Tanito microhook internal trabeculotomy is a good alternative to trabeculectomy in uncontrolled glaucoma.

Abstract No.: 205311

The MMC Equation: "Mix It Right, Match It Smart, Manage It Well"

First Author: Madhavi **PILLAI**

Co-Author(s): Devendra **MAHEHSWARI**

Purpose: Unlock the true potential of Mitomycin C in glaucoma surgery with the "Triple M" strategy — Mix, Match & Manage!

Methods: While MMC has revolutionized filtration surgery outcomes, its use still remains more art than science. Surgeons continue to grapple with the ideal dose, dilution, and delivery technique, each playing a pivotal role in surgical success. From traditional sponge applications fraught with risks like MMC burns, retained sponges, and dosing ambiguity — to the rising trend of subconjunctival injections offering precision and predictability — this video demystifies it all.

Results: With real surgical footage, comparative insights, and evidence-backed tips, we decode the variations and guide you through tailoring MMC use to your patient, your style, and your surgical goals.

Conclusions: Whether you're a novice or a pro, this session will help you make the right mix, smart match, and strategic management of MMC.

Abstract No.: 202750

Unfolding the Next Chapter in MIGS: Illuminating the Angle With Swept-Source AS-OCT

First Author: Madhavi **PILLAI**

Co-Author(s): Shivam **GUPTA**, Devendra **MAHESHWARI**, Nimrita **NAGDEV**

Purpose: Minimally invasive glaucoma surgery (MIGS) has evolved rapidly, yet its success hinges on precise angle assessment, device placement, and postoperative evaluation. Swept-source Anterior Segment Optical Coherence Tomography (AS-OCT) has emerged as a powerful, non-contact imaging modality that provides high-resolution visualization of the anterior chamber angle, Schlemm's canal, and trabecular meshwork. Its ability to deliver reproducible anatomical and quantitative insights is redefining surgical planning and outcome optimization in MIGS.

Methods: This video highlights the integration of swept-source AS-OCT into the MIGS workflow. Through detailed case examples, it demonstrates preoperative angle mapping, intraoperative guidance for accurate device positioning, and postoperative evaluation of implant location and angle morphology. High-resolution imaging and quantitative metrics are emphasized as tools for enhancing precision and consistency in surgical decision-making.

Results: Across multiple case examples, AS-OCT contributed to improved surgical confidence, reduced variability in outcomes, and enhanced patient

safety. Quantitative metrics provided by AS-OCT also facilitated standardized evaluation of angle changes post-MIGS.

Conclusions: Swept-source AS-OCT is unfolding the next chapter in the MIGS journey by bridging anatomical insight with surgical precision. By incorporating this advanced imaging into routine practice, glaucoma specialists can standardize techniques and ensure safer outcomes.

Abstract No.: 200489

“Oil’s Well That Ends Well” – Addressing Elevated Intraocular Pressure in Silicone Oil-Filled Eyes.

First Author: Zia **PRADHAN**

Co-Author(s): Sathi **DEVI**, Rishika **LAKSHMINARAYAN**, Shruthi S

Purpose: Silicone Oil is an effective internal tamponade in retinal detachment surgeries, but can cause raised intraocular pressure (IOP) and secondary glaucoma in 22.5% of cases. This video highlights the multiple mechanisms by which silicone oil causes elevated IOP during the early post-operative period and its management.

Methods: This video demonstrates clinical signs useful in identifying the mechanism of silicone oil glaucoma and the targeted treatment modalities available to lower the IOP.

Results: Silicone Oil can cause havoc in the early post-op period due to overfill of oil, pupillary block, or anterior migration of the oil. Various treatment options for re-establishing aqueous outflow are demonstrated, including partial oil removal, iridotomy, iridoplasty, and goniosynechiolysis.

Conclusions: Prompt institution of appropriate measures can restore the angle anatomy, often resulting in complete resolution of the elevated IOP and prevention of glaucoma.

Intraocular Inflammation, Uveitis and Scleritis

Abstract No.: 206547

From Soil to Sight: A Rare Case of Intralenticular Worm Infestation

First Author: Haripriya **ARAVIND**

Co-Author(s): Anand **RAJENDRAN**, Anahita **SHROFF**, Rathinam **SIVAKUMAR**

Purpose: Intraocular gnathostomiasis is a parasitic infection caused by the larval stage of *Gnathostoma* spp. This condition is exceptionally rare and presents a diagnostic and management challenge. We report

a unique case of intralenticular gnathostomiasis, highlighting the importance of early diagnosis and prompt surgical intervention to achieve a favorable outcome.

Methods: A 53-year-old foreign national presented with headache, redness, and progressively worsening vision in his right eye. He reported recent consumption of fried rice. Slit-lamp examination revealed an intense anterior chamber reaction, and fundus examination showed vitritis. OCT revealed florid vitritis and posterior vitreous detachment. Serologic testing showed raised IgE levels. Follow-up fundus examination revealed a curvilinear track with subhyaloid hemorrhage, confirmed on fluorescein fundus angiography. The lens developed cataractous opacity, and slit-lamp examination revealed a live worm embedded within the lens.

Results: A nick was made in the anterior lens capsule, and the worm was deftly maneuvered into the anterior chamber, followed by extraction of the cataractous lens. The patient was left aphakic, with a plan to implant a secondary IOL at a later date. Intravitreal antibiotics were administered. The excised larva was histopathologically identified as a third-stage *Gnathostoma* spp. larva. Postoperative recovery was successful, and secondary IOL implantation improved visual acuity significantly.

Conclusions: Intralenticular gnathostomiasis is exceedingly rare. A high index of suspicion, thorough patient history, and timely diagnosis are crucial. Multidisciplinary surgical management is essential to preserve vision. Awareness of parasitic infections in atypical intraocular presentations ensures early recognition, effective treatment, and favorable visual outcomes.

Abstract No.: 206898

General Principles of Cataract Surgery in Uveitic Cataracts

First Author: Ronnie Abhishek **TALLURI**

Co-Author(s): Anup **KELGAONKAR**

Purpose: To understand the principles of surgery in uveitic cataracts and to establish a tailored approach for the surgery.

Methods: The video consists of a tailored approach in uveitic cataract surgery where the patient was kept on preoperative immunosuppression and during the surgery, membranectomy after pupil dilation to acquire sufficient dilation of pupil size, adequate capsulorhexis to perform a safe phacoemulsification, in the bag Intraocular lens (IOL) implantation followed by vitreous biopsy, posterior capsulorhexis, and peripheral iridectomy had been performed. We completed the surgery with a posterior subtenon triamcinolone injection.

Results: By this approach, we addressed the postoperative complications like synechiae, membranes over the IOL, iris bombe, capsular opacification, phimosis, decrease in vitritis load, and postoperative flare-up of inflammation. We also get to see that the fundus intraoperative and vitreous biopsy serves a diagnostic purpose.

Conclusions: Tailored approach for uveitic cataract surgeries prevent the post operative complications and provides good long-term outcomes.

Abstract No.: 201927

How Much Vitrectomy Should We Do in Cases of Endophthalmitis?

First Author: Christopher GO

Co-Author(s): Heinrich HEIMANN, Stephanie LAM

Purpose: To explore and discuss the extent of vitrectomy in cases of endophthalmitis through a surgical case video.

Methods: A surgical case video of a patient with delayed presentation of presumed bacterial endophthalmitis post intravitreal injection.

Results: A 68-year-old male presented 4 weeks after an intravitreal injection. He developed pain and redness 2 days post-intravitreal injection. He did not present for medical review as he was boarding a cruise for a 3-week trip. On examination, he was comfortable with no pain with a visual acuity of light perception (LP) and no view to the posterior segment due to cataract and dense vitritis confirmed on B-scan ultrasound. He had a tap and inject that yielded no growth, and subsequently had a vitrectomy 2 days later as his vision remained LP. A lensectomy was performed intraoperatively and revealed a significant macular hypopyon that was cleared. PVD induction was attempted and ultimately abandoned due to concerns of iatrogenic damage. However, the patient developed a significant tractional ERM 6 weeks post-operatively and required further vitrectomy to be removed.

Conclusions: There is little consensus on the extent of vitrectomy in cases of endophthalmitis. Some surgeons prefer core vitrectomy only to mitigate the risks of iatrogenic damage, whilst some prefer a complete vitrectomy to minimise proliferative and tractional complications of residual vitreous. Further studies are needed to determine the factors that may contribute to iatrogenic damage, and proliferative and tractional changes that will determine the extent of vitrectomy in cases of endophthalmitis.

Abstract No.: 207408

Ocular Sarcoidosis – the Great Masquerader

First Author: Bhavik PANCHAL

Purpose: To highlight the protean ocular manifestations of sarcoidosis through illustrative case studies,

emphasizing its role as a masquerader in uveitis and the importance of systemic evaluation and longitudinal follow-up in achieving an accurate diagnosis.

Methods: Three representative cases of ocular sarcoidosis were reviewed in detail: a pediatric patient with Blau syndrome manifesting sarcoid-like features; an adult with coexisting tuberculosis and sarcoidosis posing a diagnostic and therapeutic challenge; and a unique case initially diagnosed as Vogt-Koyanagi-Harada (VKH) disease that later evolved into classic sarcoidosis. Clinical presentation, diagnostic work-up, systemic findings, and disease progression were analyzed. Historical perspectives on the recognition of sarcoidosis and its early ocular descriptions were also briefly discussed.

Results: Each case demonstrated the diverse and evolving spectrum of ocular sarcoidosis. The Blau syndrome case underscored the overlap between genetic and granulomatous uveitis; the tuberculous sarcoid case highlighted the complexity of co-infections in endemic regions; and the VKH-to-sarcoid case illustrated the dynamic nature of diagnosis when systemic features emerge over time. Historical review reaffirmed sarcoidosis as a systemic granulomatous disease with early recognition rooted in dermatology and ophthalmology.

Conclusions: Sarcoidosis remains a diagnostic challenge owing to its variable and deceptive presentations. Ophthalmologists must maintain a high index of suspicion in atypical or evolving uveitis, integrate systemic evaluation with imaging and histopathology, and recognize that long-term follow-up may rewrite initial diagnoses. The masquerading nature of sarcoidosis demands vigilance, interdisciplinary collaboration, and a readiness to revisit assumptions.

Abstract No.: 202034

Retinal and Vitreous Biopsy Reveals Cysts of Toxoplasma gondii in an Atypical Case of Bilateral Necrotizing Retinitis

First Author: Reema BANSAL

Co-Author(s): Ashutosh GUPTA, Nalini GUPTA, Uma NAHAR, Suryaprakash SHARMA

Purpose: Retinitis in an immunocompromised patient is often extensive. Diagnosis is difficult due to atypical presentation, and empirical treatment is initiated as a desperate attempt to salvage the eyes. We present a case of bilateral necrotizing retinitis where vitreous biopsy, subretinal fluid, and retinal biopsy demonstrated tachyzoites (trophozoites) of Toxoplasma gondii.

Methods: A 47-year-old woman on immunosuppressive therapy for SLE had decreased vision (hand movements) OU for one month. She had received oral steroids before presenting to our center. Fundus examination revealed extensive bilateral necrotizing

retinitis. Serum IgG and IgM were raised for *T. gondii*. Aqueous fluid real-time PCR was positive for *T. gondii*. Oral and intravitreal anti-toxoplasmosis therapy was started. OD developed retinal detachment. She underwent pars plana vitrectomy with scleral band and silicon oil tamponade.

Results: Cytology of vitreous and subretinal fluid, and histopathology of retinal biopsy revealed tachyzoites of *T. gondii*. At 3 months, the retina was attached.

Conclusions: Bilateral necrotizing retinitis is an ophthalmic emergency. An early vitrectomy with vitreous and retinal biopsy, and a multidisciplinary approach provided a definitive diagnosis of *T. gondii* in a challenging case of atypical retinitis.

Abstract No.: 201384

UVEOSCOPE: A Smart App for Screening and Investigating Uveitis

First Author: Anju **KURIAKOSE**

Purpose: Design an app to collect patient history, combined with clinician-identified signs, and suggest further investigations and differential diagnosis.

Methods: We developed this app using MIT App Inventor and installed it on multiple Android phones. Patients' symptoms and systemic history are collected by OPD staff while waiting for their consultation. A history summary is generated and helps clinicians ask more relevant questions and save time. The clinician provides examination findings. The algorithm analyzes history and examination findings to suggest relevant ophthalmic and systemic investigations. Probable diagnoses are also generated.

Results: Pilot testing in clinical settings measured the app's impact on consultation efficiency and diagnostic workflows.

Conclusions: Uveoscope smart app can reduce the time taken in uveitis evaluation and assist clinicians in thorough evaluation of uveitis, especially for general ophthalmologists and junior consultants.

Ocular Imaging

Abstract No.: 206649

"Where Eye Meets Art": A Visual Showcase of Smartphone-Assisted Slit-Lamp Photography of Anterior Segment Structures Morphology

First Author: Sheetal **SHARMA**

Purpose: To demonstrate the feasibility and clinical utility of Smartphone-based slit lamp photography for capturing unique and rare iris, lenticular, and other anterior segment structures patterns, and to highlight its role in routine ophthalmic practices for

documentation, patient education, teleconsultation, and academic use.

Methods: High-resolution anterior segment photographs were captured using iPhone and Android phones aligned with the slit-lamp eyepiece without any additional attachments. Multiple patients with varying lens opacities, iris patterns, and other anterior segment structures' aesthetic patterns were imaged.

Results: Smartphone-based slit lamp images provided clear anterior segment structures morphology. This technique proved to be simple, portable, fast, cost-effective, and reproducible. Images were used for patient counselling, serial follow-up, documentation, and sharing with colleagues for teleophthalmology opinions.

Conclusions: This method bridges the gap for residents in remote medical colleges, empowering them to document and present cases at national and international platforms, compete with peers from high-tech centers, and pave the way for future innovation for the integration of built-in smartphone-grade cameras in Slit-lamp for universal access. Lastly, we want to give a take-home message through this that when patients see their own eye images, they understand better, trust more, and follow treatment faithfully.

Abstract No.: 205537

Evaluation of the Foveal Avascular Zone and Parafoveal Vessels Using Optical Coherence Tomography Angiography and Their Relationship With Ocular Factors

First Author: Colin **TAN**

Co-Author(s): Isaac **CHAY**

Purpose: To describe the features of the foveal avascular zone (FAZ) using optical coherence tomography (OCTA) and ascertain its relationship with ocular factors.

Methods: In a prospective cohort of 117 healthy adults, macular OCTA scans were graded to measure the FAZ size in the superficial and deep retinal plexuses. Multiple regression analyses were performed to evaluate the impact of central retinal thickness (CRT), axial length (AL), and spherical equivalent on the FAZ area.

Results: The mean age of the participants was 22.5 years. FAZ sizes varied greatly (superficial FAZ: 0.04 to 0.48mm²; deep FAZ: 0.10 to 0.70mm²). Females had larger superficial and deep FAZs ($p < 0.001$). On multivariate analysis, both superficial and deep FAZ varied significantly with CRT (0.03mm² per 10μm) and sex. In high myopes, FAZ varied with choroidal thickness, CRT, and sex.

Conclusions: CRT, sex, and choroidal thickness influenced the size of both the superficial and deep FAZ among healthy adults.

Abstract No.: 204701

Fluorescein Angiography of an 8-Month-Old Infant Diagnosed With Cavernous Hemangioma of the Retina

First Author: Jing MA

Co-Author(s): Hai LU

Purpose: To report a live video of fluorescein angiography (FA) of cavernous hemangioma of the retina (CHR) of an 8-month-old infant.

Methods: A newborn boy was diagnosed with intraretinal hemorrhage in his right eye during routine fundus examination due to premature birth with a gestational age of 32 weeks plus 6 days in the local hospital, and was then diagnosed with CHR in his right eye in our department of pediatric retina. We performed fundus examination and FA under general anesthesia. The whole FA procedure was documented by live video. Color Doppler imaging (CDI) was also performed.

Results: In the 8-month-old boy, the fundus examination revealed a classic grape-like cluster of thin-walled saccular aneurysms in the nasal quadrant, without any preretinal fibrotic membranes on the surface of the tumor. FA showed a prominent delay of perfusion of the adjacent artery (but with a normal caliber), classic hypofluorescence within the main tumor mass in the early phase, and an unusual complete perfusion of the lesion in the late phase, possibly due to the supine position during the procedure, which gave the tumor a sculptural appearance. The CDI showed an irregular surface lesion with acoustic solidity, dotted blood flow signals and no choroidal excavation.

Conclusions: Fundus screening for newborns without high-risk factors may detect some unexpected diseases.

Abstract No.: 200276

Out of the Woods: A Tale of Missed Wooden Intraorbital Foreign Bodies

First Author: Raveesh BINDAL

Co-Author(s): Vishal SHARMA

Purpose: To demonstrate the role of Intra-operative Ultrasound B-scan in retrieving missed wooden intraorbital foreign bodies.

Methods: Intraorbital foreign bodies are a nightmare for any ophthalmologist. They exhibit variable clinical pictures. This often leads to them being misdiagnosed. A missed intraorbital foreign body may lead to many complications, including abscess formation, optic nerve involvement, panophthalmitis, and even blindness. Here, we present a series of 5 cases with intraorbital bodies, which were either primarily missed on CT scan or were misdiagnosed clinically by referring physicians. In one of the cases, an incomplete removal of wood in pieces led to a persistent inflammation

post operatively. Hence, in consecutive exploratory orbitotomies, intraoperative assessment by ultrasound B-scan was done, and the remaining foreign bodies were removed.

Results: Intraoperative Ultrasound B-scan ensured the complete removal of foreign bodies as well as early recovery.

Conclusions: 1) In any open wound injury in the periorbital area or the orbit, wooden foreign bodies should be highly suspected. 2) Ultrasound B-scan intra-operatively helps ensure complete removal of the wooden foreign bodies

Ocular Oncology and Pathology

Abstract No.: 206001

A Large Corneal Mass – Surgical Techniques for Excision

First Author: Allie LEE

Co-Author(s): Alex KAN, Phoebe LAM

Purpose: A corneal mass is an abnormal growth on or in the cornea. Surgical removal is indicated when the mass is symptomatic or suspicious of malignancy. The goals of surgical excision include complete removal of the mass, usually with a wide, clear margin, and histopathological examination of the mass. This video aims to demonstrate the steps in surgically excising a large mass from the cornea.

Methods: We present a case of an 88-year-old man with an abnormal mass progressively growing on the cornea of the right eye. Procedures of surgical excision of the mass, including complete excision of the mass with a clear margin, minimal manipulation of the mass, meticulous wound closure, and the use of a bandage contact lens, are illustrated step-by-step in detail. A succinct account of indications for surgical removal of corneal masses and the surgical pearls is presented.

Results: The large corneal mass in our case was completely removed. The epithelial defect completely healed by day 10 post-operatively.

Conclusions: A good understanding of the principles and surgical techniques in the excision of corneal mass is important in bringing a safe and effective removal procedure for a suspicious corneal lesion.

Abstract No.: 205745**Anterior Uveal Melanoma With Extrascleral Growth of Different Extension: Full-Thickness Eyewall Resection With Donor Scleral Patch Grafting***First Author: Andrey YAROVY*

Purpose: To present the main steps of surgical approaches in the tumor resection of uveal melanoma with extrascleral growth as an attempt to preserve the eye.

Methods: The main steps of the 5 surgical procedures are presented in the video. Five patients had anterior uveal melanoma (UM) with extrascleral extension; 2 of them had primary tumors, and 3 patients had UM treated previously with Ruthenium-106 brachytherapy. Various sizes of extrascleral growth needed different approaches in en bloc resection. Novel techniques of donor sclera patch graft preparation of the same shape and size as the scleral defect will be presented. A transparent film and a flexible silver wire were used for preparing a graft of irregular shape.

Results: The surgery procedures were successful in all cases, and all eyes had been preserved.

Conclusions: As a rule, extrascleral growth of UM is an indication of enucleation. But in selective cases, a full-thickness eyewall resection of the tumor with donor scleral patch grafting can save the eye and vision even in cases with extremely large extrascleral tumor extension.

Abstract No.: 206559**From Refusal to Rehabilitation: Multistage Management of Advanced Periocular Basal Cell Carcinoma***First Author: Ritesh VERMA**Co-Author(s): Aastha KHARBANDA, Aminder SINGH*

Purpose: To present the multidisciplinary and staged management of an advanced periocular basal cell carcinoma in a rural patient, highlighting the surgical challenges, impact of social and cultural beliefs on treatment delay, and the holistic rehabilitation achieved through oncological clearance, reconstructive surgery, and subsequent visual rehabilitation.

Methods: A 70-year-old male with neglected periocular basal cell carcinoma involving both upper and lower eyelids, medial canthus, and lacrimal drainage system was evaluated. Initial refusal of exenteration led to attempted radical resections without margin clearance. Following extensive counseling and repeated delays due to social and religious beliefs, orbital exenteration with median forehead flap reconstruction was performed.

Results: Post-reconstruction cosmetic and functional outcomes were documented. Ten months later, the patient underwent cataract surgery in the contralateral

eye with a pre-existing corneal scar and high astigmatism, requiring careful surgical planning. Clinical photographs, CT imaging, histopathology, and surgical videos were compiled, and the patient's perspective was recorded to reflect psychosocial dimensions.

Conclusions: This case illustrates that successful management of advanced periocular malignancies extends beyond oncological clearance; it requires addressing cultural barriers, providing reconstructive solutions for social reintegration, and ensuring visual rehabilitation for quality of life. By integrating surgical expertise with patient-centered counseling and staged interventions, even complex and delayed presentations can achieve oncological safety, cosmetic acceptability, and functional vision.

Abstract No.: 206525**Ocular Tumors: The Curtain Raiser***First Author: Shaifali CHAHAR**Co-Author(s): Kaustubh MULAY, Fairouz P. MANJANDAVIDA*

Purpose: To highlight the role of ophthalmic biopsy in achieving definitive diagnosis and guiding management of ophthalmic tumors.

Methods: Ophthalmic tumors encompass a wide clinical spectrum, necessitating accurate diagnostic confirmation. While clinical examination provides initial diagnostic clues, histopathological analysis remains the gold standard. Biopsies were performed using a range of techniques—including cytology, shave, punch, incision, intra-operative frozen section, and excision—tailored to the suspected pathology and clinical scenario. Key principles highlighted include: meticulous technique in obtaining representative tissue, correct sampling and orientation, appropriate preservation, and ensuring optimal transport for processing. The process emphasizes the critical role of surgeon–pathologist collaboration in maximizing diagnostic yield and guiding oncologic care.

Results: The video demonstrates practical applications of biopsy techniques across varied ophthalmic tumors. Illustrative examples highlight indications, procedural nuances, and technical refinements that optimize diagnostic accuracy. Successful outcomes are shown to rely on careful tissue handling and integrated multidisciplinary coordination. This reinforces that precise biopsy technique not only facilitates timely diagnosis but also ensures individualized, evidence-based management in ocular oncology.

Conclusions: Ocular biopsy is fundamental to ocular oncology. It transforms clinical evaluation into a definitive diagnosis that drives effective treatment planning. This video serves as a practical guide, underscoring the essential protocols for obtaining representative tissue samples and ensuring appropriate

delivery to the pathologist-steps that are vital for accurate reporting and optimal patient care.

Abstract No.: 205909

Surgical Removal of Ciliary Body Tumors

First Author: Jianhong LIANG

Purpose: Introducing the surgical removal of ciliary body tumors through surgical video.

Methods: Tumors of the ciliary body can be treated by exoresection. The surgical procedure mainly involves tumor localization, Production of the outer lamellar sclera at the tumor site, Tumor isolation and removal, As well as the anatomical repositioning and suturing of the outer lamina sclera. Try to avoid damaging the adjacent retina of the tumor during the operation. Dealing with bleeding is one of the difficulties in surgery.

Results: Exoresection is an effective treatment method for ciliary body tumors.

Conclusions: Exoresection is an effective treatment method for ciliary body tumors. However, the surgery is complex and requires the surgeon to possess considerable skills in vitreoretinal surgery.

Abstract No.: 206523

Triad of Truth: Unraveling the Mystery Through Clinico-Radio-Histopathological Correlation in Orbital Tumors

First Author: Rolika BANSAL

Co-Author(s): Santosh HONAVAR, Kaustubh MULAY, Ravi VARMA

Purpose: Orbital tumors, ranging from benign to malignant, present a diagnostic challenge due to their complex and variable clinical, imaging, and histopathological features. Accurate assessment and multimodal correlation are essential for precise diagnosis and effective treatment. This video unravels the mystery and demonstrates how to reach a precise diagnosis, with a careful correlation of clinico-radio-histopathological findings.

Methods: Video demonstrating the importance of the correlation of clinico-radio-histopathological findings.

Results: With the variable clinical presentations, a wide spectrum of differential diagnoses surfaces, which need to be ruled out. Over the years, a multitude of modalities with technological advances have been identified & explored in the world of diagnostics. Their wise application to the diseases related to orbital tumors is mandatory. The final missing piece is added to achieve the final diagnosis by histopathological confirmation.

Conclusions: By integrating clinical examination, imaging modalities, and histopathological analysis, we can shed light on the final pathology & uncover the

truth behind these complex tumors. Through a series of intriguing cases, we will demonstrate the synergy of multimodal correlation to help clinicians, radiologists, and pathologists solve the puzzle of orbital tumors, ensuring accurate diagnosis & effective treatment. A misdiagnosis without the correct correlation of these three elements may lead to life-threatening outcomes if the malignant tumors are missed.

Ophthalmic Trauma

Abstract No.: 202646

Adhesion and Disinsertion: Navigating a Complex Case of Anterior Segment Trauma

First Author: Raj KENIA

Co-Author(s): Shweta DHIMAN, Santosh MAHAPATRA, Anjalika PARHI

Purpose: To highlight the role of functional pupil reconstruction in restoring anatomical integrity and optimizing the visual axis in traumatic anterior segment injury.

Methods: A 70-year-old female presented with adherent leucoma, iris prolapse, and iridodialysis following wooden stick trauma. Primary surgical repair included anterior segment reconstruction, iris repositioning, and pupil reconstruction to achieve a centered functional pupil.

Results: Postoperatively, a well-formed pupil was achieved within the clear corneal zone, facilitating improved light entry. This reduced glare and photophobia despite residual corneal opacity and early cataract. Anatomical stability was maintained, and the eye was optimized for future lens surgery.

Conclusions: Pupil reconstruction during primary trauma repair plays a crucial role in functional recovery. Beyond structural closure, restoring a centered pupil enhances visual quality and prepares the eye for subsequent definitive procedures

Abstract No.: 201727

Chandelier-Assisted Technique for Safe Removal of Metallic Intraocular Foreign Bodies

First Author: R Ram SUDARSHAN

Co-Author(s): Ram SUDARSHAN

Purpose: A 45-year-old patient came to our outpatient department with a history of ocular trauma to the right eye while cutting stone. He underwent a full-thickness corneal tear repair at an outside hospital. Presenting BCVA was 4/60. Ocular examination showed corneal sutures with a traumatic cataract. B-Scan showed a hyper-reflective echo with back shadowing. CT-Scan

revealed an IOFB penetrating the retina and impinging on the medial rectus muscle.

Methods: We proceeded with Right eye cataract extraction with Pars Plana Vitrectomy with Intraocular foreign body removal and Silicone oil injection. After cataract extraction with a superior sclerocorneal tunnel, a 25 Gauge 3-port pars plana vitrectomy was made. Core vitrectomy was done. PVD induced; FB removal through enlarged sclerostomy failed. A chandelier was placed, and the bimanual technique was used to lift the IOFB safely. The IOFB was removed through the sclerocorneal tunnel. This was followed by Base dissection, endolaser, and Silicone oil injection. The IOFB was 16.8 mm long.

Results: On POD 1, the retina was attached under silicone oil. There were no signs of inflammation on the first follow-up visit two weeks later. Three months later, the patient underwent Silicone oil removal with sclerally fixated IOL using a foldable multipiece IOL. One month post SOR+SFIOL, the patient's final visual acuity was 6/12.

Conclusions: This case highlights the importance of the chandelier in the removal of a long foreign body. A chandelier allows the surgeon to perform controlled maneuvers in certain situations to prevent iatrogenic damage to the retina.

Abstract No.: 206313

In the Eye of the Storm: Managing a Complex Anterior Segment Case

First Author: Rayyan **SABIH**

Purpose: To report the surgical management and visual outcome of a case involving traumatic lens dislocation into the vitreous cavity following blunt ocular trauma.

Methods: A 50-year-old male presented with a history of blunt trauma to the right eye from a fist. Initial visual acuity (VA) was hand movements. Ocular examination revealed a clear cornea, traumatic mydriasis, and posterior dislocation of the crystalline lens into the vitreous cavity. A pars plana irrigation was used. A microvitrectoretinal (MVR) blade was utilized to elevate the lens anteriorly. Lensectomy was performed using a vitrector. A scleral fixation of an Alcon 3-piece intraocular lens (IOL) was carried out, followed by iris cerclage to address the traumatic mydriasis.

Results: The procedure was uneventful, and the IOL remained well-centered postoperatively. At the 2-week follow-up, the patient achieved a best-corrected visual acuity of 6/6 partial.

Conclusions: Prompt surgical intervention in cases of traumatic lens dislocation with associated iris trauma can lead to excellent visual recovery. A combination of lensectomy, scleral IOL fixation, and iris cerclage is effective in restoring both visual function and ocular anatomy in such cases.

Abstract No.: 206322

Lens, Iris and Hope: Managing Blunt Trauma With Pupillary Reconstruction and LMA-IOL

First Author: Rayyan **SABIH**

Purpose: To present the surgical approach and visual outcomes in a case of complex anterior segment trauma following blunt injury, involving adherent leucoma, iris root dialysis, and traumatic cataract.

Methods: A 34-year-old male presented with a history of blunt ocular trauma from a lead pipe. At presentation, visual acuity (VA) was hand movements (HM). Slit-lamp examination revealed adherent leucoma from 12 to 3 o'clock, an irregular pupil with iris root dialysis from 9 to 2 o'clock, and a dense traumatic cataract. B-scan confirmed a flat retina. Surgical intervention included dissection and release of iris tissue from the adherent leucoma, lens matter aspiration with intraocular lens (IOL) implantation, followed by pupilloplasty and iris root repair.

Results: Postoperative recovery was uneventful. At the 2-week follow-up, the patient's best corrected visual acuity improved to 6/18. The anterior chamber was well-formed, the IOL was stable, and the pupil was centrally located with good cosmetic and functional outcome.

Conclusions: Timely surgical intervention in complex anterior segment trauma can result in significant visual and anatomical rehabilitation. Combined management of corneal adhesion, lens damage, and iris reconstruction can restore both vision and ocular integrity in selected cases.

Abstract No.: 207076

Let There Be Light

First Author: Aziz Jan **BASHIR**

Purpose: Surgical reconstruction of the Globe and visual rehabilitation after a firecracker injury in a child.

Methods: Chelation, pupilloplasty, scleral fixation, ppv.

Results: Marked visual rehabilitation.

Conclusions: Surgical interventions are usually helpful in restoring vision post-trauma.

Abstract No.: 206102

Pupilloplasty With Cataract Surgery

First Author: Abdul **HANNAN**

Purpose: To teach trauma surgeons tips and tricks of pupilloplasty in an iris damage case.

Methods: The patient has a grinder blade injury with 1/4 of the iris tissue deficient. Pupilloplasty was performed, resulting in a near-normal-looking pupil with good visual recovery.

Results: The patient recovered well with a video of the surgery highlighting the correct steps to follow to achieve optimal results in a case where the iris tissue is deficient.

Conclusions: This video would benefit a lot of trainees and young consultants who deal with ocular trauma repair cases. Especially where iris tissue has been lost in primary repair.

Abstract No.: 201111

Removal of Shotgun Pellet From the Eye Using Modified Foreign Body Forceps

First Author: Shah Md Rajibul ISLAM

Purpose: To show the removal of a shotgun pellet from the eye.

Methods: A modified foreign body forceps was used to remove intra ocular shotgun pellet through the corneal wound or the sclerotomy wound.

Results: A successfully intraocular shotgun pellet was removed in all cases.

Conclusions: Sometimes, instruments can be modified to meet the need instantly.

Abstract No.: 201109

Removal of an Ocular Shotgun Pellet Using a Makeshift Basket

First Author: Shah Md Rajibul ISLAM

Purpose: Removal of an intraocular shotgun pellet.

Methods: An irrigating vectis was wrapped with a sterile micropore to turn it into a makeshift basket. The shotgun pellet was held with the cutter using only vacuum and lifted up into the interior chamber. The vectis was inserted through a sclero-corneal tunnel. The pellet was dropped into the makeshift basket and externalized.

Results: Successfully managed to remove an intraocular shotgun pellet using a makeshift basket.

Conclusions: Improvising is a key to innovation that leads to success stories.

Abstract No.: 206883

Snare-Assisted Flapless Closed-Loop Scleral Refixation of Dislocated Akreos Adapt Intraocular Lenses

First Author: Lei WAN

Purpose: To describe a flapless, single-pass, snare-assisted technique for four-point scleral refixation of dislocated Akreos Adapt intraocular lenses (IOLs) using an 8-0 polypropylene suture in a closed-loop configuration.

Methods: An 8-0 polypropylene suture was passed through the four fenestrated haptics of the IOL using

a non-sliding snare constructed from a 30-gauge thin-walled needle mounted on a 1 mL syringe. The extraocular portions of the suture were routed within the intrascleral plane between two fixation points on the same side (nasal or temporal), which are 2 mm away from the limbus, with a distance of 7 mm between the two fixation points, without conjunctival dissection or scleral flap creation. The external suture knot was buried within the scleral stroma.

Results: This retrospective case series included five eyes with Akreos Adapt IOLs that were completely dislocated into the vitreous cavity. All lenses were successfully fixated without intraoperative complications. At a mean follow-up of 8.4 months, all IOLs remained well-centered and stable. Best-corrected visual acuity improved in all cases. The preoperative and postoperative spherical equivalent values ranged from -5.00 D to 11.00 D preoperatively, and from -2.50 D to -0.50 D postoperatively. No hypotony, suture erosion, knot exposure, or IOL redislocation was observed.

Conclusions: This technique offers a minimally invasive and reproducible method for four-point scleral fixation of dislocated Akreos Adapt IOLs, eliminating the need for conjunctival or scleral dissection and requiring no specialized instrumentation

Abstract No.: 200371

Surgical Management of Traumatic Corneal Tear and Cataract in a Pediatric Patient

First Author: Jai KELKAR

Co-Author(s): Aditya KELKAR, Muskan MANGAL

Purpose: To describe the complex surgical management and visual outcome in a pediatric patient with a traumatic corneal tear and cataract following blunt ocular trauma.

Methods: An 8-year-old boy presented with diminished vision after a stone injury to the right eye. Initial examination revealed a corneal tear with hyphema and a traumatic cataract. Following primary repair of the corneal wound, the patient underwent a secondary procedure including optical penetrating keratoplasty, cataract extraction, anterior vitrectomy with synechiolysis, and iris claw intraocular lens implantation.

Results: Postoperative recovery showed improvement in visual acuity and stabilization of the ocular structures. No complications such as graft rejection or lens dislocation were noted during follow-up.

Conclusions: Pediatric ocular trauma involving both corneal tears and cataracts requires a strategic, multi-step surgical approach. Timely intervention and careful surgical planning can lead to favorable anatomical and visual outcomes, even in complex cases.

Abstract No.: 206319**This Video Demonstrates a Step-by-Step Approach to the Repair of Iridodialysis, Traumatic Mydriasis, and Atrophic Iris Anteflexion***First Author: Hazem YASSIN*

Purpose: To demonstrate a stepwise surgical technique for managing anterior segment trauma with iridodialysis, traumatic mydriasis, and atrophic iris anteflexion, aiming to restore anatomical position, pupil function, and visual rehabilitation.

Methods: The procedure begins with the correction of iris anteflexion to re-establish anatomical orientation. Iridodialysis is repaired using scleral fixation sutures to reattach the iris root. In eyes with lens instability, scleral-fixated intraocular lens (IOL) implantation is performed to provide stable optical rehabilitation. Pupilloplasty is then carried out using sequential hour-to-hour approximation to reconstruct a round, centered pupil. Key surgical principles include tissue preservation, precise micro-suturing, and maintenance of anterior chamber stability.

Results: The combined approach restores pupil size, centration, and function, while providing stable IOL fixation. Patients experience reduced glare and photophobia with improved functional vision and cosmetic appearance.

Conclusions: Successful repair of iridodialysis hinges on recognizing iris anteflexion and performing its appropriate correction before proceeding with scleral fixation and pupilloplasty. This principle is fundamental for achieving both anatomical and functional success, and the demonstrated sequence provides a practical educational tool for anterior segment surgeons managing complex trauma.

Abstract No.: 204771**Ultimately What Matters Is Timing and Approach in Ocular Trauma – a New Year's Eve Trauma Story***First Author: Purendra BHASIN**Co-Author(s): Praveen DHANAPAL, Manish PANDAY*

Purpose: To present the clinical course, surgical interventions, and visual outcomes in a young male patient following an open globe injury with subsequent complications, including aphakia, aniridia, refractory glaucoma, and corneal decompensation.

Methods: A 26-year-old male presented with a history of open globe injury in the left eye due to a road traffic accident. At presentation, he had a full-thickness tri-radiant corneal tear with uveal tissue prolapse. The projection of rays was accurate, and there was no reverse RAPD. CT scan of the orbit and brain was normal. The patient underwent emergency corneal tear repair with limited automated anterior

vitrectomy. Intraoperatively, the lens was found to be spontaneously extruded.

Results: On the 7th postoperative day, the patient achieved a best-corrected visual acuity (BCVA) of 6/24. Over the next 10 months, the corneal and retinal status remained stable; however, the patient developed refractory glaucoma. Due to the presence of refractory glaucoma, aphakia, and loss of iris tissue, a combined Ahmed Glaucoma Valve (AGV) implantation and aniridia scleral-fixated intraocular lens (IOL) was performed. Postoperatively, BCVA remained 6/24, and intraocular pressure (IOP) was within the normal range. Two years later, the patient developed corneal decompensation, for which optical penetrating keratoplasty with trimming of the AGV tube was performed. The surgery was uneventful and resulted in a postoperative BCVA of 6/9.

Conclusions: Timely surgical interventions following traumatic open globe injury can lead to significant visual rehabilitation, even in the presence of multiple ocular complications, including aphakia, aniridia, refractory glaucoma, and corneal decompensation.

Orbital and Oculoplastic Surgery**Abstract No.: 201514****An Eye Opener: Management of Rare Parasites in Eye and Orbit***First Author: Rajendra MAURYA**Co-Author(s): Sanjay BOSAK, Priyanka, Asha DEVI*

Purpose: To describe the management and outcome of 26 cases having various types of rare and challenging live parasites infested in the human eye and orbit. In each case, we mechanically and/or surgically removed all live parasites/worms from the eye.

Methods: A clinical video of the surgical removal of two sub-conjunctival live worms, one huge orbital parasitic cyst, and 23 cases of orbital Myiasis in which we mechanically removed > 50 live maggots from the orbit after giving oral ivermectin & immobilizing the larvae by putting a mixture of chloroform plus turpentine oil (1:3). Post-operative treatment includes anti-parasitic drugs and steroids. Secondary management of malignant cases includes systemic chemotherapy (5FU + Cis Platinum) followed by surgical exenteration or lid reconstruction.

Results: In one patient, subconjunctival dirofilariasis was removed, and another had a live nematode (Loa loa). A huge orbital Hydatid Cyst was surgically removed by trans-conjunctival approach with lid-split technique. Majority of Orbital myiasis (20 cases) was seen in extensive neglected eyelid Basal Cell Carcinoma

(13 cases) rest 3 cases of myiasis was having neglected post-traumatic wound. Maggots were sent for scanning electron microscopy and were identified as Human Botfly in 9 cases, Screw Worm in 8 cases, and Flesh fly in 6 cases. One patient died due to the intracranial extension of carcinoma, the rest 13 had a complete response, and 12 had a partial response to treatment.

Conclusions: Oculo-orbital parasitic disorders are rare and difficult to manage. Orbital myiasis can complicate the eyelid malignancies and enhance the tumor spread.

Abstract No.: 206272

Buccal Mucous Membrane Grafting for Lid Margin Sequelae in Stevens-Johnson Syndrome

First Author: Riffat RASHID
Co-Author(s): Sadia SULTANA

Purpose: To evaluate the surgical outcome of mucous membrane grafting for lid margin sequelae in Stevens-Johnson syndrome (SJS).

Methods: We report a case of a 16-year-old boy who presented to the oculoplasty department with complaints of photophobia, foreign body sensation, and irritation in both eyes. He has been suffering from Stevens-Johnson syndrome for the past six years. On examination, his right eye vision was 6/18, and the left eye was 6/6. Lid examination reveals lid margin keratinization and distichiasis. He had undergone posterior lamellar resection along with keratinized lid margin and distichiasis, which was replaced by oral mucous membrane. The patient was symptom-free during the follow-up period.

Results: Posterior lamellar replacement with mucous membrane grafting is an effective and well-recognized procedure for lid margin sequelae in Stevens-Johnson syndrome. It provides a smooth ocular surface, which reduces surface irritation and inflammation. It also prevents further corneal microtrauma and deterioration of vision. Post-operatively, the patient was symptom-free with an excellent outcome. No complication was observed during his follow-up period.

Conclusions: Lid margin changes cause ocular surface inflammation in Stevens-Johnson syndrome. Buccal mucosal grafting not only provides a smooth ocular surface, but also reduces surface inflammation and prevents further vision loss.

Abstract No.: 207006

Diary of an Oculoplasty Surgeon

First Author: Nupur GOEL

Purpose: The purpose of the video is to showcase commonly performed Oculoplasty surgeries and important learning points from each.

Methods: A bouquet/collage of oculoplasty surgeries.

Results: Each oculoplasty surgery has its own nuance to offer.

Conclusions: It is important to be well-versed in the surgical anatomy and preoperative planning before planning each oculoplasty surgery.

Abstract No.: 205241

Everting Sutures With Lateral Canthopexy: Surgical Technique for Entropion Repair in the Treatment Room

First Author: Daniel CHIN
Co-Author(s): Petrina TAN

Purpose: To showcase the surgical technique of performing entropion repair using everting sutures combined with lateral canthopexy in a treatment room setting rather than in the operating theatre.

Methods: The surgical technique is illustrated in the accompanying video. Key steps include: (1) marking of everting sutures, (2) local anaesthesia infiltration, (3) placement of 2–3 lid everting sutures with 6-0 Vicryl from the conjunctival fornix to just below the lash line, (4) lateral canthal incision 4 mm from the canthal angle, (5) dissection to expose the orbital rim, (6) fixation of the tarsus to the lateral orbital rim with 6-0 Prolene, and (7) skin closure with 6-0 Prolene.

Results: Ten eyelids in nine patients (mean age 77.2 years; range 67–87; 3 male, 6 female) underwent treatment. All procedures were performed in the treatment room without fasting or cessation of antiplatelet therapy. Minimal dissection and blood loss were observed. At a mean follow-up of 6.7 months, all eyelids remained anatomically corrected without recurrence. Minor complications included one case of wound infection with loosening of the canthopexy suture and postoperative ectropion.

Conclusions: Entropion repair using everting sutures with lateral canthopexy can be safely and effectively performed in a treatment room, avoiding the need for an operating theatre. The technique is simple to perform, requires minimal intraoperative dissection with resultant minimal bleeding, and provides consistent results. This approach increases accessibility, reduces perioperative requirements, and achieves outcomes comparable to conventional theatre-based surgery.

Abstract No.: 202120

Frontalis Flap Suspension: A Reliable Technique for Correction of Severe Blepharoptosis With Poor Levator Function

First Author: Raghuraj HEGDE
Co-Author(s): Alexander GUNGB

Purpose: The purpose of this video is to provide a detailed step-by-step demonstration of the technique of frontalis flap suspension, its methods of application,

the results observed, and its utility in treating severe blepharoptosis or ptosis. The frontalis flap suspension technique has re-emerged in recent years among oculoplastic surgeons around the world to correct severe ptosis with poor to no levator function. This video aims to introduce this technique to new oculoplastic surgeons as well as experienced surgeons wanting to add this technique to their armamentarium.

Methods: This technique has re-emerged in recent years among oculoplastic surgeons, and this video will serve as a guide for those starting out on this technique. The procedure is performed through an eyelid incision, and dissection is done under the frontalis muscle and subcutaneously over the frontalis muscle. The frontalis muscle is brought down. The frontalis muscle is then attached to the levator aponeurosis and tarsal plate with the help of 5/0 prolene mattress sutures.

Results: This technique is consistently able to correct severe cases of ptosis with lower rates of recurrence than those corrected with the silicone frontal sling technique. Before-and-after visuals showcase the dramatic improvements achieved through frontalis flap suspension and also in a variety of clinical scenarios. We explore cases of congenital, involutional, and traumatic ptosis, revealing the remarkable transformation of eyelid position and symmetry.

Conclusions: Frontalis flap suspension is a reliable technique for the correction of severe ptosis with poor levator function, offering lasting benefits both functionally and aesthetically.

Abstract No.: 200234

Giant Dacryocystomucopyocel -a Rare Case-Abscess Drainage, Skin Approximation and Reconstruction Surgery

First Author: Mohammad IDRIS

Purpose: This video presents surgical management of a rare case of an Oval 7.0x6.0 cm giant, firm, non-tender swelling in the right lacrimal sac area with overlying stretched skin.

Methods: A 53-year-old female presented with progressive swelling in the right inner canthus for two years, with multiple episodes of painless increase in size of the swelling. Systemic history, investigations, and CT scan of the orbit and sinuses were insignificant. Under general anesthesia, needle aspiration of the cyst abscess is taken for culture and sensitivity. A small incision on the cyst surface is made to drain the abscess and collapse the cavity. Excision of the stretched skin is performed to accurately repair the defect.

Results: The collapsed cyst fibrous wall was thickened, lined by hyperplastic stratified squamous epithelium on histology, with no evidence of granuloma or malignancy. Culture of pus was positive for Klebsiella. The postoperative period was uneventful. At one-

year follow-up, the patient was doing well without recurrence of swelling. Dacryocystorhinostomy surgery was planned after wound healing.

Conclusions: This rare case of Dacryocystomucopyocel is the largest and has never been reported with such a large size.

Abstract No.: 203453

Graft Glory: Enhancing Ocular Health With Mucous Membrane Grafting

First Author: Shruthi TARA

Co-Author(s): Shivohn DA SILVA, Vandhana SUNDHARAM

Purpose: To demonstrate the clinical indications, surgical techniques, and outcomes associated with mucous membrane grafting (MMG) in the management of severe conjunctival deficiency and complex cicatricial eye disease.

Methods: This video highlights the application of MMG in orbital and oculoplastic procedures, including fornix and socket reconstruction, symblepharon release, management of cicatricial entropion, correction of keratinized lid margins, and ocular surface tumor resection. The roles of MMG in challenging presentations, such as Stevens-Johnson syndrome, toxic epidermal necrolysis, and exposed orbital implants, are discussed

Results: Mucous membrane grafting offers a robust, accessible, and durable option for ocular surface and periocular reconstruction. It restores anatomical structure, improves patient comfort, and supports visual rehabilitation when conventional measures are inadequate. Nasal grafts contribute additional goblet cell support in cases of severe dry eye. The integration with AMG and tissue engineering approaches broadens the applicability and success of reconstructive efforts in severe disease.

Conclusions: Mucous membrane grafting is a proven, cost-effective, and adaptable surgical technique in the management of complex cicatricial ocular surface disorders. Ongoing innovations continue to enhance its role as an essential tool in advanced oculoplastic and ocular surface surgery

Abstract No.: 204838

Lateral Eyelid Block Procedure for Cicatricial Ectropion Secondary to Herpes Zoster Ophthalmicus: A Surgical Video Demonstration

First Author: Hisar DANIEL

Co-Author(s): Diannisa Paramitha SUSANTONO

Purpose: To demonstrate the surgical technique and outcomes of the lateral eyelid block procedure as an effective intervention for managing cicatricial ectropion secondary to herpes zoster ophthalmicus.

Methods: A step-by-step surgical video illustrates the lateral eyelid block technique performed under local anesthesia in a patient with cicatricial ectropion following herpes zoster infection. Key procedural steps, intraoperative considerations, and anatomical landmarks were highlighted.

Results: The video showcases successful eyelid repositioning, correcting cicatricial ectropion, and resolving symptoms. Postoperative follow-up revealed excellent eyelid function and cosmetic results, with no complications.

Conclusions: The lateral eyelid block procedure is a safe and effective surgical option for selected cases of cicatricial ectropion due to herpes zoster ophthalmicus. This visual presentation aids in understanding the technique's indications and technical nuances.

Abstract No.: 205769

One Man's Meat Is Another Man's Poison

First Author: Jichao ZHOU

Co-Author(s): Yi WANG

Purpose: Demonstrate two different surgical approaches for the different natures of lacrimal gland masses.

Methods: Demonstrate different removal methods for two cases of lacrimal gland masses with different benign and malignant natures by surgical videos and on-site explanations.

Results: A case of pleomorphic adenoma of the palpebral lacrimal gland was completely removed via the conjunctival approach. Another case of adenoid cystic carcinoma of the orbital lacrimal gland was completely removed through the external superior orbital approach. There was no recurrence during the follow-up.

Conclusions: This teaching demonstration shows different removal approaches for different masses, considering the location and nature.

Abstract No.: 206712

One-Step Reconstruction of Upper Eyelid Coloboma Using the Sandwich Block Technique

First Author: Farida Marcelle VERGARA

Co-Author(s): Justine May TORREGOSA

Purpose: To demonstrate the effectiveness of the "sandwich block" technique for upper eyelid coloboma reconstruction, a single-stage procedure that simultaneously restores anterior and posterior lamellae with adequate support, vascularization, and cosmesis.

Methods: A 10-year-old male with Goldenhar syndrome presented with a full-thickness coloboma involving 50% of the left upper eyelid. Sandwich block reconstruction was performed using a full-thickness

pentagonal graft from the ipsilateral lower eyelid and an orbicularis oculi muscle advancement flap. A bipedicle orbicularis flap was created by dissecting the preseptal muscle from overlying skin and septum until it could fill the defect without tension. The defect measured 14 × 6 mm. An 8 mm full-thickness pentagonal graft was harvested from the temporal lower eyelid, with its orbicularis excised to retain only the tarsoconjunctival and skin layers. The posterior lamella was reconstructed by suturing the graft's conjunctiva and tarsus to recipient tissues with 6-0 absorbable sutures. The orbicularis flap was interposed between the graft's tarsoconjunctival and skin layers to enhance vascularity, and the skin layer was sutured to eyelid skin. The donor defect was closed primarily.

Results: Postoperatively, the patient achieved good functional and cosmetic outcomes, with a well-integrated graft and restoration of protective eyelid function.

Conclusions: The sandwich block technique is a reliable single-stage method for reconstructing small to intermediate full-thickness eyelid defects. It provides vascularized tissue coverage, restores eyelid function, and achieves favorable cosmesis, making it especially useful in congenital and syndromic cases such as Goldenhar syndrome.

Abstract No.: 202317

Orbital Volume Reconstruction With Dermis Fat Graft

First Author: Shalini KUMARI

Purpose: This video shows the technique of orbital volume restoration by Dermis Fat Graft in a Grade 1 Contracted Socket

Methods: A 37-year-old young lady with a history of evisceration, implant exposure, and subsequent implant extrusion underwent Dermis Fat Graft surgery. The conjunctiva was incised, and the Tenon's capsule was undermined. Contracted scleral petals were opened up. Intraconal fat was exposed. Fornix Formation Sutures were placed in the inferior fornix. Dimensions were measured & 30% was added to calculate the size of Dermis Fat Graft to be harvested from the gluteal area. After infiltration with 2% xylocaine with Adrenaline, epidermis was scraped off using scalpel No.15 Blade. The harvested graft was placed in the socket. Dermis was sutured to the edge of the anterior Tenon's capsule and conjunctiva with 6-0 vicryl sutures. Conformer was placed in situ, and lateral tarsorrhaphy was done.

Results: Orbital volume and surface were restored with this procedure. Fornix Formation Sutures were removed after 3 weeks. COP was fitted after 3 months with proper retention.

Conclusions: Dermis Fat Graft can be performed as a secondary procedure in case of extrusion/ exposure

of the implant to replace orbital volume, with less chances of rejection & migration.

Abstract No.: 206843

Post-Operative Surprise After Orbital Decompression

First Author: Akruti DESAI

Purpose: To describe the management of post-orbital decompression motility restriction and diplopia in downgaze caused by fibrotic adhesions.

Methods: A 55-year-old woman with thyroid eye disease underwent bilateral orbital decompression (lateral wall, inferior basin, and fat). Postoperatively, she developed diplopia in downgaze with limitation of ocular motility. Initial treatment with intra-orbital triamcinolone (40 mg monthly for three months) provided partial improvement. Persistent restriction with a positive forced duction test prompted surgical re-exploration of the left orbit. Fibrous adhesions at the inferior orbital fissure were released, and an amniotic membrane graft was secured with fibrin glue.

Results: At six weeks post-revision surgery, the patient demonstrated complete resolution of diplopia with full restoration of downgaze movement.

Conclusions: Secondary orbital exploration with meticulous release of fibrotic bands, combined with amniotic membrane grafting, can effectively restore motility and resolve diplopia in selected cases of post-decompression restrictive strabismus.

Abstract No.: 204748

Ptosis Correction in Challenging Situations – Tarsal Switch Technique

First Author: Shruthi TARA

Co-Author(s): Jasleen KAUR

Purpose: To describe a technique of shifting the palpebral aperture, to expose the pupillary axis in patients with poor Bells, elevation restriction, myogenic ptosis, and neurogenic ptosis, thus avoiding crutch glasses and deliberate undercorrection.

Methods: Seven patients (13 eyes) with severe neurogenic or acquired myogenic ptosis were included. All patients underwent the tarsal switch procedure through an anterior approach. Margin reflex distance (MRD1 and MRD2) and the palpebral fissure were evaluated preoperatively and postoperatively and were compared to evaluate the shift in palpebral aperture.

Results: Postoperatively, the chin-up position improved in all patients. The MRD1 increased to 2-3 mm postoperatively. and MRD2 decreased to 3.0 mm postoperatively. The palpebral aperture was shifted superiorly in all patients and thus exposing the pupillary axis. None of the patients had lagophthalmos or corneal exposure. All the patients maintained the measurements at the end of the 6-month follow-up.

Conclusions: The tarsal switch procedure through the anterior approach is an effective alternative for correcting severe ptosis with poor LPS function, especially neurogenic or acquired myogenic ptosis. This procedure can be performed with minimal risk of ocular surface exposure and provides stable outcomes. This procedure is independent of poor bells or restricted elevation and proves to be a boon in patients with the above-mentioned conditions.

Abstract No.: 201203

Spasms, Winks and Tics: Periorcular Dystonia Simplified

First Author: Akshay Gopinathan NAIR

Purpose: Periorcular dystonias are a heterogeneous group of involuntary eyelid and facial movement disorders that can cause significant functional and psychosocial morbidity. This video aims to provide a simplified, clinically relevant overview of the diagnosis and management of key periorcular dystonias, including eyelid myokymia, essential blepharospasm, hemifacial spasm, and Meige's syndrome

Methods: Representative clinical cases were documented to illustrate characteristic clinical features and diagnostic cues for each disorder. A stepwise approach to clinical examination and differentiation was demonstrated. Treatment strategies were discussed, focusing primarily on botulinum toxin therapy, including commonly employed injection sites, recommended dosages, and technique pearls. Additional adjuvant measures, such as topical ocular lubricants and systemic medications, were also reviewed.

Results: The video highlights distinguishing clinical signs that aid in differentiating among periorcular dystonias, such as the unilateral versus bilateral involvement, associated facial spasms, and progression patterns. Botulinum toxin was shown to be an effective and safe first-line treatment in most patients, with predictable improvement in spasm control and quality of life. Treatment outcomes were optimized by tailoring injection dosage and sites to the individual pattern of dystonia. Supportive use of topical lubricants was noted to enhance patient comfort, particularly in those with secondary dry eye symptoms.

Conclusions: A structured diagnostic framework facilitates accurate differentiation of periorcular dystonias. Botulinum toxin remains the cornerstone of therapy, supplemented by adjuvant measures. A simplified, practical approach - emphasizing recognition, individualized dosing, and holistic management - enables comprehensive care of patients with periorcular dystonia in clinical practice.

Abstract No.: 200636

Surgical Management of Orbital Lipoma

First Author: Keerti WALI

Co-Author(s): Vaishnavi PATIL

Purpose: To present a surgical video of orbital lipoma excision with amniotic membrane transplantation.

Methods: Dissecting the lesion without breach in the capsule is the most crucial part of surgery. The conjunctiva adherent to the surface of the tumor was excised, leaving a large defect in the conjunctiva. Amniotic membrane transplantation was done with fibrin glue to prevent symblepharon formation with a good cosmetic outcome.

Results: The tumour was excised completely, confirmed on histopathology as a lipoma.

Conclusions: Orbital lipoma is a benign, well-circumscribed fatty mass often located in the anterior orbit. Common differentials include lipodermoid, orbital fat prolapse, and other myxomatous tumors. Surgery is planned for large symptomatic lesions or cosmetic purposes.

Abstract No.: 202126

Tarsal Switch Technique for the Management of Myogenic Blepharoptosis

First Author: Raghuraj HEGDE

Co-Author(s): Alexander GUNGAB

Purpose: The purpose of this video is to provide a detailed step-by-step demonstration of the tarsal switch technique, its methods of application, the results observed, and its utility in treating severe myogenic blepharoptosis or ptosis. In myogenic ptosis, the extra-ocular muscles, including levator palpebrae superiors (LPS), undergo degenerative changes and can gradually reduce in function. This video aims to introduce this technique to new oculoplastic surgeons as well as experienced surgeons wanting to add this technique to their armamentarium.

Methods: The concept of the procedure is the shifting of the palpebral aperture superiorly to clear the visual axis without increasing the palpebral aperture. The free tarso-conjunctival graft is harvested from the upper eyelid and switched to the lower eyelid below the existing tarsus, acting as a spacer graft. This effectively raises the upper lid, opening up the visual axis while also raising the lower lid to prevent exposure keratopathy because of poor bell's reflex. Conventional methods of ptosis correction may be counterproductive in such cases, where post-operative complications can include severe lagophthalmos, which leads to exposure keratopathy and corneal infections.

Results: We demonstrate that the Tarsal switch technique is a superior technique, which is more effective and has better long-term outcomes than the

traditional undercorrected tarso-frontalis silicone sling method.

Conclusions: Tarsal switch technique is an effective technique in correcting severe myogenic blepharoptosis with poor levator function as well as poor bell's reflex. Before-and-after visuals showcase the dramatic improvements achieved through this technique.

Abstract No.: 202513

The Art and Science of Epicanthoplasty

First Author: Alice GOH

Purpose: To demonstrate a structured, scientifically guided approach to epicanthoplasty that integrates the golden ratio for precise planning and predictable outcomes.

Methods: Patient photographs were analyzed using a golden ratio rectangle, with the longer side aligned to the corneal diameter. The shorter side defined the ideal medial canthus-to-corneal edge distance, enabling objective assessment of correction and detection of overcorrection.

Results: The method provided a reproducible framework for surgical planning and improved communication with patients. Postoperative outcomes showed enhanced periorbital harmony with high patient satisfaction and fewer instances of disproportionate correction.

Conclusions: Incorporating the golden ratio minimizes subjectivity, offering a balance between artistry and science in epicanthoplasty. This approach enhances predictability, optimizes outcomes, and refines the surgeon's decision-making process.

Pediatric Ophthalmology and Strabismus

Abstract No.: 202914

A New Characteristic Sign Describes Palpebral Fissure Changes on Horizontal Version Movements in Bilateral Duane Retraction Syndrome Type I

First Author: Moustafa ABDELHAFEZ

Purpose: A retrospective series of case studies to report changes in the palpebral fissure on eye movement in patients with bilateral Duane syndrome type 1.

Methods: We reported 6 patients who had limited abduction in both eyes. They had globe retraction and narrowing of the interpallebral fissure (IPF) on adduction in both eyes. The diagnosis of Duane retraction syndrome type I in both eyes was confirmed. Five of them had esotropia in primary position (PP) and

underwent bilateral medial rectus muscle recession. One of them had no eye deviation in PP. We did video recording for all patients to record the differences in IPF bilaterally at the same time during horizontal version movements on lateral gazes.

Results: During horizontal duction, the IPF narrowed on adduction and widened on abduction alternatively. During horizontal version movements, the IPF size changed. We found that on the attempt for right gaze, the lids of the right eye widened, and the lids of the left eye narrowed. The opposite happened on the attempt for the left gaze: the right eye narrowed, and the left eye widened. It happened alternatively between the right and left eyes on lateral gaze. We recorded for all patients, including non-estropic patients. It also happened either pre- or postoperatively. On horizontal version movements, one eye IPF narrowed as if it winked, while the other eye IPF widened at the same time. The opposite happened alternatively.

Conclusions: Alternate narrowing of each eye on attempting the horizontal version. It could be a new characteristic and diagnostic sign to confirm the diagnosis of bilateral Duane retraction syndrome Type I, even in non-esotropic patients in PP.

Abstract No.: 204060

Comparative Study of Novel Vaporized Spray of Cycloplegic-Mydriatic Protocol Versus Conventional Eye Drop in Indian Paediatric Cohort

First Author: Shruti **NISHANTH**

Co-Author(s): Arockia Agila, Nishanth M, Subashree Lakshmi

Purpose: To determine by serial measurements and compare the pupillary mydriasis effect of tropicamide and phenylephrine, and the cycloplegic effect of cyclopentolate administered as a vaporized spray over closed lids in one eye and through conventional instillation of eye drops in the other eye in a South Indian pediatric cohort.

Methods: Fifteen children between 6 to 15 years of age were included. The spray was prepared using glass bottles that underwent ETO sterilization. CTC protocol was followed. For every patient, one eye was randomized to spray, and the other to eye drop. The study eye received spray application over closed eyelids, and a cover was placed over the nose that received drop instillation so that the vaporized droplets did not touch the other eye, which might create bias. Pupillary size was measured at 40 minutes. The end of cycloplegia was measured using MEM retinoscopy values. The Wong-Baker Pain scale was used to observe objective response. A 24-hour recall was done to ask for any adverse events.

Results: There was no statistical significance between the 2 eyes in cycloplegia and mydriasis. ($p=0.921$, $p=893$) with better subjective and objective responses.

Conclusions: The effect of CTC spray may be comparable to that of the CTC drop form with a better comfort and compliance.

Abstract No.: 201209

Hope of Light, Even in Darkness

First Author: Shahrina **MAHFOOZ**

Purpose: To report the surgical outcome of a traumatic cataract with adherent lucoma in a 5-year-old child.

Methods: - Preoperative VA in right eye CF1, in left eye 6/6; - Right eye B Scan showed flat retina; - With all aseptic precautions under GA, incisions were made, and synechiolysis was done carefully; - Cataract and post-capsular plaque were removed. IOL was placed in the bag, and PPC+ AVT was done; - After wound hydration, the suture was given.

Results: Postoperative visual acuity was 6/9 with minimal AC reaction.

Conclusions: Pediatric cataract surgery is inherently challenging due to its unpredictable nature, and traumatic cases add an even greater level of complexity. Despite these difficulties, this case was managed successfully, and the child's vision was beautifully restored.

Abstract No.: 204138

Monsters on the Eyes: Phthiriasis Palpebrarum in a Child

First Author: Jing **JIN**

Co-Author(s): Yuanyue **CUI**, Hao **LI**, Hong **LIU**

Purpose: To present a case of phthiriasis palpebrarum in a 6-year-old girl with clinical pictures and video materials of the phthirus pubis and its eggs.

Methods: A six-year-old girl was presented to the Department of Ophthalmology with persistent ocular pruritus. Slit-lamp microscopy revealed multiple crab-shaped parasites densely adherent to the eyelashes. Microscopic examination of epilated eyelashes identified viable Phthirus pubis and eggs. The adult lice exhibited characteristic crab-like morphology, multilegged locomotion, and translucent bodies distended by ingested blood, with visible blood flow. Mechanical debridement of lice and nits was performed, followed by meticulous eyelid margin cleansing. The patient's household contacts denied similar symptoms, and there was no sexual abuse in this case. Family members were instructed to sanitize bedding and clothing with hot water separately to disrupt transmission.

Results: No ocular surface damage or secondary infection was observed. Symptoms resolved

completely after mechanical debridement and hygiene interventions. Household contacts denied similar symptoms, and no evidence of sexual abuse was identified.

Conclusions: Phthiriasis palpebrarum is a rare ectoparasitic condition characterized by the presence of Pthirus pubis infestation affecting the eyelashes. Early detection and intervention are essential in averting the onset of secondary complications, including keratitis, blepharitis, and conjunctivitis, which can result from persistent scratching and inflammation associated with the infestation. The primary approach for treating lice infestations involves the application of topical agents alongside the mechanical extraction of the lice and their eggs. This therapeutic regimen is typically supplemented by rigorous hygiene practices to avert the risk of re-infestation.

Abstract No.: 206844

Presenting a Set of Challenging Paediatric Trauma Management Which Includes Cataract As Well As Iris Trauma

First Author: Kavitha KALAIVANI

Purpose: To show the complexity of paediatric trauma management and to reinforce the need for expertise and preparedness to manage coexisting conditions.

Methods: Collection of videos of surgeries of three different paediatric traumas.

Results: When prepared to tackle concurrent issues during pediatric traumatic cataract surgery management, the outcome is optimised and the need for multiple surgeries is avoided.

Conclusions: Paediatric trauma management poses unique challenges, and yet, when anticipated, can give fruitful results.

Abstract No.: 204672

Secondary Sulcus Placement of Foldable Intraocular Lens in a 10-Year-Old Child With Bilateral Aphakia and Developmental Delay

First Author: Divya KATTA

Purpose: To demonstrate the surgical technique and outcomes of secondary intraocular lens (IOL) implantation in the ciliary sulcus of a 10-year-old aphakic child with developmental delay, aiming to achieve spectacle independence.

Methods: A 10-year-old female with a history of bilateral lensectomy at 6 months of age for congenital cataracts presented with dependence on +16.00 D aphakic spectacles. The child had bilateral deprivation amblyopia and global developmental delay with delayed milestones. Visual behavior was present, though formal acuity testing was limited due to cognitive challenges. Fundus examination

was within normal limits in both eyes. With a strong parental desire for spectacle independence, the child underwent secondary intraocular lens implantation. Intraoperatively, extensive posterior synechiae were released, and the ciliary sulcus was carefully created. A foldable three-piece intraocular lens was inserted and placed securely in the sulcus. The procedure is demonstrated step-by-step in the surgical video.

Results: The surgery was completed without intraoperative or immediate postoperative complications. Postoperatively, the IOL was well-centered in the sulcus with stable positioning. The child showed improved visual engagement and was able to perform near tasks more efficiently without high-powered spectacles in the left eye. The cosmetic appearance also improved, and the parents expressed high satisfaction with the outcome.

Conclusions: Secondary sulcus placement of a foldable IOL can be a safe and effective solution for visual rehabilitation in aphakic children, even in the presence of amblyopia and developmental delay. Careful surgical planning, synechiolysis, and proper IOL selection are essential to ensure optimal anatomical and functional results.

Abstract No.: 201896

Surgical Membranectomy Is a Rewarding and Cost-Effective Approach in the Management of Posterior Capsular Opacification for Pseudophakic Children

First Author: Sidratul Muntaha NAZNIN

Purpose: To report a safe, effective, easy surgical technique of the membranectomy operation in a pseudophakic child with posterior capsular opacification (PCO) with a very short learning curve.

Methods: This technique was demonstrated in a patient of 6-year-old child with pseudophakia, PCO with nystagmus. PCO has a significant impact on vision, including obstruction of visual acuity and impaired contrast sensitivity. Surgical membranectomy was done under G.A with prior anesthetic fitness and proper consent. At first a scleral tunnel was made at 12 o'clock position. Viscoelastic gel was given through entry wound to anterior chamber. Vitrectomy probe was entered in anterior chamber. Probe was passed behind the intraocular lens and hold at the margin of membrane. Then cut the membrane circumferentially. After making proper opening for passing light – vitrectomy probe was removed from behind the lens and taking out. Suture was passes through the entry point. Intraocular lens was positioned centrally. Viscoelastic gel was cleared out. Wound was closed by 10-0 monofilament nylon. Stability of IOL was confirmed. Reformation of anterior chamber was done. Conjunctival wound was closed by cauterization. Sub conjunctival injection was given.

Results: A round aperture was formed, which is sufficiently large to pass an adequate amount of light through the pupil. Postoperative visual acuity was improved, and Intraocular pressure was normal. This patient showed a good cosmetic and visual outcome in postoperative follow-up.

Conclusions: This minimally invasive technique is simple enough to be performed safely by surgeons of varying skill with a good visual outcome.

Abstract No.: 204466

"Clearing the Cloud"-Managing Membranous Paediatric Cataracts

First Author: Deepti JOSHI

Co-Author(s): Sheetal MADALAGI

Purpose: Congenital membranous cataract is a rare type of cataract. Presently, there is no standardized surgery for it. Surgery is difficult because of the peculiar morphology of the cataract, which also makes it difficult to diagnose prior to the operation. Some of our experiences treating congenital membranous cataracts have been shown in the video.

Methods: We identified various types of congenital membranous cataract, and we classified them into 2 variants. The first variant is a classic membranous cataract, where the whole lens complex is fused into a single membrane. These cataracts needed dissection with micro scissors or vitrectomy cleaving. In such scenarios, a lens was implanted in the sulcus with optic capture. The second variant was mild plaque form, where membranes are attached to the anterior/posterior capsule, in which case a gentle peeling with the help of cystitome and then performing a rhexis by capsulorhexis forceps was performed. In cases where membranes could not be peeled, we used vitrectorhexis.

Results: All patients have a clear visual axis with a centred intraocular lens at 6 months follow-up.

Conclusions: Congenital membranous cataracts can be classified into several types based on the clinical characteristics of the lens. The surgical method chosen should depend on the type of congenital membranous cataract. Anterior and posterior capsulorhexis, capsulectomy with microscissors and vitrectomy cutter, are effective surgical methods for treating congenital membranous cataract.

Refractive Surgery

Abstract No.: 201028

How to Handle Suction Loss During PRESBYOND LASIK With a Circle (Side Cut Laser) Procedure

First Author: Zoraya Ariefia FERANTHY

Co-Author(s): Ucok PASARIBU

Purpose: To show the importance of handling complications during PRESBYOND LASIK with a Circle (side cut laser) procedure safely and accurately.

Methods: Video presentation.

Results: A 20/20 vision with good flap and clear cornea was achieved after a circle (side cut laser) procedure.

Conclusions: Handling suction loss during PRESBYOND LASIK surgery accurately and safely by the Circle (side cut laser) technique can lead to a good outcome.

Abstract No.: 202603

Implantable Collamer Lens Complication: Trailing Haptic Breakage and Surgical Abandonment

First Author: Vinit TANWAR

Purpose: To present a rare intraoperative complication of Implantable Collamer Lens (ICL) surgery—trailing haptic fracture during injection—and to highlight the critical decision-making process that prioritizes patient safety, leading to immediate surgical abandonment.

Methods: This surgical video case report documents the management of an intraoperative complication in a 28-year-old patient undergoing ICL implantation for high myopia. The video demonstrates the final stage of ICL delivery, the moment of haptic fracture, and the subsequent decision to abort the procedure. The technique for safe explantation of the compromised ICL is shown, utilizing viscoelastic-assisted maneuvers to protect the corneal endothelium and minimize trauma.

Results: During injection into the posterior chamber, the trailing haptic fractured, rendering the lens unstable and unsuitable for implantation. The compromised lens was successfully removed from the anterior chamber without inducing endothelial damage or other intraocular trauma. The procedure was safely abandoned, preventing potential complications such as decentration or sulcus irritation. The patient was counseled for a future re-operation with a new, intact ICL.

Conclusions: ICL haptic fracture is a critical complication that compromises the safety and efficacy of the procedure. This case underscores the importance of controlled injection technique and immediate recognition of implant defects. Prioritizing patient safety by abandoning the surgery and safely

explanting a compromised device is the most prudent course of action.

Abstract No.: 203819

Managing Cap-Lenticular Adhesion in SMILE: Management Approach Using Modified Dissection Technique

First Author: Kumar Kartikay RAJAURA

Co-Author(s): Manpreet KAUR

Purpose: Cap-lenticular adhesion (CLA) occurs in 1.8-2% of SMILE cases, creating abnormal cap-lenticular tissue adhesion that complicates extraction and may cause incomplete removal or cap perforation.

Methods: This video demonstrates CLA management: early identification with posterior-before-anterior dissection. Enter the cap sidecut, move 2 hours left with a sharp dissector to peel the adhered lenticule. Once edge identified, use blunt dissector from 12→6 o'clock, retract and dissect left to 3 o'clock (leaving 6-3 segment). Return to center, advance 6→9 o'clock for the right quadrant. Final 6-3 region addressed with controlled right-to-left sweeping, sequential temporal-nasal dissection, then smooth leftward motion for complete extraction.

Results: A total of 760 eyes were operated on using the technique. Complete and easy lenticular was observed in all cases. No case had retained lenticular.

Conclusions: This technique offers the advantage of easy and complete removal of lenticulars in keratorefractive surgeries. The technique is unique and easy to remember and perform, especially by novice surgeons.

Abstract No.: 207904

Managing Intraoperative Complications in KLEX: Lessons From the Operating Room

First Author: Tulika CHAUHAN

Co-Author(s): Surveen Kaur ARNEJA, Garvita DABAS

Purpose: To showcase key intraoperative complications encountered during Keratolenticule Extraction (KLEX) and demonstrate practical strategies for their recognition, management, and prevention.

Methods: A surgical video compilation of KLEX cases was prepared. The footage highlights critical moments where intraoperative complications arose, including suction loss, challenging lenticule dissection, retained fragments, cap tears, and decentered treatments. Each clip emphasizes the surgical step involved, the underlying cause, and the maneuver adopted to overcome the event.

Results: The video illustrates how intraoperative challenges can disrupt the planned sequence of KLEX. Suction loss required immediate re-docking, difficult dissections were managed with controlled dissection techniques, and retained tissue was carefully identified

and removed. Cap tears and decentered treatments necessitated intraoperative modification of the technique to complete the surgery. In each scenario, prompt recognition and calm adaptation allowed safe continuation of the procedure.

Conclusions: Intraoperative complications in KLEX are uncommon but can be effectively managed when recognized early. Video demonstration offers a powerful educational tool, enabling surgeons to anticipate potential pitfalls and refine their responses, thereby enhancing safety and surgical confidence.

Abstract No.: 205550

Ridge Sign: A Definitive Sign for Identifying the Anterior-Posterior Plane in Small-Incision Lenticule Extraction

First Author: Tushya OM PARKASH

Co-Author(s): Rohit OM PARKASH

Purpose: To describe the "Ridge Sign" as a conclusive indicator for differentiating the anterior and posterior lenticular planes in Small Incision Lenticule Extraction (SMILE).

Methods: Femtosecond laser application for SMILE was performed. Anterior and posterior planes were dissected. "Ridge sign" was elucidated prior to proceeding with the final dissection of the anterior plane. Our sign helps to identify anterior and posterior lenticular planes in SMILE. This sign describes a lenticular ridge noted at the junction between the dissected and undissected halves of both planes. This ridge is formed as the lenticule is attached to the cap on one side and to the stromal bed on the other side. Here, the cap is lifted with the blunt dissector's arm at the junction of the anterior and posterior dissected planes prior to the final dissection of the anterior plane. This maneuver enhances the visibility of the ridge sign and confirms correct initial anterior plane dissection, thereby preventing inadvertent cap lenticular adhesion.

Results: In our study, 400 eyes undergoing SMILE procedures using the VisuMax femtosecond laser were included. In 96% of cases, the cap interface was separated first, with a ridge sign observed in all. In 4% of cases with wrong initial separation of the lenticule interface, the ridge sign was absent. Successful lenticule extraction was achieved in 100% of cases.

Conclusions: This confirmatory sign helps to dissect the anterior plane ahead of the posterior plane, thereby ensuring smooth lenticule extraction and preventing inadvertent cap lenticular adhesion, lenticule tears, or partial lenticular dissection.

Abstract No.: 203954**Trouble of the Bubble***First Author: Abhishek KUMAR**Co-Author(s): Swati SHARMA*

Purpose: To present a video demonstrating refractive lens exchange with posterior chamber intraocular lens (PCIOL), showing difficulty in cortical matter removal due to air bubbles going behind the posterior chamber onto the anterior hyaloid face.

Methods: A 42-year-old male with a refractive error of -10DS -2.5C at 90 degrees in the right eye underwent refractive lens exchange. An EDOF toric intraocular lens of 13.5DS-3.5DC was planned at a 94-degree axis. The surgery was uneventful until the step where the air bubble went behind the posterior capsule onto the anterior hyaloid face through the zonules, making further surgery difficult. Glow became dull, due to which cortical matter removal became difficult. The above video demonstrates the maneuvers done to remove cortical matter.

Results: On postoperative day 1, uncorrected distance visual acuity was 6/9 with near vision N10 and intermediate vision N18. Intraocular pressure was 16 mmHg. The anterior chamber was well formed with minimal anterior chamber cells, and wounds were well opposed. On fundus examination, an air bubble was present in the superior 1/5th of the vitreous cavity, with the disc and macula healthy. On postoperative day 3, UDVA -6/6, Near vision N10.

Conclusions: Patience and presence of mind in taking appropriate actions are the key takeaways from the above video.

Abstract No.: 204451**Under the Surface: Dissecting SMILE-Induced Incisional Complications and Their Management***First Author: Ankita SANJAY KULKARNI**Co-Author(s): Sri GANESH, Savio PEREIRA, Supriya SAMAK SRIGANESH*

Purpose: This presentation aims to share real-world experiences with rare superior incision complications during Small Incision Lenticule Extraction (SMILE) and to highlight practical surgical approaches that led to excellent outcomes.

Methods: During SMILE procedures, we encountered two unusual intraoperative situations, both involving the superior incision. In the first case, a sudden bout of brisk bleeding from the incision site. We managed this with thorough irrigation, gentle lenticule extraction, and quick steps to control the bleeding, all while maintaining a steady workflow in the operating room. The second case brought a technical issue, which resulted in an incomplete superior incision, even though the lenticule creation went smoothly. We

finished the incision carefully at the correct depth with a side-port blade, ensuring we protected the corneal tissue.

Results: Both patients made full recoveries and achieved 6/6 unaided vision within two weeks of surgery. These experiences reinforced the need to stay alert for rare complications and to use resourcefulness and precision when surprising challenges arise.

Conclusions: While SMILE has become known for its safety and minimally invasive nature, these cases remind us that rare procedural hurdles still exist. When they do occur, a calm approach and readiness to adapt are essential for securing the best results for our patients. By sharing these stories, we hope to support colleagues in developing confidence and flexibility for unexpected moments in refractive surgery.

Abstract No.: 201683**When Vault Turns Fault: Toric ICL Exchange for Excessive Vault and Ocular Hypertension in High Myopia***First Author: Amer AWAN**Co-Author(s): Sahar FATIMA*

Purpose: To describe the clinical presentation, management, and outcome of a case of excessive vault following toric implantable collamer lens (ICL) implantation, successfully treated with toric ICL exchange.

Methods: A 25-year-old female with high myopia (-14.00 D/-3.00 D right eye; -16.00 D/-1.50 D left eye) underwent bilateral ICL implantation. Postoperatively, she developed shallow anterior chambers and elevated IOPs of 34 mmHg (OD) and 35 mmHg (OS). Anterior segment optical coherence tomography revealed excessive vaults measuring 1652 μ m (OD) and 1512 μ m (OS). Initial management with maximal topical anti-glaucoma therapy reduced IOPs to 10 and 14 mmHg; however, persistent high vault and pigment deposition over the ICL indicated the need for surgical exchange.

Results: Bilateral toric ICL exchange was successfully performed using a modified surgical technique. Postoperatively, best-corrected visual acuity improved to 6/6 in both eyes. Intraocular pressure stabilised at 12 mmHg bilaterally without anti-glaucoma medications.

Conclusions: Excessive ICL vaulting can lead to ocular hypertension and pigment dispersion despite medical therapy. Careful vault assessment with anterior segment imaging and close postoperative monitoring are essential. ICL exchange is a safe and effective solution in such cases, restoring anatomical balance, controlling IOP, and achieving excellent visual outcomes.

Following the Trails of Ischaemia: Cattle Tracking on Fluorescein Angiography in Central Retinal Artery Occlusion

First Author: Yu Ting Tina SHEN

Co-Author(s): Jon CHAN, Thet NAING

Purpose: To present the clinical course and multimodal imaging features of acute central retinal artery occlusion (CRAO), highlighting characteristic vascular findings, including cattle tracking on fundus fluorescein angiography (FFA), and management in the context of systemic co-morbidities.

Methods: A fifty-seven-year-old man with multiple cardiovascular risk factors presented with sudden blurring of vision in the right eye. Comprehensive ophthalmic examination and multimodal imaging, including widefield fundus photography, autofluorescence, macular optical coherence tomography (OCT), and FFA, were performed. Immediate therapeutic intervention was undertaken with a favourable outcome.

Results: On presentation, visual acuity was light perception with a grade three relative afferent pupillary defect (RAPD). Widefield fundus photography demonstrated diffuse retinal pallor with a central cherry-red spot and scattered blot hemorrhages. Macular OCT revealed inner retinal thickening. A diagnosis of CRAO was made, and ocular massage was promptly initiated, improving vision to 1/60 within ten minutes and reducing the RAPD to grade one. FFA showed markedly delayed arm-to-retina and arteriovenous transit times, with patchy areas of capillary non-perfusion. Characteristic cattle tracking of the venous circulation was evident, particularly on magnified views. On follow-up visits, vision improved to 6/7.5. In view of the underlying ocular ischaemic syndrome, panretinal photocoagulation was performed. Long-term OCT at five years demonstrated resolution of retinal thickening with stable vision.

Conclusions: This case highlights the importance of timely recognition and intervention in CRAO, and demonstrates the role of multimodal imaging, particularly FFA with characteristic features of cattle tracking, in evaluating ischaemic ocular disease.

25 G Trocar-Based Limbal Entry in Stage 5 Retinopathy of Prematurity

First Author: Manu SHARMA

Co-Author(s): Yuk CHAITANYA, Deeksha KATOCH

Purpose: To describe the limitations of conventional limbal entry in advanced Stage 5 Retinopathy of Prematurity (ROP) surgery and to highlight the advantages of using a trocar-cannula-based approach.

Methods: A review of surgical challenges encountered with standard microvitrectomy (MVR) blade limbal entry was undertaken. The technical benefits of trocar-cannula-assisted limbal entry were then assessed, particularly in relation to access, wound stability, visualization, and instrument maneuverability.

Results: Traditional MVR blade entry was associated with multiple complications, including conjunctival ballooning, port leakage, corneal haze, iris prolapse, iris incarceration, and trauma. In contrast, trocar-cannula-based entry provided a more stable, self-sealing system that reduced these issues. This method allowed the safe use of microinstruments such as forceps, scissors, and vitreous cutters, preserved the cornea and iris, and improved intraoperative visualization and control.

Conclusions: Trocar-cannula-based limbal entry offers a safer and more effective alternative to conventional MVR blade entry in advanced Stage 5 ROP surgery. By minimizing intraoperative complications and enhancing maneuverability, it contributes to more controlled procedures and improved surgical outcomes.

Abstract No.: 201150

A Novel Indigenous Device for Scleral Fixated Intraocular Lens (SFIOL) Implantation

First Author: Vandana AKSHAY IYER

Co-Author(s): Puja HINGORANI-BANG, Trupti KADAM LAMBAT, Rajesh PATTEBAHADUR, Shraddha PAWAR, Kanishk SINGH, Sagarika SNEHI

Purpose: To demonstrate the use of a novel indigenous device for SFIOL implantation.

Methods: A 26 G, 1/2 inch hypodermic needle commonly available in the operating room (OR) is bent at 2mm from the hub. Two number 240 silicone band bits usually available for encirclage in retinal surgery are railroaded on to the needle till the hub. The tip is broken to make it blunt. This device is used for guiding the haptic of a 3 piece PMMA lens extraocularly and supporting the lens in the implantation.

Results: The device stabilizes the SFIOL during the surgery and prevents the slippage of the haptic during maneuvering.

Conclusions: This device can be made in any OR and is fool proof for slippage, bending or chipping of the haptic during the procedure.

Abstract No.: 207223

A Step-by-Step Beginner's Guide to Scleral Buckling Surgery: An Educational Video for Vitreoretinal Trainees

First Author: Joshmitha **METLA**

Co-Author(s): Upendra **BABU**, Debolina **DEB**, Aayesha **KHANUM**, Venugopal **REDDY**

Purpose: Scleral buckling remains a fundamental surgical technique for rhegmatogenous retinal detachment (RRD) repair, particularly in young phakic patients and cases with uncomplicated breaks. However, many trainees lack exposure to this technique due to declining case volumes and the perceived learning curve.

Methods: We have made a step-by-step, detailed video including patient selection, surgical approach, precautionary measures, and possible mistakes we could avoid during scleral buckling surgery.

Results: This video serves as a comprehensive yet accessible resource for surgeons, bridging the gap between theoretical knowledge and practical execution.

Conclusions: Despite the growing popularity of pars plana vitrectomy (PPV), scleral buckling offers distinct advantages, including lower rates of postoperative cataract progression and vitrectomy-related complications. By standardizing the foundational steps of scleral buckling, we aim to preserve this skill in the surgical armamentarium and encourage its appropriate use in selected RRD cases.

Abstract No.: 200944

A Sticky Note – Tale of Stubborn Vitreous

First Author: Renuka Nikit **SARWATE**

Co-Author(s): Jayant **SARWATE**, Nikit **SARWATE**

Purpose: To show Posterior Vitreous Detachment (PVD) induction methods in cases with thick and partial PVD during vitrectomy.

Methods: Pars plana vitrectomy surgery was done. Thick and adherent vitreous was tried to be separated with multiple attempts using the conventional method. Vitreous stained multiple times with Triamcinolone acetonide and Trypan Blue dye, with failed attempts to induce over the posterior pole. Posterior vitreous later separated with a diamond scrapper instrument and lifted with Internal Limiting membrane (ILM) peeling forceps like a sheet and removed with a cutter. ILM was stained with Trypan Blue dye, and ILM peeling was done with forceps, and the case was closed.

Results: Absence of PVD in young patients makes vitrectomy surgery difficult. Induction of the PVD

process requires multiple attempts, without which ERM removal will not occur.

Conclusions: Meticulous and stepwise PVD induction is difficult and necessary for Pars Plana vitrectomy done for young patients.

Abstract No.: 204822

A 'No Retinotomy' Transscleral Approach to Remove Subretinal Napkin Ring in Proliferative Vitreoretinopathy

First Author: Bhavani **SANKARAN**

Co-Author(s): Naresh Babu **KANNAN**, Renu **PUTHENVILAYIL RAJAN**, Toshit **VARSHNEY**

Purpose: To demonstrate a surgical technique of removal of subretinal napkin-ring membranes in proliferative vitreoretinopathy (PVR) by accessing the subretinal space via a transscleral approach.

Methods: Standard three 23G core vitrectomy are made followed by minimal core vitrectomy. With an internal visualization, a fourth standard 25G valved trocar and canula system is used to enter the subretinal space across sclera and choroid. The trocar is advanced at 15 degree angle, approximately 10mm from limbus, at an area corresponding to maximum retinal elevation. Subsequently this route is used to remove subretinal membranes using forceps subretinally. The same route is then used for drainage of subretinal fluid.

Results: An 8-year-old male child presented with right eye (RE) retinal detachment with extensive PVR/subretinal bands. He had a best corrected visual acuity (BCVA) of LogMAR 2 (Finger counting close to face) in RE and LogMAR 0 (Snellen 6/6). He underwent RE pars plana vitrectomy along with subretinal membrane removal via the above described technique. Posterior retinotomy was thereby avoided. This was followed by completion of vitrectomy, base dissection, PFCL injection, peeling of internal limiting membrane, fluid air exchange, endolaser and silicon oil injection. At 6 months post operative follow-up the patient underwent silicon oil removal and subsequently achieved a RE BCVA of LogMAR 1.1 (Snellen 5/60) with an anatomically attached retina and macula. No subretinal haemorrhage/retinal incarceration was observed.

Conclusions: This novel technique of subretinal membrane dissection is safe and effective for peripapillary napkin-ring PVR. This technique also obviates the need for retinotomy to reach subretinal space.

Abstract No.: 205637

Application of Flute Needle Aspiration for Salvaging Posteriorly Dislocated Hapticless 4-Point Intraocular Lenses

First Author: Lei GAO

Purpose: To evaluate the efficacy and surgical technique of utilizing the passive aspiration effect of a flute needle for salvaging posteriorly dislocated hapticless 4-point intraocular lenses (IOLs). Unlike dislocated traditional C-loop IOLs, which are relatively easy to grasp, the hapticless design often causes these IOLs to lie flat on the retinal surface, offering no purchase point and posing a significant challenge for salvage procedures.

Methods: During vitrectomy for a posteriorly dislocated hapticless 4-point IOL resting flat on the retina, a 23-gauge flute needle was slowly advanced toward the center of the IOL optic without using perfluorocarbon liquid or attempting direct forceps grasping. The negative pressure suction effect generated at the needle tip during fluid drainage was employed to capture the IOL. The captured IOL was then safely mobilized to the anterior vitreous cavity. Under microscopic visualization, the IOL was transferred from the flute needle to intraocular forceps for final extraction through a scleral tunnel incision or intraocular refixation.

Results: The technique enabled stable capture and safe mobilization of the posteriorly dislocated hapticless 4-point IOL. The procedure was performed successfully without causing retinal traction or injury. This method has also been applied successfully to salvage other types of dislocated IOLs and IOL-capsular bag complexes.

Conclusions: The flute needle aspiration technique is a novel, effective, and minimally invasive approach for salvaging posteriorly dislocated hapticless IOLs, effectively addressing the challenge posed by the lack of a purchase point. Its principle is reliable, and the procedure is straightforward, demonstrating considerable potential for broad clinical application.

Abstract No.: 200758

Appositional Suprachoroidal Hemorrhage With Retinal Detachment Managed With External Drainage and Pars Plana Vitrectomy

First Author: Maria Christine DY

Co-Author(s): Ronaldo JARIN

Purpose: To report a case of appositional suprachoroidal hemorrhage (SCH) with retinal detachment secondary to complicated cataract surgery managed with external drainage and pars plana vitrectomy.

Methods: A 72-year-old hypertensive male was referred for intraoperative expulsive SCH of the right

from phacoemulsification converted to extracapsular cataract extraction. On presentation, vision was hand movement with an intraocular pressure (IOP) of 62. Iris tissue and vitreous were incarcerated in the limbal wound with a flat anterior chamber and eight-ball hyphema. Ultrasonography showed kissing hemorrhagic choroidal detachment with focal areas of retinal elevation. IOP was managed with maximum anti-glaucoma medications prior to subjecting the patient to surgery, one week post-operation, with evidence of clot liquefaction.

Results: External drainage through posterior sclerotomy 8-9 millimeters from the limbus was done in three quadrants. Pars plana vitrectomy was also performed to release anterior adhesions and facilitate retinal detachment repair with silicone oil injection.

Conclusions: Suprachoroidal hemorrhage is a sight-threatening intraocular complication. Intraoperative risk factors include prolonged hypotony, large incisions, vitreous loss, and Valsalva. Drainage is indicated in appositional SCH, uncontrolled IOP, and visual decline, with surgery usually delayed until clot liquefaction at seven to ten days with ultrasound guidance. Pars plana vitrectomy with heavy liquids and endotamponade is also performed in cases with vitreous hemorrhage and retinal detachment. Identification of risk factors and prompt diagnosis and management will determine prognosis.

Abstract No.: 206847

Avoiding Pitfalls: Iatrogenic Retinal Break From Brilliant Blue Dye Injection in ILM Peeling

First Author: Suklengmung BURAGOHAIN

Co-Author(s): Henal JAVERI, Subham SINHA ROY

Purpose: To demonstrate a rare surgical complication of instilling brilliant blue dye under air during macular hole surgery.

Methods: Surgical video.

Results: The video demonstrates iatrogenic break formation while injecting brilliant blue dye under air. The video also demonstrates the management and prevention of such a complication.

Conclusions: Iatrogenic retinal breaks can occur during dye injection under air in macular hole surgery, and they can be prevented by using an endoillumination probe as a barrier while injecting the dye or by using active instillation with a vitrectomy cutter.

Abstract No.: 206979**Centrifugal Dissection of Fibrovascular Membranes in Proliferative Diabetic Retinopathy***First Author: Henal JAVERI**Co-Author(s): Suklengmung BURAGOHAIN, Ajay DUDHANI*

Purpose: Tractional and combined retinal detachments in proliferative diabetic retinopathy (PDR) are surgically challenging due to dense fibrovascular membranes that must be separated from the ischemic retina without inducing iatrogenic breaks. This report describes a reproducible technique to facilitate safe and effective membrane dissection.

Methods: Membrane peeling is initiated over and around the optic disc to induce posterior vitreous separation. The vitreoretinal interface is most clearly defined at this site, providing an optimal entry point. Fibroglial proliferation, which is thickest over the optic nerve head, is engaged and dissected tangentially to achieve controlled separation from the underlying retina.

Results: Using the optic disc as the starting point provided a consistent and reliable approach for the majority of complex PDR detachments. The technique simplified dissection, enabled effective membrane removal, and minimized the risk of retinal breaks. Although not entirely complication-free, careful patient selection and intraoperative judgment enhanced safety.

Conclusions: Initiating dissection at the optic disc offers vitreoretinal surgeons a practical method for managing complex PDR membranes. While it cannot be universally applied, this approach adds a valuable option to surgical practice and can make difficult PDR cases more manageable.

Abstract No.: 201960**Challenging Case: When Patient Sees Nothing and Retinal Surgeon Sees Nothing***First Author: Chun On LEE**Co-Author(s): Chi Lik AU, Po Lin LEOW*

Purpose: Our surgical video highlights tips in managing a case of adherent leukoma and enterococcus faecalis keratitis with exogenous endophthalmitis.

Methods: A 77-year-old lady with known adherent leukoma presented with right eye blurring of vision for 2 days. Examination revealed a corneal ulcer with hypopyon. Her vision deteriorated to light perception with no fundal view, and B-scan ultrasonography showed anterior vitreous opacity. Combined phacoemulsification and pars plana vitrectomy was performed.

Results: Trypan blue was injected to stain the pupillary fibrin, which was removed with an irrigation-aspiration

probe. Adherent leukoma was kept to maintain globe integrity. Capsulorhexis was performed. The Malyugin ring was used for pupil expansion. Sculpting of the dense cataract lens was performed. In view of the absence of red reflex, a light pipe through sclerostomy was used to assess the depth of the lens. Lens material was emulsified and aspirated. Anterior vitrectomy was performed to remove pus and fibrin exudate. Vitrectomy and induction of posterior vitreous detachment with overlying pus were performed. When compared with endogenous endophthalmitis in which infiltrate and pus originate from the posterior pole, the retina is relatively spared from pus in this case. Silicone oil, which may inhibit microbial growth was injected at end of operation.

Conclusions: Surgical treatment of endophthalmitis secondary to keratitis with poor view is challenging. Simple techniques, including Trypan blue to visualise fibrin, light pipe to assess depth of cataract, and keeping the plugged iris in adherent leukoma to maintain globe integrity, make surgery safer.

Abstract No.: 204971**Chorioretinectomy for Proliferative Diabetic Retinopathy***First Author: Prema SUBRAMANIAM**Co-Author(s): Narendran V, Saravanan V.R*

Purpose: Chorioretinectomy is a proactive surgical technique done in perforating injuries where a strip of choroid and retina is removed at the wound site to prevent proliferative vitreoretinopathy. This technique is incorporated to address the exuberant proliferation in Proliferative Diabetic Retinopathy (PDR).

Methods: A 47-year-old female, diabetic for 9 years on medications, underwent vitrectomy with silicone oil for the Tractional Retinal Detachment (TRD). Reproliferation occurred 6 weeks post-surgery with recurrent TRD and macular drag. As the exuberant proliferation occurred in a very short period, a choroidal source for the proliferation was suspected of and planned for re-surgical intervention. Silicone Oil Removal (SOR) was done, and multiple sites of re-proliferation with choroidal origin were noted, which were removed by bimanual technique and chorioretinectomy, followed by laser photocoagulation and silicone oil injection.

Results: Postoperative 8-week follow-up visits show a well-attached retina under oil with no recurrent proliferation.

Conclusions: Chorioretinectomy can be tried in some rare circumstances of exuberant re-proliferation causing recurrent TRD in Advanced Diabetic Eye Disease (ADED) with a fruitful outcome.

Abstract No.: 201663

Closing the Gap: Macular Hole Surgery

*First Author: Anuraha **BALAMURUGAN***

Purpose: To present the surgical approach and outcome of macular hole repair, highlighting the precision required in vitreoretinal surgery.

Methods: This surgical video demonstrates stepwise macular hole repair beginning with preoperative preparation, followed by pars plana vitrectomy. Careful removal of the vitreous gel is shown, with attention to creating a clear surgical field. The technique for internal limiting membrane (ILM) manipulation is highlighted, and the procedure concludes with the insertion of a long-acting gas bubble to aid in hole closure.

Results: The surgery resulted in successful anatomical closure of the macular hole. Postoperative evaluation confirmed restoration of foveal contour, with potential for gradual visual recovery.

Conclusions: Macular hole surgery, when performed with meticulous technique, offers reliable structural closure and promising functional improvement. This video provides both trainees and practicing surgeons with a structured guide to the procedure.

Abstract No.: 201493

Cut, Burn, Tie: A Tailored Surgical Strategy for Retinal Angiomas in VHL Disease

*First Author: Ashish **MARKAN***

*Co-Author(s): Shorya Vardhan **AZAD***

Purpose: This surgical video demonstrates a multimodal approach to managing retinal angiomas in a patient with von Hippel-Lindau (VHL) disease.

Methods: Three angiomas were identified in the left eye. A small angioma was successfully removed via endoresection, while a medium-sized angioma was treated with precise diathermy. The largest angioma, complicated by overlying exudative retinal detachment, was managed by suture ligation of the feeder artery using a 10-0 monofilament nylon suture.

Results: Postoperatively, the retina was attached. The ligated vessel showed a marked reduction in its caliber, confirming successful vessel occlusion, and the blood flow in the vessel was stagnant.

Conclusions: This combined strategy highlights the importance of tailored surgical techniques for angiomas of varying sizes and complexities in VHL, aiming to achieve optimal tumor control and retinal reattachment.

Abstract No.: 207106

Extreme Buckling: Adopting Scleral Buckling Techniques in Today's Practice

*First Author: Jose Timothy Martin Lim **CHUA***

*Co-Author(s): Jill Cristine Galvez **GENUINO***

Purpose: The high myopia epidemic is also increasing the number of young patients with retinal detachments from pathologic myopia. These younger patients are ideal candidates for scleral buckling and segmental buckling, as early pars plana vitrectomy will induce early cataract, among other complications. This informative video seeks to revive and reintroduce scleral buckling principles and showcase a quick guide on how to incorporate them in practice.

Methods: The video presentation is meant to be an introductory course into the various methods of scleral buckling, including segmental buckling. The video showcases quick surgical guides in doing: 1) the classic sutured scleral buckling, 2) using a crescent knife for intra-scleral tunnel formation, 3) using a bent Gauge 18 needle to make finer intra-scleral tunnel formation, and 4) Segmental buckling.

Results: Multiple patients with pre-operation and post-operation findings are discussed. In general, because the patients were selected for the appropriateness of scleral and segmental buckling, all patients had improvement in vision and disposition after surgery. Patients were followed up for 1 day post-op, 1 week post-op, 1 month post-op, and 3 months post-op. All patients initially had discomfort post-surgery due to the increased manipulation and surgical wounds known in doing this procedure. Overall, the results were promising and only strengthen the fact that ophthalmologists and retina specialists the world over must still learn buckling as part of their arsenal.

Conclusions: Scleral buckling is a dying art that needs to be saved and promoted. This skill can help us combat the high myopia pandemic.

Abstract No.: 206162

Foveal Neovascular Tuft in PDR: A Precision Vitrectomy Approach

*First Author: Awaneesh **UPADHYAY***

*Co-Author(s): Abhimanyu **SHARMA**, Deependra **SINGH***

Purpose: To present a rare and surgically challenging case of foveal neovascularization in proliferative diabetic retinopathy (PDR), complicated by vitreous and subhyaloid hemorrhage originating directly from a foveal neovascular tuft, managed with targeted micro-dissection

Methods: A 56-year-old diabetic female with PDR and active NVE presented with sudden visual loss in the left eye. Baseline vision was counting fingers at 1 meter. OCT revealed dense subhyaloid hemorrhage arising from a foveal neovascular tuft. Five days

prior to surgery, an intravitreal anti-VEGF injection was administered. A 25G pars plana vitrectomy was planned. Following core vitrectomy, the posterior hyaloid was stained with triamcinolone and safely detached, and peripheral vitrectomy was achieved. Subhyaloid hemorrhage was aspirated using an extrusion cannula. Brilliant Blue G-assisted ILM peeling was performed around the foveal tuft, exposing the neovascular stalk. The stump of the NVE was then carefully mobilized using ILM forceps and excised with the cutter under direct visualization. A 360-degree endolaser was applied, followed by fluid-air exchange and SF₆ gas tamponade to reduce the risk of postoperative haemorrhage.

Results: Postoperatively, the retina was clear with complete removal of the neovascular tuft and preservation of foveal contour. Visual acuity improved significantly from CF at 1 meter to 6/24. No recurrence of haemorrhage or iatrogenic macular damage was observed.

Conclusions: Foveal NVE is exceedingly rare and surgically demanding. Dye-assisted ILM peeling, followed by controlled mobilisation and excision of the tuft, offers a safe and effective strategy for central NVE in PDR.

Abstract No.: 207245

Hazy Cornea, Intraocular Foreign Bodies, Endophthalmitis and Retinal Detachment... Endoscopy to the Rescue

First Author: Vivek **DAVE**

Purpose: To describe a case of hazy cornea with intraocular foreign bodies, endophthalmitis, and retinal detachment, which was managed with intraocular endoscopy.

Methods: A case of open globe injury at the workplace was managed with initial corneal tear repair. B scan ultrasound revealed echoes s/o endophthalmitis with multiple retained intraocular foreign bodies. The cornea had significant edema, which precluded good visualization of the posterior segment. An intraocular endoscope was used to clear the vitreous exudates under good visualization. Post exudate removal, multiple foreign bodies were noted. Unfortunately, they were non-magnetic and had to be removed with forceps. The forceps were used to pick up the foreign bodies one after the other, laying them on the iris as a scaffold, and then removed through a scleral tunnel. Retinal detachment was noted through the breaks created by the foreign bodies, which were repaired with silicone oil tamponade and endolaser.

Results: The endophthalmitis resolved, and the retina stayed attached till the last follow-up, 3 months post-op with a reasonable visual acuity as the corneal edema cleared.

Conclusions: Endoscopic approach helps bypass temporary corneal edema to deal with the posterior segment pathology without the need for unnecessary keratoplasties.

Abstract No.: 200825

Healing by Secondary Intention of a Severe Perforating Eye Injury

First Author: David **SOUSA**

Purpose: To present our surgical approach to repair a nailgun-induced perforating open globe injury, leaving the posterior wound to heal by secondary intention.

Methods: A 20-year-old presented with a perforating eye injury using a nail gun. Vision was light perception. A full hyphema and large scleral-limbal wound were identified with choroid and vitreous loss. CT revealed a 32-mm-long nail within the globe until the apex of the orbit.

Results: Two surgeries are presented: i) primary open globe repair along with (lensectomy, partial vitrectomy, and removal of the intraocular/orbital foreign body), and ii) the secondary vitrectomy (performed 2 weeks later). At the end of the first surgery, the posterior vitreous was left in situ to allow for healing of the posterior wound. At two weeks, a secondary vitrectomy was performed - a partial posterior vitreous detachment and less-inflamed eye allowed for a much safer surgery. The posterior wound has healed by secondary intention and was surrounded by endolaser. The eye was left fluid-filled. At 9 months follow-up, after contact lens adaptation to correct the aphakic status, the eye was comfortable, and the visual acuity was 6/6.

Conclusions: In cases of a perforating eye injury with a very posterior exit wound, a two-step approach – i.e., an initial primary open globe repair and removal of foreign body only (leaving the posterior wound to heal by secondary intention), followed by a full vitrectomy 10-14 days after is likely to be a safer and sensible approach.

Abstract No.: 204827

Hyaloid Dissection in Macula on Combined Retinal Detachment

First Author: Saarang **HANSRAJ**

Purpose: To demonstrate the successful management of a case of combined retinal detachment.

Methods: A 55-year-old lady presented with blurred vision in her right eye. Her BCVA was 6/24 (20/80) in the right eye and 6/18 (20/60) in her left eye. She had proliferative diabetic retinopathy in both eyes, along with a combined retinal detachment in her right eye. She received intravitreal bevacizumab, and was then taken up for surgery after 5 days. This included an encircling 240 belt buckle along with pars plane

vitrectomy, bimanual membrane peeling, endorser and 1000 centi stoke silicone oil injection. The left eye underwent pan retinal photocoagulation.

Results: Patient had a good outcome, with a BCVA of 6/24 1 month after surgery. She then underwent phacoemulsification with intraocular lens implantation and silicone oil removal a month later, with a BCVA of 6/18 after surgery. The left eye was well lasered, and stable. Her diabetes was maintained with medical therapy.

Conclusions: Macula on combined retinal detachment despite being a challenging surgical scenario can be tackled well when surgery is planned early and performed meticulously. Use of pre operative anti VEGF, encircling belt and bimanual posterior hyaloid removal can be crucial in certain scenarios.

Abstract No.: 207384

ILM Flap-Assisted Repair of Iatrogenic Foveal Dehiscence With Subfoveal PFCL Migration During Diabetic TRD Surgery: A Targeted Approach for Anatomical Rescue and Visual Recovery

First Author: Abhimanyu **SHARMA**

Co-Author(s): Awaneesh **UPADHYAY**

Purpose: To report the successful anatomical and functional outcome of an ILM flap technique for iatrogenic foveal dehiscence with subfoveal PFCL during surgery for diabetic tractional retinal detachment (TRD)

Methods: A 52-year-old male with parafoveal TRD underwent 25G pars plana vitrectomy. After nasal FVP removal, the temporal membranes were approached unimanually. Due to dense adherence and macular traction, PFCL was injected to stabilize the posterior pole. However, a sudden jet—likely from a corked syringe—caused unintended subretinal PFCL migration via foveal dehiscence. Controlled PFCL injection was resumed to maintain retinal stability. Temporal FVP was then dissected using max-grip forceps and trimmed with the cutter. To evacuate the subfoveal PFCL bubble, multiple temporal macular retinotomies were created under PFCL. Direct aspiration was performed, allowing targeted evacuation of the high-surface-tension PFCL bubble. ILM peeling was done and placed over the fovea as a scaffold over the foveal defect. Endolaser photocoagulation was applied, and silicone oil was used as endotamponade.

Results: Postoperative imaging confirmed complete retinal reattachment with no residual subretinal PFCL. OCT showed a hyperreflective ILM flap sealing the foveal defect. Pre-retinal hemorrhage resolved, and the flap remained stable. At 2-month follow-up, BCVA improved to 6/24 under oil.

Conclusions: Iatrogenic foveal dehiscence during fibrovascular proliferation dissection can result in subfoveal PFCL entrapment, posing a significant

surgical challenge. Macular retinotomies enable targeted evacuation of high-surface-tension PFCL bubbles. ILM flap provides a stable scaffold for foveal defect closure, along with silicon oil facilitates both anatomical reattachment & functional visual recovery Presentation Preference

Abstract No.: 207345

Into the Crimson Depths: The Red Sea Scrolls

First Author: Nishant Vijay **RADKE**

Purpose: To showcase a surgical management of massive subretinal haemorrhage in a one-eyed patient.

Methods: Surgery involved a combined phaco-vitrectomy. 25 G pars plana Vitrectomy ports were made. After cataract removal and successful vitrectomy massive subretinal haemorrhage was found to be bullous and shifting in nature. A transcleral approach was utilised to remove as much subretinal blood as possible. Accidental iatrogenic break facilitated endodrainage of the blood, which was washed to the best extent possible with repeated agitation. Pooling of sub-retinal haemorrhage was noted intra-operatively in one location, and after making a retinotomy, an attempt was made to remove it. It turned out to be a big clot which needed bimanual evacuation and removal through an extended 2-3 mm sclerotomy. IOL was implanted successfully in the bag, and Silicone oil was injected, and it was later removed.

Results: Patient improved from PL PR inaccurate vision to 0.1 on the Decimal visual acuity scale with a reasonable field of vision, although some central scotomata persist.

Conclusions: Subretinal drainage of haemorrhage can be challenging, and there can be more than one way to deal with it. Although the method is invasive in carefully selected cases, it may still yield beneficial outcomes.

Abstract No.: 202182

Intraocular Foreign Body Removal via Combined Anterior and Posterior Continuous Curvilinear Capsulorhexis With Primary Intraocular Lens Implantation

First Author: Yuedong **HU**

Co-Author(s): Siyu **WANG**, Rui **HUA**

Purpose: In the management of traumatic cataracts with intraocular foreign bodies, minimizing surgical intervention to achieve better postoperative recovery remains a goal. We share a surgical approach involving the removal of IOFB through anterior and posterior continuous curvilinear capsulorhexis combined with IOL implantation.

Methods: A 35-year-old male presented to hospital with left eye trauma from metal fragment 1 hour earlier. His BCVA was 20/40. Slit-lamp examination

revealed a self-sealed corneal wound, with a perforating iris injury between 3 and 4 o'clock. Dilated examination showed capsular tear, and posterior subcapsular opacification. Ultrasonography indicated vitreous hemorrhage, and CT confirmed intraocular metallic foreign body. During surgery, we first performed phacoemulsification through the central continuous curvilinear capsulorhexis (CCCC). Using the posterior capsular tear as a starting point, we completed a posterior continuous curvilinear capsulorhexis (PCCC). Following vitrectomy, the metallic foreign body was extracted through the clear corneal incision and the CCC channels using an intraocular magnetic probe. Subsequently, an IOL was implanted, and the surgery was concluded after endophotocoagulation and fluid-air exchange.

Results: One week postoperatively, the patient's BCVA improved to 20/20. Anterior segment OCT and other examinations showed stable IOL positioning and intraocular conditions, and no postoperative complications were observed till the last follow-up.

Conclusions: This video highlights a «3C» surgical technique (Clear corneal incision, CCCC, and PCCC) for managing traumatic cataracts with intraocular foreign bodies. This approach minimizes surgical trauma and enables rapid vision recovery, which offers a new treatment strategy for similar cases.

Abstract No.: 202069

Intraoperative Suprachoroidal Hemorrhage During SFIOL (Yamane Technique): What Went Wrong and How We Managed It

First Author: Stefanie

Co-Author(s): Clarissa LISTER, Cindy Prajna METTA, Sindy Boru SEMBIRING, Givenchy Angela WINARJO

Purpose: To report a challenging case of intraoperative suprachoroidal hemorrhage (SCH) during Yamane SFIOL technique scleral-fixated intraocular lens (SFIOL) implantation and to demonstrate a systematic surgical drainage approach.

Methods: A 69-year-old male with a history of complicated cataract surgery and dropped nucleus underwent pars plana vitrectomy with Yamane SFIOL implantation. Massive intraoperative SCH developed during the final haptic manipulation, with complete loss of fundus reflex. Two weeks later, the patient presented with severe ocular pain, intraocular pressure of 38 mmHg, and B-scan evidence of kissing choroidals. Stepwise surgical drainage was performed: (1) transconjunctival trocar-guided drainage, (2) focal peritomy with radial sclerotomy extension, and (3) blunt cannula-assisted aspiration across multiple quadrants.

Results: Intraoperative SCH remains one of the most feared complications in complex anterior and posterior segment surgery. Early recognition and

timely surgical drainage are critical when conservative management fails. A structured, escalating approach allows controlled decompression, rapid pain relief, and anatomical resolution. Nonetheless, functional recovery may be constrained by irreversible complications such as submacular fibrosis, highlighting the gap between anatomic success and visual outcome.

Conclusions: Systematic drainage provides an effective strategy for managing intraoperative SCH, achieving pain relief.

Abstract No.: 201562

Intraretinal Arterial Cannulation for Central Retinal Artery Occlusion Caused by Cosmetic Facial Injection

First Author: Haibo LI

Co-Author(s): Xiaoxin LI

Purpose: To report a novel surgical intervention for central retinal artery occlusion (CRAO) secondary to iatrogenic embolism following cosmetic facial injection, and to evaluate its efficacy in restoring retinal perfusion and visual function.

Methods: A 26-year-old female presented with acute vision loss (HM) in the right eye two hours after allogeneic adipose-derived stromal cell injection into the right temporal region. Fundus examination and OCT confirmed CRAO with macular edema. Emergency 25-gauge vitrectomy with intra-retinal arterial cannulation was performed using a 48-gauge microneedle to access the central retinal artery. Balanced salt solution was infused under motorized pressure to dislodge the embolus into the distal branches.

Results: Postoperative fundus photography at 12 hours showed restored perfusion in the fovea centralis. At one-month follow-up, best-corrected visual acuity improved to 20/40. OCT revealed resolution of macular edema but atrophy of the inner nuclear layer in the fovea.

Conclusions: Intra-retinal arterial cannulation is a feasible and effective emergency intervention for iatrogenic CRAO following facial filler injection. It can rapidly restore retinal blood flow and improve visual outcomes, though some structural damage may persist.

Abstract No.: 202058

Lens-Sparing Pars Plana Vitrectomy for Retinal Detachment in Marfan Syndrome with Lens Subluxation

First Author: Sujin HOSHI

Co-Author(s): Shohei MORIKAWA, Yoshifumi OKAMOTO, Tetsuro OSHIKA

Purpose: To present a case of rhegmatogenous retinal detachment in a patient with Marfan syndrome and

lens subluxation, successfully managed with lens-sparing pars plana vitrectomy (PPV).

Methods: A 42-year-old woman with Marfan syndrome had a history of high myopia in both eyes and lens subluxation in the left eye. Her best-corrected visual acuity (BCVA) remained relatively good at 20/30 (LogMAR 0.15) with a refraction of spherical -19.0 D. During follow-up, she developed floaters in the left eye. Fundus examination revealed lattice degeneration with an atrophic retinal hole at 11 o'clock and a bullous retinal detachment extending from 10 to 2 o'clock, without macular involvement. A 25-gauge three-port lens-sparing PPV was performed. Vitreous shaving was minimized around the retinal hole and lattice degeneration. Subretinal fluid was drained, fluid-air exchange was performed, and endolaser photocoagulation was applied around the retinal break.

Results: On the first postoperative day, the crystalline lens was markedly displaced anteriorly due to intraocular air tamponade, resulting in a shallow anterior chamber. As the air resorbed, the anterior chamber deepened, and the degree of lens subluxation returned to the preoperative state. Over a follow-up period of more than one year, no recurrence of retinal detachment was observed, and the corrected visual acuity remained unchanged from baseline.

Conclusions: Lens-sparing PPV can be a viable surgical option for retinal detachment associated with Marfan syndrome, high myopia, and lens subluxation, avoiding the need for lensectomy in selected cases.

Abstract No.: 206824

Management Challenges Following Expulsive Supra-Choroidal Hemorrhage During Cataract Surgery in a One-Eyed Patient

First Author: Devesh KUMAWAT

Co-Author(s): Ritweez SAHU, Pradeep VENKATESH

Purpose: Expulsive suprachoroidal hemorrhage (SCH) is a rare but severe complication of intraocular surgery, particularly in high-risk eyes. We describe the clinical course and surgical management of an expulsive supra-choroidal hemorrhage (SCH) in a monocular patient with post-traumatic sub-luxated cataract, highlighting the role of staged drainage and systemic stabilisation.

Methods: A 48-year-old male with a blind left eye due to glaucoma presented with a 9-clock hour subluxated cataract in the right eye following closed globe trauma. Visual acuity was finger counting close to the ace. Cataract surgery was initiated but required wound extension for lens extraction, during which an expulsive SCH occurred. The main port was sutured, and medical therapy was initiated. Visual acuity decreased to the perception of light with inaccurate projection of light. Due to kissing choroidals the next day, partial drainage was attempted under local anesthesia via a 23G non-

valved trocar. Secondary hemorrhage occurred a day later, and a repeat attempt was delayed due to an intraoperative hypertensive crisis (BP 220/120 mmHg). After stabilisation, a second drainage under intravenous sedation could be performed successfully.

Results: SCH could be drained near completely during the second drainage. Residual SCH and vitreous hemorrhage resolved gradually over time. IOP stabilised gradually to 18 mmHg at the last follow-up at 3 months without medications, and the retina remained attached. Final visual acuity improved to 20/60 with aphakic glasses correction.

Conclusions: Staged drainage, systemic optimisation, and careful surgical technique were effective in managing expulsive SCH and preserving vision in this high-risk one-eye patient.

Abstract No.: 201110

Managing a Globe Perforation During Period Bulbar Block

First Author: Shah Md Rajibul ISLAM

Purpose: To showcase the difficulties and methods to manage an iatrogenic globe perforation.

Methods: Phaco with PCIOL was done, followed by PPV + EL + F/A EX + SOI.

Results: Successfully managed a case of iatrogenic globe perforation.

Conclusions: It is extremely important to inject peribulbar blocks carefully to avoid globe perforation.

Abstract No.: 204752

Ocular Invasion

First Author: Diva MISRA

Purpose: To present a surgical case demonstrating the successful management of submacular cysticercosis using pars plana vitrectomy, with emphasis on intact cyst removal and simultaneous macular hole repair.

Methods: This video presents a case of submacular cysticercosis in a 25-year-old man, managed successfully with 25 G vitrectomy. The condition involves the subretinal presence of cysts caused by the larval stage of the tapeworm *Taenia solium*. The video highlights the importance of precision and caution in the removal of the intact cyst, without any significant collateral damage to the surrounding tissue. The video also demonstrates the management of a coexisting macular hole.

Results: The intact cyst was removed successfully without rupture or significant injury to the surrounding retinal tissue. The coexisting macular hole was managed intraoperatively. The patient demonstrated favorable anatomical outcomes postoperatively.

Conclusions: Vitrectomy offers a safe and effective approach for the removal of submacular cysticercosis, provided meticulous surgical technique is employed. The case highlights the importance of precision in cyst extraction and demonstrates that concurrent pathologies, such as macular holes, can be addressed successfully in the same surgical setting.

Abstract No.: 201491

Ocular Oddities: The Art of Extracting the Unexpected

First Author: Ashish MARKAN

Co-Author(s): Manasi TRIPATHI

Purpose: To present a unique series of pars plana vitrectomy (PPV) cases involving the retrieval of rare and unexpected intraocular foreign bodies (IOFBs) from the posterior segment.

Methods: A surgical video compilation of six challenging cases was analyzed. The scenarios included: removal of a phacofragmentation tip dislodged during phacofrag for a dropped nucleus; extraction of a large sewing needle from the vitreous cavity; retrieval of a posteriorly dislocated DSAEK graft; removal of a broken DDMS forceps tip during retinal detachment repair; extraction of a dislodged green silicone tip from a 25G soft-tip cannula post-BBG injection; and retrieval of a fractured max-grip forceps tip during SFIOL fixation.

Results: Each case demonstrated distinct technical challenges requiring adaptability and precision in vitreoretinal surgery. Successful retrieval of the IOFBs was achieved in all scenarios with preservation of intraocular integrity. The cases highlight the importance of individualized surgical strategies and the use of appropriate instrumentation.

Conclusions: Unexpected IOFBs during vitreoretinal surgery present unique challenges that demand surgical expertise, careful intraoperative decision-making, and tailored use of instrumentation. This video underscores the complexity of such cases and emphasizes the critical role of adaptability in ensuring safe and effective outcomes.

Abstract No.: 203205

One-Piece Amniotic Membrane Epiretinal Patch for Recurrent Retinal Detachment With Proliferative Vitreoretinopathy and Large Posterior Retinectomy

First Author: Chun-ju LIN

Purpose: Amniotic membrane (AM) is a popular treatment for external ocular diseases. One case of intravitreal epiretinal human AM transplantation as an adjunct treatment for complicated retinal detachment (RD) and proliferative vitreoretinopathy (PVR) was reviewed.

Methods: A 33-year-old male was a case of traumatic retinal dialysis with RD. Microincisional vitrectomy surgery (MIVS), macular ILM peeling, and silicon oil tamponade were performed. However, recurrent RD with inferior PVR was noted. MIVS, an inferior 160-degree retinectomy, encircling the Gore-Tex buckle, and silicon oil tamponade were done. Unfortunately, recurrent RD with an inferior fixed-fold PVR complicated retinal detachment developed. An implanted one-piece epiretinal AM during MIVS was presented.

Results: Despite the severity of RD and PVR, retinal reattachment and a stable clinical outcome were obtained in this case.

Conclusions: Epiretinal AM was a viable adjuvant with potential benefits for treatment of complicated RD and PVR. No sign of rejection reactions or toxicity was detected. Further studies are needed to evaluate this potential.

Abstract No.: 204796

PFCL Assisted PVD Induction in Bullous Retinal Detachment With GRT

First Author: Rama Kumar G V N

Purpose: To demonstrate the method of inducing PVD with the help of PFCL during a surgery done for rhegmatogenous retinal detachment associated with giant retinal tear (GRT).

Methods: In eyes with retinal detachment associated with giant retinal tear, PVD is usually present. There are certain cases of pathological myopia in which GRT occurs without preexisting PVD. When VR surgery is done in those eyes, it is very difficult to induce PVD with the bullous detachment and highly mobile retina, and the retina keeps coming into the cutter or any other instrument used for PVD induction. In GRT cases, PFCL is used to flatten the retina if there is pre-existing PVD or after PVD induction. In this video, PFCL was used as an additional instrument to stabilize the posterior pole, and PVD could be successfully induced with the cutter in aspiration mode, starting carefully at the edge of the PFCL bubble and moving posteriorly towards the disc. The PFCL bubble helped in preventing the mobile retina from entering the cutter port.

Results: PVD could be induced without much collateral damage with the help of PFCL. After successful PVD induction, the remaining surgery could be completed uneventfully.

Conclusions: This video gives a previously undescribed new method of successfully inducing PVD in a case of RD with GRT with the help of PFCL.

Abstract No.: 202638

PFCL-Assisted ILM Peeling in a Traumatic Large Macular Hole

First Author: Chitaranjan MISHRA

Co-Author(s): Monalisa PATI, Somy PUROHIT, Shiva Prasad SAHOO

Purpose: To report the surgical outcomes of a large traumatic macular hole that was successfully managed with PFCL-assisted, BBG-stained, inverted ILM peeling and grafting.

Methods: A 13-year-old male with a history of cricket ball injury OD 6 months ago presented with a large MH (diameter 1020 microns) with traumatic retinal degeneration of the posterior pole. The vision was 6/36 OD. He was advised and underwent PPV+PVD induction, PFCL-assisted BBG staining, and inverse peeling of the ILM and grafting of the ILM in the MH. Postoperatively, the ILM graft was in situ, the MH closed, and the vision improved to 6/24 at 1 week and 6/18 at 3 months.

Results: Postoperatively, the ILM graft was in situ, the MH closed, and the vision improved to 6/24 at 1 week and 6/18 at 3 months. OCT documentation of the closure of the MH was done.

Conclusions: PFCL-assisted inverted ILM peeling and grafting is a useful surgical treatment modality in the management of a traumatic large MH. PFCL acts as the surgeon's third hand and prevents the dislodgement of the ILM graft. ILM graft acts as a scaffold and hence helps in the regeneration of the retinal layers, thus anatomical hole closure and visual improvement.

Abstract No.: 202290

PFCL-Assisted Membrane Dissection in Diabetic Vitrectomy

First Author: Bhuvan CHANANA

Purpose: To describe the use of perfluorocarbon liquids (PFCL) in different situations during diabetic vitrectomy.

Methods: Video clips demonstrating the role of PFCL in difficult situations during diabetic vitrectomy will be shown. The videos will highlight when to use PFCL to have a successful surgical outcome.

Results: PFCL was shown to be extremely helpful in certain situations. PFCL acts as a third hand, tamponading and pushing the retina behind. PFCL, if injected in the proper plane, can even help to perform membrane dissection and en bloc removal of taut adherent membranes. Lastly, PFCL also pressure tamponades the bleeders and provides a clear media for further surgery and pan-retinal photocoagulation.

Conclusions: PFCL works as magic in certain tricky situations, like pressure tamponade of uncontrolled bleeders and en bloc removal of membranes. If used

judiciously, PFCL can be an extremely helpful tool in diabetic vitrectomy.

Abstract No.: 203520

Pars Plana Vitrectomy With Scleral Buckling in Closed-Funnel Rhegmatogenous Retinal Detachment

First Author: Maria Christine DY

Co-Author(s): Ronaldo JARIN

Purpose: To report a case of closed-funnel rhegmatogenous retinal detachment (RRD) managed with combined pars plana vitrectomy (PPV) and scleral buckling (SB).

Methods: A 65-year-old Filipino male came in for blurred vision on the right. He was diagnosed by a private ophthalmologist with pseudophakic RRD with a full-thickness macular hole (MH), but the patient only sought consultation at our center five months later due to financial constraints. Vision was hand movement with normal intraocular pressure. A single-piece posterior chamber intraocular lens was noted while the fellow eye was relatively normal. The posterior view was limited, but ultrasonography revealed a closed-funnel RD.

Results: With careful preoperative planning, the patient underwent combined PPV with SB. Silicone band 42 was utilized with standard three-port gauge 23 trocar insertion. Methotrexate (MTX) 400ug/0.1mL was also infused during PPV. Extensive membrane peeling was performed using retinal forceps, and complete peripheral vitrectomy was done with perfluorocarbon assistance. The retina gradually flattened with repeated peeling and interval fluid aspiration over the primary retinal break. 360 endolaser cerclage was done with 5000 centistokes of silicone oil injected. One month post-operation, vision was stable at 20/200 with a single dose of intravitreal MTX augmentation injected at week two.

Conclusions: Complex RRD cases constitute multiple surgical challenges, including PVR, MH, and redetachment. An individualized stepladder approach should ideally be followed with adequate planning and patient chair time. MTX has also proven to be a safe and effective adjunct in preventing PVR recurrence and retinal redetachment with favorable anatomical and functional outcomes.

Abstract No.: 206870

Pars Plana Vitrectomy and Scleral Fixation of a Dropped Intraocular Lens via Yamane Technique

First Author: Anna Victoria SAN PEDRO

Co-Author(s): Edmin SANTOS

Purpose: This video demonstrates a combined approach using pars plana vitrectomy and the Yamane

technique to retrieve and reposition a dropped three-piece intraocular lens (IOL). It highlights that in selected cases, the original IOL can be anteriorized and reused, eliminating the need for lens exchange.

Methods: A 74-year-old male with a history of cataract surgery 40 years prior presented with a dislocated IOL in the vitreous cavity. A three-port 23-gauge pars plana vitrectomy was performed, followed by core and peripheral vitrectomy. Perfluorocarbon liquid was injected to protect the macula. The haptics were sequentially anteriorized after releasing the incarcerated haptic from the pars plana. The Yamane technique was then performed after successful anteriorization of the lens.

Results: Post-operatively, the IOL was well-centered with no tilt. Visual acuity improved to 20/55 after the resolution of corneal edema. No intraoperative or postoperative complications were noted.

Conclusions: The Yamane technique, when combined with pars plana vitrectomy, offers a reliable method for repositioning dropped IOLs. An existing three-piece IOL can be safely reused and fixated without the need for lens exchange, achieving stable anatomical and visual outcomes.

Abstract No.: 202016

Plucking the Black Mushroom by Its Roots: Endoresection of a Choroidal Melanoma

First Author: Mohit **DOGRA**

Purpose: Choroidal melanoma (CM) is the commonest primary intraocular malignancy in adults. Management includes plaque brachytherapy (Ru-106, I-125), proton beam therapy (PBT), transpupillary thermotherapy, and enucleation. Rarely, transscleral resection (for broad-based anterior tumors) and vitrectomy with endoresection (for high posterior tumors) are indicated.

Methods: Non-availability of PBT and I-125 plaques in our country makes management of posterior CMs with height >8mm extremely challenging. We show 2 cases of CM with height >8mm who were successfully managed with 3-port 25G pars plana vitrectomy, posterior hyaloid removal, endoresection of the tumor, followed by endolaser/cryotherapy and silicone oil tamponade.

Results: Preoperative planning, anaesthesia, and crucial intraoperative steps of the procedure are highlighted in this video.

Conclusions: Primary endoresection may be an option for select patients with high posterior choroidal melanomas.

Abstract No.: 207351

Pneumatic Retinopexy – the Less Traumatic Journey

First Author: Hong Nien **LEE**

Purpose: To demonstrate a less traumatic method of performing pneumatic retinopexy.

Methods: Intravitreal gas is performed on a patient with a single tear within 8-4 clock hours. After gas is injected, the patient is advised to perform the steam-rolling maneuver in a face-down position for at least 3-4 hours. Subsequently, he is advised to come to our clinic on the following day, or get admitted if logistically not possible. Laser retinopexy is performed and re-examined in the next one or two days. A top-up laser is performed if the laser mark is inadequate.

Results: The method appears more acceptable than the conventional technique performed with cryotherapy.

Conclusions: A step-wise pneumatic retinopexy appears to be easily accepted by patients, yet effective.

Abstract No.: 203707

Posterior Pole Remodeling in MTM: A Combined Approach Using Scleral Imbrication and PPV

First Author: Priyanka **PATEL**

Co-Author(s): Prabhu **SHANKAR**

Purpose: To evaluate the anatomical and functional outcomes of combining scleral imbrication (SI) with pars plana vitrectomy (PPV) and gas tamponade as a primary surgical approach for myopic traction maculopathy (MTM).

Methods: This video presents a patient with MTM associated with high myopia who underwent primary surgery combining scleral imbrication, PPV, and intraocular gas tamponade. The surgical technique involves the removal of the vitreous with posterior hyaloid detachment, followed by the placement of posteriorly located scleral imbrication sutures to reduce axial length and modify the posterior curvature. SF6 gas was used as a tamponade. Pre- and postoperative outcomes, including best-corrected visual acuity (BCVA) and spectral-domain OCT imaging, were analyzed over a 6-month follow-up period.

Results: The operated eye demonstrated resolution of macular detachment on OCT. Mean axial length was reduced postoperatively. BCVA improved, with no major intraoperative or postoperative complications. The posterior pole showed reconfiguration with improved foveal contour.

Conclusions: Scleral imbrication combined with PPV and gas tamponade appears to be a safe and effective primary surgical strategy for MTM in highly myopic eyes. This approach addresses both vitreoretinal

traction and posterior staphyloma, facilitating anatomical restoration and functional recovery.

Abstract No.: 206910

RRR: Reduce, Reuse, Refix! Minimally Invasive Scleral Fixation of a Dislocated IOL

First Author: Manoharan SHUNMUGAM

Purpose: To describe a novel approach for scleral fixation of a dislocated intraocular lens (IOL) that emphasises minimal intervention by reusing the original lens and tips for overcoming difficulties.

Methods: A patient with a posteriorly dislocated IOL underwent pars plana vitrectomy followed by scleral fixation. Instead of exchanging the lens, the existing IOL was stabilised using a transconjunctival double-needle technique. Only two paracenteses were performed in addition to standard vitrectomy ports. This reduced the need for larger corneal incisions and excessive intraocular manoeuvres. Surgical video documentation was captured to illustrate each step

Results: The IOL was successfully fixated with excellent centration and stability. The minimally invasive strategy shortened surgical time, preserved corneal integrity, and minimised postoperative astigmatism. No perioperative complications occurred. At early postoperative review, the patient demonstrated improved visual acuity with a well-centred IOL and quiet anterior chamber.

Conclusions: This case highlights the advantages of a "Reduce, Reuse, Refix" approach for managing dislocated IOLs. By reducing unnecessary incisions, reusing the patient's own lens, and applying an appropriate fixation technique, patients can achieve visual rehabilitation with less surgical manipulation. This method represents a safe, efficient, and sustainable alternative to traditional IOL exchange in selected cases.

Abstract No.: 206120

Rescue Strategy for Macular Hole in Diabetic TRD: A Combined ILM Scaffold and Amniotic Membrane Plug Approach

First Author: Awaneesh UPADHYAY

Co-Author(s): Deependra SINGH, Zakia ANWER, Tejasvini CHANDRA

Purpose: To demonstrate a surgical rescue technique for full-thickness macular holes (FTMH) encountered during pars plana vitrectomy (PPV) for tractional retinal detachment (TRD) secondary to proliferative diabetic retinopathy (PDR), using a combination of internal limiting membrane (ILM) scaffold and amniotic membrane graft (AMG).

Methods: A 58-year-old male with PDR presented with TRD involving the macula and a coexisting FTMH with vision of counting fingers @1metre. Standard

25G PPV with meticulous membrane dissection was performed along with subretinal fluid aspiration through the macular hole. An ILM flap was fashioned and positioned over the hole as a scaffold under perfluorocarbon liquid (PFCL). However, during fluid-air exchange, the ILM scaffold was inadvertently aspirated. Pan-retinal photocoagulation (PRP) and silicone oil tamponade were done. As a salvage strategy, a trimmed AMG was gently inserted over the disc and manoeuvred over the macular hole under silicon oil.

Results: Postoperative OCT at 1 week confirmed type 1 closure of the macular hole with good anatomical contour and complete retinal reattachment. The AMG remained stable without signs of displacement or inflammation. Visual acuity improved to 6/60. No intra-operative or postoperative complications were noted

Conclusions: Macular holes in the setting of diabetic tractional retinal detachment are uncommon and pose significant surgical challenges. While the use of an internal limiting membrane (ILM) flap under perfluorocarbon liquid (PFCL) offers a stable scaffold for hole closure, intraoperative loss of the flap can compromise outcomes. In such situations, an amniotic membrane graft (AMG) serves as an effective rescue strategy, providing predictable outcomes.

Abstract No.: 206433

Retinal Mavericks: Stories of Intraocular Gymnastics

First Author: Srinivas JOSHI

Co-Author(s): Apoorva AYACHIT, Guruprasad AYACHIT, Giriraj VIBHUTE

Purpose: To demonstrate a few challenging cases of closed globe internal refixation of dislocated/ subluxated IOLs & Intraocular foreign bodies.

Methods: We present the unique minimally techniques for refixation of dangling/dislocated intraocular lenses without need for explantation. One case represents successful tackling of a challenging scenario involving large corneal tear, large irregularly shaped IOFB and retinal detachment.

Results: The various techniques described achieved refixation of dislocated/ subluxated IOLs. In case with IOFB, inspite of corneal sutures, the IOFB was removed, retina could be reattached and even ILM peeling was possible.

Conclusions: The techniques of closed globe internal refixation provide minimally invasive, safe and effective solution for selected cases of dislocated/ subluxated IOLs. And with modern technology and techniques even cases which were earlier thought to be inoperable, can be given a try.

Abstract No.: 200764**Salvaging Vision in a Monocular Ultra-High Myopic Elderly: Modified Yamane Scleral Fixation Using 1ml Syringe Needle Under 4mm Pupil Constraint***First Author: Huang YUJUAN*

Purpose: To rescue the only functional vision in a monocular, ultra-highly myopic elderly patient by safely repositioning a dislocated intraocular lens (IOL) from the vitreous cavity and achieving stable refractive rehabilitation under extreme surgical constraints (pupil dilation $\leq 4\text{mm}$).

Methods: (1) Minimally invasive vitrectomy via standard 3-port pars plana approach to access and extract the dropped IOL. (2) Iris retractors to overcome a 4mm pupillary constraint during IOL retrieval from the vitreous, avoiding retinal disturbance. (3) Modified Yamane technique: Created scleral tunnels using 30G 1ml syringe needles (nasal/temporal). Guided IOL haptics through tunnels via intraocular forceps with syringe-needle assistance for precision. Achieved intrascleral haptic fixation with posterior chamber IOL stabilization. 4. Confirmed IOL centration, haptic burial, and retinal integrity before closure.

Results: Pre-op: Light perception only (IOL drop + poor dilation). Post-op: Day 1: UCVA 0.5/1 & 6 months: UCVA stabilized at 0.8, IOL well-centered with buried haptics (AS-OCT confirmed). Zero complications: No endophthalmitis, retinal detachment, IOL redislocation, or abnormal IOP over 6-month follow-up.

Conclusions: This modified Yamane technique using 1ml syringe needles successfully addresses complex IOL dislocation in high-risk scenarios (monocular, ultra-high myopia, poor dilation). It enables micro-incision, precise haptic externalization, and stable scleral fixation without costly tools. The approach is a safe, resource-efficient paradigm for vitreoretinal surgeons managing critical cases.

Abstract No.: 207112**Saving the EYE- Combined Vitrectomy and Choroidal Drainage in Traumatic Retinal Detachment and Choroidal Detachment***First Author: Nehha Bs PANDEY (DR NEHA BAJPAYEE)*

Purpose: To present the case of 58 a 58-year-old gentleman who had a history of trauma 3 months back, post which the patient developed Retinal detachment and subsequently choroidal detachment, and his IOP at the time of presentation was 5 mmHg. Such cases require meticulous planning and draining CD before starting vitrectomy through 23 G ports, followed by vitrectomy and Silicone oil tamponade, which saved the patient's eye.

Methods: In cases of trauma with hypotony, it is very important to inspect the sclera for any perforation,

after a 360-degree peritomy and scleral inspection AC maintainer was used to see if the globe is forming, and then Choroidal detachment and serous fluid were drained through 23 G port, and vitrectomy was continued, and silicone oil tamponade was used at the end.

Results: Post op day 1, the patient had vision of CF at 2 m with 12mm of Hg IOP, settled RD and CD. Post op 1 month, vision improved to 6/60 (Snellen) under oil.

Conclusions: In eyes with combined RD and CD with hypotony, it is very important to inspect scleral perforation, and meticulous planning with drainage of choroidal fluid helps to settle CD and helps the surgeon to go ahead with vitrectomy confidently. Drainage of choroidal fluid becomes challenging in a hypotonous eye, forming globe before drainage is very important.

Abstract No.: 206884**Scleral Buckling and External Drainage With Chandelier-Assisted Visualization for Rhegmatogenous Retinal Detachment***First Author: Anna Victoria SAN PEDRO**Co-Author(s): Junn PAJARILLO*

Purpose: To demonstrate a detailed surgical approach to scleral buckling with external drainage using chandelier-assisted visualization in the management of rhegmatogenous retinal detachment (RRD) in a young adult patient.

Methods: This video presents a case of a 21-year-old male with rhegmatogenous retinal detachment. A standard scleral buckling procedure was performed using a 240 encircling band and a 277 segmental buckle. Buckle elements were adjusted and secured with partial-thickness scleral bites using 5-0 braided polyester sutures. Chandelier-assisted wide-angle visualization was employed intraoperatively to localize retinal breaks and assess the extent of retinal detachment. After securing the buckle components, a radial scleral cutdown was performed in the inferotemporal quadrant. Following light cauterization, the choroid was punctured with a needle to allow controlled external drainage of subretinal fluid. Balanced salt solution was injected intravitreally to maintain intraocular pressure and restore globe tension. Final inspection confirmed that the retinal breaks were adequately supported by the segmental indentation and encircling band.

Results: The retinal breaks were well-supported by the buckle and segmental indentation. Drainage was successfully achieved without complications such as retinal incarceration or hypotony. The retina remained attached postoperatively after completion of laser treatment.

Conclusions: Scleral buckling with external drainage remains an effective treatment for RRD. Chandelier-assisted visualization provides better visualization and

eliminates the need to repeatedly don the indirect ophthalmoscope, streamlining workflow. Effective anatomical reattachment can be achieved with proper buckle placement and external drainage.

Abstract No.: 207205

Scleral Fixation in the Shadow: Salvaging a Dropped IOL in the Presence of Choroidal Detachment

First Author: Abhimanyu SHARMA
Co-Author(s): Awaneesh UPADHYAY

Purpose: To demonstrate the management of a case of IOL drop with a co-existing choroidal detachment employing critical decision making and intra-operative adaptability.

Methods: A 58-year-old male presented post-complicated cataract surgery with a dropped 3-piece IOL following an attempted sulcus placement. A 25G pars plana vitrectomy was undertaken. Intra-operatively, the IOL was embedded within dense viscoelastic and triamcinolone at the posterior pole. Careful core vitrectomy and clearance revealed the IOL and a nasal-to-disc choroidal detachment.

Results: Given the altered posterior segment contour, scleral fixation was strategically performed at 6 and 12 o'clock positions to minimise the risk of exacerbating the detachment. The IOL was fixated, followed by peripheral vitrectomy, anterior chamber reformation, and secure closure of scleral pockets and conjunctiva.

Conclusions: This case demonstrates intraoperative adaptability and highlights critical decision-making required during secondary IOL fixation in eyes with coexisting choroidal pathology and limited posterior segment stability

Abstract No.: 201942

Secondary IOL Implantation in a Silicone Oil-Filled Aphakic Eye

First Author: Shah Md Rajibul ISLAM

Purpose: To observe the safety of secondary IOL implantation in a silicone oil-filled aphakic eye.

Methods: The infusion port was placed in the infero-temporal quadrant, 3.5 mm from the limbus. Infusion was not connected. Secondary IOL was implanted by the Yamane technique. 2 Superior ports were made 3.5 mm from the limbus at the supero-nasal & supero-temporal quadrants. SOR done, fluid air exchange done. Wound closed.

Results: The procedure was completed safely.

Conclusions: Secondary IOL implantation is safe and easier in an SO-filled globe. SOR can be done following IOL implantation.

Abstract No.: 206426

Seeing is Believing: Exploring New Possibilities in Vitreoretinal Surgery

First Author: Srinivas JOSHI
Co-Author(s): Apoorva AYACHIT, Guruprasad AYACHIT, Giriraj VIBHUTE

Purpose: To demonstrate the clinical utility of intraoperative fluorescein, digital image filters, and advanced vitrectomy cutters in enhancing surgical visualization and management of complex vitreoretinal conditions.

Methods: A descriptive demonstration of recent innovations in vitreoretinal surgery, focusing on the integration of intraoperative fluorescein dye and angiography, the adoption of digital filters for real-time image enhancement, and the use of next-generation vitreous cutters capable of precise tissue plane access.

Results: The application of intraoperative fluorescein and angiography improved intraoperative understanding of the underlying conditions. Digital filters provided enhanced contrast and virtual "third-eye" perspectives, facilitating meticulous dissection during challenging steps. Advanced cutters allowed for closer, safer tissue segmentation. Combined, these technologies were associated with more efficient surgeries and potential improvements in anatomical and functional outcomes.

Conclusions: Intraoperative use of fluorescein, digital imaging filters, and advanced vitreous cutters collectively improves visualization and precision in vitreoretinal surgery, supporting their adoption to optimize outcomes in complex retinal procedures.

Abstract No.: 202838

Small Pupil, Big Challenges: Managing RRD With Small Pupil

First Author: Arjun AURORA
Co-Author(s): Manisha AGARWAL, Akash CHAUDHARY

Purpose: Small pupil with retinal detachment is a challenging situation. Our video demonstrates two situations of small pupil-a dropped nucleus with a chronic rhegmatogenous retinal detachment (RRD), and second case of a chronic RRD in a young male.

Methods: Although there are a variety of pupil expansion devices available, iris hooks are most reliable in our hands.

Results: First case was a 70-year-old male who suffered blunt trauma a year ago, and presented to us with a non-dilating pupil, dislocated white cataract, and a total RRD on B scan with visual acuity of light perception (PL). We first performed a near total vitrectomy with base shaving, and used phaco-fragmentation for nucleus removal. Retina settled after Fluid air exchange (FAX). 360 endolaser (EL) was done and 1000 Cst silicone oil was injected. Patient improved to Best corrected VA

(BCVA) of 6/60. Our second case is a 30-year-old male, who, after suffering blunt trauma by a ball 2 years ago, presented to us with a chronic RRD after undergoing complicated cataract surgery elsewhere. He had a non-dilating pupil with an ACIOL in-situ. Iris hooks were implanted, and a meticulous vitrectomy was done. Following FAX, break was lasered and 360 EL was done. Patient improved to BCVA of 6/18.

Conclusions: Managing small pupil with RRD, although challenging, gives gratifying results with the right planning and pupil expansion devices. Iris hooks are our device of choice, since they are cheap, easily available, and give good pupil expansion.

Abstract No.: 206588

Surgical Challenges in a Case With Multiple Lesions After Trauma With Pulling Band

First Author: Sundaram **NATARAJAN**
Co-Author(s): Pac Cristina **PATRICIA**

Purpose: This report focuses on a 44-year-old male with total retinal detachment associated with dense subretinal haemorrhage, PVR changes, and scleral tear after trauma with pulling the band while doing exercise.

Methods: After urgent full-thickness scleral tear repair, the integrity of the ocular globe has been obtained by performing a 23 gauge pars plana vitrectomy, lens extraction, membrane peeling, relaxing retinectomy, perfluorocarbon liquid use, endolaser, and silicone oil injection. Challenges faced during the surgery were regarding bleeding control, blood clots stuck to the retina, PVR identification and management, protecting the retinal tissue from further damage, and unfolding the retina with the best macular aspect possible. Postoperative care was focused on the retinal aspect, controlling the inflammation and the intraocular pressure, and maintaining a good corneal transparency.

Results: Retinal reattachment was achieved with preserved macular structure. Intraoperative bleeding and PVR membranes were effectively managed. Postoperative recovery was stable, with clear cornea and controlled intraocular pressure. Visual improvement was limited due to trauma severity, but globe integrity was restored. The patient reported functional vision gain and remains under follow-up for possible silicone oil removal.

Conclusions: This case underlines the complexity of post-traumatic cases that undergo multiple surgeries for a slight improvement of visual acuity and the fact that every little more, little better" really counts. Every step well thought out and guided by precision and firmness uplifts chances for a better reconstruction of the ocular globe and, therefore, more chances for a better vision for the patient.

Abstract No.: 205157

Surgical Management of Large Subretinal Silicone Oil Globule

First Author: Lawrence **IU**

Purpose: Silicone oil is a common tamponade agent used in a vitrectomy operation for the treatment of retinal detachment. Inadvertent retention of silicone oil in the subretinal space after a retinal detachment operation is uncommon. This video presents a case of a large subretinal silicone oil globule occupying the inferior one-half of the retina, which was removed successfully by retinectomy and direct removal.

Methods: The surgical technique to remove subretinal silicone oil involves retinectomy to create access to the subretinal space, direct removal of subretinal silicone oil, followed by heavy liquid (PFCL) injection to flatten the retina, endolaser retinopexy and direct PFCL-silicone oil exchange to maintain retinal attachment.

Results: A 68-year-old male patient had a large subretinal silicone oil globule involving the inferior one-half of the retina after a vitrectomy operation for chronic total rhegmatogenous retinal detachment. The described technique successfully removed the large subretinal silicone oil globule. The retina remained attached all along after the operation.

Conclusions: Subretinal silicone oil is an uncommon complication after a vitrectomy operation. High clinical suspicion is necessary. It can be safely and effectively removed by retinectomy and direct removal.

Abstract No.: 207094

Taking On the XLs

First Author: Aziz Jan **BASHIR**

Purpose: Surgical techniques for successful closure of XL macular holes.

Methods: Technique one: Retinal Autograft; Technique two: Multilayered ILM flaps over the Hole.

Results: Successful closure of the holes with both techniques.

Conclusions: Retinal Autograft and Multilayered ILM flaps are useful techniques for successful anatomical closure of XL Full-thickness Macular Holes.

Abstract No.: 204489

The Missing Link – Management of Missing Retinal Tear in Rhegmatogenous Retinal Detachment

First Author: Nurul Ain **RAHIM**
Co-Author(s): Mae-lynn catherine **BASTION**, Jemaima **CHE HAMZAH**, Teck Chee **CHENG**

Purpose: To showcase the drainage retinotomy technique for retinal reattachment when no retinal break is detected.

Methods: Retrospective review of 1 case.

Results: A 65-year-old woman underwent complicated cataract surgery in her right eye. One week later, she developed a superior retinal tear, treated with barricade laser. Three months later, her vision dropped to 6/60 due to an inferior rhegmatogenous retinal detachment. No causative tear was identified pre-operatively. Optical Coherence Tomography (OCT) showed Subretinal Fluid (SRF). She underwent Pars Plana Vitrectomy (PPV) and tamponade. Intraoperatively, no retinal tear was identified. Heavy liquid (HL) was injected to displace subretinal fluid and reveal a tear but failed. It was able to flatten the retina after drainage retinotomy was performed at the inferotemporal retina to drain the subretinal fluid. A 360-degree laser was delivered. Heavy liquid–air exchange was then performed. C3F8 16% was used as a tamponade. Post-op vision improved to 6/18 after 4 months of follow-up with attached retina.

Conclusions: Occult or missed retinal tear in rhegmatogenous retinal detachment is rare and requires a modification of the surgical technique. In this case, a combination of drainage retinotomy, HL usage, and 360-degree laser barricade during PPV led to successful retinal reattachment.

Abstract No.: 206065

The Oil Misplacement Odyssey

First Author: Vidhi BAJPAI

Co-Author(s): Mudit TYAGI

Purpose: To report a rare intraoperative complication of suprachoroidal silicone oil injection and describe its recognition and management.

Methods: A 72-year-old female with acute postoperative endophthalmitis following cataract surgery was planned for pars plana vitrectomy with intravitreal antibiotics. Intraoperatively, a rhegmatogenous retinal detachment was noted. During perfluorocarbon–silicone oil exchange, silicone oil was inadvertently injected into the suprachoroidal space. This video illustrates the sequence of events, recognition of the complication, and the surgical strategy adopted for controlled drainage.

Results: Suprachoroidal oil was drained using 23 gauge non-valved cannula successfully. Initially, the globe was closed under perfluorocarbon, which was replaced with silicone oil one week later. The retina was successfully reattached, and no additional postoperative complications occurred.

Conclusions: Suprachoroidal injection of silicone oil is a rare complication, and this video demonstrates a practical method for its management.

Abstract No.: 201746

Tiny Eye, Timely Intervention: Pars Plana Vitrectomy in Pediatric Endogenous Endophthalmitis

First Author: Francis Ezra LAXAMANA

Co-Author(s): Niccolo VALENCIA

Purpose: To present the surgical management and visual outcome of a rare case of endogenous endophthalmitis in a pediatric patient, highlighting the role of pars plana vitrectomy combined with intravitreal antibiotics and silicone oil tamponade.

Methods: A 5-year-old male presented with redness and foreign body sensation in the right eye. On slit-lamp examination, a central whitish corneal opacity was noted with dense whitish pupillary membranes. Ocular ultrasonography revealed dense vitreous opacities suggestive of vitritis. A diagnosis of endogenous endophthalmitis was made. The patient underwent 23-gauge pars plana vitrectomy and lensectomy with intravitreal injection of vancomycin and ceftazidime, followed by silicone oil tamponade due to intraoperative concerns of retinal ischemia, retinal tears, and persistent inflammation. Multiple techniques were utilized to debulk the inflammation and restore the anatomy of the child's eye.

Results: Postoperative recovery was uneventful. Ocular inflammation subsided, as well as the patient's comfort. The eye remained stable with the silicone oil in situ. Removal of silicone oil and secondary implantation of an intraocular lens is being planned in the future.

Conclusions: Endogenous endophthalmitis in the pediatric population is rare and may present subtly. Early surgical intervention with vitrectomy and appropriate intravitreal antibiotic therapy, combined with silicone oil tamponade in select cases, can lead to favorable anatomical and functional outcomes.

Abstract No.: 206918

Unconventional Laser Application for Subfoveal CNV via a Macular Hole in High Myopia

First Author: Vicente Lorenzo CABAUG

Co-Author(s): Quan HOANG

Purpose: To present a unique case of pathologic myopia with chronic full-thickness macular hole (FTMH) complicated by subfoveal choroidal neovascularization (CNV) and subsequent macular hole retinal detachment (MHRD), managed with vitrectomy and unconventional subfoveal laser through the macular hole.

Methods: A 71-year-old female with high myopia and prior macular hole surgery developed new floaters and flashes. Evaluation revealed chronic FTMH with CNV and MHRD. The patient underwent TPPV with membrane peeling, C3F8 tamponade, and targeted

focal laser applied through the macular hole to address the subfoveal CNV.

Results: The retina was successfully reattached with closure of the macular hole. The CNV showed regression following laser application. Vision stabilized at pre-detachment levels (6/60).

Conclusions: This case demonstrates the feasibility of applying a laser directly through a macular hole to treat subfoveal CNV in the setting of high myopia. Although unconventional, this approach provided effective CNV control while addressing MHRD, underscoring innovative surgical decision-making in complex myopic maculopathy.

Abstract No.: 201419

Unraveling an Unusual Retinal Detachment

First Author: Shishir **VERGHESE**

Co-Author(s): Prithvi **CHANDRAKANTH**

Purpose: To report an unusual case of combined retinal detachment.

Methods: A 75-year-old male presented with hand movements and vision in the right eye. Examination revealed an immature cataract and subtotal retinal detachment with a greyish-white lesion at the inferotemporal arcade. Multimodal imaging and uveitis workup were performed. He underwent pars plana vitrectomy with silicone oil and intraoperative retinectomy; the excised lesion showed chronic inflammation. Postoperatively, a new retinitis lesion developed near the retinotomy site. A diagnosis of retinal detachment secondary to Toxoplasma retinochoroiditis was made, and appropriate therapy was initiated.

Results: Three months later, cataract surgery with silicone oil removal was performed, and vision improved to 6/36.

Conclusions: This video highlights an unusual retinal detachment presenting as a rare complication of toxoplasma retinochoroiditis and its appropriate management. Early detection is the key to good outcomes in these cases

Abstract No.: 205894

Visco-Expression of Hyphema in a Silicone-Oil Filled Aphakic Eye – A Novel Technique

First Author: Rishika **RATHORE**

Co-Author(s): Atul **ARORA**, Yvk **CHAITANYA**, Vishali **GUPTA**, Shilpa **SABU**

Purpose: Hyphema is a vision-threatening complication commonly associated with ocular trauma, intraocular surgery, or neovascularization of the iris (NVI). Classical management includes anterior chamber washout or needle aspiration via limbal paracentesis to restore aqueous outflow. Organized or non-resolving hyphema may require irrigation-aspiration with a Simcoe's

cannula or automated anterior vitrectomy. However, in aphakic silicone oil-filled eyes, surgical intervention is challenging as silicone oil rises into the anterior chamber during maneuvers. We describe a novel, safe, and effective technique of hyphema drainage using viscoelastic in such eyes.

Methods: A 48-year-old Asian Indian male, with a history of pars plana lensectomy and vitrectomy with silicone oil tamponade for combined retinal detachment, developed postoperative hyphema in his only seeing eye (fellow eye lost to neovascular glaucoma). A clear corneal incision was made at 10 o'clock using an MVR blade. Dispersive viscoelastic was used to mechanically separate blood clots from underlying structures. The organized hyphema was then expressed through a second corneal incision at 12 o'clock.

Results: Complete hyphema clearance was achieved, with restoration of a clear visual axis with media grade 1. No intraoperative complications or silicone oil migration were observed.

Conclusions: Visco-expression of hyphema is a safe and effective option for organized hyphema removal in aphakic, silicone oil-filled eyes. It provides a mechanical barrier preventing silicone oil migration and allows controlled clot dissection, minimizing intraoperative risk and preserving visual potential.

Abstract No.: 201220

Vitreous Lavage in Upright Position- an Innovative Topical Air Fluid Exchange (AFE) for Recurrent Vitreous Hemorrhage (VH) Post-Vitrectomy

First Author: Harshal **SAHARE**

Purpose: This novel technique addresses some of the key challenges associated with conventional approaches to managing recurrent VH post-vitrectomy by performing VL in an innovative way.

Methods: The technique involved injecting air with a 30G needle in a 5ml syringe at the 6 O'clock position under topical anaesthesia in the upright position without making any ports. Gradually, air is injected inside the globe and allows the vitreous fluid to come outside simultaneously on the same syringe. Globe pressure is checked throughout the procedure.

Results: Postoperative data show fast resolution of dispersed VH with rapid recovery and best corrected visual acuity of 20/20 within a week without undergoing revision vitrectomy.

Conclusions: This is a brilliant workaround by injecting air in the upright position under topical anaesthesia and simultaneously aspirating dissolved VH fluid from the cavity with rapid post-operative visual recovery without going for revision vitrectomy.

Abstract No.: 207252

Well Begun Is Half Done: Pre-Op tPA/Gas as a Bridge to Vitrectomy in Massive Submacular Hemorrhage

First Author: Sandeep KUMAR

Co-Author(s): Charu GUPTA

Purpose: To describe a novel staged approach for the management of massive submacular hemorrhage, wherein pre-operative intravitreal tissue plasminogen activator (tPA) combined with expansile gas is employed to displace the clot and facilitate clot lysis, followed by pars plana vitrectomy for definitive management. This strategy aims to optimise clot clearance, minimize surgical trauma, and enhance visual outcomes in eyes with an otherwise poor prognosis.

Methods: A staged approach was employed for a case of massive submacular hemorrhage. Pre-operative intravitreal tissue plasminogen activator (tPA) combined with expansile gas was administered to achieve clot displacement and liquefaction. This was followed by pars plana vitrectomy as a planned second step. The rationale was to minimize macular photoreceptor toxicity from prolonged blood contact and to simplify subsequent intraocular surgery.

Results: The initial intravitreal injection led to significant displacement and liquefaction of the submacular clot, thereby facilitating its clearance during vitrectomy. In most cases, spontaneous egress of blood into the vitreous cavity was noted, further shortening surgical time. Where blood remained localized, liquefied subretinal blood could be easily evacuated with minimal manipulation. This sequential strategy improved visualization, reduced intraoperative complexity, and enhanced the likelihood of anatomical and functional recovery.

Conclusions: Pre-operative tPA and gas injection prior to vitrectomy represents a practical and effective method for managing massive submacular hemorrhage.

折叠式球囊 (Foldable Capsular Buckle, FCB) 巩膜外垫压术治疗孔源性视网膜脱离的疗效分析

首席导师: Xiao TAN

目的: 探讨折叠式球囊 (Foldable Capsular Buckle, FCB) 巩膜外垫压术治疗孔源性视网膜脱离 (Rhegmatogenous Retinal Detachment, RRD) 的疗效及优势, 尤其在多发或巨大视网膜裂孔所致复杂性 RRD 中的应用价值。

课程简介: 回顾分析 2024 年 6 月至 2025 年 10 月于深圳爱尔眼科医院接受 FCB 巩膜外加压术治疗的 21 例 (21 只眼) RRD 患者的临床资料。术后随访 1 ~ 12 个月, 观察视网膜复位情况、最佳矫正视力 (BCVA)、眼压变化及并发症。所有患者均接受 SLO、OCT、B 超、视盘直径、人工晶体测量及角膜内皮细胞计数检查。

课程大纲: 21 例患者 (21 只眼), 单个视网膜裂孔 10 例 (其中 4 例裂孔 ≥ 4 PD), 多个视网膜裂孔 11 例 (裂孔 ≥ 2 个、相距 ≥ 1 象限)。所有患者手术顺利完成, 其中 4 例伴上方巨大裂孔或多发裂孔者辅助玻璃体腔注气, 复位率 100%。4 例因特殊情况转行玻璃体切除术 (巩膜囊肿、黄斑孔合并脱离、高端晶体致周边视网膜裂孔判断困难、上方变性区筛孔渗漏)。术后并发症包括眼压升高 3 例 (停激素后恢复)、复视 4 例 (取出 FCB 后恢复)。13 例视网膜脱离未累及黄斑患者术后 BCVA 约 1.0; 8 例术前视网膜脱离累及黄斑者 (术前 BCVA 0.2-0.3) 术后 BCVA 提高至 0.5 ± 0.2 , OCT 显示黄斑结构恢复。随访期间全部病例视网膜复位良好, 无再脱离发生。

人工智能在儿童近视防控中的应用与展望

第一作者：Rouan CHEN

目的：近视在全球儿童与青少年中呈现高发与低龄化趋势，对公共卫生构成严峻挑战。传统预测方法因精度有限与个体化评估不足，难以满足精准防控需求。本研究旨在系统总结人工智能（Artificial Intelligence, AI）在该领域的主要建模思路与应用进展，探讨其技术潜力与临床价值。

方法：研究通过文献梳理与比较分析，构建了基于数据类型的 AI 方法选择框架：传统机器学习擅长处理屈光度、眼轴长度等结构化数值数据，在风险分层中兼具效能与良好可解释性；深度学习在解析眼底图像、光学相干断层扫描（Optical Coherence Tomography, OCT）等非结构化影像方面展现出卓越的特征提取能力，能自动识别与近视相关的微观结构标志；多模态融合模型则通过整合数值与影像信息，实现了预测结果的稳健性与泛化性显著提升。

结果：应用层面，AI 已贯穿于近视管理的全链条：在测量层面，AI 能利用眼底照片等易得数据替代复杂检测，自动精准量化关键参数；在预测上，基于数值数据、影像特征乃至二者融合信息，构建了从早期筛查、风险分层到基于时间序列的个体化进展动态预测模型；在防控干预上，展现出在个性化关键参数预测与药物疗效评估（如角膜塑形镜验配、阿托品疗效预测）中的辅助决策潜力。

结论：综上所述，人工智能正成为儿童近视预测与防控体系的核心技术支撑。尽管前景广阔，当前研究仍面临模型泛化能力不足、多维度信息整合不充分以及“黑箱”决策可解释性有限等挑战。未来应致力于构建多中心、大样本的标准化数据库，深化多模态数据融合，并加强可解释性 AI 研究，以推动人工智能从技术工具向能够支撑精准公共卫生策略与个体化临床管理的核心能力转变。

摘要编号：201865

人工智能在眼底病创新诊疗中的四维突破

第一作者：Xianwei LI

目的：破解眼底病诊疗困境：眼底病是全球致盲的主要原因，糖尿病视网膜病变（DR）患者超 1.4 亿，而基层眼科医生缺口达 70%。传统诊疗依赖人工阅片，三甲医院单张 OCT 影像分析需 8-12 分钟，误诊率高达 23%。本研究旨在通过人工智能（AI）技术实现三大目标：提升诊断效率：缩短影像分析时间至秒级，缓解医疗资源不均问题；突破诊断瓶颈：构建多模态数据融合模型，提升黄斑变性等复杂病变识别精度；推动个性化治疗：通过 AI 预测 DR 进展风险，指导精准干预。

方法：多维度技术融合路径 1. 数据采集与处理 多模态数据库：整合 1 万例 OCT、眼底彩照及患者电子病历，涵盖 DR、青光眼等 5 类疾病；数据增强：采用生成对抗网络（GAN）扩增罕见病变样本，解决数据不平衡问题。2. AI 算法构建 深度学习架构：搭建 3D-ResNet-50 网络，提取 OCT 分层特征（如视网膜神经纤维层厚度）；多任务学习：同步完成病灶定位（误差 ± 0.11 mm）、分级（准确率 96.7%）及预后预测。3. 临床验证设计 前瞻性试验：在 8 省市 32 家医院开展对比试验，AI 组与专家组双盲阅片；性能指标：采用 ROC 曲线、Kappa 值评估模型一致性，F1-score 衡量分类性能。

结果：临床效能显著提升 诊断效率突破 AI 系统单张 OCT 分析时间降至 3.2 秒，基层医生工作量下降 68%；DR 筛查敏感度达 98.2%，特异性 91.5%，超越中级职称医生水平。复杂病变识别 黄斑裂孔自动分割 Dice 系数 0.89，较传统 U-Net 提升 12%；脉络膜新生血管检出率提高至 94.3%，漏诊率从 17% 降至 4.2%。治疗决策支持 DR 5 年失明风险预测模型 AUC 值 0.93，指导抗 VEGF 治疗时机选择；AI 辅助治疗方案使患者年就诊次数减少 3.2 次，医疗费用下降 41%。

结论：AI 重塑眼底病诊疗范式 技术价值验证 AI 显著提升眼底病诊疗标准化水平，使基层医院 DR 筛查准确率从 67% 跃升至 89%。多中心试验证实，AI 系统可减少 38% 的过度治疗和 26% 的治疗不足。临床应用挑战 数据异质性：不同设备影像特征差异导致模型泛化性下降（如 Topcon 与

Heidelberg OCT 数据)；伦理风险：7.3% 患者对 AI 诊断存疑，需建立人机协同决策机制。本研究证实，AI 不仅是一把“数字手术刀”，更是打破医疗资源壁垒的核心引擎。随着《医疗 AI 临床应用指南》的出台，人工智能有望在 5 年内覆盖 80% 眼底病诊疗场景，让“光明守护”突破时空界限。

摘要编号：210337

儿童近视神经网络中鲁棒的可解释的单元级因果推理

第一作者：Zihui JIN

共同作者：Shi-ming LI

目的：理解深度学习中的因果机制对于临床应用至关重要，其中可解释性和可靠性是关键所在。目前大多数人工智能系统如同黑箱，限制了医学领域的透明度。我们提出了一个集成于神经网络中的因果推断框架，用于评估个体特征对预测的影响。

方法：通过对一个 3000 多名儿童纵向随访的前瞻性儿童眼科队列的研究，通过干预估计直接和间接因果效应。采用多重证伪策略进行的反驳实验验证因果效应的稳健性和可靠性。

结果：我们的方法通过干预估计了直接和间接因果效应。将该方法应用于儿童近视进展的研究中，不仅取得了良好的性能，还识别出了临床上合理的因果路径。因果效应的稳健性和可靠性也得到了证实。该方法不受模型影响，适用于需要可解释性的数字健康干预。

结论：通过将单元级因果推理融入深度学习，这项工作推动了与精准医学和公平医疗目标相一致的透明、可靠人工智能系统的发展。

摘要编号：209271

因果注意力网络用于糖尿病黄斑水肿疗效预测

第一作者：Yan LIU

共同作者：Yao FU, Ao SHEN, Xuefei SONG, Xieyang XU

目的：探讨基于光学相干断层扫描 (OCT) 影像的糖尿病黄斑水肿抗 VEGF 疗效预测新方法，评估玻璃体 - 黄斑界面病变在疗效预测中的价值，构建具备解释性和泛化能力的多任务深度学习模型。

方法：研究收集 600 张 OCT 采集的图像建立模型。由一名经验丰富的眼科医生初步标注图像中黄斑前膜区域，并由另一名医生复检验证。引入因果注意力学习模块，构建多模态输入通道，在内部数据集上完成训练与验证，并与多种算法进行性能对比。

结果：基于因果注意力学习的多任务 OCT 深度模型 (ERM-CAL-Net) 在疗效预测与结构分割双任务中均取得优于现有 SOTA 模型的表现。课程学习策略有效改善了模型的收敛效率与稳定性；多模态输入的引入进一步增强了预测的准确度与可解释性。该模型刻画糖尿病黄斑水肿中黄斑前膜及相关微结构异常的特征。

结论：本研究提出的 ERM-CAL-Net 在 OCT 图像的多任务分析中实现了方法学创新，兼具预测准确性与临床可解释性。未来可进一步扩展至其他眼科疾病（如黄斑裂孔、视网膜脱离），并结合 OCTA、眼底照相及功能学检查，构建具备跨模态与跨病种泛化能力的智能诊疗系统。

摘要编号：209301

基于 AI- 医师协同定量分析眼底 ISI 与房水中细胞因子的相关性研究

第一作者：Suyan LI

共同作者：Chang XIAO

目的：AI- 医师协同定量分析糖尿病视网膜病变 (DR) 患者超广角荧光素眼底血管造影不同区域缺血指数 (ISI)，并探讨其与房水细胞因子的相关性。

方法：本研究为横断面研究。收集接受抗血管内皮生长因子 (VEGF) 药物治疗的 DR 患者 40 例 40 只眼。根据临床诊断标准将受检者分为非增生型 DR (NPDR) 组 18 例和增生型 DR (PDR) 组 22 例。采用 Luminex 液相芯片技术检测房水中 VEGF、胎盘生长因子 (PLGF)、血管生成素样蛋白 4 (ANGPTL4)、白细胞介素 -6 (IL-6)、IL-8、IL-1 β 、单核细胞趋化蛋白 -1 (MCP-1)、细胞间黏附分子 -1 (ICAM-1) 和肿瘤坏死因子 - α (TNF- α) 9 种细胞因子的浓度。所有患者均行 UWFA。使用 “AI-Doctor” 协同模型对获取的图像进行处理，自动分割视网膜区域（后周部、中周部、远周部），并计算每个区域的 ISI。分析各区域 ISI 值与房水细胞因子浓度的相关性，并采用受试者工作特征 (ROC) 曲线评价 ISI 和关键细胞因子对 DR 临床分期的诊断效能。

结果：DR 眼中，全视网膜、后极部、中周部及远周部 ISI 分别为 4.62 (1.54, 11.93) %、6.32 (2.49, 18.72) %、7.24 (1.26, 21.51) %、0.96 (0, 3.85) %，总体比较差异均有统计学意义 ($P < 0.001$)。其中，后极部、中周部 ISI 高于远周部 ISI，差异均有统计学意义 (均 $P < 0.001$)。PDR 眼全视网膜、后极部、中周部及远周部 ISI 均高于 NPDR 眼，差异均具有统计学意义 ($Z = 3.126, 2.61, 2.827, 2.932$ ，均 $P < 0.05$)。视网膜各区域 ISI 均能有效地预测 DR 的进展，其中，全视网膜 ISI 预测 NPDR 进展为

PDR 的曲线下面积 (AUC) 最大, 最佳临界值为 8.11%, 灵敏度为 0.681, 特异度为 0.944。PDR 眼房水中 VEGF 和 PLGF 质量浓度高于 NPDR 组, 差异均有统计学意义 ($Z = 6.637, 2.093$, 均 $P < 0.05$)。房水中 VEGF 预测 NPDR 进展为 PDR 的曲线下面积 (AUC) 最大, 最佳临界值为 198.49 pg/mL, 灵敏度为 0.818, 特异度为 0.722。DR 眼房水中 VEGF、PLGF、ANGPTL4 和 IL-8 的水平与视网膜各区域 ISI 均呈正相关, 具有统计学意义 (均 $r \geq 0.331$, 均 $P < 0.05$)。

结论: DR 眼的无灌注区主要位于后极部与中周部。视网膜各区域 ISI 与 DR 的严重程度显著相关, 全视网膜 ISI $\geq 8.11\%$ 时, NPDR 进展为 PDR 的可能性大。房水中 VEGF、PLGF 的含量与 DR 的严重程度密切相关, VEGF ≥ 198.49 pg/mL 时, NPDR 进展为 PDR 的可能性大。VEGF、PLGF、ANGPTL4 和 IL-8 是与 DR 缺血进展紧密相关的细胞因子, 它们不仅是评估 DR 缺血程度的重要指标, 更是抑制 DR 缺血进展的潜在治疗靶点。

基于 FDA 不良事件报告系统数据库的眼用阿托品不良反应信号挖掘

第一作者: Zihang XU

共同作者: Wenting CAI, Ruoyi LIN, Yan WU, Jing YU

目的: 全面系统地挖掘眼用阿托品导致的药品不良反应 (ADR), 为临床医生安全用药提供参考。

方法: 运用信息成分法 (IC) 和报告比值比法 (ROR), 基于美国食品药品监督管理局 (FDA) 不良事件报告系统 (FAERS) 数据库对从建库至 2025 年第 2 季度中眼用阿托品的 ADR 进行挖掘。

结果: FAERS 数据库中共有眼用阿托品 ADR 报告 425 份, 检测出阳性信号 83 个, 主要集中于眼器官疾病、各类神经系统疾病、各类损伤中毒及操作并发症、感染及侵染类疾病等。其中, 眼内炎 ($n = 74$, IC025 = 6.62, ROR025 = 101.90) 是信号强度最强且报告频次最高的 ADR; 其他较强的信号强度依次为脉络膜炎 (IC025 = 6.05, ROR025 = 69.26)、眼内压升高 (IC025 = 5.77, ROR025 = 56.93)、视力下降 (IC025 = 5.46, ROR025 = 45.74)、瞳孔散大 (IC025 = 5.37, ROR025 = 43.34) 和葡萄膜炎 (IC025 = 5.36, ROR025 = 42.93)。除眼内炎外, 眼痛 ($n=64$, IC025 = 4.99, ROR025 = 32.91) 是报告频次较高的 ADR。

结论: 眼用阿托品在眼科系统存在较多的 ADR, 临床医生应充分关注并及时采取相应措施保证患者的用药安全。

摘要编号: 209387

基于人工智能眼底定量技术量化评估黄斑前膜视网膜血管特征

第一作者: Jiyang TANG

共同作者: Saiguang LING, Heng MIAO, Yaoyao SUN, Mingwei ZHAO

目的: 使用基于人工智能的眼底定量技术观察特发性黄斑前膜 (ERM) 患眼视网膜血管形态特征, 并分析其与 ERM 分期的相关性。

方法: 回顾性病例研究。纳入我中心 2023 年 1 月至 2025 年 3 月的 146 名 ERM 患者 292 只眼。使用基于人工智能的视网膜血管形态定量参数采用眼底图像分析系统 EVisionAI 对眼底图像处理并分析。根据患眼光相干断层眼底扫描检查记录患眼基于连续的异位中心凹内层结构 (EIFL) 的 ERM 分期、EIFL 厚度及黄斑中心凹视网膜 (CFT) 厚度。统计分析视网膜血管形态特征参数的不同 ERM 分期的组间差异及其与 ERM 分期的相关性。

结果: 单侧 ERM 患者中, ERM 眼较对侧健康眼血管平均分支夹角、血管平均管径、血管平均弯曲度更大, 血管分形维数、血管弓和黄斑夹角更小 ($P < 0.05$); 血管分形维数 ($P = 0.004$)、血管平均管径 ($P < 0.001$)、血管平均弯曲度 ($P < 0.001$) 与 ERM 分期相关。血管分形维数 < 1.553 (OR = 7.247, $P < 0.001$)、血管平均管径 $> 61.93 \mu\text{m}$ (OR = 2.277, $P = 0.013$)、血管平均弯曲度 $> 0.893 \times 104$ (OR = 5.044, $P < 0.001$)、血管弓和黄斑夹角 $< 88.84^\circ$ (OR = 4.628, $P < 0.001$) 是 ERM 患眼达到 ERM 3 期或 4 期的危险因素。使用 Python 构建对视网膜血管形态及人口学特征预测 ERM 是否到达 3 级及以上的二分类模型, 采用集成学习方法随机森林, 模型测试 AUC 0.808, 准确率 75.9%, 召回率 70.0%, 精确率 66.7%, F1 0.683; 交叉验证 AUC 0.828 ± 0.080 , 前 5 个最重要特征依次为黄斑中心凹 5 mm 及 3 mm 范围内平均管径值、血管分形维数、血管弓和黄斑夹角。

结论: 基于人工智能的 EVisionAI 眼底图像分析系统可精准定量视网膜血管形态特征参数。血管分形维数、血管平均管径及血管平均弯曲度与 ERM 分期相关, 视网膜血管形态特征参数可作为潜在的预测 ERM 患眼是否达到 3 期及以上的指标。本研究探索了各项视网膜血管参数与 ERM 分期的相关性及其与 ERM 分期的危险因素, 为利用眼底彩照进行 ERM 分级、严重程度提供了一种新的建模思路。

摘要编号: 203577

基于图像处理与 OCR 的眼科多模态数据提取研究

第一作者: Wufeng ZHANG

共同作者: Li DING, Deteng HUANG, Xuemin LI

目的: 本研究的主要目的是自动获取眼科 OCTA 图像以及 PDF 报告中的有效信息, 即提取视网膜与脉络膜的血管密度、分形维数、弯曲度及厚度等关键量化参数, 以作为眼科临床和科学研究的基础, 从而辅助眼科疾病的诊断和科研分析。另一目标是在高效和批量处理眼科多源数据和报告的基础上, 初步建成眼科人工智能研究标准化及结构化专病数据集, 为眼科人工智能深度学习模型开发和辅助工具开发提供数据支撑。

方法: 项目采用多模块协作的系统架构, 综合运用图像处理与 OCR 技术完成端到端的数据提取流程。在图像处理模块, 对 OCTA 图像进行灰度转换、CLAHE 增强、中值滤波、二值分割和骨架提取, 进而计算得到血管密度 (VD)、分形维数 (D)、骨架密度 (SD)、弯曲度等形态参数。针对 PDF 报告, 则借助 PaddleOCR 引擎进行光学字符识别, 并通过图像预处理 (灰度处理、反转、增强、二值化) 以提高数字识别的正确性。系统内置 PDF 类型判断模块, 针对不同的类型做模板判别, 并结合坐标定位技术对相应区域中的数据进行提取。同时, 开发了区域可视化工具用于 OCR 检测区域的调试与验证, 以提升复杂版式下的识别准确率和鲁棒性。

结果: 本系统可以自动对 OCTA 图片进行批量分析处理, 提取相应血管的关键量化参数, 并输出结构化的 CSV 格式表格数据。同时能够自动解析 PDF 文本中的数字信息, 并按照文本内容类别整理出规范格式的 Excel 表格文件, 与人工录入相比, 错误率和工作量大大减少; 而且对中间处理产生的所有图片及最后的分析结果均作保存, 方便查询验证, 初步形成统一的、规范的眼科影像和参数信息数据库, 从而为后续人工智能相关应用的研究和发展打下基础。

结论: 本研究成功开发出一套集成图像处理与 OCR 技术的自动化系统, 能够高效、准确地提取眼科 OCTA 图像及其报告中的关键参数, 不仅可以支持临床眼科数据的快速处理与分析, 也为构建高质量眼科人工智能专用数据库提供了有效工具。系统具备良好的可扩展性与实用性, 未来可进一步结合深度学习算法, 以用于眼底疾病筛查、诊断及预后评估的智能辅助工具开发。

摘要编号: 204665

基于房水蛋白质组学联合机器学习分析年龄相关性白内障的易感因子及衰老模型构建

第一作者: Xiaosheng HUANG

共同作者: Lishi LUO, Kun ZENG

目的: 研究表明房水蛋白质表达谱的变化随年龄增长参与了多种衰老相关疾病的进展, 但目前关于生理性房水蛋白质组学的衰老特征仍尚不明确, 尤其是其与年龄相关性白内障 (ARC) 的潜在关联尚未被充分揭示。本研究目的在于明确房水中蛋白质表达谱随年龄增长的变化趋势, 继而深入探讨房水衰老相关蛋白质表达谱与 ARC 发生发展的相关性。

方法: 本研究共纳入 52 例年龄在 19 岁至 91 岁之间的患者房水样本, 其中包括 33 例年龄相关性白内障 (ARC) 患者及 19 例屈光不正患者。采用液相色谱-质谱联用 (LC-MS/MS) 结合数据非依赖采集 (DIA) 技术进行蛋白质组学检测; 通过秩和检验与线性回归分析鉴定房水衰老相关蛋白 (APs), 并进一步开展 APs 与 ARC 晶状体混浊程度的相关性分析、APs 功能富集分析; 同时借助 LASSO 回归及线性回归机器学习模型, 构建房水衰老预测模型, 筛选衰老标志物及关键调控因子。

结果: 房水中共检出 634 种蛋白质, 其中 179 种 APs (其中 141 种 APs 下调, 38 种 APs 上调, all Padj < 0.05), 主要富集于氧化损伤、细胞外基质及蛋白质稳态调控等生物学过程。进一步分析显示, APs 中有 13 种蛋白质与晶状体混浊程度显著相关 ($0.60 < |r| < 0.80$, all Padj < 0.05), 其中仅 SPINK1 与晶状体混浊程度呈正相关 ($r = 0.68$), 其余均与晶状体混浊程度呈显著负相关 (ABI3BP、COL9A2、GGH、GPNMB、HSPA6、HSPA8、NPTX2、PENK、PRDX1、PRDX2、SCUBE1 和 VGF)。基于房水中 AZGP1、COL1A2、COL6A3、CRYGS、CTBS、GSTO1、LEFTY2、LINGO1、LYZ、NPTX2 和 RBP4 的表达量构建的房水年龄预测模型, 与实际年龄呈现高度相关性 ($AUC = 0.72$, $rA_{Page} = 0.82$), 可作为预测房水衰老的理想标志物。通过机器学习构建年龄预测模型并与实际年龄对比分析显示, 有 22 种 APs 与年龄显著相关 ($P < 0.05$), 包括 APOA1、APOA2、APOH、COL6A3、KNG1、LEAP2、LRG1、SAA4、SPINK1、THAP4、VTN、CASP14、COA3、CTBS、GOT1、HEG1、NELL2、NPTX2、OMG、PTPRG、SIAE 和 TFPI2。

结论: 在房水中鉴定出 179 种与衰老密切相关的年龄相关蛋白质, 主要富集于氧化损伤、细胞外基质及蛋白质稳态调控等信号通路; 13 种 APs 是 ARC

相关的易感因子，包括 12 种易感因子。基于房水中 11 种 APs 构建的年龄预测模型可作为评估房水衰老状态的理想预测模型。22 种 APs 可能成为调控房水衰老进程的关键调节因子。

摘要编号：203633

基于机器学习与多模态数据的糖尿病视网膜病变疾病亚型鉴定

第一作者：Tian NIU

共同作者：Kun LIU, Qian ZHU

目的：糖尿病视网膜病变（DR）是工作年龄人群首要致盲性眼病，早期识别高风险人群对防治至关重要。传统风险评估方法依赖有限指标，难以全面反映疾病复杂性。本研究旨在开发并验证一种整合多模态数据的机器学习框架，以实现 DR 风险的精准分层和亚型解析。

方法：基于 UK Biobank 数据库，我们构建了一个包含 10,478 名参与者的 DR 巢式病例队列，整合了多维度数据，涵盖人口统计学、社会经济与环境因素、体格与生理指标、生活方式与行为特征、认知功能以及生化参数，并进一步结合蛋白组学（ClinPro）、代谢组学（ClinMet）、光学相干断层扫描（ClinOCT）和眼底影像（ClinFI）数据。采用 XGBoost 算法构建预测模型，并通过 SHAP 值解读特征重要性。进一步采用无监督聚类识别患者亚型，并建立可解释的临床分类规则。进一步通过蛋白组学和代谢组学分析探索不同亚群的分子表型。亚群的风险分层结果在来自国家标准化代谢性疾病管理中心（MMC）分中心的独立队列中进行外部验证。

结果：多模态数据整合显著提升了 DR 的预测性能（AUC = 0.75, AP = 0.74），其中，仅基于临床变量的模型表现出最佳诊断效能。SHAP 分析提示慢性肾脏病（CKD）、糖尿病病程、糖化血红蛋白（HbA1c）、胰岛素使用、糖尿病病程及磺脲类药物使用等为关键预测因子。聚类分析识别出九个具有显著差异 DR 发病风险的亚群，其中 cluster1 风险最低（8.5%），cluster4 风险最高（54.2%）。基于简洁临床指标的分类规则实现了可解释的风险分层。蛋白组与代谢组分析进一步揭示了各亚群在分子水平上的异质性，例如 cluster4 中补体相关蛋白 C1QTNF1 显著上调。外部验证队列（MMC）结果支持该模型具有良好的稳健性与泛化能力。

结论：本研究证实了多模态数据与机器学习在 DR 风险分层中的价值。所识别的临床亚型具有鲜明分子特征和疾病风险，为 DR 的精准防治提供了新策略。

摘要编号：201655

基于深度学习的白内障手术器械损伤实时检测研究

第一作者：Hongzhuang CHENG

共同作者：Shuangwen KANG, Jie ZHONG

目的：开发经济高效的小目标手术器械损伤监测系统，降低因器械碎片残留眼内导致的医源性损伤风险。

方法：本研究提出基于改进的 YOLOv11 模型用于白内障手术器械检测与损伤评估。在模型架构方面，首先将 Head 层 P3 路径中的 C3k2 模块重复次数增加到 3 次，以增强网络对微小手术器械的特征提取能力；其次在 Backbone 部分采用 ScConv 模块替代标准卷积，该模块通过空间和通道重建卷积减少冗余计算并促进代表性特征学习。在数据增强方面，针对手术器械损伤图像数据匮乏的问题，本研究提出基于 OpenCV 的金属损伤仿真方法，通过自适应圆形掩模与局部透明度梯度变换模拟器械凹陷缺损，同时采用随机角度和长度的线段生成算法实现断裂缺损的仿真效果。

结果：该模型在验证集上达到 86.1% 的精确率（Difference: 9.8%, 95% CI: 74.5%–87.5%, $P < 0.05$ ）、86.3% 的召回率（Difference: 8.3%, 95% CI: 76.2%–87.7%, $P < 0.05$ ）、82.8% 的 mAP@0.5（Difference: 12.8%, 95% CI: 68.1%–84.4%, $P < 0.05$ ）和 86.2% 的 F1 分数（Difference: 9.1%, 95% CI: 75.3%–87.6%, $P < 0.05$ ）

结论：本研究提出的手术器械损伤智能监测系统实现将参数规模压缩至基线模型以下的同时显著提升检测精度，并实现 140 FPS 的检测速度，兼具低成本部署和高效运算的双重优势。

摘要编号：208719

基于超广角眼底图像的糖尿病视网膜病变多阶段一体化智能诊断系统研究

第一作者：Jie WANG

共同作者：Shan DING, Jianbin HU, Haiyu HUANG, Hengming ZHANG, Suzhen WANG

目的：基于超广角眼底图像（ultra-widefield fundus photography, UWF-FP）研发并验证一套针对糖尿病性视网膜病变（Diabetic Retinopathy, DR）的多阶段、多病灶、全流程自动化智能诊断系统，覆盖异常图像筛查、病灶分割与检测以及 DR 分期与基于检测结果分类修正，以克服现有单一任务模型的局限，提升对超广角影像的识别精度、可解释性与临床适配性。

方法：本研究基于 7740 张 UWF-FP，构建了集异常图像筛查、病灶分割与检测、DR 分期及分类修正于一体的多阶段人工智能诊断系统。该系统包含三个核心模块：① WT-U2net-- 引入小波变换卷积 (WTConv) 与通道先验卷积注意力 (CPCA) 以实现多尺度特征提取和精细化分割，并通过面积阈值法 (220 像素) 区分微血管瘤 (Microaneurysm, MA) 与出血点 (Hemorrhage, HE)；② YOLOv11-SPD-EMA-SIoU-- 融合空间到深度卷积 (Spatial-to-Depth Convolution, SPD)、高效多尺度注意力机制 (Efficient Multi-scale Attention, EMA) 及可扩展交并比损失函数 (Scylla-IoU Loss, SIoU)，提升小病灶检测精度与定位稳定性；③ NIDConvNeXt-- 结合大核条带卷积与无参注意力模块 (Simple Attention Module, SimAM) 增强增殖期病灶捕捉能力，并引入改进 YOLOv11 检测结果对增殖期 (Proliferative Diabetic Retinopathy, PDR) 分类进行修正。

结果：WT-U2net 在异常图像筛查中取得 94.2% 准确率 (召回率 97.4%)，HE/MA 分割 Dice 系数 0.881，优于 U-Net、U-Net++ 与原始 U2Net。YOLOv11-SPD-EMA-SIoU 在多病灶检测中达到 mAP 91.0%，其中增殖膜检测精确率和召回率分别为 98.3% 和 97.6%。NIDConvNeXt 初始分类准确率 89.8%，结合分类修正后提升至 94.5%，并显著降低 PDR 漏判率。最终 0-4 期 DR 分级准确率分别为 84.9%、86.9%、89.6%、91.7% 和 92.6%。

结论：本研究提出的多阶段一体化人工智能系统在 UWF-FP 的质量控制、病灶精确检测与分期分类中均表现出优越性能，显著优于多种现有深度学习方法。该系统与国际 DR 分期标准高度一致，具备良好的可解释性与临床适配性，有望在大规模筛查及个体化管理中实现临床转化。未来将通过多中心、多模态数据扩展与前瞻性临床验证，进一步提升其泛化能力与应用价值。

摘要编号：208639

基于超广角眼底成像与人工智能的视网膜裂孔分割和激光光凝术自动化规划探索

第一作者：Jing LUO

共同作者：Yuwei CHEN, Quanlei REN, Qi YIN

目的：视网膜裂孔 80% 以上发生于周边部视网膜，是导致视网膜脱离这一致盲性眼病的直接原因之一，因此，视网膜裂孔的早期发现和治疗具有重要意义。超广角眼底成像 (ultra-widefield fundus imaging, UWF) 可提供高达 200 度的单

次扫描视野，可以帮助早期发现视网膜裂孔。视网膜激光光凝术是目前视网膜裂孔的首选治疗方案。但 UWF 筛查及标准化治疗仍面临挑战。因此，开发自动检测的 AI 算法至关重要。本研究探索基于 UWF 与 AI 实现激光光凝术全流程辅助的可行性，涵盖病灶分割至治疗规划，以推动该技术向高效、标准化发展。

方法：在这项研究中，我们回顾性分析了通过 Optos 设备获得的 267 张诊断为视网膜裂孔的眼睛的 UWF 图像。这些图像由眼科医生在像素级进行标记，以分割视盘和病变区域。利用这个数据集，我们训练了基于 U-Net 架构的最先进的语义分割模型，并系统地评估了主干选择、模型规模和预训练策略的影响。基于分割结果，我们开发了一个治疗计划系统，以按照临床指南和要求提出光凝区域并生成激光点的网格图案。这些自动生成的光凝固治疗计划由两位玻璃体视网膜专家根据安全性方面和临床可行性进行评估。

结果：最优分割模型的 Accuracy 0.9995, Precision 0.9415, Recall 0.9087, Specificity 0.9623, IoU 0.8433, Dice 0.9102。系统评估结果表明，模型容量的增加和采用任务相关的预训练策略显著提升了分割性能，最新的基座模型 (foundation model) 仍未突破现有 state-of-the-art 模型。在分割结果基础上，视网膜光凝治疗规划模块可自动提出激光灼烧区域及网格方案，同时考虑病灶区与保护区。结合最佳分割模型，由治疗计划系统生成的超过 90% 的光凝固计划被玻璃体视网膜专家认为是令人满意的。

结论：本研究通过病灶分割和治疗规划实现了视网膜裂孔诊疗的全流程辅助，提高了视网膜裂孔的临床诊断效率，并且在视网膜激光光凝术治疗的标准、效率 and 安全性方面具有潜力，为未来进一步开发智慧医疗系统与智能手术导航奠定了基础。

摘要编号：202517

基础模型驱动的三维 OCT 视网膜疾病全流程诊断系统开发与验证

第一作者：Jinze ZHANG

共同作者：Jiaxiong LI, Xiaoying TANG, Peng XIAO, Jin YUAN, Jian ZHONG

目的：光学相干断层成像 (OCT) 凭借高分辨率三维成像已彻底改变视网膜疾病诊断模式，但其智能化潜力仍受多阶段流程和单任务 AI 架构的限制。本研究旨在构建一个基础模型驱动的 3D OCT 视网膜疾病全流程自动化诊断系统，并在真实世界系统验证其临床可行性与泛化性能。

方法：我们构建了 FOCUS (Full - process OCT - based Clinical Utility System)，一个能够真实模拟 OCT 临床筛查流程的全流程自动化系统。FOCUS 首先利用 EfficientNetV2 - S 模型进行 OCT 图像质量评估，仅保留质量合格的二维切片进入后续分析；随后，基于微调的视觉基础模型 (Vision Foundation Model, Vision FM) 完成异常检测与多疾病分类；最后，通过统一的自适应聚合策略整合多切片结果，生成 3D OCT 患者级诊断报告。系统在 3,300 例患者 (40,672 张切片) 的数据上完成训练与内部测试，并在来自不同层级医疗机构和多种 OCT 设备的 1,336 例患者 (19,798 张切片) 上进行外部验证。同时，我们参考真实世界的诊疗流程，设计了人机对比实验，评估 FOCUS 在不同临床阶段中与眼科技师及不同级别医生之间的诊断一致性。

结果：FOCUS 在图像质量评估 ($F1 = 99.01\%$)、异常检测 ($F1 = 97.46\%$) 和多疾病诊断 ($F1 = 94.39\%$) 任务中均显著优于现有算法，展现出卓越的全流程诊断性能。在外部真实世界验证中，系统在不同医疗中心的 $F1$ 分数维持在 $90.22\% - 95.24\%$ ，显示出出色的跨设备与跨机构泛化能力。人机对比结果表明，FOCUS 在异常检测方面超越专家 ($F1: 95.47\% \text{ vs. } 90.91\%, p < 0.005$)，在多疾病诊断中达到相当水平 ($F1: 93.49\% \text{ vs. } 91.35\%, p = 0.376$)，并显著提升了诊断效率。

结论：综上所述，FOCUS 以基础模型为核心，首次实现了 3D OCT 视网膜疾病诊断的全流程自动化，从图像质量控制到患者级诊断均表现出卓越的准确性与泛化能力。系统在真实世界中验证了其与传统专家相当甚至更优的诊断性能与显著的效率优势，展现出在临床实践中应用与推广的可行性。本研究为 OCT 智能化诊断的临床落地提供了新范式，也为构建以基础模型为驱动的多任务医疗 AI 系统提供了重要参考。

摘要编号：202418

应用大语言模型回答先天性晶状体疾病患儿家长提问的效果

第一作者：Yue ZHANG

目的：评价国内开源大语言模型 (LLM) 回答先天性晶状体疾病患儿家长常见诊疗问题的准确性、完整性及情感支持性，探讨其作为健康教育智能助手的可行性。

方法：分别收集 69 个与先天性晶状体疾病诊疗相关的问题及答案，问题涉及危险因素、疾病诊断、症状、筛查及检查、治疗与预后 5 个方面。将所有问题采用“开启新会话”形式重复输入 2 次到

LLM，记录答案。由 3 位高年资白内障科医师独立对答案进行评价，准确性评价采用 1-6 级李克特量表，完整性和情感支持性评价采用 1-3 级李克特量表。对于每个应答，评估者须在 LLM 回答和人工答案中给出推荐并对 Kimi chat、豆包、DeepSeek-R1、文心一言 3.5 进行评价。

结果：在 4 个 LLM 中，DeepSeek-R1 表现最佳，69 个问题中准确性 6 分、完整性 3 分和情感支持性 3 分的比例依次为 90%、100%、80%。人工回答的字数明显少于 DeepSeek-R1 的应答字数，差异存在统计学意义 ($Z = -1.96, P < 0.05$)。Deepseek-R1 回答字数与准确性评分无明显相关性 ($r_s \approx 0.12, P > 0.05$)，与完整性评分呈正相关 ($r_s \approx 0.608, P < 0.05$)。但在疾病诊断上表现欠佳。未选择的原因包括回答高专业度问题时专业性不足等。

结论：DeepSeek-R1 回答儿童晶状体疾病的相关诊疗问题具有较高的准确性、完整性和情感支持性。LLM 在医疗健康领域的应用具有巨大潜力，但目前仍无法取代临床医师，且存在信息安全、“幻觉”现象和偏见等问题。

摘要编号：201651

开发经济效益的眼科大语言模型优化眼科诊疗

第一作者：Hongzhuang CHENG

共同作者：Shuangwen KANG, Jie ZHONG

目的：开发经济高效的眼科专用大语言模型，辅助基层眼科医生诊疗，提升经济欠发达地区的可及性。

方法：ChatEye 是基于包含超过 42 万条眼科专业数据的 EyeCN 知识库并通过知识蒸馏技术对 ChatGLM-6B 模型进行领域微调的 LLM。本研究通过 3 个环节评估改进后的模型性能：首先采用 GPT-4、豆包和百川 4 作为评审模型，对比 ChatEye 与 Llama2-Chinese-7B、Baichuan2-7B、Qwen-7B、Chatglm2-6B 在 300 道眼科问题上的表现差异；其次通过模拟真实临床场景中患者和医师的随机提问，由 3 位临床专家基于评分标准评估模型的实用性和环境适应性；最后，临床专家对比不同临床经验阶段的眼科医师和 ChatEye 的回答质量，衡量 ChatEye 的医学水平对应的临床经验阶段。

结果：临床医师双盲对照评估和 AI 自动评估相结合的双重验证机制中，ChatEye 以 9.12 分领先其它同参数量的轻量级 LLM，相较于 Chatglm6b 提升 2.32 分 (95% CI: 62.8%-94.0%; $P < 0.05$)，相较于 LLaMA2-7B 提升 6 分 (95% CI: 25.9%-94.0%; $P < 0.05$)。临床医生的对比评估环节中，ChatEye 医学能力初步达到 PGY-4/5 (Difference

= +3.17; $P < 0.05$), 暂未达到主治医师水平 (Difference = -0.72; $P > 0.05$)

结论: ChatEye 在眼科领域的表现和 PGY-4/5 医生相当, 能低成本的本地部署在医疗环境中辅助 PGY-1/3 提升诊疗效率和准确性。

智慧丝路光明之眼科智慧服务模式探索

第一作者: Xiaoting MAI

共同作者: Xiangli WANG, Yan YANG

目的: 通过将“甘肃特色”的护理内涵与智慧医疗技术深度融合, 探索一个可及、高效、人性化的眼科智慧化服务模式。

方法: 在智慧医院建设及“优质护理服务”成熟体系的基础上, 针对甘肃省地域狭长、地形复杂、民族多样化等特点, 结合眼科护理需求, 探索解决远程就医困难、就医语言沟通困难、地域性眼病及环境性眼病的护理挑战等难题的方案。

结果: 依托智慧医院建设系统、5 G 远程诊疗技术及“优质护理服务”体系, 建立覆盖州县乡的远程眼科诊疗网络; 建立多语种智慧交互系统; 开发以甘肃高发眼病为核心的 AI 诊断模型, 实现 AI 预警和循证护理; 建立“环境性眼病”智能随访管理系统; 构建“防盲治盲”资源动态调度平台; 建设基层医护人员“云培训”体系等, 以上方案构成眼科智慧化服务模式, 可统称为“智慧丝路光明”。

结论: “智慧丝路光明”模式将护理人文关怀底蕴与尖端信息技术有机结合, 可构建一个“服务人性化、诊疗精准化、管理精细化、协同网络化”的智慧眼科生态体系, 将更好地服务于区域民众的眼健康。

视网膜微血管改变与颈动脉狭窄及颈动脉斑块的相关性研究

第一作者: Xiaoxia FANG

共同作者: Huiling HU, Wei HUANG, Bing LIANG, Saiguang LING, Fan YANG, Weizhong ZENG, Guoming ZHANG

目的: 利用基于深度学习算法 (DL) 的眼底照相评估视网膜微血管改变与颈动脉狭窄 (CAS) 或 CAS 合并斑块之间的关系。

方法: 回顾分析 715 名健康体检者数据, 包括双侧颈动脉彩超和双侧眼底照相相等, 根据颈动脉内 - 中膜厚度 (IMT) 及是否存在斑块将纳入者分为对照组、CAS 组及其亚组 (CAS 无斑块组、CAS 合并

斑块组)。利用基于 DL 的眼底照相量化视网膜血流参数, 包括: 视网膜动静脉比 (AVR)、视网膜总分形维数 (FD)、视网膜动脉分形维数 (AFD)、视网膜静脉分形维数 (VFD)、视网膜血管密度 (VD)、距离黄斑中心凹 3 mm (VD 3 mm) 和 5 mm (VD 5 mm) 范围内的 VD。对比观察各组间的视网膜微血管变化, 并采用 Spearman 相关性分析评估视网膜微血管指标与 IMT 之间的相关性。

结果: 715 名研究对象中, 对照组 402 名, CAS 组 313 名 (其中: CAS 合并斑块组 91 名, CAS 无斑块组 222 名)。在 CAS 组中, AFD、VFD、FD 均明显小于对照组 (所有 $P < 0.001$), VD、VD 3 mm 和 VD 5 mm 在两组间均存在显著差异 (所有 $P < 0.05$)。CAS 合并斑块组中的 VFD 明显小于 CAS 无斑块组 ($P = 0.026$)。相关性分析结果显示: 在 CAS 组中, VD 3 mm 和 VD 5 mm 与 IMTmin 呈负相关。

结论: 与对照组相比, CAS 患者的 AFD、VFD、FD、VD、VD 3 mm 和 VD 5 mm 更小, 基于 DL 的眼底照相有望为 CAS 的大规模筛查提供新方向。

摘要编号: **208856**

重要致盲眼底病智能诊断与自动图文报告系统

第一作者: Anyi LIANG

共同作者: Honghua YU

目的: 创建人工智能 (AI) 驱动的重要致盲眼底病智能筛查、诊断与自动图文报告系统。该系统旨在为包括早产儿视网膜病变 (ROP)、糖尿病性视网膜病变 (DR)、糖尿病黄斑水肿 (DME) 和黄斑裂孔 (MH) 在内的全生命周期重要致盲眼底病的早期识别和分级诊疗提供“筛查 - 诊断 - 治疗”的闭环流程, 减少不可逆盲。

方法: 该研究创新性研发了一系列视网膜图像处理技术, 包括基于风格引导的视网膜超分辨率技术、视网膜动静脉多维分割量化系统和多模态视网膜影像融合系统。我们开发了一种基于 Laplace 正则化与秩约束的多视图聚类方法, 并提出了基于稀疏匹配的多组学数据关联方法。基于多中心大数据, 我们构建了用于 ROP、DR、DME 和 MH 的诊断、预测与图文报告系统。该研究率先将智能图文报告系统通过广东省人民医院 5G 互联网医院平台部署至远程阅片中心, 并应用于中国 10 家医疗机构。

结果: 该研究开发了 (1) 基于 ROP 眼底图像和危险因素深度学习模型, 准确预测 ROP 的发病风险与严重程度 (AUC 分别超过 0.90 和 0.87); (2) DME 全流程管理系统, 创新性整合了早期预警模型 (AUC 超过 0.8)、基于 OCT 形态的 DME 自动分型模型 (AUC 超过 0.97) 和疗效预测集成学

习模型 (AUC 为 0.8–0.9) ; (3) 基于病因学分类的 MH 手术决策模型, 根据病因自动分型并预测手术疗效 (AUC 为 0.95) 。

结论: 该研究成功建立了覆盖全生命周期重要致盲眼底病的 AI 系统, 实现了多种眼底病的精准筛查, 促进了“筛查 – 诊断 – 转诊 – 治疗”全流程的优化。

Foresight 软件对半飞秒术后患者角膜形态变化的预测能力评估

第一作者: Yijia CHEN

共同作者: Guofu HUANG

目的: 本研究旨在评估新型软件工具 Foresight 在激光原位角膜磨镶术 (LASIK) 术后 1 周、1 个月和 3 个月随访中对术后角膜曲率变化的预测准确性。

方法: 本研究回顾性地分析了 2024 年 11 月至 2025 年 3 月间于中山大学中山眼科中心就诊的拟行 LASIK 手术患者术前, 我们使用眼前节分析系统测量患者的角膜形态参数, 并利用 Foresight 软件基于术前数据进行术后角膜形态预测。在术后 1 周、1 个月及 3 个月对患者进行随访, 收集其实际的屈光状态 (包括球镜、柱镜及等效球镜) 与角膜地形图参数。将不同随访时间点的实测数据, 特别是 2 mm、4 mm 及 6 mm 直径角膜中央区的曲率测量值, 与 Foresight 的预测值进行对比。采用重复测量方差分析比较不同时间点的数据, 并通过组内相关系数 (ICC) 与 Bland-Altman 分析评估预测值与实测值之间的一致性与可靠性。以 $P < 0.05$ 为差异有统计学意义。

结果: 本研究共纳入 29 例患者 (平均年龄 29 ± 7 岁, 女性占 62.1%)。患者术前平均等效球镜 (MRSE) 为 -5.93 ± 1.66 D。术后屈光结果分析显示, 球镜、柱镜及 MRSE 在术后 1 周、1 个月及 3 个月时的测量值与 Foresight 预测值之间存在显著差异 ($p < 0.001$), 但其变化趋势随时间推移逐渐接近预测值。角膜曲率 (K1、K2) 的预测值与术后各时间点实测值无显著差异 ($p > 0.05$)。在 2 mm、4 mm 及 6 mm 直径的中央区域内, Foresight 的预测值与术后 1 周、1 个月及 3 个月的实际测量值均表现出高度的一致性。具体而言, 组内相关系数 (ICC) 在所有区域和时间点均显示出极好的信度: 在 2 mm 区域, ICC 范围为 0.822 至 0.830; 在 4 mm 区域, ICC 更高, 为 0.876

至 0.914; 在 6 mm 区域, ICC 为 0.788 至 0.895 (所有 $p < 0.001$)。值得注意的是, 在 6 mm 区域, 术后 3 个月的测量值 (45.94 ± 1.60) 与 Foresight 预测值 (46.31 ± 2.62) 最为接近, 表明随着术后恢复, 角膜形态逐渐趋近于术前预测。Bland-Altman 一致性分析显示, Foresight 预测值与 Sirius 实际测量值的差异绝大多数位于 95% 一致性界限内。

结论: Foresight 系统能够对 FS-LASIK 术后角膜中央区域的形态进行高精度预测。术后不同时间点的实际角膜曲率测量值与预测值在 2 mm、4 mm 及 6 mm 区域均表现出高度一致性, 且随着术后恢复, 两者趋同性增强。Foresight 软件对提升屈光手术规划的可预测性、优化手术方案及保障术后视觉质量具有重要临床价值。

摘要编号: 210050

不同中心定位方法对角膜屈光手术后视觉质量影响的系统评价及 meta 分析

第一作者: Lulu XU

共同作者: Yan WANG

目的: 系统评价不同中心定位方法对接受角膜屈光手术的屈光不正患者术后视觉质量的影响。

方法: 通过对八个数据库的全面检索, 从 65,604 条记录中筛选出 3,140 只眼的数据库。共有 13 项研究被纳入本次荟萃分析, 以评估中心定位方法对视觉质量结果的影响。

结果: 以角膜共轴反光点 (CSCLR) 为中心组的术后偏心量显著低于以瞳孔中心 (EPC) 为中心组 ($P < 0.05$)。CSCLR 中心组的术后等效球镜 (SE) 在 ± 0.50 D 范围内的比例明显更多 ($P = 0.001$)。然而, 两组在术后裸眼远视力 (UDVA)、术后最佳矫正远视力 (CDVA)、达到 20/20 或更好 UDVA 的术眼比例、CDVA 丢失 ≥ 2 行的术眼比例或散光方面均未发现显著差异 (P 均 > 0.05)。CSCLR 中心组引入彗差显著更低 ($P < 0.00001$), 而在球镜度或其他高阶像差 (HOAs) 方面无显著差异。在 Kappa 角 ≥ 0.2 mm 组较 Kappa 角 < 0.2 mm 组引入更多的高阶像差, 差异有统计学差异 ($P = 0.03$), 而在术后 UDVA、SE、球镜度或水平彗差 / 垂直彗差方面, 2 组之间未发现显著差异 (P 均 > 0.05)。

结论: 在角膜屈光手术后, CSCLR 中心定位相较于 EPC 中心定位方法, 可能在获得更好的术后结果 (SE 残余度、彗差引入) 方面具有潜在优势。当术前角 Kappa 较大时, 建议进行角 Kappa 调整。然而目前可获得的证据质量均较低, 需要更多高质量研究进一步验证上述结论。

摘要编号: 208745

不同单眼视设计的激光老视手术临床对照观察

第一作者: Bai JJ

目的: 对比三种单眼视设计的激光老视矫正手术(仅单眼视、单眼引入 EDoF、双眼引入 EDoF)的早期临床疗效,探索 EDoF 技术在激光老视手术中的临床应用价值。

方法: 选取 44-65 岁、主诉视近困难的患者 62 例,其中正视 8 例,单眼/双眼近视 42 例,单眼/双眼远视 12 例。所有患者均接受角膜激光老视矫正手术(LASIK),并分为三组:9 例采用微小单眼视设计(未引入 EDoF);18 例采用优化单眼视设计(视近眼引入 EDoF);35 例采用 PRESBYOND 设计(双眼引入 EDoF),三组双眼屈光参差量分别为 1.22 ± 0.21 D、 1.38 ± 0.24 D、 1.50 ± 0.17 D。

结果: 术后 1 天,仅微小单眼视组 1 例出现角膜瓣移位,其余患者无手术并发症;术后 1 周,三组双眼裸眼远、中、近视力均较术前提升,且 PRESBYOND 组效果最优,所有患者均未出现最佳矫正视力丢失;术后 1 个月问卷调查显示,PRESBYOND 组患者满意度最高,微小单眼视组最低。

结论: 基于 EDoF 引入方式的差异,三种角膜激光老视手术的临床疗效存在显著区别,其中 PRESBYOND 设计的老视矫正效果最佳,且能为患者带来最高的术后满意度。

摘要编号: 203744

两种不同紫外线辐照能量去上皮 A-CXL 治疗青少年进展型圆锥角膜:一项为期两年的临床对比研究

第一作者: Dan WEN

共同作者: Wen Chen CHEN

目的: 比较标准紫外线辐照能量 (5.4 J/cm^2) 与高紫外线辐照能量 (7.2 J/cm^2) 去上皮加速角膜交联术(A-CXL)治疗青少年进展型圆锥角膜的两年临床疗效差异。

方法: 本回顾性对照研究共纳入 42 名青少年患者的 62 只眼(平均年龄 15.3 ± 2.6 岁),分别接受标准紫外线辐照能量 A-CXL (5.4 J/cm^2 ; 9 mW/cm^2 , 10 min, 31 只眼)或高紫外线辐照能量 A-CXL (7.2 J/cm^2 ; 30 mW/cm^2 , 4 min, 31 只眼)。术前及术后 1 月、3 月、6 月、1 年和 2 年对患者进行裸眼视力(UCVA)、最佳矫正视力(CDVA)、屈光状态、角膜地形图(K1、K2、Kmax、CA、

CCT、TCT)以及角膜光密度(COD)等多项指标评估。

结果: 两种 A-CXL 方案在 2 年内均可有效控制青少年圆锥角膜进展,未见严重不良事件。标准紫外线辐照能量组 (5.4 J/cm^2) UCVA 在术后 6 月显著改善 ($P = .010$),CDVA 自术后 6 月起持续改善 ($P < .010$);高紫外线辐照能量组 (7.2 J/cm^2) CDVA 在术后 1 月一过性下降 ($P < .010$),其后未见显著变化。两组等效球镜(SE)、角膜散光(CA)未见显著改变;柱镜仅在标准紫外线辐照能量组 (5.4 J/cm^2) 自术后 3 月起显著减低 ($P < .010$);Kmax 仅在标准紫外线辐照能量组 (5.4 J/cm^2) 术后 2 年显著下降 ($P < .010$),K1、K2 平坦化亦更明显;两组 CCT 与 TCT 在术后 1-3 月短暂变薄,随后逐步恢复,术后 2 年与术前无统计学差异;角膜光密度(CD 值)分析显示,两组在术后 1-3 月各角膜基质层均出现暂时性 CD 值升高,并于术后 1-2 年恢复至术前水平;术后早期(1-3 月),高紫外线辐照能量组 (7.2 J/cm^2) 在 0-10 mm 区域前层及中层 CD 值低于标准紫外线辐照能量组 (5.4 J/cm^2) ($P < .05$);术后 2 年,高紫外线辐照能量组 (7.2 J/cm^2) 在后层周边区域(6-12 mm) CD 值显著高于标准紫外线辐照能量组 (5.4 J/cm^2) ($P < .05$)。

结论: 两种不同紫外线辐照能量的去上皮 A-CXL 均可在青少年患者中有效控制圆锥角膜进展,但标准紫外线辐照能量 (5.4 J/cm^2) 方案在视力提升和角膜平坦化方面更具优势。高紫外线辐照能量 (7.2 J/cm^2) 方案可在早期减少角膜雾状混浊,但可能导致远期深层角膜反光增强。因此,青少年 A-CXL 的紫外线辐照能量参数应在疗效与角膜透明度之间权衡选择。

摘要编号: 208955

可泛化机器学习方法在术后拱高异常预测中的应用

第一作者: Yixuan YANG

共同作者: Jian YE

目的: 术后拱高异常的早期识别对干预策略的制定至关重要,但多中心数据差异使预测模型的泛化能力面临挑战。

方法: 收集来自中国四川、安徽、陕西、重庆四家医学中心的临床数据,使用 TabNet 作为核心预测模型,并与逻辑回归算法和多层感知机神经网络进行比较。首先在四中心合并数据上进行训练和内部验证,以评估总体性能;随后采用留一中心交叉验证(LOCO)策略,即每次留出一个中心作为外部

测试集，其余中心数据训练模型，验证跨中心泛化能力。

结果：在合并数据集上，TabNet 在预测术后拱高异常方面取得最佳表现，AUC 达 0.87，显著优于 LogReg (AUC = 0.67) 和 MLP (AUC = 0.85)。在 LOCO 验证中，TabNet 在四个外部测试中心的 AUC 均保持在 0.84–0.90 区间，表现出良好的跨中心稳健性。尤其针对临床关注的异常样本识别，TabNet 在外部验证的召回率约为 80%，明显高于传统方法。特征重要性分析显示，CACD、STS、WTW 等特征在整体模型中贡献最高，在拱高预测中具有关键作用。

结论：基于 TabNet 的预测框架在多中心数据下不仅具备优越的总体预测能力，而且在跨中心外推中保持稳定；结合特征重要性解释可揭示中心间差异来源，为模型在多中心场景下的可解释与临床推广提供依据。

摘要编号：210003

基于 AI 和动态形变的局部角膜生物力学表征及 FFKC 智能诊断

第一作者：Xuan CHEN

共同作者：Yan WANG

目的：本研究基于人工智能 (Artificial intelligence, AI)，结合动态形变视频，提出了一种表征局部角膜生物力学的新方法，并据此构建智能诊断模型，以提升顿挫型圆锥角膜 (Forme Fruste Keratoconus, FFKC) 早期诊断水平。

方法：纳入圆锥角膜 (Keratoconus, KC)、FFKC 和正常角膜 (Normal Corneas, NC) 1604 例 (1604 眼) 受试者。在空气脉冲的作用下，利用 Scheimpflug 技术采集角膜动态形变视频。通过无监督语义分割视频及共享模型提取角膜轮廓，获得 115200 (256*200) 个像素点，基于样条理论计算新型像素级参数。将样本数据集随机分为用于训练的训练集、用于参数验证的验证集和用于性能评估的测试集，采用十折交叉验证及集成学习算法训练智能诊断模型。以受试者工作特征曲线下面积、精准性、召回率及 F1 得分评估模型效能，并与现有诊断指标 Belin/Ambrósio 增强扩张显示 (BAD-D)、角膜生物力学参数 (CBI) 和断层扫描联合生物力学指数 (TBI) 进行比较。此外，以同样的标准独立纳入同一国家另一城市 230 例 (230 眼) 受试者进行外部验证，评估模型的临床适用性。

结果：共纳入 1834 例受试者 (1834 眼)。基于 1 mm 内 72 个像素点 (576 像素/8 mm) 计算并重命名 14 个新的像素级生物力学参数，具有较高重复性，能够有效反映局部角膜力学特征。在样本

数据集中，模型用于诊断 FFKC 的曲线下面积是 0.997，准确率为 95.73%，召回率为 95.61%，F1 得分为 95.50%，显著优于临床上现有的广泛使用的诊断方法 (准确率从 86.28% 到 93.36%，均 $P < 0.01$)。在外部验证集中，准确率为 91.38%，召回率为 92.11%，F1 得分为 91.18%，表现出良好的泛化能力。

结论：研究基于 AI 结合动态形变视频，提出了一种全新的局部角膜生物力学表征方法，突破以往分析整体生物力学特征的传统模式，实现了对细微生物力学变化的高灵敏检测。所构建的基于集成学习与投票策略的智能诊断模型，显著提升了 FFKC 早期诊断准确性及效率，有望为临床提供新的辅助诊断工具，降低漏诊率，改善患者视力健康。

摘要编号：210294

多种 ICL 拱高预测公式组合方案的比较研究

第一作者：Jianli YANG

共同作者：Lu XIONG, Xiaoyi YU

目的：本研究旨在系统比较 OCOS、NK 与 KS 三种公式在 ICL 尺寸选择中的表现，评估其在不同推荐组合下的术后实际拱高与预测效能，筛选最优尺寸推荐方案，为 ICL 尺寸选择提供循证依据，并构建标准化临床决策路径。

方法：回顾性纳入 2021 年 12 月至 2023 年 10 月于广州爱尔眼科医院接受 ICL 植入术的患者 205 例 (364 只眼)，排除术中 ICL 植入角度偏差超过 $\pm 10^\circ$ 者。以 OCOS、NK、KS 三种公式为基础，构建 8 种尺寸推荐方案，并根据公式一致性分为 4 组：共识组 (OCOS-NK-KS 三公式一致)、两共识组 (OCOS-NK、OCOS-KS、NK-KS 两两一致)、单一公式组 (任一单一公式推荐) 及个性化组 (没有参考公式推荐)。收集患者的临床基线数据、各方案推荐尺寸与预测拱高值，以及术后 1、3、6、12 个月的实际拱高测量值，并进行相关统计学分析。

结果：术后 1 年，各组拱高处于理想范围内的比例分别为：共识组 88.3%、两共识组 80.9%、单一公式组 73.1%、个性化组 95.8%。共识组与单一公式组间差异具有统计学意义 ($\chi^2 = 8.408$, $P = 0.004$)，共识组的理想拱高比例显著高于单一公式组；而共识组、两共识组及个性化组间差异无统计学意义 ($P > 0.05$)。单一公式组的拱高值显著高于其他三组 (均 $P < 0.001$)，提示其推荐尺寸偏大。各组术后拱高降幅 (1 天至 12 个月) 差异均具有统计学意义 ($P < 0.01$)，其中单一公式组降幅最大 ($213.01 \pm 110.99 \mu\text{m}$)。不同尺寸 ICL (12.1 ~ 13.7 mm) 间拱高差异显著，尺寸与拱高呈正相关 ($r > 0$, $P < 0.05$)，且尺寸越大，术后拱高下降幅度越明显。

结论: 综合多公式共识推荐的 ICL 尺寸选择方案能显著提高术后拱高处于理想范围的比例, 具有更高的预测准确性与稳定性; 单一公式推荐易导致术后拱高偏高。ICL 尺寸与拱高呈正相关, 尺寸越大, 术后拱高及其下降幅度越显著。本研究结果为建立标准化 ICL 尺寸选择策略及优化术后拱高预测提供了参考依据。

摘要编号: 208725

角膜大小导致 Pentacam BAD 诊断偏移的临床研究

第一作者: Bai JJ

目的: 运用假设检验模型, 探究基于欧美角膜数据库的 Pentacam 圆锥角膜筛查系统 BAD 软件, 在汉族近视人群中的诊断准确性; 分析种族间角膜结构差异对该系统的影响, 为系统优化改进提供数据支撑。

方法: 纳入 1643 例汉族近视患者 (均接受角膜屈光手术超 2 年, 且随访记录完整), 以其右眼为研究对象。通过 Pentacam 设备采集水平经线白到白距离 (HWTW), 并按 $HWTW < 11.2 \text{ mm}$ 、 $11.2-11.8 \text{ mm}$ 、 $> 11.8 \text{ mm}$, 将患者分为小角膜组、中角膜组与大角膜组。对三组术前 BAD 偏差指数 (含前表面高度差偏差 Df、后表面高度差偏差 Db 等指标) 进行单因素分析, 同时对比手术前后角膜最薄点后表面高度差值。

结果: 1. 各组术前与术后 2 年的角膜后表面高度值无异常升高, 且组间差异无统计学意义, 提示本研究队列术后未出现圆锥角膜病例; 2. 小、中、大角膜组占比分别为 14.4%、73.4%、13.2%, 表明汉族近视患者角膜大小存在显著个体差异; 3. 术前单因素分析显示, 除角膜厚度外, 三组间所有 BAD-D 参数差异均有统计学意义 ($p < 0.05$); 异常值比例呈“小角膜组最高、中角膜组次之、大角膜组最低”的趋势, 差异有统计学意义 ($p < 0.05$)。上述结果提示, 该软件在角膜直径适配性上存在偏移, 角膜直径越小, 假阳性风险越高; 直径越大, 假阴性风险越高。

结论: 基于欧美角膜数据库的 Pentacam 圆锥角膜筛查系统 BAD 软件, 在汉族近视人群中应用时存在诊断偏移。临床开展术前圆锥角膜筛查时, 应将角膜直径纳入评估体系, 并结合其他临床信息、角膜生物力学等指标综合判断, 以提升诊断准确性。

摘要编号: 209280

角膜屈光手术后 5 年长期角膜生物力学稳定性的分析研究

第一作者: Xiaotong LV

共同作者: Fengju ZHANG

目的: 比较不同术式及屈光度患者角膜屈光手术后 5 年角膜生物力学情况, 分析术后 5 年角膜生物力学特性的影响因素, 为临床合理制定手术方案提供理论依据。

方法: 横断面研究。纳入 SMILE 或 FS-LASIK 术后 5 年的近视与近视散光患者 600 例 (600 眼)。根据手术方式分为 FS-LASIK 组、SMILE 组, 根据术前等效球镜 (SE) 分为中低度组 ($-6.00 \text{ D} \leq \text{SE} < -0.50 \text{ D}$)、高度组 ($\text{SE} < -6.00 \text{ D}$)。收集基本资料及术前眼部参数。术后 5 年行 Corvis ST 角膜生物力学检查。采用倾向性评分匹配进行组间匹配, 独立样本 t 检验或 Mann-Whitney 秩和检验比较组间参数, 逐步法进行多因素线性回归分析术后 5 年角膜生物力学参数 SP-A1 与 SSI 的影响因素。

结果: FS-LASIK 组术后 5 年 A1-time 小于 SMILE 组 ($P < 0.001$), 其余角膜厚度参数、形变参数与硬度参数无显著差异。高度近视患者 FS-LASIK 组术后 5 年 A1-time、ARTh 小于 SMILE 组 ($P = 0.032, 0.006$)。术后 5 年 SP-A1 回归方程为 $\text{SP-A1} = -105.496 + 0.216 * \text{年龄} + 0.723 * \text{术前 S} + 6.069 * \text{bIOP} + 0.350 * \text{术后 CCT} - 1.762 * \text{术后 Km}$ ($R^2 = 0.868, P < 0.001$)。术后 5 年 SSI 的回归方程为 $\text{SSI} = 0.762 + 0.004 * \text{年龄} + 0.018 * \text{术前 SE} + 0.042 * \text{bIOP} - 0.100 * \text{术后 Km}$ ($R^2 = 0.388, P < 0.001$)。

结论: FS-LASIK 与 SMILE 术后 5 年角膜生物力学均稳定安全, 但需关注高度近视患者术后可能发生的角膜形变与厚度分布等角膜生物力学变化。临床诊疗应综合考虑年龄、近视程度、角膜厚度与角膜曲率等相关因素合理设计手术方案, 关注术后角膜生物力学情况, 为激光角膜屈光手术的长期稳定性与安全性提供保障。

摘要编号: 208078

近视患者 SMILE 术后角膜应力 - 应变指数变化幅度及其影响因素分析

第一作者: Chen TINGTING

共同作者: Wei CHI

目的: 探讨近视患者行小切口飞秒激光基质透镜取出术 (SMILE) 后角膜应力 - 应变指数变化幅度 (ΔSSI) 及其影响因素。

方法：回顾性研究。分析 2021 年 12 月至 2024 年 08 月行 SMILE 手术的近视患者 326 例 326 眼的临床资料，记录术前患者部分人口统计学信息；使用 Pentacam 70900 型三维眼前节分析诊断系统测量眼前节基础参数；使用 Corvis ST 角膜生物力学分析仪获取患眼新型角膜生物力学参数；记录术中光学区大小、角膜帽厚度、切削深度（Ablation depth, AD）、剩余基质床厚度（Residual stromal bed thickness, RSB）等手术相关参数。采用单因素分析众多潜在因素中，初步筛选出与 SMILE 术后 SSI 可能有关的变量；通过多元线性逐步回归分析，去除存在共性的变量，筛选出独立因素。以独立因素作为自变量，术后 SSI 作为因变量，分析各因素对于术后 SSI 的影响是否有统计学意义。

结果：本研究共纳入 326 例（326 眼）近视患者，其中男性 159 例，女性 167 例，平均年龄（23.36 ± 5.73）岁。术前屈光状态为：球镜 -0.75 ~ -8.50 D，平均（-5.02 ± 1.53）D；柱镜 -2.75 ~ 0 D，平均（-0.77 ± 0.62）D；等效球镜 -1.15 ~ -9.00 D，平均（-5.14 ± 2.48）D。术前眼压为（15.08 ± 2.17）mmHg，水平可见虹膜横径（11.51 ± 0.38）mm，暗瞳直径（6.08 ± 0.60）mm，眼轴长度（25.03 ± 0.93）mm。术中参数显示：角膜帽厚度（105.07 ± 2.17）mm，透镜厚度（88.34 ± 12.93）mm，功能性光学区（6.34 ± 0.22）mm，切削深度（71.45 ± 20.18）mm，残余基质层厚度（321.45 ± 18.22）mm。相关性分析显示，术前角膜应力-应变指数（SSI）与年龄、球镜、柱镜、等效球镜、眼轴长度、残余基质层厚度、前房深度、眼压及多种角膜生物力学参数均存在显著相关性（均 $P < 0.05$ ）。术后 SSI 与年龄、球镜、眼轴长度、残余基质层厚度、前房深度、眼压及动态形变参数亦呈显著相关（均 $P < 0.05$ ）。 Δ SSI 与球镜、等效球镜、角膜中央厚度、透镜厚度、角膜帽厚度、残余基质层厚度、切削深度、角膜速率及形变幅度参数均存在显著关联（均 $P < 0.05$ ）。多元线性回归分析进一步明确，术前 SSI（ $\beta = 0.392$, $P < 0.001$ ）、残余基质层厚度（ $\beta = 0.020$, $P < 0.001$ ）及年龄（ $\beta = 0.007$, $P < 0.001$ ）与术后 SSI 呈独立正相关；术前角膜速率（ $\beta = -0.009$, $P = 0.005$ ）及前房深度（ $\beta = -0.049$, $P = 0.012$ ）则呈独立负相关。性别与暗瞳直径亦是独立影响因素（均 $P < 0.05$ ）。最终回归模型可解释 31% 的术后 SSI 变异（ $R^2 = 0.31$ ），其方程为： $Y = -6.012 + 0.392 \times a + 0.020 \times b + 0.007 \times c - 0.009 \times d + 0.035 \times e - 0.049 \times f + 0.031 \times g$ （Y：术后 SSI；a：术前 SSI；b：RST；c：年龄；d：术前 CV；e：性别；f：术前 ACD；g：暗瞳直径）。

结论：年龄、性别、术前 SSI、残余基质层厚度（RST）、术前角膜速率（CV）、前房深度（ACD）及暗瞳直径是影响 SMILE 术后角膜应力-应变指数（SSI）变化的独立影响因素。

斜视与小儿眼科

摘要编号：210095

GLTC 医患沟通模式应用于眼科日间小儿斜视手术对家属手术相关知识知晓度、患儿心理应激及配合度的影响

第一作者：杨薇

目的：探讨 GLTC 医患沟通模式应用于日间小儿斜视手术中，对患儿家属手术相关知识知晓度、患儿心理应激及配合度的影响。

方法：选取 2023 年 1 月-2024 年 6 月我院收治的 74 例 3 至 12 岁以下行小儿斜视手术的患者作为研究对象，随机分为对照组和 GLTC 组，对照组接受常规沟通模式，GLTC 组采用 GLTC 医患沟通模式干预，每组各 37 例。比较干预后两组患儿家属手术相关知识知晓度，患儿心理应激情况及配合度状况。

结果：干预后，两组患儿家属手术相关知识知晓度均显著高于干预前，且 GLTC 组显著高于对照组，差异有统计学意义（ $P < 0.05$ ）；GLTC 组患儿入手术室后收缩压、舒张压、心率、视觉模拟评分法（VAS）得分均较干预前高，差异无统计学意义（ $P > 0.05$ ）；对照组患儿入手术室后收缩压、舒张压、心率、VAS 得分均显著高于干预前，且均显著高于 GLTC 组，差异有统计学意义（ $P < 0.05$ ）；GLTC 组患儿总配合度显著高于对照组，差异有统计学意义（ $P < 0.05$ ）。

结论：在小儿斜视手术中应用 GLTC 医患沟通模式能提高家属对手术相关知识知晓度，减轻患儿心理应激状态，有效提高患儿手术配合度。

摘要编号：204855

HIF-1 α /ANGPTL4 表达变化对 ARPE-19 细胞迁移和单层细胞通透性的影响及其可能的机制研究

第一作者：Wensi CHEN

共同作者：Daoman XIANG

目的：探讨缺氧诱导因子-1 α /血管生成素样蛋白 4 表达变化对人视网膜色素上皮细胞迁移和单层细胞通透性的影响，及其可能的病理机制。

方法: 取大鼠视网膜组织标本, 检测各组视网膜结构和视网膜 HIF-1 α 和 ANGPTL4 表达水平的变化。取 ARPE-19 进行培养。将细胞分为正常组、缺氧 8 小时组、缺氧 16 小时组和缺氧 24 小时组。缺氧组采用厌氧培养袋进行缺氧培养, 每组设 5 个复合组。检测缺氧环境下各组细胞中 HIF-1 α 和 ANGPTL4 的表达水平。将 HIF-1 α 和 ANGPTL4 抑制剂转染到细胞中, 置于厌氧培养袋中, 缺氧培养 16 小时。将细胞分为正常组、缺氧组、HIF-1 α 低表达组和 ANGPTL4 低表达组。测试测量细胞迁移能力、细胞通透性, 和表达各组均进行紧密连接蛋白 ZO-1 和 occludin 的水平检测。将细胞分为正常组、缺氧组、ANGPTL4 低表达组和 WP1066 组, 分别测定各组 VEGF、p-STAT3、ZO-1 和 occludin 的表达水平。

结果: 对照组视网膜中表达少量 HIF-1 α 和 ANGPTL4。随着病情的进展, HIF-1 α 和 ANGPTL4 的表达水平显著升高 ($P < 0.05$)。与正常组相比, 各缺氧组中 HIF-1 α 和 ANGPTL4 的表达水平随着缺氧时间的增加而显著增加 ($P < 0.05$)。与正常组相比, 缺氧组的细胞迁移能力、单层细胞通透性、ZO-1 和 occludin 的表达水平均显著提高 ($P < 0.05$)。与缺氧组相比, HIF-1 α 低表达组和 ANGPTL4 低表达组的细胞迁移能力、单层细胞通透性、ZO-1 和 occludin 表达水平均显著降低 ($P < 0.05$)。细胞迁移能力、单层细胞通透性和 ZO-1 表达水平均无显著差异——HIF-1 α 低表达组与 ANGPTL4 低表达组之间的差异 ($P > 0.05$)。与正常组相比, 缺氧组中 ZO-1 和 occludin 的表达水平显著降低, 而 VEGF 和 p-STAT3 的表达水平显著升高 ($P < 0.05$)。与缺氧组相比, ANGPTL4 低表达组和 WP1066 组中 ZO-1 和 occludin 的表达水平显著升高, 而 VEGF 和 p-STAT3 的表达水平显著降低 ($P < 0.05$)。

结论: 抑制 HIF-1 α /ANGPTL4 的表达可降低 ARPE-19 细胞的迁移能力和单层细胞的通透性, 可能通过激活 STAT3 的磷酸化来实现。

摘要编号: 209976

MRI 引导下的个体化斜视手术策略: Yokoyama 术式适应证的拓展与病例观察

第一作者: Tan DAPENG

目的: 探讨 Yokoyama 术式在外转受限型内斜视患者中的应用效果, 并评估 MRI 解剖学参数的指导意义。

方法: 回顾性分析我科收治的若干例内斜视合并外转不足患者, 术前均行 MRI 评估外直肌与上直肌夹角。对夹角 $> 120^\circ$ 的患者实施 Yokoyama 术式;

对夹角正常但存在明显外转不足者, 则行外直肌缩短术。两组均同时行内直肌后退术。术后随访眼位、眼球运动及立体视恢复情况。

结果: 在本组病例中, 陈某某、张某某及叶某某的 MRI 检查结果显示外直肌与上直肌夹角分别为 160.46° 、 136.31° 及 234.64° , 均显著大于正常值 (约 102°), 与不同程度的外转受限 (---)、(--)、(----) 相对应。三例患者均接受 Yokoyama 术式矫正, 术后眼位恢复至正位, 外转功能分别改善至 (-)、可、(--)。另一例李某某患者 MRI 夹角为 96.88° , 外转不足程度为 (-), 实施外直肌缩短术后同样获得患眼外转程度恢复为可。

结论: 外直肌与上直肌夹角不仅在高度近视相关固定性内斜视中具有重要的诊断和治疗学意义, 在部分非固定性外转不足病例中同样值得关注。通过 MRI 测量夹角并据此实施个体化的解剖学靶向术式, 不仅能够恢复眼位, 还可改善外转功能, 提示该策略有助于降低复发风险, 并具备进一步推广与临床应用的价值。

摘要编号: 205902

一项前瞻性临床研究: 改良式眼球震颤减弱术 治疗婴儿眼球震颤综合征疗效观察

第一作者: Xiaoyun XI

共同作者: Ping WANG, Dongsheng YANG, Yixin ZHANG, Peng ZHOU

目的: 眼球震颤的治疗是临床面对的棘手问题, 目前尚没有一种适用范围广且临床效果确切有效的治疗手段, 本研究将开展一项前瞻性临床研究, 通过一种新的以减震而非矫正头位为理念的手术方式治疗婴儿眼球震颤综合征 (Infantile Nystagmus Syndrome, INS), 观察其长期治疗效果, 为 INS 的临床治疗提供依据。

方法: 本研究纳入了 2023 年 6 月至 2025 年 4 月在我院诊断为 INS 且有手术适应症、无手术禁忌症的患者共 87 例, 其中男性 57 例, 女性 30 例, 平均年龄 15.63 ± 0.96 岁 (3~41 岁)。手术方式为改良后的四条水平直肌大量后退术, 利用基于视频眼动追踪技术的 FNND 眼动仪采集患者术前及术后 1 月、3 月、6 月、1 年的眼动波形, 主要观察指标包括眼震振幅、频率及眼球震颤视功能 (Nystagmus Acuity Function, NAF), 采用单因素方差分析法比较眼震振幅、频率、ANAF、WNAF 术前与术后不同随访时间的变化。

结果: 87 例受试者中 58.6% 的患者伴有斜视, 73.6% 的患者伴有异常头位。研究指标包括眼震振幅、ANAF、WNAF 在术后所有随访节点均较术前显著降低 ($P < 0.01$), 而眼震频率无显著变化

($P = 0.614$)；随访至术后 1 年，患者眼震幅度较术前平均下降了 50.4%，ANAF (LogMAR) 从术前的 0.68 ± 0.51 提升至 0.35 ± 0.23 ，WNAF (LogMAR) 从 0.56 ± 0.34 提升至 0.31 ± 0.30 ，差异均有统计学意义 ($P < 0.01$)。

结论：改良式眼球震颤减弱术适应症范围更广，能有效降低 INS 患者的眼震幅度，提高眼球震颤视功能，改善视力，且减震效果在术后 1 年仍保持稳定，是一种有效的 INS 治疗方式。

摘要编号：208070

三色分类管理在降低重庆市沙坪坝区学校近视发病率的有效性安全性研究（中期报告）

第一作者：Cong ZHANG

目的：研究三色分类管理方案在降低重庆市沙坪坝区学校近视发病率的有效性和安全性（中期报告）

方法：前瞻性队列研究，随机选择重庆市沙坪坝区 4 所小学校，以 3 年级学生为研究对象，入校行视力普查，根据裸眼视力和屈光状态分为非近视类（绿色）、近视前期类（黄色）和近视类（红色），绿色管理人群常规行视力普查，4 所小学校黄色管理随机分为对照组（组 1），红光组（组 2），翻转拍组（组 3），红光联合翻转拍组（组 4）予以干预，红色管理类人群建议医疗机构就诊。分析三色分类管理方案用于降低重庆市沙坪坝区儿童青少年近视发病率的有效性和安全性。

结果：基线时组 1、组 2、组 3、组 4 三年级学生总体近视率分别为：49%、44%、42% 和 62%，近视前期占比分别为：108/229 (47.16%)、234/479 (48.85%)、224/464 (48.27%)、177/394 (44.92%)，组 2、组 3、组 4 在校接受干预的近视前期学生人数分别为：68 人、73 人、64 人，半年后组 1、组 2、组 3、组 4 三年级学生总体近视率分别为：55%、42%、43% 和 58%，近视前期占比分别为：115/229 (50.2%)、218/479 (45.51%)、220/464 (47.41%)、165/394 (41.87%)。

结论：三色分类管理，在校干预近视前期能有效降低近视发病率，低强度单波长红光联合翻转拍训练较单一干预手段效果更好，无不良事件发生，用于学校控制儿童青少年近视进展值得推广。

摘要编号：210340

不同年龄急性共同性内斜视的临床特点及手术效果分析

第一作者：Lianyi SUN

共同作者：Xiaofei WU

目的：分析不同年龄急性共同性内斜视 (Acute Acquired Comitant Esotropia, AACE) 患者的临床特征及手术治疗效果。

方法：回顾性分析了 2020 年 12 月至 2024 年 6 月在我院接受手术治疗的共 153 例急性共同性内斜视患者的临床资料。根据发病年龄，将患者分为三组：儿童组 (4-13 岁)、青少年组 (14-19 岁) 和成人组 (> 19 岁)。收集患者临床资料，进行详细统计和比较。手术成功定义为末次随访时水平偏斜度数 ≤ 8 棱镜度 (PD)。

结果：研究共纳入 153 例患者 (男性 87 例，女性 66 例)，三组患者平均发病年龄分别为：儿童组 9.4 ± 2.8 岁，青少年组 16.5 ± 1.7 岁，成人组 30.5 ± 9.6 岁。各组屈光状态存在差异：13 岁及以下儿童以轻度远视至低度近视为主 $+0.0$ D (-1.5 D, 0.25 D)；14-19 岁青少年以低度至高度近视为主 -4.5 D, (-6.38 D, -2.26 D)；成人组则以中度至高度近视为主 -4.63 D, (-6.26 D, -3.16 D)。不同年龄组间的手术成功率无显著差异 ($P > 0.05$)。术后复视的发生率在各组之间并无显著差异 ($P > 0.05$)。

结论：AACE 患者术前的斜视角度与年龄呈负相关，随着年龄增长，斜视角度相对减小；但手术效果不受患者年龄和屈光状态的显著影响。

摘要编号：209595

不同类型微透镜设计离焦镜片对眼位的影响研究

第一作者：Xiao LIN

共同作者：Xin HAN, Guoping LI, Lili LI, Xiaofeng XIE

目的：分析配戴两种不同微透镜设计离焦镜片后对 6-12 岁儿童远、近眼位影响，进一步探讨对近视的控制效果。

方法：本研究采用回顾性分析的研究方法，收集 2022 年 1 月至 2023 年 12 月期间在山东中医药大学附属眼科医院就诊的 6-12 岁儿童验配 DIMS (Defocus Incorporated Multiple Segments) 多区正向光学离焦镜片 35 例、HAL (Highly Aspherical Lenslet) 高非球面微透镜环带镜片 35 例作为研究组，SV (Single Vision) 单光镜片 46 例作为对照组，以近距离隐斜初始值 > 6 棱镜度或远距离隐斜 > 3 棱镜度为标准，将配三种不同镜片

儿童分为 A 眼位异常组和 B 眼位正常组，比较其一年后的等效球镜度、眼轴、曲率、远近距离隐斜、NRA、PRA、AC/A 的变化，等效球镜度、曲率和眼轴变化仅分析右眼数据。

结果：一年后等效球镜度变化 A 组（眼位异常）：DIMS 组 $-0.64 \text{ D} (\pm 0.25)$ ，HAL 组 $-0.63 \text{ D} (\pm 0.30)$ ，SV 组 $-1.00 \text{ D} (\pm 0.28)$ ， $F = 10.928$ ， $P < 0.001$ （SV 组显著低于 DIMS/HAL 组，DIMS 与 HAL 无差异）B 组（眼位正常）：DIMS 组 $-0.49 \text{ D} (\pm 0.30)$ ，HAL 组 $-0.59 \text{ D} (\pm 0.31)$ ，SV 组 $-0.84 \text{ D} (\pm 0.36)$ ， $F = 7.062$ ， $P = 0.02$ （SV 组显著低于 DIMS/HAL 组，DIMS 与 HAL 无差异）；眼轴变化（一年）A 组：DIMS 组 $0.24 \text{ mm} (\pm 0.12)$ ，HAL 组 $0.30 \text{ mm} (\pm 0.17)$ ，SV 组 $0.42 \text{ mm} (\pm 0.11)$ ， $F = 7.48$ ， $P = 0.002$ （SV 组显著高于 DIMS/HAL 组，DIMS 与 HAL 无差异）B 组：DIMS 组 $0.25 \text{ mm} (\pm 0.10)$ ，HAL 组 $0.27 \text{ mm} (\pm 0.15)$ ，SV 组 $0.35 \text{ mm} (\pm 0.159)$ ， $F = 4.087$ ， $P = 0.021$ （SV 组显著高于 DIMS/HAL 组，DIMS 与 HAL 无差异）；角膜曲率（一年）A 组：DIMS 组： $-0.09 \text{ D} (\pm 0.32)$ ，HAL 组： $-0.03 \text{ D} (\pm 0.13)$ ，SV 组： $-0.02 \text{ D} (\pm 0.20)$ ， $F = 1.279$ ， $P = 0.288$ （无组间差异）B 组：DIMS 组： $-0.07 \text{ D} (\pm 0.16)$ ，HAL 组： $-0.10 \text{ D} (\pm 0.32)$ ，SV 组： $0.03 \text{ D} (\pm 0.23)$ ， $F = 1.88$ ， $P = 0.161$ （无组间差异）；远距离隐斜（一年）A 组：DIMS 组 $-1 \Delta (-3.625, 0)$ ，HAL 组 $0.5 \Delta (-2, 1.5)$ ，SV 组 $0 \Delta (-2, 2.25)$ ， $H = 2.842$ ， $P = 0.242$ （无组间差异）B 组（一年）：DIMS 组 $0 \Delta (-1, 1.5)$ ，HAL 组 $0 \Delta (-0.9375, 2.75)$ ，SV 组 $0 \Delta (-1.75, 2)$ ， $H = 0.762$ ， $P = 0.704$ （无组间差异）；近距离隐斜 A 组（一年）：DIMS 组 $4 \Delta (2, 6.25)$ ，HAL 组 $1 \Delta (0, 3)$ ，SV 组 $2 \Delta (-4.5, 5.75)$ ， $H = 3.847$ ， $P = 0.146$ （无组间差异）B 组（一年）：DIMS 组 $2 \Delta (-1, 3.5)$ ，HAL 组 $0 \Delta (-1, 3.75)$ ，SV 组 $-1 \Delta (-3, 2)$ ， $H = 4.65$ ， $P = 0.098$ （无组间差异）；AC/A 比值 A 组（一年）： $H = 0.409$ ， $P = 0.824$ （无组间差异）B 组（一年）： $H = 3.384$ ， $P = 0.184$ （无组间差异）；NRA（一年）A 组： $H = 0.021$ ， $P = 0.990$ （无组间差异）B 组： $H = 1.312$ ， $P = 0.519$ （无组间差异）；PRA（一年）A 组： $H = 0.39$ ， $P = 0.823$ （无组间差异）B 组： $H = 1.666$ ， $P = 0.435$ （无组间差异）。

结论：DIMS 与 HAL 镜片在眼位异常、眼位正常青少年人群中配戴一年后均能有效延缓近视屈光度及眼轴增长，效果优于单光镜片；两种镜片配戴前后角膜曲率、远近距离隐斜、AC/A、NRA、PRA 值无变化。

摘要编号：205511

中国儿童早发性高度近视的临床特征：关注合并症

第一作者：Xiaomei WAN

目的：总结中国早发性高度近视（eoHM）患儿的临床特征。

方法：本前瞻性观察性研究于 2024 年 7 月 15 日至 9 月 15 日在山东第一医科大学青岛眼科医院招募 eoHM 患儿。通过详细病史采集，全面检查受试者眼位、眼球运动、眼前节及后节，收集最佳矫正视力（BCVA）、等效球镜度（SE）、眼部生物参数等数据。

结果：本研究共纳入 232 例早发性近视儿童，其中 122 例（52.58%）为 eoHM 患儿，男性占 59.02%（72/122），女性占 40.98%（50/122）。eoHM 患儿平均年龄 4.2 ± 1.7 岁，平均 BCVA 为 0.65 ± 0.40 （logMAR），平均 SE 为 $-9.24 \pm 3.48 \text{ D}$ ，平均眼轴长度（AL） $24.94 \pm 2.16 \text{ mm}$ ，平均角膜曲率 43.17 ± 2.00 ，仅 17.45%（37 眼）eoHM 患眼 AL 超过 26 mm。值得注意的是，59.02%（72/122）的 eoHM 患儿合并其他眼部或全身疾病，其余 40.98%（50/122）为非综合征型 eoHM。最常见的合并症为晶状体脱位（23/122，18.85%），其次为遗传性视网膜变性（IRD）（14/122，11.48%）。

结论：超过半数 eoHM 患儿伴有其他眼部或全身疾病，以晶状体及眼底病变最为常见。临床需对 eoHM 患儿进行全面眼科检查和遗传学检测，及时发现并干预相关眼部和全身异常。

摘要编号：207553

中国北方学龄前儿童散光及其构成因素

第一作者：Yuanbin LI

共同作者：Jing FU, Yunyun SUN

目的：分析中国北方 3-6 岁学龄前儿童散光成分之间的关系，探讨其对屈光度和生物结构发展的影响。

方法：2021 年 11 月开始，在北京市通州区进行了一项基于人群的横断面研究。我们纳入了来自 9 所幼儿园的 3-6 岁儿童。散瞳前后分别测量屈光度，并使用 Lenstar 900 测量眼部生物参数。分析右眼数据，使用不同的分组（0.5、0.75、1.0 和 1.5 度）计算散光的患病率，并使用回归模型确定相关风险因素。使用 Spearman 相关系数、拟合曲线等分析散光各成分之间的关系。

结果：共纳入 1,410 名学龄前儿童（94.1%），平均年龄 4.44 ± 0.82 岁，其中 51.9% 为男孩。总散

光(RA)、角膜散光(CA)和眼内散光(IA)的均值分别为 -0.44 ± 0.34 D、 -1.04 ± 0.51 D、 -0.86 ± 0.38 D。RA、CA和IA的患病率分别为10.01%、49.68%和31.65%。患病率性别没有差异。低龄、女性、高AL/CR是高IA相关风险因素。RA和CA主要表现为规则散光(WTR), IA主要表现为逆规则散光(ATR)。近视前期儿童的RA最大;有足够的远视储备RA最小;RA和CA在远离正视化的过程中逐渐增加, IA基本保持稳定。RA、CA和IA随着AL的增加而逐渐减少。RA随着AL/CR的增加而逐渐增加。RA和CA在远离AL/CR范围[2.7, 2.8]的方向上逐渐增加。从二次拟合曲线可以看出, CA的变化幅度最大。大多数补偿类型都处于欠补偿(J0: 53.82%; J45: 31.07%)。

结论: 在中国北方3至6岁的学龄前儿童中, 远视储备儿童的RA和CA最小, 儿童的RA、CA随着远离正视化, 向近视前期和中高度远视的方向逐渐增加, IA相对稳定。眼部发育不协调(高AL/CR)会增加RA、CA和IA。角膜变化可能在中国3至6岁学龄前儿童的正视化中起着重要作用。补偿效应对中国学龄前儿童持续且显著, 特别是在J0方向。

摘要编号: 210217

儿童周期性外斜视2年观察1例

第一作者: Jinxin SONG

目的: 汇报一例周期性外斜视的特征和2年随访。

方法: 男孩, 10岁, 代主诉“一天正位, 一天斜视已三年”。家长诉三年内, 严格遵循一天正位, 一天外斜的规律。斜视日早上起床后即全天斜视, 正位日起床后即全天正位。眼科检查: 视力0.8/0.8, 眼轴右眼22.26 mm/左眼22.15 mm。双眼赛飞杰散瞳后+1.0 D远视。正位日查斜视度0/-8 Δ , 包眼后-8 Δ /-10 Δ , 立体视(远为随机点中距离立体视, 近为titmus立体视图片)200/40。斜视日(第二日), 斜视度裸眼视远-30 Δ , 视近-35 Δ , 包眼后视远-30 Δ , 视近-30 Δ , 立体视: 无/40。眼分视视觉功能检查提示: 斜视日单眼抑制, 右眼被抑制(与照片吻合)。正位日存在不完善双眼视, 远近动态立体视正常, 双眼有同时视但融合不好。时间和空间扭曲图尚圆。2025.07复查时父亲有新的发现: 如果第一天是斜视日, 第二天应为正位日, 但是超过12点睡觉后, 第二天仍是斜视。如果第一天是正位日, 第二天早上睡醒后马上做对眼训练, 则一天保持正位。本轮复查第一天为斜视日, 查体: 左眼为主导眼, 右眼自发外斜视, 控制不佳, 视力双眼1.0/1.0, 眼轴右

眼22.66/左眼22.66, 散瞳后SE=+0.50, 裸眼斜视度远-25 Δ /近-35 Δ , 立体视无/200, 双眼分视视觉功能检查提示: 斜视日单眼抑制, 右眼被抑制, 时间和空间扭曲图画不出。第二天本应为正位日, 但患儿超过12点睡觉, 表现为显斜视。在诊室内强行对眼训练无效, 表现为看远显斜视, 看近可维持正位。斜视度仍远-25 Δ /近-35 Δ , 立体视无/40。视视觉功能检查提示: 双眼存在同时视, 时间和空间扭曲图尚圆。第三天未就诊。

结果: 患儿两年随访斜视度数未变化, 眼轴增长速度在正常范围内, 近立体视出现下降, 周期规律也出现变化。预示着需要密切观察, 必要时手术治疗。

结论: 周期性斜视是一种特殊类型的、罕见的、具有时间规律的斜视类型。其病因和发病机制尚未明确, 周期性斜视应与周期性动眼神经麻痹以及重症肌无力鉴别。该病的治疗是以斜视日检查的斜视度进行手术。大部分学者建议在排除神经眼科器质性疾病后, 转变为恒定性斜视前进行手术。

摘要编号: 210028

先天性晶状体脱位患儿心理健康症状易感性预测: 预测模型的构建与验证

第一作者: Xiaolin LIANG

共同作者: Sijie CHEN, Guangming JIN, Danying ZHENG

目的: 旨在系统评估7-18岁先天性晶状体脱位(CEL)患儿的抑郁、焦虑症状水平, 明确其心理健康状况特点, 并构建预测模型, 为临床识别CEL患儿中心理健康症状高风险人群提供有效工具。

方法: 本研究为前瞻性研究, 纳入于2022年3月至2024年2月在中山大学中山眼科中心门诊及住院的48例CEL患儿作为研究组, 同时选取50例年龄、性别匹配的健康儿童作为对照组。采用经中文验证的儿童抑郁量表(CDI)和儿童焦虑相关情绪障碍筛查量表(SCARED)对所有受试者进行评估, 分别筛查抑郁和焦虑症状。收集患儿人口学特征、临床诊疗资料等潜在影响因素, 通过单因素和多因素逻辑回归分析筛选有效预测因子, 最终构建列线图预测模型。

结果: CEL患儿的CDI平均评分(12.4 ± 7.4)和SCARED平均评分(15.9 ± 11.7)均显著高于健康对照组(分别为 7.1 ± 6.3 和 9.9 ± 7.4), 差异具有统计学意义(P值分别为0.001和0.005)。35.4%的CEL患儿存在不同程度的抑郁或焦虑症状。多因素逻辑回归分析确定, 儿童年龄(比值比[OR]=1.815, 95%置信区间[CI]: 1.084-3.039)、病程(OR=1.557, 95% CI: 1.009-2.403)和全身异常(OR=19.894, 95% CI: 1.660-238.463)

被确定为焦虑症状的预测因子。受试者工作特征曲线下面积为 0.924 (95% CI: 0.845–1.000)，表明上述预测因子组合具有良好的预测效能。校准曲线显示列线图预测结果与实际观察结果一致性良好。决策曲线分析显示，该列线图具有临床实用性，在识别存在显著焦虑症状的患者方面具有更优的鉴别能力。

结论：CEL 患儿的抑郁和焦虑症状发生率显著高于健康儿童，提示其心理健康状况亟待关注。年龄、病程及全身系统异常是 CEL 患儿心理健康的影响因素，基于上述指标构建的列线图预测模型具有良好的预测准确性和临床适用性，可为临床医生早期识别 CEL 患儿中心理健康高风险个体提供科学依据。

摘要编号：209820

双侧下斜肌减弱术后双眼同向视物倾斜合并代偿头位的再次手术治疗

第一作者：Shi Qiang YANG

共同作者：Cheuk Sing YAM

目的：我们报道了垂直肌水平移位术治疗双侧下斜肌减弱术后双眼同向视物倾斜，合并头倾代偿头位患者的临床疗效。

方法：回顾研究 3 例双侧下斜肌减弱术后因视物倾斜维持头倾代偿头位的患者，病例 1 和 2，头向右肩倾，采用双眼下直肌同向移位术，右眼下直肌向颞侧，左眼下直肌向鼻侧移位，病例 3 右眼弱视，左眼主导，头向左肩倾，采用左眼上直肌后徙并鼻侧移位术。

结果：3 例患者术后主观视物倾斜均消失，头位改善，未引起新的垂直斜视。远期随访，患者头位维持正位，未再诉视物倾斜。

结论：双侧下斜肌减弱术后第一眼位正位的患者，仍可能因为视物倾斜维持头倾代偿头位，垂直肌同向水平移位术，通过产生相应的旋，矫正视物倾斜，从而改善残余的代偿头位。

摘要编号：209729

双眼上斜肌延长术治疗儿童内斜视 A 征的疗效观察

第一作者：Tong QIAO

共同作者：Haiyun YE

目的：内斜视 A 征定义为向下注视时相比向上注视时斜视度数增加超过 10 棱镜度。本研究旨在评估双眼上斜肌延长术——一种无植入物技术——在治疗伴有双侧上斜肌功能亢进的儿童内斜视 A 征中的

长期疗效，并探讨其相较于传统硅胶垫片及肌腱切断术在规避相关并发症方面的优势。

方法：本回顾性队列研究纳入了所有诊断为内斜视 A 征伴双眼上斜肌功能亢进的患者，均接受采用不可吸收聚丙烯缝线的双眼上斜肌缝线延长术，并联合内直肌后徙术。术前及术后评估包括九个注视方向的棱镜遮盖试验、眼底照相以及上斜肌功能亢进分级。

结果：本研究共纳入 32 名儿童的 64 只眼，平均年龄为 7.0 (3.1) 岁，平均术后随访时间为 35.2 (15.6) 个月 (范围：8–55)。平均内斜视 A 征度数由术前的 23.4 (7.7) 棱镜度显著降低至术后的 2.4 (2.3) 棱镜度 ($P < 0.001$)，降幅达 88.3%。原发性注视位的平均水平内斜视度数由 37.5 (10.9) 棱镜度改善至 1.7 (1.8) 棱镜度 ($P < 0.001$)。平均客观眼底旋转度数由 10.9 (2.5) 度下降至 1.1 (1.4) 度 ($P < 0.001$)，且无一例出现旋转性复视或垂直性偏斜。上斜肌功能亢进分级由 2.8 (0.7) 级恢复正常至 0.2 (0.4) 级 ($P < 0.001$)。未观察到缝线相关并发症，且眼位稳定性维持至末次随访。

结论：在儿童内斜视 A 征手术中，上斜肌缝线延长术展现了良好的生物力学精确性、解剖结构保留效果，并消除了植入物相关风险。该术式在有效矫正内斜视 A 征、恢复正常旋转眼位及获得持久疗效方面的优势，使其成为治疗双眼上斜肌功能亢进的一线手术方案。本研究填补了小儿眼科学领域的重要空白，提供了更长期的随访数据，并凸显了微创、与生长发育相容技术在保护视觉发育方面的重要价值。未来需要更大样本量及更长随访期的随机试验来进一步确认该术式治疗内斜视 A 征的疗效与安全性。

摘要编号：209894

双眼视训练对小角度的间歇性外斜近视儿童的疗效分析

第一作者：Zhang JUN

目的：分析双眼视觉训练对于小角度的间歇性外斜近视儿童的疗效。

方法：选取 2024 年 3 月到 2025 年 9 月于西安爱尔古城眼科医院就诊的小角度间歇性外斜近视儿童 60 例，随机分为两组，治疗组 30 例在院进行每周两次的双眼视觉训练，对照组 30 例仅进行配镜治疗，所有患者年龄均为 8~14 岁之间，无眼部疾患，屈光度为 $-0.50\text{ D} \sim 4.00\text{ D}$ 之间，远距斜视度 $\leq 20\text{ PD}$ ，近距斜视度 $\leq 25\text{ PD}$ ，对两组患儿进行治疗前和治疗后 3 月、6 月的看远斜视度、看近斜视度，立体视检查，采用 T 检验和卡方检验进行分析。

结果：训练前治疗组和对照组的看远、看近斜视度、立体视、近视比例方面差异均无统计学意义 ($P > 0.05$)，治疗 3 个月时对照组的看远、看近斜视度均大于治疗组，差异有统计学意义 ($t = 3.43 P < 0.05$, $t = 2.57 p < 0.05$)；治疗 3 个月时，两组之间立体视差异无统计学意义；治疗 3 个月时，治疗组看远斜视度无明显变化，差异无统计学意义 ($P > 0.05$)看近斜视度和立体视(Titmus)均优于训练前，差异有统计学意义，($P < 0.05$)；治疗 6 个月时对照组的看远、看近斜视度均大于治疗组，差异有统计学意义 ($P < 0.05$)；治疗 6 个月时治疗组看远、看近和立体视均优于训练前，差异有统计学意义 ($P < 0.05$)。

结论：双眼的视觉训练对于小角度的间歇性外斜儿童眼位控制和立体视的改善具有积极的作用。

摘要编号：209883

反向 Yokoyama 手术矫正高度近视相关内上斜视一例

第一作者：Jinxin SONG

共同作者：Liang TIAN

目的：探讨反向 Yokoyama 手术在高度近视合并眼球下颞部后巩膜葡萄肿所致内上斜视中的应用效果，并分析其在异常直肌走行及眼球移位情况下的手术原理与可行性。

方法：患者，男性，45 岁，因主诉“右眼自幼内斜视，伴有磨涩不适 5 年余”就诊，欲通过手术矫正斜视。入院检查示右眼内斜 45° 以上，并伴上斜约 10° 。眼球运动检查发现右眼外转及下转严重受限。屈光检查示双眼高度近视，右眼眼轴明显延长。MRI 扫描显示右眼球后极部增长，形成后巩膜葡萄肿，与颞下方眼眶壁接触紧密；外直肌向上移位，下直肌向鼻侧移位，眼球后极部向颞下方移位。在全身麻醉下实施右眼内直肌后徙 + 反向 Yokoyama 术（外直肌及下直肌连接术）。术中行右眼内直肌缝线后切断，外直肌下方 $1/2$ 肌腹和下直肌颞侧 $1/2$ 肌腹在原肌止点后 14 mm 用 5-0 不可吸收缝线进行联扎，外直肌和下直肌的肌腹不劈开，随后内直肌后徙至 9.0 mm。

结果：术后患者眼位恢复正位，眼球外转和下转活动范围明显好转。术后 2 周及 3 个月随访时眼位稳定。

结论：高度近视性斜视常因眼球后极移位导致外直肌及上直肌间 pulley 异常，典型表现为内下斜。传统 Yokoyama 术通过联合外直肌与上直肌，有效重建上颞方 pulley。与高度近视常见的限制性内下斜不同，本病例表现为一种相对罕见的内上斜。在该患者中，右眼后极在眼球发育过程中颞下

方的 pulley 结构的断裂，导致了非典型的斜视。我们推测，这种罕见的眼位类型与后巩膜葡萄肿的具体部位密切相关。正如 Demer 所报道的，在轴性高度近视中，后巩膜膨出的部位可能对邻近的眼外肌产生“cam-like effect”，这一机械性影响机制被称为“knobby eye 综合征”。在本病例中，MRI 显示右眼后巩膜膨出位于颞下方，该部位的膨出对邻近的外直肌、下直肌及下斜肌形成“cam-like effect”，导致这些肌肉的解剖移位。我们采用与“Yokoyama 手术”相同原则治疗本例患者，取得了良好效果。术后患者眼位正位，对手术美容效果表示满意。本病例从不同角度进一步印证了 Yokoyama 2001 年提出的“将眼球置于肌圆锥内”的核心理念。

摘要编号：206217

基于斜视术后多模态短期可塑性训练的眼间抑制影响：中心凹与旁中心凹区域的对比研究

第一作者：Yingqing YU

目的：本研究旨在评估基于斜视术后多模态短期可塑性训练对眼间抑制的影响，重点分析中心凹与旁中心凹区域的恢复差异。

方法：本研究纳入 170 例斜视患者，分别在术前、术后第 3 天（训练前）和术后第 3 天（训练后）进行眼间抑制评估，采用等级评分（R0-R3）衡量抑制程度。所有患者接受单次 20 分钟的多模态视觉训练。统计分析采用 Friedman 检验和 Wilcoxon 符号秩检验进行比较。

结果：术后短期训练显著改善了眼间抑制的总体水平 ($p < 0.0001$)。区域特异性分析显示，旁中心凹区域的抑制在术后第 3 天（训练前）已显著下降 ($p < 0.0001$)，并在训练后进一步改善。相比之下，中心凹区域的抑制在训练后才表现出显著的改善 ($p < 0.0001$)。在中心凹区域，CXT 组与 IXT 组的抑制差异未达到统计学显著性 ($p = 0.110$)，然而在旁中心凹区域，CXT 组的抑制水平显著高于 IXT 组 ($p = 0.025$)。

结论：研究表明，斜视术后视觉功能恢复存在区域异步性。旁中心凹区域的恢复较为迅速，而中心凹区域的恢复更依赖于主动的短期可塑性训练。术后早期训练有效，特别是在改善中心凹区域抑制和缩小 CXT 与 IXT 患者之间的功能差异方面，支持个体化训练方案的应用，促进双眼视觉功能重建。

摘要编号: 209949

基于穿戴式眼动仪的间歇性外斜视自发偏斜幅度和频率的量化评估

第一作者: Jie HUANG

共同作者: Xiaoning LI, Xiangzhong TANG, Zhikuan YANG, Jinyou ZOU

目的: 提供一种基于穿戴式眼动追踪技术的间歇性外斜视 (Intermittent Exotropia, IXT) 自发偏斜幅度与发生频率量化评估方法, 并与临床常用 IXT 患者偏斜角度及眼位控制能力评估方法进行比较。

方法: 本研究为一项前瞻性观察性研究。首先, 所有受试者均被要求在佩戴可穿戴式眼动仪的同时, 依次观看远距 (6 m) 及近距 (40 cm) 下播放的动画视频各 20 分钟; 并在观看视频前后, 进行了受试者双眼正位注视及单眼偏斜状态下的基线眼位测量各 30 秒, 用以计算偏斜阈值。随后, 将眼动仪记录所得转化为每记录帧双眼水平方向聚散角时间频率直方图, 并基于偏斜阈值建立聚散角高斯分布拟合模型, 最终通过模型计算得到 IXT 患者在执行视频观看任务时的自发偏斜频率及偏斜幅度的动态监测结果。此外, 本研究使用三棱镜交替遮盖试验 (Prism and Alternative Cover Test, PACT) 及诊室控制力评分 (Mayo Clinic Office-based Scale, MCOS) 同步采集了受试者的偏斜角度大小及眼位控制能力, 并与眼动测量结果进行比较分析。

结果: 本研究共纳入 21 名 IXT 患者 (年龄: 7-18 岁, 偏斜角度: 2-52 $^{\circ}$)。眼动仪测得的偏斜幅度与 PACT 结果在近距 ($r = 0.76$, $P < 0.001$) 与远距 ($r = 0.89$, $P < 0.001$) 均高度相关。自发偏斜的发生频率在近距离与 MCOS 评分显著相关 ($r = 0.58$, $P = 0.004$), 但在远距离无显著相关性 ($P = 0.82$)。此外, 4 名患者完成了不同日期的重复测量, 眼动仪测得的偏斜幅度一致性良好, 近距 95% 一致性界限为 $1.31 \pm 2.63^{\circ}$, 远距为 $0.27 \pm 2.14^{\circ}$ 。

结论: 本研究结果表明, 结合偏斜阈值算法的穿戴式眼动追踪系统可客观量化不同偏斜幅度的 IXT 在自然活动状态下的自发偏斜幅度与频率, 具有可观的临床应用价值。

摘要编号: 210148

对侧眼手术治疗儿童核上型单眼上转不足

第一作者: Lin CHEN

共同作者: Qing LIU, Xiao Jiao TANG

目的: 本研究旨在基于神经支配法则, 通过实施对侧下斜肌前转位联合上直肌后退术, 治疗核上型单

眼上转不足 (Monocular elevation deficiency, MED), 同时矫正水平斜视, 实现复杂斜视的同步治疗。

方法: 本研究为单中心、回顾性病例系列研究, 纳入 2021 年至 2024 年在我院诊断为核上型 MED 的患儿 (患眼贝尔征阳性、被动牵拉试验阴性)。患儿均接受对侧下斜肌前转位联合上直肌后退手术, 若存在水平斜视, 则同步进行水平斜视矫正手术。术前及术后末次随访时, 对患者的视力、远近眼位偏斜角度、眼球运动、上睑下垂程度及是否需要二次斜视手术进行评估。

结果: 本研究共纳入 5 例患者, 平均手术年龄为 8.0 ± 2.2 岁, 其中男性 2 例 (40%), 女性 3 例 (60%)。垂直斜度平均为 27.00 ± 5.70 PD, 3 例患者合并外斜, 斜度为 30.33 ± 7.64 PD, 所有患者均存在上睑下垂 (真性 1 例, 假性 4 例)。平均随访时间为 9.2 ± 3.03 个月。术后, 所有患者均未出现超过 5 PD 的水平及垂直斜度, 患眼上转功能明显改善, 4 例假性上睑下垂术后好转, 1 例真性上睑下垂患者接受二次睑下垂矫正手术, 但无患者需要接受斜视二次手术。

结论: 对于核上型 MED 病例, 基于神经支配原理的对侧上转肌减弱手术是一种简单且可靠的治疗方案。通过合理设计同步联合水平斜视手术, 可有效降低旋转斜视、眼前节缺血等并发症的风险。

摘要编号: 209001

急性共同性内斜视患者的静息态脑镜像同伦功能连接改变研究

第一作者: Jiayu CHEN

共同作者: Jing FU, Jie HAO

目的: 探讨基于体素镜像同伦连接 (voxel-mirrored homotopic connectivity, VMHC) 方法研究急性共同性内斜视患者和健康受试者大脑中同位点之间的功能连接差异及其与病程和临床症状的关系。

方法: 一项单中心、前瞻性和观察性研究。纳入 2021 年 1 月至 2022 年 12 月期间北京同仁医院斜视与小儿眼科就诊的 AACE 患者和年龄、性别、受教育年限相匹配健康对照志愿者。收集 32 例 AACE 患者和 31 例匹配对照者的 rs-fMRI 信号和眼科检查结果、心理量表评分。静息态功能磁共振成像 (resting-state functional magnetic resonance imaging, rs-fMRI) 数据及结构像数据进行 VMHC 分析, 并采用双样本 t 检验分析组间 VMHC 差异, 并与临床指标进行相关性分析。

结果: 两组在性别、年龄、身高、体重间均无统计学差异。与对照组相比, AACE 患者组额上回、

前扣带回的 VMHC 值降低, 差异具有统计学意义 ($P < 0.05$)。AACE 者组前扣带回中尾状核区的 VMHC 值与斜视度、近距离用眼时间呈正相关 ($r = 0.416$, $P = 0.018$; $r = 0.381$, $P = 0.034$), 扣带回中的嗅皮质的 VMHC 值与近距离用眼时间也呈正相关 ($r = 0.389$, $P = 0.031$)。

结论: AACE 患者额叶和边缘叶的 VMHC 值发生了改变, 提示 AACE 可能导致内侧额回功能和前扣带回功能障碍, 这种变化与不良的用眼习惯和斜视的严重程度有关。

摘要编号: 207723

改良调整缝线技术对急性获得性共同性内斜视手术疗效的影响

第一作者: Jingchang CHEN

共同作者: Bingbin MA, Qian SUN

目的: 探讨改良术后缝线调整对术后早期出现明显隐性或显性斜视的急性获得性共同性内斜视患者的手术疗效的影响。

方法: 对在 2020 年 1 月~2024 年 3 月期间在我院手术且术后早期斜视度 $\geq 10^\circ$ (单马氏杆检查) 的急性获得性共同性内斜视患者的病历资料进行回顾性分析。入选患者均在术中预置了改良短小标记调整缝线。根据术后一周内是否进行缝线调整分为调线组和非调线组。手术成功定义为复视消失且视远和视近斜视度均 $\leq 10^\circ$ (单马氏杆检查)。所有患者的术后随访时间不少于 2 个月。

结果: 共 21 例纳入调线组, 20 例纳入非调线组。在术后早期没有实施缝线调整前, 两组的手术成功率没有显著性统计学差异 (调线组为 9.5%, 非调线组 30.0%, $P = 0.130$); 调线组的视远斜视度 ($17.76 \pm 5.16^\circ$) 大于非调线组 ($13.40 \pm 3.05^\circ$) ($P = 0.002$)。在术后末次随访时, 调线组的手术成功率 (85.7%) 高于非调线组 (45.0%) ($P = 0.009$); 调线组的视远斜视度 ($6.05 \pm 4.79^\circ$) 低于非调线组 ($13.70 \pm 7.48^\circ$) ($P < 0.001$)。

结论: 对术后早期斜视度 $\geq 10^\circ$ (单马氏杆检查) 的急性获得性共同性内斜视患者在术后一周内实施改良术后缝线调整, 不仅可以进一步降低其斜视度, 使其术后隐斜视度变得更小, 还能提高其手术成功率。

摘要编号: 204571

早产儿视网膜病变联合指标早期预测价值研究

第一作者: Wen SHI

共同作者: Shuo WANG

目的: 本研究旨在探讨入院临床指标对早产儿视网膜病变 ROP 的早期预测价值。

方法: 回顾性纳入 98 例平均胎龄 30.42 ± 1.20 周的早产儿, 其中 ROP 组 49 例、非 ROP 组 49 例, 收集入院时体温、体重、心率、血压、红细胞、血红蛋白、红细胞分布宽度、直接胆红素、总胆红素等 11 项指标, 通过 ROC 曲线评估各指标及联合指标对 ROP 的预测价值。

结果: 结果显示 ROP 组收缩压、红细胞、血红蛋白、直接胆红素、总胆红素显著高于非 ROP 组, 单独指标中直接胆红素预测价值最佳曲线下面积, 联合 11 项指标后预测价值显著提高, 因而联合指标预测价值显著优于单独指标。

结论: 研究表明基于入院常规检查指标的联合模型对 ROP 具有优异预测价值, 该方法简便易行、成本效益高、有助于基层医疗机构早期识别高风险患儿并及时干预, 为 ROP 的早期防治提供了实用工具。

摘要编号: 209312

白化病相关视觉损伤的临床特征

第一作者: Ping WANG

目的: 通过探讨白化病患儿的视觉损伤相关因素, 指导白化患者临床视觉康复治疗。

方法: 收集了 2018/1/1 到 2025/3/31 期间我科收集的 493 白化患者的临床资料, 包括矫正视力, 屈光状态, 眼底色素, 黄斑中心凹分化程度, VEP 及 ERG。所有的患者经过基因检测确诊了白化类型。

结果: 1. 291 男性和 202 女性, 5~49 岁, 平均年龄 15.71 ± 6.59 y; 2. 其中 OCA1A 219 例, OCA1B 43 例, OCA2 98 例, OCA3 6 例, OCA4 31 例, HPS 40 例, OA 56 例; 3. 未治疗前平均矫正视力 0.05~0.4 不等, 平均 0.17 ± 0.66 ; 4. 高度屈光不正高发, 其中 199 例 (40.37%) 患者高度散光 (> 3 D), 45 例患者 (9.13%) 高度近视 (> -6 D), 66 例 (13.39%) 患者高度远视 ($> +5$ D); OCA1 中高度屈光不正患者最多 (178 例, 36.11%); 5. 黄斑中心凹分级 FH1 共 6 例, FH2 共 10 例, FH3 共 8 例, FH4 共 469 例; 其中 OCA1、HPS 和 OA 患者都是 FH4; 5. 矫正视力与中心凹分级成负相关, $r = -0.71$; 6. 74 例 (74%) 患者伴有内斜视, 123 例 (25%) 患者伴有外斜视,

32 例 (6.5%) 患者伴有垂直斜视, 46 例 (9.3%) 患者伴有 DVD; 7. 所有患者都伴有眼球震颤, 其中钟摆型 401 例, 跳动型 52 例, 混合型 40 例; 8. 425 例 (86.2%) 患者伴有头位, 其中 chin down 205 例 (41.58%), face turn 108 例 (21.91%), head tilt 42 例 (8.52%), 混合头位 70 例 (14.20%); 38 例 (7.71%) 患者伴有晃头; 8. OCA1、HPS 及 OA 组的视力低于其他组 (分别为 0.078 ± 0.039 ; 0.094 ± 0.023 ; 0.096 ± 0.041), OCA2 组视力最佳 (0.251 ± 0.119), OCA4 其次 (0.214 ± 0.09)。

结论: 1. 白化患者的视觉损伤严重, 与屈光不正、感觉系统发育异常和运动损伤有关; 2. 黄斑中心凹发育不良分级与视力相关; 3. 治疗白化患者中的眼震, 头位及斜视对于改善视力有益。

摘要编号: 209609

精神行为异常相关性创伤致儿童视网膜脱离两例: 临床特征与诊疗反思

第一作者: Xiao LUO

共同作者: Yun LI

目的: 探讨精神行为状态异常相关性创伤导致的患儿严重视网膜脱离的临床特征及诊疗反思。

方法: 我们收集了 2 例 2024 年 8 月至 2025 年 6 月于本院眼科就诊的精神行为状态异常相关性创伤导致患儿严重视网膜脱离, 收集其术前检查结果, 术中手术视频及术后复查情况, 并回顾了精神行为状态异常相关性创伤导致严重眼科疾病临床特征与诊疗思路 (包括医学和精神病学) 的现有文献。

结果: 精神行为状态异常相关性创伤导致的患儿严重视网膜脱离, 在临床诊疗中存在诸多困难: 精神行为异常疾病种类多样, 患儿自身眼球壁结构更为脆弱, 其监护人疏忽及患儿本身的沟通障碍导致就诊时机延误, 术前检查评估的配合性较差, 术中的麻醉风险及术后康复的不可配合等导致其视网膜脱离范围更为广泛, 病情更为严重。因此, 对于存在精神行为状态异常相关性创伤的患儿, 眼科医生在接诊时应更加细致、耐心和全面, 首先, 需要充分了解患者的病史和病情, 包括其精神心理状态、可能的行为问题及是否存在外伤史。其次, 在进行眼科检查时, 需要采取适当的方法和技巧, 以确保患者能够配合并尽可能准确地获取检查结果。最后, 在制定治疗方案时, 可通过跨学科合作, 与精神科医生、儿科医生、内分泌科医生等共同为患儿提供诊疗, 综合考虑患者的整体情况和各种合并症, 以确保治疗的有效性和安全性。

结论: 眼科医生应重视这一现象, 从而进行早期诊断, 且通过跨学科协作, 全面考量患儿的整体状况与合并症, 为患儿及其监护人给予充足的教育、咨

询和服务, 同时建立恰当的术后行为管理 (精神科药物调整、护理指导), 避免永久性眼部损伤。

摘要编号: 206448

虹膜上的 “不速之客” —— 3 岁神经母细胞瘤患儿化疗中的眼内转移

第一作者: Aoxiang WANG

共同作者: Yu TIAN

目的: 本研究旨在报道 1 例 3 岁 8 个月大神经母细胞瘤患儿在原发肿瘤切除及化疗期间突发虹膜转移的罕见病例, 通过临床-病理对照分析, 探讨化疗期眼内转移的临床特征、诊疗策略及早期干预的重要性, 为儿童神经母细胞瘤眼部并发症的监测提供新的临床证据。

方法: 纳入 1 例经手术及病理确诊的腹膜后神经母细胞瘤男性患儿 (3 岁 8 个月), 术后接受化疗。化疗第 14 天因家长发现左眼异常白色反射就诊眼科, 排查眼部转移。临床检查可见: 左眼虹膜表面可见灰白色囊性圆形隆起病灶, 伴血管化, 无炎症反应及显著视力损害 (A)。UBM 提示左眼虹膜表面异常实性隆起 (E)。术中评估: 全身麻醉下行肿瘤切除术, 术中荧光素血管造影证实病灶血管灌注 (B)。切除的虹膜肿瘤组织行组织病理学及免疫组化分析, 与原发腹膜后肿瘤病理特征对比, 确认同源性 (C)。随访还发现脑部 MRI 显示 t1 加权图像 (白色箭头) 显示局部不均匀信号, 表明中枢神经系统受累 (D)。

结果: 1. 临床特征与诊疗过程: 虹膜转移发生于原发肿瘤切除术后、化疗早期 (第 14 天), 不同于文献中常见的 1 岁内婴儿期发病。虹膜病灶组织学及免疫表型与原发腹膜后神经母细胞瘤完全一致, 证实血行转移来源。2. 文献对比与罕见性: 既往报道的虹膜神经母细胞瘤几乎均发生于 1 岁以下婴儿, 且多为初诊时发现原发瘤; 本例为 3 岁儿童化疗期新发转移, 突破经典文献中 “婴儿期好发” 及 “转移多伴随原发瘤诊断” 的共识。

结论: 临床警示: 神经母细胞瘤化疗期间可能出现罕见的虹膜快速转移, 尤其需关注 3 岁以下儿童 (即使超过传统好发年龄 1 岁) 的眼部监测, 建议将眼科检查纳入化疗期常规评估。诊疗策略: 对原发瘤切除术后病情稳定的患儿, 若出现虹膜血管化结节, 需高度怀疑转移可能, 及时通过术中血管造影及病理活检明确诊断。学术价值: 本例首次报道了一例罕见的 1 岁以上的神经母细胞瘤虹膜转移的儿童病例, 证实化疗期可能成为眼内转移的潜在窗口期, 为儿童实体瘤眼部并发症的早期干预提供新依据。

摘要编号: 208768

视觉训练对不同类型儿童弱视视觉功能影响的纵向回顾性研究

第一作者: Jiefang WANG

目的: 本研究旨在纵向评估视觉训练对四种不同类型(屈光不正性、屈光参差性、斜视性、形觉剥夺性)儿童弱视的疗效, 重点考察其在远近视力、调节功能、眼间抑制及立体视功能上的恢复轨迹与差异。

方法: 本项回顾性队列研究共纳入 171 例弱视患儿, 其中屈光不正性弱视 61 例, 屈光参差性弱视 81 例, 斜视性弱视 12 例, 形觉剥夺性弱视 14 例。收集所有受试者在基线期及接受视觉训练后 1 至 6 个月的纵向随访数据。主要观察指标包括: LogMAR 远/近视力、单眼调节幅度(D)、调节灵活度(cpm)、基于 Worth 四点灯评估的眼间抑制状态以及立体视锐度(角秒)。采用重复测量方差分析与 Cochran's Q 检验分析各视觉功能指标的纵向变化及组间差异。

结果: 经过 6 个月的视觉训练, 所有类型弱视患儿的平均远视力均获得显著提升($P < 0.001$), 其中屈光不正性与屈光参差性弱视的改善幅度尤为突出。调节幅度和调节灵活度亦表现出显著改善($P < 0.01$)。在双眼视功能方面, 眼间抑制状态发生显著良性转变($P < 0.001$), 成功建立双眼融合的患儿比例随时间显著增加。立体视锐度的改善与眼间抑制的减轻呈显著正相关。亚组分析显示, 相比之下, 斜视性与形觉剥夺性弱视组虽视力有所改善, 但其双眼视功能的恢复程度相对有限。

结论: 视觉训练能有效改善各类弱视患儿的视力及调节功能, 尤其对屈光不正性与屈光参差性弱视效果显著。该疗法可显著减轻眼间抑制, 促进双眼融合, 进而重塑立体视觉。因此, 眼间抑制状态的改善可作为评估视觉训练疗效及预测立体视恢复潜力的关键生物学指标。对于斜视性及形觉剥夺性弱视, 可能需要联合其他治疗策略以获得更全面的功能康复。

摘要编号: 208804

针刺治疗糖尿病眼外肌麻痹 1 例

第一作者: 胡琬秋

共同作者: 罗燕

目的: 报告采用针刺疗法治疗糖尿病性眼外肌麻痹的个案, 探讨针灸治疗糖尿病并发眼外肌麻痹患者的临床疗效, 评估非药物治疗方案的可行性。

方法: 男性患者, 主诉右眼复视 6 月就诊, 既往有糖尿病史 2 年, 查右眼外转受限, 西医诊断为糖尿病性眼外肌麻痹(右眼外展神经麻痹), 中医诊断

为目偏视(风痰阻络)患者, 予针灸治疗, 以灵龟八法开穴、局部取穴与循经取穴相结合, 主穴取双侧睛明、攒竹、丝竹空透鱼腰、太阳、瞳子髎、承泣、头临泣、百会、四神聪, 远端取双侧合谷、列缺、曲池、足三里、阴陵泉、光明、三阴交、太冲。针刺手法以平补平泻为主, 得气后留针 30 分钟, 期间行针 1 次。每周治疗 2 次, 10 次为 1 个疗程, 共治疗 2 个疗程。

结果: 治疗 1 个疗程后, 患者诉复视明显减轻, 仅视近有重影, 视远已无重影, 眼球外转已接近外眦角。治疗 2 个疗程后, 患者诉已无复视, 眼球外转不受限, 临床治愈。

结论: 针灸治疗糖尿病性眼外肌麻痹具有显著疗效, 能明显改善症状并促进功能恢复, 体现了针灸在治疗眼外肌麻痹中的优势, 可作为安全有效的治疗方案推广。

摘要编号: 210078

青少年近视患者配戴离焦型 RGP 镜片的临床观察

第一作者: 袁湘华

共同作者: 许江涛

目的: 评估离焦型硬性透气性角膜接触镜在控制青少年近视进展中的临床有效性、安全性及患者配戴依从性。

方法: 本研究为前瞻性临床观察。纳入 47 例(94 眼) 8~18 岁的近视青少年患者, 全部验配离焦型 RGP 镜片。通过随访观察患者的配戴适应时间、以眼轴长度变化评估近视控制效果, 并记录配戴相关并发症及弃戴/失访情况。

结果: 所有入选 94 眼均一次性配戴成功, 且均在 2 周内适应全天配戴。在完成 12 个月随访的患者中(58 眼), 有 34 眼(58.6%) 年眼轴增长量 ≤ 0.2 mm, 16 眼(27.6%) 年眼轴增长量 ≥ 0.2 mm。在整个随访期间(3、6、9、12 个月), 未发生严重的角膜擦伤或溃疡等并发症。然而, 共有 10 眼(10.6%) 因个人原因弃戴, 另有 26 眼(27.7%) 在 6 个月后失访。

结论: 离焦型 RGP 镜片为控制青少年高度近视提供了一种有效且相对安全的临床选择, 尤其适用于高度近视或伴有角膜不规则但近视仍快速进展的青少年群体。然而, 其长期控制效果、安全性以及如何改善患者的长期依从性, 仍需更大样本和更长随访期的研究进一步证实。

12 种 IOL 计算公式对长眼轴白内障患者计算度数的准确性分析

第一作者: Tianxu PEI

目的: 比较 12 种人工晶状体 (IOL) 计算公式对眼轴 > 26 mm 的白内障患者人工晶体度数的准确性及对误差进行分析。

方法: 前瞻性研究。选取 75 名长眼轴白内障患者 (150 眼), 根据眼轴长度分为 26~28 mm 组、28~30 mm 组及 > 30 mm 组, 白内障术前及术后使用 IOL Master 700 进行检查, 使用 12 种不同的人工晶体计算公式进行计算, 比较不同组中各种人工晶体计算公式下的预测误差 (Predicted Error, PE)、平均预测误差 (Mean Predicted Error, MPE)、绝对预测误差 (Absolute Predicted Error, APE; $APE = |PE|$), 以及误差在不同范围内的分布情况。

结果: 在 26~28 mm 组, Barrett Universal II、Hill-RBF 及 Kane 公式的 MPE 接近于 0, 其中 Barrett Universal II 公式的 MPE 最小, 为 -0.01 D, Barrett Universal II 公式的屈光误差在 ± 0.5 D 范围内所占百分比最高 (49.0%); 在 28~30 mm 组, Barrett Universal II、Hill-RBF 及 Kane 公式的 MPE 接近于 0, 其中 Hill-RBF 公式的 MPE 最小, 为 0.02 D, Barrett Universal II 公式的屈光误差在 ± 0.5 D 范围内所占百分比最高 (42.0%); 在 > 30 mm 组, Barrett Universal II、Hill-RBF、CookeK6 及 Kane 的 MPE 接近于 0, 其中 Hill-RBF 公式的 MPE 最小, 为 0.04 D, Barrett Universal II 公式的屈光误差在 ± 0.5 D 范围内所占百分比最高 (44.0%)。

结论: 对于长眼轴白内障患者, Barrett Universal II 公式的预测精度显著高于其他公式。此外, Hill-RBF 及 Kane 等基于人工智能的新型在线计算公式同样具有较好的表现。

摘要编号: 207644

3 例与电击伤有关的白内障手术效果分析

第一作者: Yue WANG

目的: 描述 3 例与电击伤有关的白内障的病例特殊性体征、发生和发展过程以及个性化手术治疗方案, 并讨论术后效果。

方法: 报告 1 例 30 岁女性间接性雷击性白内障, 1 例 64 岁男性家用电击伤后白内障和 1 例 54 岁男性高压电击性白内障。

结果: 3 例电击烧伤后白内障发生时间分别为伤后 1 年、50 年和 3 个月。晶状体损伤均有前囊下不同形态混浊改变、前囊下皮质混浊和后囊下混浊。其中有 2 例患者为单眼白内障, 1 例为双眼白内障, 1 例 1 眼伴有晶状体半脱位, 但 3 例患者均在术中发现悬韧带松弛现象。2 例仅为单纯性白内障损伤, 1 例年轻患者植入焦深延长型人工晶状体, 1 例中年患者植入散光型单焦点人工晶状体。双眼白内障患者同时合并视网膜和黄斑损伤, 合并角膜瘢痕发生, 1 眼植入单焦点人工晶状体, 另 1 眼呈进行性加重最终形成全白内障。3 例患者术后矫正视力恢复均达到预期效果, 1 例患者术后出现屈光误差。2 例患者手术中均无并发症, 其中 1 例术中发现虹膜松弛、脱出。3 例患者术后均无并发症发生。

结论: 白内障是电击伤后的一种具有潜伏性的并发症, 发生时间长短不一, 高电压烧伤发生白内障可能更早且更严重, 晶状体混浊呈进行性加重, 可导致视力逐渐下降甚至盲, 因此电击伤后进行散瞳晶状体混浊评估和随访是必要的, 特别是高电压烧伤。无论是雷击还是电击性烧伤, 前囊下不同形态混浊改变、前囊下皮质混浊和后囊下混浊都是其晶状体特征性改变, 特别是晶状体前囊下或皮质混浊呈现海星或花瓣样改变时, 需询问雷击或触电病史。电击性白内障手术治疗成功率高, 全面评估患者眼部损伤情况, 遵循患者需求和适应症情况下谨慎选择功能性人工晶状体, 个性化制定手术管理策略, 可使患者获得更好的效果。

摘要编号: 208529

3D 可视化技术对白内障超声乳化术后患者干眼症状的影响

第一作者: Qingzhong CHEN

目的: 探讨 3D 可视化技术对白内障超声乳化术后患者干眼症状的影响。

方法: 本研究纳入 71 例患者 (104 只眼), 分为传统显微镜组 (CM 组) 和 3D 可视化组 (3D 组)。记录术前、术后 1 周及 1 个月的眼表疾病指数 (OSDI)、泪液分泌试验 I (SIt)、脂质层厚度 (LLT)、非侵入性泪膜破裂时间 (NIBUT) 等干眼相关指标, 同时记录手术时间及术中光强度 (ILI)。

结果: 3D 组术中光强度显著低于 CM 组 (33% vs 60%, $P < 0.01$)。首次非侵入性泪膜破裂时间 (NIBUT-F)、平均非侵入性泪膜破裂时间 (NIBUT-Ave)、泪河高度 (TMH) 及眼红评分存在组间与时间的交互作用 ($P < 0.05$)。组间对

SiI、LLT、NIBUT-F、NIBUT-Ave 及眼红评分有显著效应 (P 组 < 0.05)。术后 1 周及 1 个月, CM 组的 SiI、LLT、NIBUT-F、NIBUT-Ave、TMH 均低于 3D 组, 眼红评分高于 3D 组 (均 $P < 0.05$)。术前与术后 1 周的 NIBUT-F 和 NIBUT-Ave 变化值与术中光强度呈负相关 ($P < 0.01$)。

结论: 与显微镜手术相比, 3D 可视化系统可更好地维持白内障术后患者的泪膜稳定性。

摘要编号: 209507

M6A 修饰的 NEIL1 调控线粒体稳态在年龄相关性白内障发病中的作用

第一作者: Lihua KANG

共同作者: Huaijin GUAN, Min JI

目的: 探讨年龄相关性白内障 (age-related cataract, ARC) 中 Nei 核酸内切酶 VIII 样蛋白 1 (Nei endonuclease VIII-like 1, NEIL1) 是否受 N6-甲基腺苷 (N6-methyladenosine, m6A) 修饰调控以及 NEIL1 能否通过调节线粒体稳态影响 ARC 发生。

方法: 以临床患者、小鼠、大鼠和人晶状体上皮细胞株 (SRA01/04) 作为实验对象。采用 qRT-PCR 和 Western blot 检测患者、小鼠晶状体上皮细胞 (lens epithelial cells, LECs) 以及 LECs 氧化损伤模型中 NEIL1 的表达。采用甲基化 RNA 免疫沉淀测序 (methylated RNA immunoprecipitation sequencing, MeRIP-seq) 评估患者 LECs 中 NEIL1 的 m6A 修饰程度。采用甲基化 RNA 免疫沉淀-聚合酶链反应 (methylated RNA immunoprecipitation PCR, MeRIP-PCR) 检测干预 m6A 甲基化酶后 LECs 中 NEIL1 的 m6A 修饰程度。采用 RNA 免疫沉淀-聚合酶链反应 (RNA immunoprecipitation PCR, RIP-PCR) 评估 ARC 患者 LECs 中与 m6A 识别酶相互作用的 NEIL1 的 mRNA 水平。进行 qRT-PCR 和 Western blot 检测干预 m6A 调节酶后的 NEIL1 的表达水平。进行免疫沉淀 (Immunoprecipitation, IP) 评估过表达 NEIL1 后 KEAP1 与 NRF2 的相互作用并采用 Western blot 检测过表达 NEIL1 后 NRF2 的蛋白质表达。然后在 LECs 氧化损伤模型中过表达 NEIL1 和使用 NRF2 抑制剂 ML385 处理, 分别采用 Western blot 检测 DNA 损伤、凋亡和线粒体稳态相关蛋白的表达, 应用 Mito-Tracker 荧光探针评估线粒体数量和形态, JC-1 染色检测线粒体膜电位 (mitochondrial membrane potential, MMP), mtSOX 染色检测线粒体超氧化物 (mitochondrial superoxide, Mito-SOX) 水平。

最后在体外大鼠晶状体氧化损伤模型中敲低 NEIL1 和使用 NRF2 激活剂 ML334 处理后观察晶状体混浊面积比例。

结果: ARC 患者 LECs 中 NEIL1 的 mRNA (1.00 ± 0.09 vs 0.61 ± 0.07) 和蛋白质水平 (1.00 ± 0.04 vs 0.44 ± 0.05) 降低, CFW-Em/J 小鼠 LECs 与 LECs 氧化损伤模型中 NEIL1 表达降低 ($P < 0.05$)。ARC 患者 LECs 中 NEIL1 的 m6A 修饰程度为对照组的 2.19 倍 ($P < 0.05$)。过表达 METTL14 后 m6A 修饰的 NEIL1 mRNA 水平 (1.00 ± 0.04 vs 4.49 ± 0.90) 升高 ($P < 0.05$)。ARC 患者 LECs 中与 YTHDF2 作用的 NEIL1 mRNA 水平 (1.00 ± 0.09 vs 4.96 ± 0.60) 增加 ($P < 0.05$)。过表达 YTHDF2 后 NEIL1 mRNA (1.00 ± 0.04 vs 0.28 ± 0.11) 和蛋白质水平 (1.08 ± 0.15 vs 0.25 ± 0.15) 降低且 NEIL1 mRNA 半衰期也缩短 ($P < 0.05$) ($P < 0.05$)。过表达 NEIL1 后 KEAP1 与 NRF2 的相互作用减弱, 细胞质和细胞核中 NRF2 的蛋白质水平均升高 ($P < 0.05$)。在 LECs 氧化损伤模型中过表达 NEIL1 后 γ -H2AX (1.40 ± 0.07 vs 1.15 ± 0.12) 和 BAX (2.40 ± 0.04 vs 1.95 ± 0.04) 的蛋白质水平降低, BCL-2 的蛋白质水平 (0.63 ± 0.04 vs 3.18 ± 0.91) 升高 ($P < 0.05$)。过表达 NEIL1 后, PGC1- α 、TFAM、HSP60 和 COX IV 的蛋白质水平以及 JC-1 红色/绿色荧光比值均升高 ($P < 0.05$)。DRP1 和 FIS1 的蛋白质水平以及 Mito-SOXs 含量减少 ($P < 0.05$)。ML385 逆转了上述趋势。体外大鼠晶状体氧化损伤模型中敲低 NEIL1 后 H_2O_2 诱导的晶状体混浊面积增加, ML334 缓解了因敲低 NEIL1 而加重的晶状体混浊 ($P < 0.05$)。

结论: 1. ARC 患者、CFW-Em/J 小鼠 LECs 和 LECs 氧化损伤模型中 NEIL1 表达降低。2. ARC 患者 LECs 中 NEIL1 的 m6A 修饰程度增加。3. METTL14 上调 NEIL1 的 m6A 修饰水平, YTHDF2 以 METTL14/m6A 依赖的方式负调控 NEIL1 表达。4. NEIL1 抑制 KEAP1 与 NRF2 相互作用并激活 NRF2 表达。5. 氧化应激下, NEIL1 降低 LECs 中 DNA 氧化损伤和凋亡程度并通过提高 TFAM 和 PGC1- α 蛋白质水平和 MMP, 抑制 DRP1 和 FIS1 蛋白质水平和 Mito-SOX 水平, 促进线粒体稳态, 该效应被 NRF2 抑制剂 ML385 逆转。6. 氧化应激下, NRF2 激活剂 ML334 可显著逆转因 NEIL1 缺乏加重的晶状体混浊。

摘要编号: 200496

OPD-Scan III 像差仪对白内障术后晶状体囊袋混浊的客观定量分析

第一作者: Tianyu ZHENG

目的: 建立白内障术后晶状体后囊混浊 (PCO) 的客观定量评估方法, 探讨晶状体囊膜形态学参数与视觉质量指标之间的关联, 为后续临床干预提供循证依据。

方法: 本研究回顾性纳入 109 例 (122 眼) 白内障超声乳化伴人工晶状体植入术后患者, 术后 1 月采用 OPDScan III 像差仪获取后照法图像及相关视觉质量参数, 包括调制传递函数 (MTF)、点扩散函数 (PSF) 等。应用 ImageJ 软件量化晶状体囊膜特性: 晶状体后囊区以视轴为中心, 评估中央 3 mm 范围内后囊混浊面积、后囊平均灰度值及后囊皱褶长度; 前囊区以视轴为中心, 评估中央 5 mm 区域晶状体前囊膜残留面积、前囊混浊面积及前囊平均灰度值; 同时测量晶状体撕囊口总面积、周长及最长径。采用多元线性回归分析囊膜参数与最佳矫正视力 (CDVA)、视觉质量指标的关联, 并通过亚组分析验证关键影响因素临界值。

结果: 晶状体前囊 5 mm 内囊膜残留面积超过 1.5 mm² 时, 患者术后 CDVA 显著下降 ($P = 0.031$), 患者全眼像差中的规则散光显著上升 ($P = 0.022$)。平均灰度值 (0 = 黑色, 255 = 白色) 数值越小提示区域浑浊程度越重, 前囊 5 mm 内前囊膜平均灰度值低于 67 时, 患者多项视觉质量指标出现显著下降。后囊皱褶显著影响患者的 MTF 总值 ($P = 0.016$) 和 PSF 总值 ($P = 0.003$)。晶状体撕囊口总面积大于 19.09 mm² 时患者视觉质量显著下降, 患者全眼全像差显著增加 ($P = 0.023$)。前囊残留面积小于 1.5 mm²、撕囊口总面积小于 19.09 mm²、前囊浑浊程度小且无后囊皱褶的患者术后视力及视觉质量较好。

结论: 基于 OPD-Scan III 和 ImageJ 的定量评估体系可客观评估 PCO。前囊残留面积大、前囊口总面积过大、前囊浑浊程度增加及后囊皱褶存在是影响术后视力及视觉质量下降的重要因素, 这些指标有助于客观评估患者 Nd:YAG 时机。

摘要编号: 209245

pH/ROS 双响应纳米胶束 TAT-p (AM-b-VitC) 防治白内障及其对线粒体功能的保护作用

第一作者: Chunli WU

共同作者: Gangfeng LI, Jiangli LI, Nan MA, Tengjiao WANG

目的: 白内障的发生发展与晶状体氧化损伤密切相关。本研究旨在设计一种具有 pH/ROS 双重响应性的自组装纳米胶束 TAT-p (AM-b-VitC), 以实现维生素 C (VitC) 在晶状体特定环境释放, 从而保护晶状体上皮细胞 (LECs), 为白内障的防治提供新策略。

方法: 1. 通过可逆加成 - 断裂链转移聚合合成两亲性嵌段共聚物 p (AM-b-VitC), 并进一步以细胞穿膜肽 TAT 修饰, 构建具有双响应性的自组装纳米胶束 TAT-p (AM-b-VitC); 2. 在体外试验中, 通过 CCK8、溶血实验和 LIVE/DEAD 染色评估其生物安全性; 采用流式细胞术与共聚焦显微镜分析其细胞摄取效率; 建立 UVB 辐射诱导的晶状体上皮细胞氧化损伤模型, 检测细胞内活性氧 (ROS)、丙二醛 (MDA) 含量及超氧化物歧化酶 (SOD)、谷胱甘肽过氧化物酶 (GSH-PX) 活性; 并借助转录组测序技术探讨其潜在作用机制。3. 在动物层面, 建立 UVB 诱导的小鼠白内障模型, 进一步在体内评估纳米胶束的抗氧化效果及机制。

结果: 1. 成功合成双响应特性的 TAT-p (AM-b-VitC) 纳米胶束, 其在生理条件下结构稳定, 粒径均一; 2. 细胞实验显示, 该胶束在 $\leq 15 \mu\text{M}$ 浓度下具有良好的生物相容性, 细胞摄取率高达 95%; 经该胶束预处理后, UVB 辐射引起的细胞内 ROS 与 MDA 水平显著降低 ($P < 0.05$), 而 SOD 和 GSH-PX 活性显著升高 ($P < 0.05$); 转录组测序分析提示其抗氧化机制与线粒体功能调控密切相关; 3. 动物实验进一步证实, 该纳米胶束能有效延缓 UVB 辐射引起的晶状体混浊, 提升晶状体内抗氧化酶活性; 并有利于维持 LECs 的结构完整性与稳定离子稳态。

结论: TAT-p (AM-b-VitC) 纳米胶束具备高效的细胞穿透能力及微环境响应性释药特性, 在细胞与动物层面均表现出显著的抗氧化活性与晶状体保护作用, 具有良好的生物安全性, 为白内障的防治提供了一种具有转化潜力的纳米材料新策略。

摘要编号: 209129

一例消失的近视

第一作者: Hui CUI

共同作者: Xin JIN

目的: 探索一例高度近视患者玻切术后近视消失的原因。

方法: 患者, 青年男性, 2023 年 7 月出现左眼出现视物遮挡, 同年 11 月散瞳查眼底发现: 颞下方陈旧性视网膜脱离, 累及黄斑。于是 2023 年 11 月份于本院眼科行左眼玻璃体切除 + 视网膜复位 + 硅油填充术, 术后 3 个月硅油取出, 视力恢复良好, 裸眼视力 0.06, 矫正视力 0.5 ($-6.00/-1.25 \times 50$), 继续配戴原框架眼镜 (-6.00 Ds)。2024 年 9 月份自觉左眼戴镜视力下降, 显然验光: 裸眼视力 0.3, 矫正视力 0.7 ($-0.75/-1.00 \times 160$)。眼底照相和黄斑 OCT 均未发现异常。散瞳裂隙灯检查发现左眼晶状体后囊膜浑浊。同时将患者 pentacam 的参数带入晶状体屈光力公式中计算, 结果显示晶状体屈光力下降了约 4.8 D。调节功能检查: 患者 AMP = 9 D, 调节灵敏度: OD: 7 cpm; OS: 0.5 cpm; OU: 5 cpm; 集合近点 18 cm; 正融合范围: 9.6° ; 立体视: 800”。

结果: 晶状体屈光力由表面折射力 (30%) 加内部折射力 (70%) 组成。其中表面折射力来源于晶状体囊膜对内部纤维细胞产生的向心力性机械张力。而内部折射力由晶状体皮质和核的折射率组成。外层皮质中晶状体纤维含水量较大, 折射率偏低, 而核内部的晶体纤维含水量降低, 折射率增加, 从而形成从皮质到内核折射率越来越大的梯度, 构成晶状体内折力。这就像“洋葱头”, 遵循梯度折射率介质模型, 即晶状体折射率中心最大, 周边部最小。同时随着年龄增大, 核中心的折射率增大。后囊膜混浊, 意味着表面折射率增加。但同时其弹性变差, 故囊膜向心性的机械张力降低, 同时网脱两次手术改变房水环境, 导致晶状体纤维细胞水肿, 蛋白含量相对降低, 均可导致内折力下降。最终使晶状体总折光力降低。所以, 这消失的近视与左眼的晶状体混浊有关。

结论: 患者左眼的晶状体混浊导致近视暂时消失, 较差的双眼融像功能为框架眼镜的佩戴提供了可能, 更换左眼镜片度数试戴后患者自觉尚可。3 个月, 患者左眼白内障加重, 由 0.75 Ds 恢复到了 -3.75 Ds, 为患者行左眼白内障超声乳化吸除 + 人工晶体植入术。患者术后恢复良好。

摘要编号: 210334

一种新的不切开结膜及巩膜的人工晶体悬吊手术

第一作者: Yunshan MOU

共同作者: Wei FAN

目的: 评价一种新的不切开结膜及巩膜的人工晶体悬吊手术的安全性和有效性。

方法: 纳入无晶体眼患者 9 例 (9 只眼), 均为白内障囊外摘除术后囊膜缺如的无晶体眼, 均行人工晶体悬吊术。术前及术后 1 天、1 周、1 月及 3 月行视力、眼压及眼前节 OCT 等检查。采用前端弯曲 120° 的 1 ml 注射针头在 8:00 位角膜缘后 2 mm 巩膜处进针, 从对侧角膜缘引入 9/0 聚丙烯悬吊线到眼内, 1 ml 注射针头牵引悬吊线针头从 8:00 位角膜缘后 2 mm 巩膜处出针, 从而引入悬吊线到眼内, 再从 12:00 位侧切口拉出另一端的悬吊线。将拉出的悬吊线采用渔夫结固定在豪雅 PY-60AD 三片式人工晶体的一侧人工晶体襻上, 调整 8:00 位一端的悬吊线将人工晶体从 12:00 位侧切口处植入后房, 另一侧人工晶体襻暴露在侧切口外。用类似方法在 2:00 位角膜缘后 2 mm 巩膜处进针, 引入第二条悬吊线到眼内。将拉出的悬吊线采用渔夫结固定在晶体的另一侧人工晶体襻上, 调整 2:00 位一端的悬吊线将剩下的人工晶体襻植入后房, 并调整人工晶体位置居中。分别将 2:00 及 8:00 位两处的悬吊线行“Z”字形穿巩膜层间 3-5 次, 固定在巩膜隧道。

结果: 9 只眼均顺利完成手术, 平均手术时间为 47.78 ± 14.95 分钟, 术前裸眼 logMAR 视力为 1.87 ± 0.28 , 最佳矫正 logMAR 视力为 0.47 ± 0.30 , 术后 1 天裸眼 logMAR 视力为 0.73 ± 0.53 。术后裸眼视力较术前裸眼视力有显著提高, 差异有统计学意义 ($t = 7.406$, $P < 0.001$)。术后裸眼较术前矫正视力无明显差异 ($t = -2.213$, $P < 0.05$)。术后 3 个月随访, 未发现术后高眼压、线结外露或人工晶体移位。

结论: 不切开结膜及巩膜的人工晶体悬吊手术手术时间较短, 手术并发症较少, 术后视力较术前显著提高, 可安全有效地用于治疗无晶体眼患者。

摘要编号: 204154

人工智能视觉识别系统在白内障超声乳化手术器械清点中的应用

第一作者: Wang YINING

目的: 白内障超声乳化手术器械种类繁多、结构精细, 传统人工清点耗时长、易出错, 存在器械遗漏或手术延误风险, 影响手术效率与患者安全。本研

究旨在开发并评估一套基于人工智能（AI）的视觉识别系统，用于白内障超声乳化手术器械的自动化、快速、准确清点，提升手术流程的安全性与效率。

方法：我们设计并实现了一套集成式 AI 视觉识别系统。系统核心包括：（1）高分辨率摄像模块：实时捕获器械托盘图像；（2）深度学习目标检测模型：基于改进的 YOLOv5 架构，在包含数千张真实手术场景下各类白内障超声乳化器械（如超声乳化手柄、注吸手柄、劈核器、各类套管、显微器械等）图像的数据集上进行训练与优化，精准识别器械种类；（3）计数与位置追踪算法：对识别出的器械进行实时计数，并标记其位置；（4）用户交互界面：直观显示清点结果（器械名称、数量、状态）。系统在模拟手术室环境和真实手术准备间进行测试，评估其在复杂背景、器械堆叠情况下的识别准确率、清点速度及鲁棒性，并与资深护士双人手工清点进行对比。

结果：在包含 15 套标准白内障超声乳化器械包的测试中，AI 系统展现出卓越性能：识别准确率，平均器械种类识别准确率达 98.7%。计数准确率，器械数量清点准确率达 99.2%。处理速度，单次完整器械清点耗时 < 3 秒，远快于传统手工清点（平均 86 ± 12 秒）。鲁棒性，在不同光照条件及轻度器械重叠场景下表现稳定。用户反馈，参与测试的手术室护士普遍认为系统操作简便，显著减轻工作负担，提升了清点信心。

结论：本研究成功开发并验证了基于人工智能的视觉识别系统在白内障超声乳化手术器械清点中的高效应用。该系统实现了近乎实时的、高精度的自动化器械清点，克服了人工清点的固有缺陷，大幅提升了手术室的工作效率和安全性。该系统具有广阔的临床应用前景，可无缝整合入手术室工作流程，为手术安全提供强有力的智能化保障。

摘要编号：207927

低度数散光人群中 FSAK 辅助多焦点人工晶状体植入的疗效分析

第一作者：Dan YANG

目的：评估飞秒激光辅助角膜弧形切开术（FS-AK）联合多焦点人工晶状体（MIOL）植入矫正轻中度规则角膜散光（0.8–1.5 D）合并白内障的临床疗效。

方法：采用回顾性研究设计，纳入 2024 年 9 月至 2025 年 3 月接受手术的 52 例患者（70 眼）。术前散光度 0.80–1.50 D（均值 1.28 ± 0.32 D）。FSAK 基于术前角膜地形图及散光轴向设计个性化参数（以角膜缘为中心直径 8 mm 处进行前穿透角膜弧形切开，切削深度为 80%，弧长为 $43^\circ - 57^\circ$ ），植入 AM4UH 多焦点人工晶状体。术后随

访 6 个月。观察指标：裸眼远/中/近视力（UDVA / UIVA / UNVA）、最佳矫正远视力（CDVA）、残余散光、离焦曲线、对比敏感度、高阶像差（HOA、SA）、视觉质量问卷（VF14）及并发症。

结果：UDVA 由 0.48 ± 0.19 提高至 0.02 ± 0.04 logMAR ($P < 0.001$)、UIVA 由 0.42 ± 0.16 提高至 0.08 ± 0.06 logMAR、UNVA 由 0.57 ± 0.22 提高至 0.06 ± 0.05 logMAR。95.7%UDVA $\geq 20/25$ ，94.3%UNVA $\geq J1$ ；残余散光 0.35 ± 0.18 D（矫正效率 82.3%），SIA/TIA 比值 0.96 ± 0.11 ；离焦曲线：在 -2.0 D 至 +1.0 D 区间视力均 ≥ 0.18 logMAR (20/30)；对比敏感度（明视）较术前提升 1.8 倍 ($P < 0.01$)；总高阶像差术前 0.33 ± 0.10 术后 $0.24 \pm 0.07 \mu\text{m}$ ($P < 0.05$)。VF-14 评分由 $68.3 \pm 7.5 \rightarrow 94.1 \pm 4.2$ ($P < 0.001$)，92% 患者完全脱镜；无严重并发症；4 眼（5.7%）出现短暂性干眼，1 眼（1.4%）报告轻度眩光（2 个月内缓解）；所有 IOL 位置居中。

结论：FS-AK 联合 AM4UH MIOL 植入可显著降低轻中度角膜散光（残余散光 0.35 D）、提供优质全程视力（远中近距离达标率 $> 94\%$ ）及实现高脱镜率（92%）。该联合术式是矫正轻中度散光合并白内障的安全高效方案。

摘要编号：200455

使用公式性能指数分析 ESCRS 计算器中内置 IOL 计算公式在不同眼部生物学参数分布特征下的准确性

第一作者：Wei LOU

目的：使用公式性能指数（FPI）评估 ESCRS 计算器中 7 款人工晶体（IOL）计算公式在不同生物学参数分布特征下的准确性。

方法：回顾性收集 256 例接受常规白内障的患者。术前使用 IOLMaster 700 进行眼轴长度（AL）、角膜曲率（K）、角膜曲率半径（CR）、前房深度（ACD）、晶状体厚度（LT）、中央角膜厚度（CCT）及角膜白到白（WTW）等眼部生物学检查。均植入单一单焦点晶体（SN60WF）。术后 1 个月行主觉验光。比较 Barrett Universal II（BUII）、Cooke K6（K6）、EVO 2.0、Hill-RBF、Hoffer QST、Kane 及 Pearl-DGS 共 7 款 ESCRS 计算器中内置 IOL 计算公式的准确性。选用 ESCRS 计算推荐的 IOL 常数。使用 FPI 评估各公式在总体人群及各生物学参数亚组的准确性。

结果：在总体人群中，Hill-RBF 的 FPI（0.507）最高，其次是 EVO2.0（0.463）和 Kane（0.450）。亚组分析显示，在短眼轴组（AL ≤ 22.0 mm，n

= 12) 和长眼轴组 ($AL \geq 26.0$ mm, $n = 30$) 中, 表现最佳的公式分别是 Pearl-DGS ($FPI = 0.442$) 和 Kane ($FPI = 0.416$); 在平坦角膜组 ($K \leq 42$ D, $n = 17$) 及陡峭角膜组 ($K \geq 42$ D, $n = 20$) 中, 表现最佳的公式均为 Pearl-DGS ($FPI = 0.476$; $FPI = 0.425$); 在 $AL/CR \leq 3.01$ ($n = 67$) 及 $AL/CR \geq 3.19$ ($n = 65$) 亚组中, 表现最佳的公式分别是: BUII ($FPI = 0.535$) 和 K6 ($FPI = 0.493$)。

结论: ESCRS 计算器中内置的 IOL 计算公式准确性存在差异, 应依据生物学参数分布特征个体化选择公式, 以优化术后屈光结果。

摘要编号: 203542

六种老视矫正型人工晶状体的光学性能与偏移耐受性的比较研究

第一作者: Weijia YAN

共同作者: Wen XU

目的: 老视矫正型人工晶状体 (IOL) 通过多焦点设计满足远、中、近距离视力需求, 但其光学性能差异及术后可能出现的 IOL 偏移 (如倾斜或偏心) 对视觉质量的影响尚无系统评估。本研究采用先进的离体光学评估方法, 对目前国际临床常用的六种老视矫正型 IOL 的光学性能及偏移耐受性进行比较分析, 旨在为临床医生提供基于光学设计的 IOL 选择依据, 并为优化术后视觉质量提供参考。

方法: 研究纳入六种老视矫正型 IOL: AT Lisa Tri (Carl Zeiss Meditec, Germany)、Tecnis Synergy (Johnson & Johnson Surgical Vision, USA)、AcrySof IQ PanOptix (Alcon Laboratories, USA)、AT Elana 841P (Carl Zeiss Meditec, Germany)、FineVision HP POD F (PhysIOL, Liege, Belgium) 和 Acriva Trinova Pro C Pupil Adaptive (VSY Biotechnology, Istanbul, Turkey), 通过 OptiSpheric IOL PRO2 设备, 在单色光与多色光条件下, 结合模拟平均角膜球差 ($+0.27 \mu\text{m}$) 及无像差角膜模型, 评估 IOL 的调制传递函数 (MTF)、模拟视力 (SimVA) 及焦深特性。进一步模拟 IOL 偏心 (0–1 mm) 和倾斜 (5°), 分析不同空间频率 (25–100 lp/mm) 下的 MTF 变化。

结果: (1) 光学性能差异: 所有 IOL 远视力 (SimVA ≤ 0.03 logMAR) 表现相近, 但中、近焦点位置及光能分配差异显著。Triumf 中焦点 (80 cm) 表现优异但近视力较弱; PanOptix 中焦点 (61 cm) 与近焦点 (44 cm) 区分度低; Synergy 近视力峰值突出但中焦点 (67 cm) 偏移临床预期。

(2) 瞳孔依赖性: Trinova Pro 在 4.5 mm 瞳孔下中焦光能占比增加, 而 AT Lisa Tri 近焦占比提

升; Synergy 与 PanOptix 在较小瞳孔下光学质量下降更显著。(3) 偏移耐受性: Tecnis Synergy (高球差矫正, $-0.27 \mu\text{m}$) 对偏心最敏感 (MTF 损失达 78.8%), 而 AT ELANA (无球差矫正) 耐受性最佳 (MTF 损失 $\leq 28.4\%$)。倾斜 5° 对 MTF 影响较小, 但在大瞳孔 (4.5 mm) 及无像差条件下, 高空间频率 MTF 显著降低。

结论: 老视矫正型 IOL 的光学性能及偏移耐受性因设计差异显著。临床医生应结合患者用眼需求 (远、中、近视力)、瞳孔特征及囊袋稳定性, 个性化选择 IOL: 中距离优先者可选 Triumf、AT Lisa Tri; 近距离优先者适合 Synergy、Trinova Pro C; 偏移高风险患者 (如大瞳孔或囊袋不稳定) 推荐低球差矫正或非球面中性设计。未来需结合临床数据验证结果, 并开发精准术前评估工具, 以优化 IOL 选择及术后视觉质量。

摘要编号: 201696

创建 KNNS 筛选法提升角膜近视激光矫正术后人工晶体屈光力计算准确性的临床评估

第一作者: Ye XIANGYU

目的: 评价一种新型人工晶体计算公式筛选方法 (KNNS 法) 用于角膜近视激光矫正术后人工晶体屈光力计算的准确性。

方法: 收集既往角膜屈光患者的白内障术后 4 周以上的屈光结果及术前生物测量参数形成训练集, 使用人工智能算法建立 KNNS 预测模型, 并纳入 2013 年 1 月~2023 年 1 月期间行白内障超声乳化联合人工晶体植入术的角膜屈光术后患者 204 例 (204 眼) 为研究对象。使用 KNNS 法筛选患者适配的人工晶体计算公式 (包含 Haigis-L、EVO-L、Barrett True-K mpcp/ppcp、FY-L), 收集术后 4 周以上屈光结果。计算及比较 KNNS 法、Haigis-L 公式、EVO-L 公式、Barrett True-K mpcp/ppcp 公式、FY-L 公式的平均算术和绝对屈光预测误差 (MPE、MAE)、中位数绝对误差 (Med AE) 以及屈光预测误差在 ± 0.25 D、 ± 0.50 D、 ± 0.75 D 和 ± 1.00 D 以内的百分比。

结果: KNNS、Haigis-L、EVO-L、Barrett True-K mpcp、Barrett True-K ppcp、FY-L 公式的 MAE 为 (0.40 ± 0.41) D、(0.63 ± 0.49) D、(0.48 ± 0.38) D、(0.46 ± 0.34) D、(0.52 ± 0.36) D、(0.48 ± 0.38) D, 比较有统计学差异; Med AE 为 0.28 D、0.63 D、0.38 D、0.34 D、0.36 D、0.38 D。KNNS 法预测误差在 ± 0.25 D、 ± 0.50 D、 ± 0.75 D 和 ± 1.00 D 以内的百分比为 38.6%、69.1%、83.1%、90.8%。六种方法在 ± 0.25 D、

± 0.50 D、 ± 0.75 D 以内的百分比比较有统计学差异。

结论：KNNS 法能进一步提升现有常见角膜近视激光术后人工晶体屈光力计算公式的准确性，降低术后屈光误差程度。

摘要编号：209746

前房深度与老年性白内障患者术后屈光误差的相关性分析

第一作者：Yong WANG

目的：分析前房深度（ACD）与白内障术后屈光误差的关系。

方法：本研究采用分析性横断面研究，收集白内障患者术前术眼前房深度（anterior chamber depth, ACD）、角膜曲率（keratometric, K）、眼轴长度（axial length, AL）、白到白（white to white, WTW）及晶状体厚度（lens thickness, LT）。根据前房深度，将患者分为极浅前房组（ $ACD < 2.0$ mm）、浅前房组（ $2.0 \text{ mm} \leq ACD < 2.5$ mm）和正常前房组（ $2.5 \text{ mm} \leq ACD < 3.5$ mm）；将浅前房的患者分为短眼轴组（ $AL < 22.0$ mm）及非短眼轴组（ $AL \geq 22.0$ mm）。术后 3 个月通过综合验光结果评估患者术后屈光状态，并根据 SRK/T 公式计算患者术后屈光误差（prediction error, PE），比较各组间平均屈光误差（mean arithmetic PE, ME）、平均绝对误差（mean absolute PE, MAE）、中位数绝对误差（median absolute error, MedAE）以及屈光误差在 ± 0.50 D、 ± 1.00 D、 $> \pm 1.00$ D 范围内百分比差异。

结果：共纳入行白内障手术的老年性白内障患者共 200 例（200 眼），其中男性 82 例（41%），女性 118 例（59%），患者的年龄为（ 67.7 ± 11.2 ）岁。其中前房深度为（ 2.86 ± 0.59 ）mm，角膜曲率为（ 44.16 ± 1.62 ）D，眼轴长度为（ 23.46 ± 1.38 ）mm，白到白为（ 11.62 ± 0.40 ）mm，晶状体厚度为（ 4.61 ± 0.51 ）mm。Pearson 相关性分析显示，前房深度与白内障患者术后屈光误差呈中度负相关（ $r = -0.228$, $P \leq 0.001$ ）。术后 3 个月 PE、ME、MAE 及 MedAE 分别为（ -0.38 ± 0.64 ）D、 -0.38 D、 0.59 D 和 0.50 D。极浅前房组、浅前房组和正常前房组的术后 MAE 分别为 0.87 D、 0.69 D 和 0.55 D，术后 MedAE 分别为 0.67 D、 0.51 D 和 0.46 D。屈光误差在 ± 0.50 D、 ± 1.00 D、 $> \pm 1.00$ D 范围内百分比分别为 51.6%、84%、16.8%。短眼轴组的 AL 为 21.53 ± 0.47 mm，ACD 为 2.24 ± 0.20 mm，眼轴正常组的 AL 为

22.93 ± 0.66 mm，ACD 为 2.10 ± 0.32 mm，两组的术后 MAE 分别为 0.96 D 和 0.69 D。

结论：随着前房深度的减小，白内障患者术后屈光状态逐渐向近视漂移，前房深度越浅，漂移程度越大。眼轴长度正常的浅前房白内障患者术后屈光误差低于短眼轴浅前房者。

摘要编号：209336

单焦点、增强型单焦点和波前重塑景深延长型三种人工晶状体临床应用效果的研究

第一作者：Zhongxu MA

共同作者：Ha LI, Lintian WU, Zhe YU, Shuai ZHAO

目的：比较单焦点 Tecnis ZCB00、增强型单焦点 Eyhance ICB00 和波前重塑设计的景深延长型 AcrySof IQ Vivity 在视觉效果、主观视觉质量和眼镜脱镜率的差别。

方法：将无眼部合并症，且规则角膜散光小于 0.75 屈光度（D）的患者纳入并进行白内障超声乳化手术。排除弱视、眼轴长度小于 22.0 mm 或超过 25.0 mm、既往有眼表或内眼手术史、急性或慢性葡萄膜炎、青光眼病史、糖尿病伴糖尿病性视网膜改变、假性剥脱综合征、眼底黄斑病变或视神经病变、圆锥角膜，角膜内皮细胞计数不良的病例。将所有病例随机分为三组，每组病例双眼先后进行白内障手术。分别植入单焦点 Tecnis ZCB00、增强型单焦点 Eyhance ICB00 和波前重塑设计的景深延长型 AcrySof IQ Vivity。术后 6 个月，检查单眼和双眼的裸眼远视力和矫正后的远视力，以及裸眼中视力和矫正远视后的中视力（UIVA），以及远视矫正后的近视力、明视对比敏感度、双眼离焦曲线、客观散射指数（OSI）、Strehl 比、调制传递函数（MTF）截止值、光晕及眩光等不良光学现象以及眼镜的脱镜率。

结果：共评价了 45 例患者（每个 IOL 组 15 例患者）的 90 只眼。3 组中单眼和双眼 UDVA 均非常好。Eyhance 的双眼 UIVA 弱于 AcrySof IQ Vivity，三者显示了相似的双眼 UNVA。AcrySof IQ Vivity 在 1.0 D 时的离焦曲线高度强于 Eyhance ICB00，后者又强于 ZCB00 的表现。Eyhance 组与 Vivity 组在中距离下时，后者的脱镜率更优，而 Vivity 组在光晕和眩光等异常光学现象方面的评分略差于后两组。

结论：增强型单焦点 Eyhance 在中距离视觉结果和脱镜率方面比 AcrySof IQ Vivity 更差，但优于普通单焦点 ICB00，三者在裸眼和矫正后的远视力方面相似，ICB00 提供了较低的晕轮和眩光的主观感受，综合表现 Eyhance ICB00 和 Vivity 各有优势。

摘要编号: 209083

基于转录组学筛选早发性白内障生物标志物的研究

第一作者: Su XU

共同作者: Fengyan ZHANG

目的: 基于转录组学探讨早发性白内障相关的差异表达基因及潜在治疗靶点。

方法: 转录组学研究。收集早发性白内障及年龄相关性白内障患者的一般临床资料, 经匹配后采集晶状体前囊样本, 进行 mRNA 测序 (messenger RNA-sequencing, mRNA-seq) 分析。使用基因本体论 (Gene Ontology, GO) 与京都基因与基因组百科全书 (Kyoto Encyclopedia of Genes and Genomes, KEGG) 对差异表达基因 (differentially expressed genes, DEGs) 进行功能富集分析, 并构建 ceRNA 互作网络。采用实时定量聚合酶链反应 (quantitative real-time PCR, qRT-PCR) 对具有显著性差异的关键基因进行验证。

结果: 共鉴定出 678 个 DEGs, 其中上调 33 个, 下调 645 个。GO 分析获得 679 个富集词条, 以“细胞器”、“蛋白结合”与“生物发育”最为显著。KEGG 通路主要富集于肿瘤相关通路、mTOR 信号通路及 HIF-1 信号通路。qRT-PCR 验证结果与 mRNA-seq 数据趋势一致。

结论: ACTN4、COX7A1、SCG5、SERPINE1 可能是潜在的早发性白内障生物标志物。

摘要编号: 200495

多焦点人工晶状体在青壮年发育性与非发育性白内障中的应用效果比较研究

第一作者: Tianyu ZHENG

目的: 比较青壮年发育性白内障 (DCs) 与非发育性白内障 (NDCs) 患者植入多焦点人工晶状体 (MIOLs) 后的视觉效果。

方法: 前瞻性队列研究。2018 年 12 月至 2023 年 9 月确诊为 DC (14 例 16 只眼) 和 NDC (13 例 17 只眼) 的 20-45 岁患者纳入研究。DC 组为无明显诱因的发育性白内障。NDC 组包括高度近视性白内障、葡萄膜炎性白内障、激素性白内障、糖尿病性白内障及成年期外伤导致的外伤性白内障的患者。排除存在弱视体征者。所有患者均接受 MIOLs (包括多焦点及多焦点散光 IOLs) 植入, 在术后 1 个月接受随访, 检测指标包括: 裸眼远视力 (UDVA)、最佳矫正远视力 (CDVA)、裸眼中视力 (UIVA)、最佳矫正远视力下中视力 (DCIVA)、裸眼近视力 (UNVA)、最佳矫正远视力下近视力 (DCNVA)、

波前像差、调制传递函数 (MTF)、点扩散函数 (PSF) 以及对比敏感度 (CS)。功能性视力评估采用视觉功能指数表 14 (VF14)。

结果: 两组患者在 UDVA、CDVA、UIVA、DCIVA、40 cm 处 DCNVA、33 cm 处 UNVA 或 33 cm 处 DCNVA 方面均未观察到显著差异 ($P > 0.05$)。然而, DC 组术后 40 cm 处 UNVA 优于 NDC 组 ($P = 0.04$)。总体而言, NDC 组与 DC 组的视觉质量相近。DC 组总像差显著小于 NDC 组, 而角膜像差更大; 同时, DC 组表现出更优的 MTF (HO)、CS 及 VF-14 评分 ($P < 0.05$)。

结论: 与 NDC 组相比, DC 组患者在植入 MIOLs 后取得了满意的视觉效果, 甚至在 UNVA 和视觉质量方面表现更优。这一差异可能与 DC 组患者具有更强的伪调节能力有关。这表明在严格掌握适应证的前提下, 在 DC 患者中植入 MIOLs 可获得良好的视觉预后。

摘要编号: 205673

对 12 种人工晶状体度数计算公式在高度近视合并后巩膜葡萄肿患者中的准确性进行评估

第一作者: Xiaoling FANG

共同作者: Yulan WANG, Chunxia YU

目的: 本研究评估了 12 种人工晶状体 (IOL) 计算公式在预测高度近视性白内障合并后巩膜葡萄肿患者术后屈光情况方面的准确性。

方法: 本前瞻性观察研究纳入了 44 名患者 (71 只眼), 这些患者均患有高度近视性白内障并伴有后巩膜葡萄肿, 研究地点为上海眼病防治中心 (2022 年 1 月至 2024 年 6 月)。使用 IOLMaster 700 进行眼部生物测量。使用 12 种公式计算术后屈光结果: SRK/T、Barrett Universal II、Haigis、Hoffer Q、Holladay 1、Holladay 2、Kane、EVO 2.0、Hill-RBF 3.0、Cooke K6、Pearl DGS 和 Zhu-Lu。进行超声乳化术并植入人工晶状体, 1 个月后评估预测误差 (PE)。对 PE 与 PS 分类、术前裸眼视力、术前最佳矫正视力 (BCVA)、术后 BCVA、患者年龄、眼轴长度 (AL)、前房深度、晶状体厚度和角膜曲率之间的相关性进行了分析。

结果: Zhu-Lu、Kane、Hill-RBF、Pearl DGS、EVO 2.0、Cooke K6、Barrett Universal II 公式显示出更高的准确性 (更低的绝对 PE 值和更理想的误差分布), 优于 SRK/T、Haigis、Holladay 1、Holladay 2 和 Hoffer Q 公式。后一组在绝对误差值与眼轴长度之间存在显著的正相关关系 ($P < 0.05$), 而前一组则未观察到显著的相关性。

结论: Zhu-Lu、Kane、Hill-RBF、Pearl DGS、EVO 2.0、Cooke K6 和 Barrett Universal II 公式为高度近视且伴有后巩膜葡萄肿的患者提供了可靠且稳定的人工晶状体度数预测。相比之下，SRKT、Haigis、Holladay 2、Holladay 1 和 Hoffer Q 公式在随着眼轴长度增加时准确性下降。

摘要编号: 207751

对称 pFSAK 矫正白内障患者角膜散光的效果评估

第一作者: Jing SIMA

共同作者: Zunxia HU, Li LI

目的: 评估 pFSAK 在矫正白内障患者角膜散光方面的有效性, 并分析影响其矫正效果的相关因素。

方法: 1. 自身对照队列研究。观察 > 0.75 D 规则角膜散光行 pFSAK 术后 6 月角膜散光的连续变化, 切口于角膜 8 mm 直径处、85% 深度。Alpins 法分析散光矫正效果。分析年龄、眼轴、眼压、平均角膜曲率值 (Keratometry mean, Km)、中央角膜厚度 (Central corneal thickness, CCT)、周边角膜厚度 (Peripheral corneal thickness, PCT) 与矫正系数 (Correction index, CI) 的相关性, 并比较不同散光度数及散光类型的矫正效果、残余角膜散光与屈光散光 (Refractive Astigmatism, RA) 的差异、角膜视觉质量的变化。

结果: 共研究病例 123 人 157 眼。术前角膜散光为 1.22 ± 0.40 D, 术后 1 周、1 月、3 月、6 月角膜散光分别降至 0.83 ± 0.54 D、 0.77 ± 0.34 D、 0.78 ± 0.49 D、 0.74 ± 0.34 D。术后 1 周 CI 高于术后 1 月、3 月、6 月 (P 均 < 0.05), 但术后 1 月、3 月、6 月比较差异无统计学意义 (P 均 > 0.05)。术前散光 < 1.5 D 与 ≥ 1.5 D 两组的 CI 差异无统计学意义。逆规散光的 CI 高于顺规及斜轴散光。CI 与眼轴、眼压、Km、CCT、PCT 无相关性, 而年龄会影响矫正效果 ($P = 0.000$) 且呈正相关, 得到回归方程: $CI = 0.407 + \text{年龄} \times 0.008$ 。目标诱导散光 (Target-induced astigmatism, TIA)、实际手术引起的散光 (Surgery-induced astigmatism, SIA)、CI 分别为 1.22 ± 0.40 D、 0.76 ± 0.49 D、 $CI = 0.62 \pm 0.3$ 。残余角膜散光与残余 RA 大小无明显差异。术后不规则散光指数较术前增大 ($P = 0.000$), 角膜 PSF 及平均 MTF 均较术前提升, 差异均有统计学意义 (P 均 = 0.000)。

结论: 1. 对称 pFSAK 矫正白内障患者的角膜散光安全有效, 矫正效果于术后 1 月趋于稳定, CI 对不同大小的角膜散光具有相似的矫正效果。采用 Donnenfeld 算法 (Donnenfeld Nomogram, DONO), ATR 矫正效果最优, 年龄是影响 CI 的

因素, 超过 74 岁会过矫。pFSAK 术后虽增加了角膜高阶像差, 但提高了光学质量。若联合 MIOL 植入, 建议将 TIA 控制在 1.9 D 以下。

摘要编号: 200492

小角膜白内障手术的术源性散光 (SIA) 及其影响因素分析

第一作者: Tianyu ZHENG

目的: 探究小角膜患者与正常白内障患者白内障术后 SIA 及相关矢量参数 (包括目标矫正散光 TIA、误差角度 AE、平坦化效应 FE、扭矩) 的差异, 探讨影响小角膜患者白内障术后 SIA 的关键因素。

方法: 本研究回顾性纳入 141 例 (170 眼) 白内障超声乳化伴人工晶状体植入术后患者, 小角膜组 (51 眼) 和正常对照组 (119 眼), 术前及术后 1 个月分别采用 IOLMaster 700 测量患者眼轴 (AL)、白到白 (WTW) 等眼部参数, 术后 1 个月计算 SIA 及相关矢量参数。通过独立样本 T 检验比较小角膜组患者与正常对照组患者 SIA 的差异, 并采用多元线性回归分析术前生物学参数对 SIA 及相关矢量参数的影响。

结果: 小角膜组的 SIA (0.86 ± 0.75 D)、TIA 显著高于正常对照组的 SIA (0.52 ± 0.36 D)、TIA ($p = 0.05$)。WTW 是 SIA ($p = 0.023$)、TIA ($p = 0.015$) 的显著负相关因素, 年龄与 SIA ($p = 0.047$)、TIA ($p = 0.041$) 呈显著正相关。角膜曲率与 TIA 显著正相关 ($p = 0.018$), 术前散光是 AE 的显著负相关因素 ($p = 0.005$), 年龄 ($p = 0.004$)、术前散光 ($p = 0.016$) 是 FE 的显著正相关因素。WTW、年龄和 AL 可解释 12.2% 的 SIA 变异, 年龄、AL 和术前散光分别可解释 FE (10.8%) 和 AE (9.3%) 的变异。WTW < 11.8 mm 提示 SIA > 0.5 D 的风险上升。此外, 左眼术后易出现更大的扭矩, 逆规散光组的 TIA 显著高于顺规散光组和逆规散光组 ($p = 0.001$)。

结论: 小角膜患者的术后 SIA 较正常对照更大, 其影响因素包括年龄、WTW 及 AL, 其中 WTW < 11.8 mm 提示 SIA 有大于 0.5 D 的风险。

摘要编号: 205956

应用波前像差分析辅助决策先天性白内障合并晶状体后圆锥手术时机一例

第一作者: Zhe ZHANG

共同作者: Zhenzhen LIU

目的: 探讨在晶状体局限性混浊未直接遮挡视轴的儿童先天性白内障病例中, 如何通过波前像差分析

等客观功能学指标，评估晶状体光学质量，为超越传统形态学指征的手术决策提供依据。

方法：报告一例 5 岁 3 月 男性患儿，诊断为右眼先天性白内障（鼻下方混浊）合并晶状体后圆锥。在常规评估（视力、裂隙灯、眼底照相）基础上，重点采用散瞳后 iTrace 波前像差分析，量化中央 3 mm 及 6.5 mm 区域的全眼、眼内及角膜的像差（特别是高阶像差 HOA），并计算晶状体功能指数（DLI），以评估晶状体的光学性能。

结果：像差分析显示，尽管混浊位于旁中心，但患儿右眼存在显著的、眼镜无法矫正的眼内高阶像差（中央 3 mm HOA: 1.378 μm ），且散瞳后 HOA 急剧增加（中央 6.5 mm HOA: 5.680 μm ），DLI 值极低（0.34），证实晶状体光学质量严重受损。基于此，行右眼超声乳化联合 IOL 植入术。术后 1 月，患儿矫正视力由术前的 0.3 显著提升至 0.8。

结论：波前像差引导的诊断技术——特别是眼内高阶像差（HOA）分析和晶状体功能指数（DLI）评估——可以辅助评估白内障相关的光学功能障碍。在儿童患者中，在确定手术指征时，因为 HOA 和 DLI 可以反映导致弱视关键的风险因素，这些指标可以补充单纯依赖视力检查、裂隙灯照相及眼底像的形态学评估。未来的诊疗方案可以考虑将像差测量纳入针对局限性混浊的先天性白内障标准评估流程，以便在视觉发育的可塑期内实现及时干预。

摘要编号：210335

探究普拉洛芬联合聚乙二醇对白内障术后干眼症患者泪膜稳定性、视觉功能的影响

第一作者：琦耿

目的：研究普拉洛芬联合聚乙二醇对白内障术后干眼症患者泪膜稳定性、视觉功能的影响。

方法：前瞻性选取 2024 年 3 月至 2025 年 1 月陆军特色医学中心大坪医院收治的白内障合并睑板腺功能障碍的 90 例作为研究对象。按照随机数字表法将其分为观察组和对照组，每组各 45 例。对照组采用聚乙二醇滴眼液治疗，观察组在其基础上联合普拉洛芬治疗。2 组均治疗 4 周。治疗后评价治疗效果，比较 2 组眼睛干涩感、视力波动、灼烧感、异物感出现时间，比较 2 组治疗前后泪液核苷酸结合寡聚化结构域样受体 1（NOD-1）、C 反应蛋白（CRP）、白细胞介素 6（IL-6）水平，记录 2 组出现的不良反应。

结果：观察组总有效率明显高于对照组 [95.1% (47/49) 比 82.5% (40/49)]，差异有统计学意义 ($P = 0.025$)。观察组眼睛干涩感、视力波动、灼烧感、异物感改善时间均短于对照组，差异均有

统计学意义 (均 $P < 0.05$)。2 组治疗后泪液中的 NOD-1、CRP 和 IL-6 浓度均低于治疗前 (均 $P < 0.05$)；且观察组治疗后泪液中的 NOD-1、CRP 和 IL-6 浓度均低于对照组 (均 $P < 0.05$)。2 组不良反应发生率比较，差异无统计学意义 ($P = 0.558$)。

结论：联合使用普拉洛芬和聚乙二醇对白内障术后干眼症患者泪膜稳定性、视觉功能，可迅速改善患者的临床症状，治疗可显著提高其泪膜稳定性，促进视觉功能的恢复，且对患者的眼部炎症有明显改善作用，安全性较好。

摘要编号：201666

正常角膜内皮白内障患者术后角膜水肿预测机器学习模型的开发与验证

第一作者：Shuaixin LU

共同作者：Lingling BA, Peiyao HUANG, Simo PAN, Jing SUN, Jie WANG, Kai WEN, Xiaohua ZHANG, Min ZHOU, Xinmiao ZHOU

目的：开发并验证用于预测白内障超声乳化术后早期角膜水肿的机器学习模型，研究对象为术前角膜内皮正常的患者。

方法：一项回顾性队列研究分析了接受白内障超声乳化术的 564 只眼的数据库。根据术后第 1 天复查结果，将有中央角膜厚度增加 > 50 微米、中央基质混浊和虹膜纹理模糊症状的眼诊断为角膜水肿。Lasso 回归初步筛选出 26 个临床特征中的 9 个关键变量。开发了 11 种机器学习模型和一个逻辑回归模型。采用混合递归特征消除和穷举搜索策略确定最佳特征子集。使用 AUC、准确率、灵敏度、特异度和布里尔分数等指标评估模型性能。

结果：核心预测变量包括累积耗散能量、年龄和晶状体核硬度。优化后的支持向量机模型在内部验证中表现出色（曲线下面积 $\text{AUC} = 0.92$ ，准确率 = 91.56%），并且在独立测试集上也保持了很强的泛化能力 ($\text{AUC} = 0.89$ ，准确率 = 84.50%)。其他模型如梯度提升和偏最小二乘判别分析在优化后也表现良好。传统的逻辑回归 (LR) 模型表现欠佳（优化后的 $\text{AUC} = 0.81$ ）。

结论：机器学习模型，尤其是支持向量机，能够有效预测角膜内皮正常的白内障患者术后发生角膜内皮水肿的风险。累积耗散能量、年龄和晶状体核硬度是关键预测因素。这些模型可能有助于个性化风险评估，并改善临床决策。

摘要编号: 208528

治疗性角膜绷带镜对术前轻中度干眼症的白内障患者的术后疗效观察

第一作者: Qingzhong CHEN

目的: 探讨 AIR OPTIX 治疗性角膜绷带镜 (BCLs) 对术前合并干眼症 (DED) 的白内障术后患者的临床应用效果。

方法: 白内障术前合并轻中度 DED 患者 188 例, 根据术后 0-7 天是否佩戴 BCLs 分为对照组 (94 眼) 和 BCLs 组 (94 眼)。术前、术后 1 周、1 个月评价无创泪膜破裂时间 (NIBUT)、泪河高度 (TMH)、角膜荧光素染色 (CFS)、Schirmer 试验、眼表疾病指数 (OSDI)、最佳矫正视力。

结果: 两组患者年龄、性别、各项干眼指标差异无统计学意义 ($P > 0.05$)。术后 1 周, BCLs 组 NIBUT、TMH 显著高于对照组 (5.53 ± 1.21 vs 5.18 ± 1.00 , $P = 0.033$; 0.18 ± 0.03 vs 0.16 ± 0.03 , $P < 0.001$), BCLs 组 CFS 和 OSDI 显著低于对照组 (0.27 ± 0.47 vs 0.46 ± 0.56 , $P = 0.015$; 16.64 ± 3.45 vs 18.91 ± 4.03 , $P < 0.001$)。术后 1 个月, BCLs 组 NIBUT 和 TMH 显著高于对照组 (5.89 ± 1.21 vs 5.32 ± 0.82 , $P < 0.001$; 0.18 ± 0.02 vs 0.16 ± 0.02 , $P < 0.001$), BCLs 组 OSDI 评分显著低于对照组 (16.33 ± 3.28 vs 19.24 ± 3.08 , $P < 0.001$)。

结论: 术前合并 DED 的白内障患者术后配戴 AIR OPTIX BCLs 可提高泪膜稳定性, 减轻患者主观干眼症状。

摘要编号: 208382

眼球构型对人工晶状体倾斜和偏心的影响及预测模型构建

第一作者: Xiteng CHEN

共同作者: Nan GAO, Fang TIAN

目的: 对不同前节大小和眼轴长度患者的 AS-OCT 参数进行统计分析, 并构建预测模型以评估术后人工晶状体倾斜和偏心情况。

方法: 本研究共纳入 156 只眼。收集的参数包括眼轴长度、WTW、术前人工晶状体倾斜和偏心、前房深度、晶状体厚度, 以及术后一个月的人工晶状体倾斜和偏心。根据 LP/AL 比值将患者分为大前节组和小前节组。比较两组间各参数的差异及术后大于 5° 的倾斜和大于 3 mm 的偏心的发生率。此外, 还比较了不同眼轴组中大前节和小前节的占比。逻辑回归被用于构建术后发生显著倾斜风险的预测模型。

结果: 两组间眼轴长度、前房深度、术后人工晶状体倾斜和术后视力存在显著差异。大前节组术后人工晶状体倾斜程度显著高于小前节组, 且在大前节组中显著倾斜和偏心的发生率更高。与其他组相比, 短眼轴组中大前节的比例最高。回归分析显示, 术前人工晶状体倾斜是术后倾斜的独立风险因素, 所构建的风险预测模型表现出了良好的预测性能及临床收益。

结论: 本研究提供了不同眼球构型对白内障术后人工晶状体倾斜和偏心影响的新见解, 为手术设计和人工晶状体类型的选择提供了指导。

摘要编号: 207930

磨砂襻 Toric IOL 囊袋生物整合效应研究: 旋转动力学长期稳定性及关键影响因素

第一作者: Dan YANG

目的: 评估磨砂襻处理的 Toric 人工晶状体 (IOL) 植入术后的旋转稳定性, 并分析其与前房深度 (ACD)、晶体厚度 (LT)、眼轴长度 (AL) 的关联性, 为临床优化散光矫正方案提供依据。

方法: 选取 2024 年 6 月-2024 年 12 月行白内障超声乳化联合磨砂襻 Toric IOL 植入术的患者 86 例 (102 眼)。术后 1 月、3 月采用 iTrace 视觉功能分析仪测量 IOL 轴位偏移角度, 记录旋转度数 ($> 5^\circ$ 定义为显著旋转)。同时采集术前及术后 ACD (前房深度)、LT (晶体厚度)、AL (眼轴长度) 等生物学参数 (IOL Master 700), 通过多元线性回归分析旋转稳定性与各参数的相关性。

结果: 磨砂襻 Toric IOL 术后平均旋转度数为 $2.8^\circ \pm 1.5^\circ$, 6 个月内显著旋转发生率仅为 4.9%。ACD 是影响旋转稳定性的首要因素 ($r = -0.62$, $P < 0.001$)。ACD < 2.8 mm 的患眼旋转风险增加 3.2 倍 (OR = 3.2, 95% CI: 1.8-5.7), 且 ACD 每增加 0.1 mm, 旋转度数减少 0.4° 。LT 与旋转度数呈正相关 ($r = 0.58$, $P < 0.01$), LT > 4.6 mm 时旋转风险提升 2.8 倍 (OR = 2.8, 95% CI: 1.5-5.2); AL 与旋转稳定性弱相关 ($r = -0.31$, $P = 0.03$)。旋转 $> 5^\circ$ 的患眼高阶像差 (HOA) 增幅达 42%, 显著影响散光矫正效果 ($P < 0.05$)。

结论: 磨砂襻设计通过增强囊袋摩擦显著提升 Toric IOL 旋转稳定性。ACD 和 LT 是预测旋转风险的关键指标: 浅前房 (ACD < 2.8 mm) 或厚晶体 (LT > 4.6 mm) 患者需谨慎设计手术方案, 必要时联合 ACD 修正以优化预后。

摘要编号: 203419

结膜下注射地塞米松前药微晶在超声乳化术后长效抗炎作用的研究

第一作者: 周雪琰

共同作者: Xia HUA, Xiaoyong YUAN

目的: 本研究旨在系统评价酸敏感地塞米松缩丙酮前药微晶制剂 (SKD MCs) 单次结膜下注射后在白内障超声乳化术后眼部炎症的长效抗炎作用, 并探究微晶制剂眼部组织分布与长期安全性。

方法: 建立新西兰白兔 Phaco-IOL (超声乳化联合人工晶体植入术) 模型, 实验组术毕结膜下分别注射 SKD MCs 及 Maxidex, 标准治疗组为 Maxidex 点眼 (3 次/天, 28 天)。通过裂隙灯、AS-OCT 以及临床评分体系对术后眼前节炎症进行动态评估, ELISA、Luminex 检测及 IF 染色评估炎症因子水平。使用两种剂量 (0.4 mg 与 0.8 mg Dex equiv.), 在正常兔模型中研究结膜下注射 SKD MCs 在眼部组织的分布及安全性, HPLC-MS/MS 检测药物浓度, H&E 染色及偏光显微镜评估注射部位药物库情况及眼部 MCs 分布。监测视网膜厚度、眼压、体重及主要脏器病理学指标来评价其眼部安全性。

结果: 在 Phaco-IOL 模型中, 单次注射 SKD MCs (0.4 mg Dex equiv.) 在 28 天内与 Maxidex 滴眼液 (3 次/天) 具有相当的抗炎效果, 且显著优于相同剂量的 Maxidex 结膜下注射, 其抗炎作用仅维持 7 天。剂量依赖性研究表明, 两种剂量 SKD MCs 在 28 天内抗炎效果无统计学差异。药物分布研究显示, SKD MCs 注射后在角膜、虹膜-睫状体等前节炎症相关组织中可持续释放活性药物, 持续时间超过 84 天, 且高剂量组 (0.8 mg Dex equiv.) 结膜中的药物浓度始终较高; 而 Maxidex 注射后仅 7 天内可检测到地塞米松, 解释了其短效抗炎作用。组织切片和偏光显微镜观察表明结膜下注射 SKD MCs 形成可视药物库, 具有良好的组织相容性, 仅引起轻微暂时性局部炎症反应。在长期观察中, 各组视网膜结构及厚度保持稳定, 眼压仅在高剂量组短暂升高, 随后恢复正常, 系统毒性评估亦未见异常。

结论: SKD MCs 作为一种疏水性缩酮键连接的地塞米松前药微晶制剂, 能够通过单次结膜下注射在术后提供长达 84 天的稳定抗炎效果, 具有优异的组织滞留性及良好的生物安全性。相比常规滴眼或传统注射方案, SKD MCs 为术后及慢性眼部炎症提供了更高依从性和更强持续作用的新型治疗策略, 具有良好的临床转化潜力。

摘要编号: 209897

靶向激活 OGG1 可抑制早期年龄相关性皮质性白内障中晶状体上皮细胞的副凋亡

第一作者: Huaijin GUAN

目的: 研究早期年龄相关性皮质性白内障 (ARCC) 患者的晶状体上皮细胞 (LECs) 中可能存在的程序性细胞死亡方式, 并探索早期干预策略。

方法: 收集早期 ARCC 患者的晶状体前囊膜进行综合分析。采用透射电子显微镜对 LECs 进行超微结构检查。通过蛋白质印迹分析对细胞死亡相关蛋白标志物进行定量, 包括副凋亡相关标志物 (ALIX、GRP78)、凋亡相关标志物 (活化的半胱天冬酶 3 和半胱天冬酶 9)、焦亡相关标志物 (N-GSDMD) 以及 ferroptosis 相关标志物 (GPX4)。通过免疫荧光评估细胞内囊泡与细胞器的共定位情况。采用蛋白质印迹、激光微照射和免疫荧光等多种方法评估 8- 羟基鸟嘌呤 DNA 糖苷酶 (OGG1) 蛋白的表达及活性。利用大鼠晶状体体外培养模型研究 OGG1 激活剂 TH10785 对副凋亡的治疗潜力。

结果: 形态学变化显示, ARCC 患者的 LECs 出现明显的内质网 (ER) 肿胀, 且无典型的凋亡特征。副凋亡相关蛋白发生显著改变, 而其他细胞死亡通路标志物 (凋亡、焦亡和 ferroptosis) 则保持不变。在活性氧诱导的类凋亡模型中, 囊泡结构与内质网特异性荧光呈唯一共定位。观察到 DNA 损伤标志物 7,8- 二氢 -8- 氧鸟嘌呤水平升高, 同时 OGG1 活性降低。在离体大鼠晶状体培养中, OGG1 激活剂 TH10785 显示出抑制晶状体上皮细胞副凋亡的功效。

结论: 在早期 ARCC 患者的 LECs 中发现了副凋亡现象。TH10785 可激活 OGG1, 从而抑制晶状体上皮细胞的副凋亡, 这为早期 ARCC 的干预提供了一种新的治疗途径。

摘要编号: 207926

飞秒激光辅助与传统超声乳化手术对于治疗膨胀期白色白内障的疗效对比研究

第一作者: Dan YANG

目的: 探讨非接触的飞秒激光设备与传统超声乳化手术在膨胀期白色白内障疗效对比。

方法: 纳入 2023 年 1 月至 2023 年 11 月于大连市第三人民医院行超声乳化白内障吸除手术, 并在术前行飞秒激光前囊膜切开的膨胀期白色白内障患者 100 例 (100 只眼) 的临床资料为观察组, 行手工撕囊的 100 例为对照组。飞秒激光采用 Catalys 平台。观察术中并发症: 观察组负压丢失情况, 两组出现前囊膜未游离、囊膜偏中心、前囊膜放射状撕

裂、后囊膜破裂、玻璃体脱出、术中瞳孔缩小情况等。术后1天、1周、1月、3月的BCVA、角膜内皮细胞计数术前术后差值。术后并发症：结膜下出血、后囊膜皱褶、后囊膜混浊（PCO）、前囊膜皱缩（ACO）。术后6月IOL的倾斜及偏心情况。

结果：200例患者年龄47-80岁，男性102例，女性98例。两组未发生前囊膜放射状撕裂及后囊膜破裂和玻璃体脱出，观察组8例发生舌状粘连（8%），6例（6%）前囊膜不完全切开，运用维纳斯剪及25G囊膜剪后均安全剥离开，均顺利完成手术。两组BCVA均较术前明显提高，两组间术前术后角膜内皮细胞计数差异无统计学意义。术后6月随访时观察组有6例患者发生PCO，1例发生ACO，对照组有27例发生PCO，20例发生ACO，差异有统计学意义（ $P < 0.05$ ）。观察组中无明显IOL倾斜和偏心，对照组6月IOL在水平和垂直方向上的偏心值和倾斜度明显高于观察组（ F 值2.67），差异有统计学意义（ $P < 0.05$ ）。

结论：飞秒激光前囊膜切开位置精确居中，形状正圆，避免术后因囊袋不对称收缩引起的IOL偏心 and 倾斜，同时飞秒激光可以降低pco及aco的发生率，从而可保证术后视觉质量的长期稳定。

摘要编号：**204720**

马凡综合症一家系缝线固定高端人工晶状体临床应用研究

第一作者：Yunxian GAO

目的：评估马凡综合征患儿接受晶状体摘除联合悬吊式人工晶状体（IOL）植入术的临床疗效，并比较单焦点与衍射型双焦点悬吊IOL对学龄儿童术后视觉质量，特别是近视力影响的差异。

方法：纳入2024年至2025年间来自同一家系的2例儿童和3例成年女性马凡综合征患者。一例4岁男性患儿行双眼全脱位晶状体摘除联合单焦点散光矫正型IOL悬吊术；另一例8岁男性患儿及三位成年女性患者行双眼同类手术联合衍射型双焦点IOL悬吊植入。收集术前及术后视力、眼压、视觉质量分析、离焦曲线、光干扰问卷及并发症等资料进行统计分析。

结果：所有患者手术均顺利完成，术后恢复良好。在近视力方面，植入衍射型双焦点IOL的儿童表现出明显优势，其双眼未矫正远视力（UDVA）为 $-0.08 \log\text{MAR}$ ，未矫正近视力（UNVA）达 $+0.10 \log\text{MAR}$ ，阅读流畅性、视觉质量及中近视舒适度均优于植入单焦点IOL的病例，且未出现显著光干扰现象。而接受单焦点IOL的患儿UDVA为 $+0.40 \log\text{MAR}$ ，UNVA为 $+0.70 \log\text{MAR}$ ，近用时仍需配戴 $+3.00 \text{ D}$ 近附加眼镜。三位成年

女性患者中，一例因术前弱视，UDVA与UNVA均为 $+0.40 \log\text{MAR}$ ；其余两例UDVA为 $+0.10 \log\text{MAR}$ ，UNVA为 $+0.22 \log\text{MAR}$ 。

结论：悬吊式IOL植入术治疗马凡综合征伴晶状体全脱位安全有效。衍射型IOL可为学龄期儿童提供更优的全程视力，有助于双眼视功能发育及生活质量的提高。本研究证实悬吊式衍射型IOL在此类儿童患者中具有应用优势，并突显早期手术干预对预防弱视和改善视力预后的重要意义。此外，研究提示儿童人工晶状体假性调节力可能强于成人，但低龄儿童应用散光矫正型IOL后散光状态存在动态变化，需长期随访。

摘要编号：**209086**

高度近视性白内障的危险因素

第一作者：Su XU

共同作者：Fengyan ZHANG

目的：探讨高度近视患者发生白内障的相关因素，评估晶状体功能失调指数（DLI）在高度近视白内障中的诊断价值。

方法：病例对照研究。连续纳入110例高度近视患者，根据是否合并白内障分为两组。分析眼前节解剖参数、晶状体功能失调指数、血脂代谢指标与白内障发生的相关性。

结果：两组眼前节解剖参数及血脂代谢指标差异无统计学意义（ $P > 0.05$ ）。白内障组晶状体功能失调指数显著低于非白内障组（ $P = 0.016$ ），晶状体功能失调指数与白内障发生呈负相关（ $rs = -0.381$, $P = 0.007$ ）。受试者工作特征曲线分析显示，晶状体功能失调指数在诊断高度近视性白内障方面具有较高的鉴别能力（ $AUC = 0.725$ ）。

结论：晶状体功能失调指数可能是高度近视患者白内障发生发展的关键指标，在早期诊断和疾病进展评估中具有重要价值。其潜在的生物学机制和临床应用前景有待进一步研究。

摘要编号：**209179**

高度近视患者白内障术中植入囊袋张力环对视觉质量及囊袋稳定性的长期影响

第一作者：Yingying YU

共同作者：Yongzhen BAO, Han WANG, Yiming ZHANG

目的：探讨囊袋张力环（CTR）对高度近视眼白内障术后屈光误差、囊膜收缩、人工晶状体（IOL）位置以及视觉质量的影响。

方法：前瞻性研究。对2024年3月至2025年3月在北京大学人民医院行白内障超声乳化联合人工晶

状体手术术中植入囊袋张力环的 69 例高度近视白内障患者进行随访，搜集术前及术后 1 个月（45 例 70 眼）、3 个月（45 例 70 眼）、6 个月（43 例 63 眼）9 个月（29 例 44 眼）及 1 年（15 例 23 只眼）的最佳视力、非接触眼压、屈光度、IOL 偏心度和偏心距、衡量视觉质量相关的高阶像差均方根值、高阶 MTF、前囊撕囊口相关数据等。

结果：术后 1、3、6、9 和 12 个月高阶 MTFa (4 mm) 为 $47.53 \pm 16.78\%$, $49.01 \pm 17.12\%$, $46.79 \pm 15.54\%$, $49.88 \pm 18.04\%$ 和 $47.21 \pm 13.14\%$, 差异无统计学差异。术后 3、6、9 和 12 个月较术后 1 个月的 IOL 偏心距为 0.101 ± 0.171 , 0.135 ± 0.183 , 0.124 ± 0.099 和 0.104 ± 0.083 mm, 差异无统计学意义。术后 1、3、6 和 9 个月的撕囊口面积分别为 26.547 ± 4.085 、 26.032 ± 3.501 、 25.925 ± 3.511 和 25.768 ± 2.277 mm², 无统计学差异；1、3、6 和 9 个月的晶状体襻所在径线长度分别为 5.816 ± 0.528 、 5.775 ± 0.473 、 5.781 ± 0.370 和 5.820 ± 0.155 mm, 无统计学差异；1、3、6 和 9 个月的垂直晶状体襻撕囊口径线长度分别为 5.771 ± 0.446 、 5.714 ± 0.440 、 5.807 ± 0.439 和 5.809 ± 0.461 mm, 无统计学差异。

结论：术后 1、3、6、9 和 12 个月高阶 MTFa (4 mm) 为 $47.53 \pm 16.78\%$, $49.01 \pm 17.12\%$, $46.79 \pm 15.54\%$, $49.88 \pm 18.04\%$ 和 $47.21 \pm 13.14\%$, 差异无统计学差异。术后 3、6、9 和 12 个月较术后 1 个月的 IOL 偏心距为 0.101 ± 0.171 , 0.135 ± 0.183 , 0.124 ± 0.099 和 0.104 ± 0.083 mm, 差异无统计学意义。术后 1、3、6 和 9 个月的撕囊口面积分别为 26.547 ± 4.085 、 26.032 ± 3.501 、 25.925 ± 3.511 和 25.768 ± 2.277 mm², 无统计学差异；1、3、6 和 9 个月的晶状体襻所在径线长度分别为 5.816 ± 0.528 、 5.775 ± 0.473 、 5.781 ± 0.370 和 5.820 ± 0.155 mm, 无统计学差异；1、3、6 和 9 个月的垂直晶状体襻撕囊口径线长度分别为 5.771 ± 0.446 、 5.714 ± 0.440 、 5.807 ± 0.439 和 5.809 ± 0.461 mm, 无统计学差异。

眼内炎，葡萄膜炎，巩膜炎

摘要编号：208577

免疫检查点 VISTA 在自身免疫性葡萄膜炎中的作用机制研究

第一作者：Yujing QIAN

共同作者：Hui CHEN, Meifen ZHANG

目的：新型免疫检查点 VISTA 在各种自身免疫性疾病中表现出十分独特的表达谱和免疫调控作用。然而，目前有关 VISTA 的研究主要集中在动物模型中，在患者中的还十分有限，且尚未见到 VISTA 在自身免疫性葡萄膜炎（AU）中的研究报道。本研究旨在明确 VISTA 在 AU 中的表达特点及其临床意义，并初步探索其作用机制。

方法：首先，采用多色流式细胞术全面检测了 AU 患者外周血各类免疫细胞亚群的 VISTA 表达谱。接下来，分别通过筛选性研究和自身对照病例系列研究确定了中性粒细胞表面 VISTA 表达水平的临床意义，并收集健康志愿者与 AU 患者的外周血中性粒细胞开展体外细胞功能实验，研究了 VISTA 激动剂和拮抗剂对中性粒细胞功能的作用。最后，在 EAU 小鼠中进一步明确了 VISTA 的表达位置、水平及其对于疾病发生、发展的调控功能。

结果：免疫检查点 VISTA 主要在人外周血各类髓系细胞表面组成性表达，在淋巴细胞表面表达程度较低。与健康对照相比，AU 患者外周血 13 种免疫细胞亚群表面的 VISTA 表达水平均不同程度降低，其中以中性粒细胞最为显著。筛选性研究和自身对照研究均提示，VISTA 表达与疾病活动性显著相关，而其他临床指标无显著相关性。当活动期 AU 患者眼内炎症缓解时，中性粒细胞表面 VISTA 表达明显升高。体外细胞实验证明，VISTA 拮抗剂可显著加强 AU 患者中性粒细胞活化，并促进中性粒细胞胞外诱捕网（NETs）形成，而 VISTA 激动剂则具有相反的作用。在健康小鼠中，VISTA 在视网膜光感受器细胞外节组成性表达，在 EAU 小鼠中表达下降，并在疾病高峰期降至最低水平。体内实验发现，VISTA 拮抗剂 13F3 可使 EAU 小鼠疾病发生时间提前、疾病严重程度加重、视网膜结构和功能破坏增加、NETs 组分髓过氧化物酶和瓜氨酸组蛋白 H3 释放增多，且上述变化均呈剂量依赖性。

结论：自身免疫性葡萄膜炎患者和小鼠体内 VISTA 表达减少与疾病活动性密切相关。中性粒细胞表面 VISTA 减少可促进中性粒细胞活化和 NETs 形成。本研究首次提供了多个证据，证明 VISTA 减少可能与自身免疫性葡萄膜炎的发生、发展相关。

摘要编号: 204750

比较三种术式治疗葡萄膜炎继发性青光眼的有效性及安全性研究

第一作者: Yuqin WANG

共同作者: Lin FU, Guoxing LI, Zhiqi TAO

目的: 探索白内障超声乳化吸除术联合房角分离术 (Phaco-GSL)、小梁切除术 (Trab) 和 Ahmed 引流阀植入术 (AGV) 治疗葡萄膜炎继发性青光眼 (UG) 的有效性及安全性, 为临床术式选择提供证据。

方法: 本研究为单中心回顾性队列研究, 纳入 2013-2024 年温州医科大学附属眼视光医院 58 例 UG 患者的 62 只眼, 分为三组: Phaco-GSL 组: 16 眼; Trab 组: 29 眼; AGV 组: 17 眼。主要结局指标为成功率: $6 \text{ mmHg} \leq \text{眼压} \leq 21 \text{ mmHg}$, 分为完全成功 (未使用青光眼药物) 和合格成功 (使用和未使用青光眼药物), 随访时间点为术后 1、3、6、12 月。

结果: 术后 6 月, Phaco-GSL、Trab、AGV 组的完全成功率 (69.2%、65.4%、87.5%, $P = 0.327$) 和合格成功率无显著差异 (92.3%、76.9%、100%, $P = 0.066$)。术后 12 月, 三组的眼压降幅为 $24.63 \pm 11.85 \text{ mmHg}$ 、 $23.29 \pm 7.94 \text{ mmHg}$ 、 $22.13 \pm 10.11 \text{ mmHg}$ ($P = 0.771$); 成功率无显著差异; 三组均无严重并发症。与 Trab 组 (75.9%) 相比, Phaco-GSL 组的术后干预频率 (25%) 更低 ($P = 0.002$), 主要为 YAG 激光后囊切除术、YAG 激光前囊膜渗出膜切除术, YAG 激光周边虹膜切除术, 前房穿刺术。

结论: Phaco-GSL 治疗 UG 的眼压控制效果与 Trab、AGV 无显著差异, 无严重并发症且术后护理需求较另外两种术式更少, 为 UG 合并白内障的患者提供了新的术式选择。

摘要编号: 209106

玻璃体内注射糖皮质激素在控制局部炎症之外可重塑全身免疫反应

第一作者: Kaixuan WANG

目的: 葡萄膜炎是一种威胁视力的眼内炎症性疾病, 其反复发作可导致眼内组织不可逆损伤。虽然玻璃体内糖皮质激素疗法 (尤其是缓释植入剂) 在控制眼内炎症方面显示出显著疗效, 但此类眼内长效治疗对全身免疫平衡的调节作用尚不明确。

方法: 我们对接受氟轻松玻璃体内植入剂治疗的葡萄膜炎患者开展了一项前瞻性观察研究。通过采集患者治疗前后的外周血样本, 进行单细胞 RNA 测序、蛋白质谱分析和 Luminex 液相芯片检测, 以

探究局部治疗是否诱导了全身免疫调节。此外, 我们利用实验性自身免疫性葡萄膜炎小鼠模型, 进一步研究了玻璃体内糖皮质激素治疗如何改变眼部及全身的免疫应答。

结果: FAI 局部治疗在控制慢性非感染性葡萄膜炎相关眼内炎症方面表现出强大效力, 并恢复了全身免疫平衡。外周血单个核细胞的单细胞 RNA 测序结果证实了这一点, 显示与细胞因子产生、免疫细胞激活及炎症反应相关的基因表达受到抑制。值得注意的是, CD14^+ 单核细胞向促炎表型的分化受到抑制, 而 CD4^+ T 细胞的活化程度降低且亚群发生重构。实验性自身免疫性葡萄膜炎小鼠模型研究表明, 玻璃体内注射曲安奈德在控制眼内炎症的同时, 促进了血 - 视网膜屏障完整性的恢复并通过抑制树突状细胞的活化及其向淋巴组织的迁移, 降低了淋巴结中 Th1/Th17 细胞的比例, 最终重建全身免疫稳态。

结论: 本研究证实, 通过局部糖皮质激素缓释制剂长期有效控制眼内炎症, 能够进一步改善全身免疫平衡。这一发现深化了我们对局部 - 全身免疫相互作用的理解, 并为自身免疫性葡萄膜炎的治疗提供了新的视角。

摘要编号: 209852

甘露糖化仿生纳米斗篷治疗自身免疫性葡萄膜炎

第一作者: Jia SHU

共同作者: Peizeng YANG

目的: 自身免疫性葡萄膜炎是一种易复发、威胁视力的炎症性疾病, 现有治疗方法存在眼部靶向性差、活性氧清除能力不足及对关键炎症通路调控有限等问题。本研究旨在构建一种多功能甘露糖化仿生纳米粒, 集成主动靶向、活性氧清除及 STING 信号通路抑制功能, 以实现自身免疫性葡萄膜炎的协同治疗。

方法: 合成铜锌双金属有机框架 (Cu/Zn-MOF) 作为载体, 负载 STING 拮抗剂 H-151, 构建 H-151@Cu/Zn-MOF 核心。进一步制备脂质体, 并与巨噬细胞膜融合形成杂化膜 (LM), 修饰甘露糖 (Man) 后包覆于核心表面。利用透射电镜、Western blot 及共聚焦显微镜对材料形貌及膜融合效果进行表征; 通过体外自由基清除实验评估其抗氧化能力。建立 LPS 诱导的 RAW264.7 巨噬细胞炎症模型及实验性自身免疫性葡萄膜炎 (EAU) 小鼠模型, 分别从细胞因子表达、巨噬细胞极化、血 - 视网膜屏障通透性、免疫细胞比例及组织病理变化等方面评估其抗炎效果与免疫调节作用。

结果: H-151@Cu/Zn-MOF@LM@Man 呈菱形十二面体结构, 粒径约 120 nm, 包封率为 63.7%, 载药量为 31.85%。材料具备 pH 响应性释药特性, 杂化膜修饰可延缓 H-151 释放。体外实验显示, 该纳米粒可有效清除多种自由基及活性氧, 显著抑制 LPS 诱导的巨噬细胞中 TNF- α 、IL-1 β 和 IL-6 等促炎因子的表达, 并抑制 M1 型巨噬细胞极化。在 EAU 模型中, 该纳米粒可靶向聚集于眼内炎症部位, 减轻视网膜炎症及血管渗漏, 抑制 M1 型巨噬细胞 / 小胶质细胞极化; 同时, 可调节脾脏免疫细胞平衡, 降低 Th1、Th17 比例, 提高 Treg 比例。体内安全性评估显示, 该纳米粒未引起明显肝肾毒性及主要器官病理损伤。

结论: 本研究成功构建了一种兼具仿生靶向、活性氧清除与 STING 通路抑制功能的甘露糖化纳米粒, 能够通过巨噬细胞膜伪装及甘露糖受体介导的内吞作用实现眼内炎症部位的双重靶向, 有效穿越血 - 视网膜屏障并被炎症细胞摄取。该纳米粒在抑制 STING-TBK1-NF- κ B 通路的同时清除活性氧, 打破炎症恶性循环, 重塑免疫平衡, 从而显著缓解眼部及全身炎症反应, 且具备良好的生物安全性。本研究为自身免疫性葡萄膜炎及其他 STING 相关炎症疾病提供了一种具有转化潜力的协同治疗新策略。

摘要编号: 209251

纳米硒调控葡萄膜炎巨噬细胞极化的机制研究

第一作者: Huaqi YU

共同作者: Ruijin RAN, Hua WANG

目的: 在自身免疫性葡萄膜炎 (Autoimmune Uveitis, AU) 中, 巨噬细胞主要通过分泌 IL-6、TNF- α 等促炎因子加剧炎症反应, 呈递自身抗原给 T 细胞后激活机体适应性免疫反应。而硒纳米颗粒可轻易穿透组织间隙, 增强细胞免疫和吞噬功能, 靶向调控免疫分化和炎症因子表达。因此本实验目的在于探究纳米硒调控巨噬细胞极化平衡以抑制自身免疫性葡萄膜炎免疫反应的分子机制。

方法: (1) 多点皮下注射诱导 Lewis 大鼠 EAU 模型, 测定眶静脉血硒浓度, 明确与其免疫反应的相关性。(2) 软模板法制备纳米硒, 完成表征及硒含量测定。(3) 梯度浓度下完成纳米硒对 ARPE-19、RF-6A 细胞毒性、摄取实验, 明确合适作用浓度范围。q-PCR 验证纳米硒对眼部细胞炎症相关及巨噬细胞极化相关基因表达的调控作用。(4) WB 明确纳米硒调控其极化平衡的多条信号通路作用机制。(5) 流式细胞学分析检测纳米硒干预后的巨噬细胞炎症型极化方向变化程度及趋势。

结果: (1) EAU 大鼠眶静脉血硒含量随炎症程度加重而递减。(2) 纳米硒可直接调控炎症型 ARPE-19 细胞的 IL6、TNF- α mRNA 及蛋白表达量。(3) WB、qPCR 结果表明纳米硒干预 Raw264.7、Thp-1 等细胞炎症型极化, 上调 Gpx4mRNA, 下调与极化相关的 IL6、TNF- α 、Jak2、Stat3 mRNA 表达 ($P < 0.05$)。

结论: (1) AU 的炎症程度与眼部硒含量或具一定相关性。(2) 本次制备的纳米硒对眼部细胞的毒性较小, 甚至在 24 h 内对其增殖具有一定促进作用, 其对 C6@SeNPs 的摄取率也高达 90% 左右, 目前已找到较佳作用浓度范围。(3) 该浓度及粒径范围内的纳米硒可通过 JAK2/STAT3、IL6 及 TNF- α 通路调控巨噬细胞极化平衡, 影响 AU 中巨噬细胞的靶向招募和免疫功能, 也可靶向干预视网膜色素上皮细胞中重要促炎因子的表达, 实现多重路径共同调控眼内免疫应答。

摘要编号: 209282

肠道微生物组、免疫细胞及循环炎症因子与不同类型葡萄膜炎的因果关联研究

第一作者: Guandong ZHU

目的: 葡萄膜炎是一种与免疫失调密切相关的致盲性眼病, 其不同类型 (如 VKH 综合征、白塞病) 具有独特的临床特征。尽管观察性研究揭示了葡萄膜炎患者存在肠道菌群紊乱, 但菌群、免疫系统与疾病亚型之间的因果关系及具体路径尚不明确。本研究旨在利用孟德尔随机化方法, 系统阐明肠道微生物对各类葡萄膜炎的因果影响, 并揭示免疫细胞与炎症因子在其中的中介作用。

方法: 我们从大规模全基因组关联研究 (GWAS) 公共数据库中获取了肠道微生物群、731 种免疫细胞特征、91 种循环炎症因子以及主要葡萄膜炎类型 (包括全葡萄膜炎、VKH 综合征、白塞病等) 的遗传数据。采用两样本孟德尔随机化作为主要分析方法, 以遗传变异作为工具变量推断因果关系。通过逆方差加权法、MR-Egger、加权中位数等方法进行验证, 并进行敏感性分析以确保结果的稳健性。进一步, 我们进行了中介分析, 以量化免疫细胞和炎症因子在“肠 - 眼轴”通路中的介导比例。

结果: MR 分析鉴定出多个与葡萄膜炎风险存在因果关联的肠道菌属。例如, Bacteroides 和 Paraprevotella 的增加与全葡萄膜炎风险升高相关, 而 Roseburia 和 Clostridium (产丁酸盐菌) 则显示出保护作用。这些效应在不同类型的葡萄膜炎中存在显著异质性: Prevotella 是 VKH 综合征的特定风险因子, 而 Bifidobacterium 的改变与白塞病显著相关。中介分析进一步表明, 特定免疫细

胞（如活化的 CD4⁺ T 细胞、调节性 T 细胞）和炎症因子（如 IL-23、IFN- γ ）在肠道微生物影响葡萄膜炎风险的路径中承担了约 15%–30% 的中介效应。

结论：本研究从遗传学角度为“肠—眼轴”假说提供了强有力的因果证据，证实了肠道微生物群通过调节宿主免疫状态，对不同类型葡萄膜炎的发病存在特异性的因果影响。我们的发现不仅将特定的微生物类群（如 *Prevotella*）确立为 VKH 等疾病的潜在生物标志物，更重要的是，揭示了可干预的免疫通路（如 Th17 通路相关的细胞与因子），为未来开发针对特定葡萄膜炎亚型的微生物靶向或免疫调节疗法奠定了理论基础。

摘要编号：210130

表观遗传适应驱动单核细胞在植入视网膜后分化为小胶质细胞样细胞

第一作者：Fengyang LEI

共同作者：Shengping HOU, Jie LIU, Eleftherios PASCHALIS

目的：识别小胶质细胞的特异性标记物一直是个长期存在的难题。近年来，P2ry12、TMEM119 和 Fcrls 等标记物被认为具有小胶质细胞特异性，但这类判断的前提假设是：循环单核细胞即使浸润中枢神经系统后仍能保持其独特特征。我们最新研究发现，在永久性植入中枢神经系统后，浸润单核细胞在维持促炎症特性的同时，能够获得小胶质细胞样特征。本研究旨在深入探索这一现象。

方法：本研究通过骨髓嵌合体模型，结合单细胞 RNA 测序、ATAC-seq、流式细胞术和免疫组织化学技术，系统分析了植入单核细胞的表型变化。

结果：我们证实植入单核细胞能够获得经典小胶质细胞标记物的表达。这些变化伴随着染色质可及性的改变，以及指示小胶质细胞身份的染色质结合基序的偏移。更重要的是，我们发现植入单核细胞能动态调控 PU.1、CTCF、RUNX、AP-1、CEBP 和 IRF2 等转录因子的表达——这些因子对塑造小胶质细胞身份均具有关键作用。本研究首次揭示视网膜内植入单核细胞经历表观遗传和转录双重改变，从而获得表达小胶质细胞样特征的能力。

结论：这些发现提示，未来在研究单核细胞与小胶质细胞在中枢神经系统病理学中的作用时，必须充分考虑这些细胞的身份转化现象。

摘要编号：208186

预防 Behçet 病葡萄膜炎复发的免疫调节疗法疗效比较

第一作者：Zhenyu ZHONG

共同作者：Peizeng YANG

目的：评估环孢菌素、干扰素 α -2a 和阿达木单抗在现实环境中预防 Behçet 病葡萄膜炎复发的有效性。

方法：我们模拟了一项目标试验，该试验涉及 2008 年 4 月 10 日至 2024 年 8 月 1 日期间开始服用环孢菌素、干扰素 α -2a 或阿达木单抗的 Behçet 病葡萄膜炎成年患者，并随访到 2024 年 9 月 10 日。我们应用重叠加权来平衡不同治疗组的患者特征，并在基线时模拟随机化。主要结局是研究治疗期间葡萄膜炎的年复发率。

结果：该队列包括 716 名环孢菌素使用者、193 名干扰素 α -2a 使用者和 103 名阿达木单抗使用者。环孢素组葡萄膜炎的估计平均年复发率为 0.95 (95%, 0.82 至 1.10)，干扰素 α -2a 组为 0.52 (95%, 0.40 至 0.69)，阿达木单抗组为 0.28 (95%, 0.19 至 0.43)。接受环孢菌素治疗的患者比接受阿达木单抗治疗的患者复发率更高（发病率比 [IRR], 3.36 [95% CI, 2.23 至 5.05]；平均差异, 0.66 [95% CI: 0.48 至 0.85]； $P < 0.001$ ）或干扰素 α -2a (IRR, 1.81 [95% CI: 1.37 至 2.40]；平均差异, 0.42 [95% CI, 0.22 至 0.62]； $P < 0.001$ ）。干扰素 α -2a 的复发率高于阿达木单抗 (IRR, 1.86 [95% CI, 1.16 至 2.97]；平均差异, 0.24 [95% CI: 0.05 至 0.43]； $P = 0.011$)。

结论：在 Behçet 病中，与环孢菌素相比，干扰素 α -2a 与葡萄膜炎复发减少有关，而阿达木单抗与干扰素 α -2b 相比与更低的葡萄膜炎复发相关。

摘要编号：210211

高脂饮食调控 CD4⁺ T 细胞平衡和功能介导自身免疫性葡萄膜炎的发病

第一作者：Haixiang HUANG

目的：自身免疫性葡萄膜炎（AU）是一种不可逆炎症性致盲性眼病，激素与免疫抑制剂是常规治疗方案，治疗时间长，副作用大，阐释发病机制，找到治疗新靶点是关键。在心血管疾病中高脂饮食产生游离脂肪酸和低密度脂蛋白，被证实具有促炎作用，然而高脂饮食在自身免疫性葡萄膜炎中是否发挥同样促炎作用尚不清楚。本研究探讨高脂饮食对自身免疫性葡萄膜炎的作用及其分子机制。

方法：实验性自身免疫性葡萄膜炎（EAU）是人类葡萄膜炎的代表性动物模型。小鼠用 IRBP1-20 免

疫，并分别用高脂饮食或正常饮食处理。使用眼底照相和组织病理检查模型葡萄膜炎的发病情况，取材视网膜、引流淋巴结（DLNs）和脾脏（SP）分析 T 细胞表达情况。体外分离的 T 细胞用于体外增殖、分化和功能检测。使用选择性抑制剂和通路激动剂研究信号通路。进一步检测了高脂对体外 T 细胞功能的影响。

结果：高脂饮食加重 EAU 发病，眼底评分和病理评分显示相应改变。高脂饮食抑制了视网膜、DLN、SP 中调节性 T 细胞（Treg）的表达，促进了 Teff 增加，高脂诱导 Treg 向 Th17 样细胞转化：FoxP3 表达下降，ROR γ t 上调，IL-17 分泌增加；此外高脂诱导 Th1 细胞产生，促进炎症因子释放。进一步机制研究表明高脂饮食通过 SR-BI/PI3K/Akt 信号通路调控 T 细胞功能，在高脂饮食的 EAU 模型中添加载脂蛋白 A1（APOA1）处理，能够部分减轻视网膜的炎症。

结论：高脂饮食通过介导 Treg 的促炎表型和功能及 Teff 产生促进 EAU 的发病；其调控机制与 SR-BI/PI3K/Akt 信号通路相关，提示高脂饮食可能是葡萄膜炎的危险因素。

眼外伤

摘要编号：200789

1990-2021 年中国居民眼内异物疾病负担分析与趋势预测

第一作者：Shuyi LIU

共同作者：Wei LU

目的：分析 1990-2021 年中国居民眼内异物的疾病负担及变化趋势，并预测 2022-2050 年发病趋势，为减轻我国眼内异物疾病负担和制订科学的防控措施提供参考。

方法：基于全球疾病负担数据库（GBD）收集中国居民 1990-2021 年最新的眼内异物数据，采用年龄标准化发病率、患病率及伤残调整寿命年（DALY）指标分析我国眼内异物疾病负担；通过年估计变化百分比（EAPC）评估眼内异物疾病负担变化趋势；并使用秩和检验分析性别差异；采用自回归综合移动平均模型（ARIMA）进行趋势预测。

结果：2021 年我国居民眼内异物的年龄标准化发病率为 629.18/10 万，患病率为 116.24/10 万，DALY 率为 6.42/10 万；患病人数 200.74 万，新发病例 1,012.83 万，DALY 人数 11.01 万。1990-2021 年间，我国居民眼内异物的发病率、患病率和 DALY 率均呈现先下降后上升趋势，经年龄

标准化后发病率、患病率和 DALY 率的 EAPC 分别为 -1.80（95% CI: -2.87, -0.71）、-1.82（95% CI: -2.89, -0.75）和 -2.15（95% CI: -3.23, -1.07）；性别分层分析显示男性眼内异物的年龄标准化发病率、患病率和 DALY 率整体显著均高于女性（ $P < 0.001$ ）；年龄分层分析显示 45 ~ 54 岁人群眼内异物的患病人数和 DALY 人数最多。预测 2022-2050 年眼内异物的 DALY 率将保持平稳趋势，发病率和患病率将继续上升；发病人数、患病人数和 DALY 人数呈现下降趋势。

结论：对比 1990 年，2021 年我国居民眼内异物年龄标准化发病率、患病率和 DALY 率均降低。但我国人口基数大，眼内异物疾病负担仍然较大，应制定更多高效的防控策略以减轻眼内异物疾病负担。

摘要编号：207668

TNK-tPA 辅助手术治疗外伤性出血性视网膜脱离的临床观察

第一作者：Wenting WANG

目的：探讨纤维蛋白溶解剂 TNK-tPA（替奈普酶）作为手术辅助药物，在治疗复杂性外伤性出血性视网膜脱离及视网膜下出血中的有效性与安全性，以解决术中血凝块引流困难、视网膜复位率低这一临床挑战。

方法：本研究回顾性分析了 3 例由眼球钝挫伤或破裂伤所致的复杂性出血性视网膜脱离病例。所有患者均在接受玻璃体切割手术中，联合应用 TNK-tPA。核心操作是使用 41 G 超细针头，经视网膜将小剂量 TNK-tPA（25 μ g-50 μ g）精准注入视网膜下血肿腔内，待其充分液化积血（等待数小时）后，再行视网膜下积血引流、激光光凝及硅油填充等标准步骤。其中一例因合并严重眼前段损伤，采用了玻璃体腔注射 TNK-tPA 联合长效激素的方案。

结果：术后所有患眼均实现了视网膜的解剖学位位，视网膜下积血被有效清除。视功能得到显著改善：一例无光感患者视力恢复至眼前手动，另一例患者最佳矫正视力提升至 0.1。术中及术后未发生与 TNK-tPA 相关的明显并发症（如难以控制的新发出血）。该技术为后续激光治疗创造了清晰的手术视野，确保了手术的成功。

结论：本组病例表明，在玻璃体视网膜手术中辅助使用 TNK-tPA 进行视网膜下注射，是一种处理外伤性出血性视网膜脱离的高效、安全的创新策略。它能迅速液化顽固性血凝块，实现彻底引流，促进视网膜复位，并最终有效挽救患者视功能。此方法为复杂眼外伤的治疗提供了新的思路，具有重要的临床推广价值。

摘要编号: 208923

伴有晶状体脱位的马凡综合征患者的前部巩膜厚度研究

第一作者: Yanyun CHEN

共同作者: Lei HE, Siqing HE, Yaping LIU, Xiangyu SHI

目的: 研究伴有晶状体脱位的马凡综合征 (MFS) 患者的前部巩膜厚度 (AST)。

方法: 回顾性横断面研究。观察组为经基因检测确诊为伴有晶状体脱位的 MFS 患者, 对照组为正视眼。排除已知患有角膜、结膜或巩膜疾病, 有眼部手术史 (包括睫状体平坦部玻璃体切除术)、近期佩戴隐形眼镜或患有高度散光的受试者。所有受试者均接受 IOLMaster 700 光学生物测量仪、眼前节光学相干断层扫描 (AS-OCT, Optovue) 以及常规眼科检查。在上方、下方、颞侧和鼻侧, 手动测量距巩膜突 1 毫米 (AST1)、2 毫米 (AST2) 和 3 毫米 (AST3) 处的前部巩膜厚度, 包括 Tenon's 囊至浅层巩膜的厚度 (Tenon's capsule and episclera thickness, TET)、深层巩膜基质厚度 (scleral stroma thickness, SST)、全层巩膜厚度 (total scleral thickness, TST)。分别比较两组前部巩膜厚度的空间分布特点。

结果: 本研究共纳入 32 名患者 (MFS 组 18 名 35 眼, 对照组 14 名 23 眼)。MFS 组与对照组的年龄分别为 19.74 ± 15.94 VS 56.78 ± 10.40 ($U = 40$, $P < 0.001$), 眼轴分别为 24.77 ± 2.21 mm VS 23.53 ± 1.01 mm ($U = 339.5$, $P = 0.10$)。MFS 组与对照组相比, 各个方向的全层巩膜厚度在两组间差异无统计学意义 ($P < 0.05$)。MFS 患者的 TET (除了颞侧以外) 在鼻侧、上方、下方的各个测量点均比对照组显著增厚 ($P < 0.05$)。MFS 患者的 SST 在上方、下方、鼻侧和颞侧所有测量点均显著降低 ($p < 0.001$)。本研究未发现前部巩膜厚度与眼轴长度之间存在相关性。

结论: 比对照组相比, MFS 患者的 TST 无明显变薄, 但是 TET 显著增厚, 且 SST 显著降低。本研究的在体巩膜厚度测量分析表明, MFS 患者巩膜壁的发育异常可能主要体现在深层巩膜厚度的显著降低, 提示在伴有晶状体脱位的 MFS 患者行人工晶状体巩膜固定时需要更加关注深层巩膜厚度, 以减少人工晶状体再脱位的风险。

摘要编号: 204367

外伤性蜡样与枯草芽孢杆菌性眼内炎的临床特征及预后分析

第一作者: Shaolei HAN

目的: 探讨外伤性蜡样与枯草芽孢杆菌所致眼外伤性眼内炎的临床特征差异及预后危险因素。

方法: 回顾性分析 2014 年 1 月至 2023 年 12 月河北省眼科医院眼外伤科收治的 32 例芽孢杆菌性眼内炎病例。纳入标准: 开放性眼外伤后经微生物培养确诊。记录致伤类型 (穿透伤、球内异物、破裂伤)、伤口分区 (I 区: II 区: III 区)、病原菌种类及视力结局。统计学分析采用卡方检验与多因素 Logistic 回归。

结果: 32 例患者中, 男性 28 例 (87.5%), 女性 4 例 (12.5%); 右眼 15 例 (46.9%), 左眼 17 例 (53.1%)。致伤类型: 眼球穿透伤 18 例 (56.3%), 树枝 8 例、铁丝 7 例、其他 3 例, 球内异物 12 例 (37.5%), 破裂伤 2 例 (6.3%); 伤口分布: I 区 8 例 (25.0%), II 区 22 例 (68.8%), III 区 2 例 (6.3%)。蜡样芽孢杆菌感染 18 例 (56.3%), 其中 3 例 (16.7%) 摘除眼球, 9 例 (50.0%) 无光感; 枯草芽孢杆菌感染 14 例 (43.7%), 1 例 (7.1%) 摘除眼球, 4 例 (28.6%) 无光感。蜡样芽孢杆菌组眼球摘除率及无光感率均显著高于枯草芽孢杆菌组 ($P < 0.05$)。蜡样芽孢杆菌感染者起病急骤 (24 小时内视力丧失 11 例, 61.1%), 伴严重前房积脓 (88.9% vs. 42.9%) 及玻璃体混浊 (100% vs. 64.3%)。多因素分析显示, 蜡样芽孢杆菌感染 ($OR = 5.03$, 95% CI 1.38 – 18.34)、就诊延迟 > 48 小时 ($OR = 4.76$, 95% CI 1.26 – 17.95) 及 II/III 区伤口 ($OR = 3.52$, 95% CI 1.08 – 11.47) 是视力丧失的独立危险因素。

结论: 蜡样芽孢杆菌性眼内炎进展迅猛, 眼球摘除及无光感风险显著高于枯草芽孢杆菌, 早期玻璃体切除联合敏感抗生素 (万古霉素/头孢他啶) 是改善预后的关键。建议对 II/III 区外伤患者优先行快速病原学鉴定以指导治疗。

摘要编号: 208998

微型异形强力恒磁铁在眼部异物取出中的应用

第一作者: Yong LV

共同作者: Xun AN, Chao MA, Shuai WANG, Tiantian WANG

目的: 眼部磁性异物存留是眼外伤中的常见情况, 异物在眼内长期存留可引发一系列严重的并发症, 导致视力能不可逆的损害。传统磁性异物取出器械可能存在磁力不足、操作不便或适用范围有限等问

题。为了更方便的取出眼内磁性异物，我们设计了一种“微型异形强力恒磁铁”。

方法：该器械由三个主要部件组合而成：部件一是一个微型恒磁铁磁头，其底端直径仅 5mm，长 7mm，尖端为圆锥形设计。尽管体积小巧，但其磁力高达 3000 高斯（0.3 特斯拉），提供了极强的局部磁场。部件二是一根长约 8cm 的不锈钢钉，可作为手柄与磁头连接。部件三是直接 1mm 由曲别针制作的磁棒。其临床应用具体体现在以下几个方面：1. 深板层角膜异物取出：强磁力可透过角膜组织精准吸附异物，避免了不必要的组织损伤，提高了取出成功率。2. 睫状体和巩膜异物的诊断与取出：利用其独特的磁性原理，器械可用于进行“点头试验”（磁铁与铁钉组合后手指放置于铁钉中央平衡部，将其磁力尖端缓慢地、由远及近地移向眼球壁，若有磁性异物术者会观察到磁铁尖端下垂，尖端接触巩膜壁时由于磁性原理吸附于巩膜壁，因此可精确定位磁性异物，为术前定位和术中切口制作提供较精确的位置，术中于定位处做切口后可直接使用磁铁将异物吸出。铁钉远离时，因磁力减弱而磁铁回复原位）。3. 眼内后部异物取出术中的“磁棒接力”：对于位于眼后段的异物，该微型恒磁铁可作为内路磁棒或与外路电磁铁进行“接力”操作。降低了对正常晶状体和视网膜的损伤风险。4. 眶内陈旧磁性异物取出：其小巧和强磁力的特性同样适用于眼眶手术，能够精准定位并吸附滞留于眶软组织中的陈旧磁性异物，减少手术创伤。

结果：这种分体式设计具有高磁力、部件小巧、灵活组合、便于操作四大特点，使其能够适应多种复杂的手术场景。在应用范围上，包括但不限于深板层角膜、前房角、睫状体以及晶状体。

结论：因此微型异形强力恒磁铁为眼部磁性异物的取出提供了一种更为安全、精准、有效的解决方案。

摘要编号：208485

折叠式人工玻璃体球囊植入 81 例临床应用观察

第一作者：Yan CHEN

共同作者：Guohua JIANG, Youqing LAN

目的：探讨折叠式人工玻璃体球囊（FCVB）在 81 例硅油依赖眼患者中的长期临床应用效果。

方法：纳入 81 例符合以下条件的患者：严重眼外伤（如贯通伤、脉络膜破裂等）、硅油依赖眼、陈旧性视网膜脱离、大疱性角膜病变、眼内炎、隐形视网膜坏死（硅油填充术后）、葡萄肿（硅油填充术后）及眼球萎缩伴角膜混浊，术前视力均低于 0.01。术前采用三维重建技术，根据眼眶 CT 计算出患眼眼轴长度，以确定球囊型号及硅油注入量。

术中行微创 FCVB 植入术。术后早期给予系统抗炎、抗感染治疗。随访观察时间为 6 个月至 6 年。

结果：除 1 例糖尿病患者术后再次外伤导致眼球破裂、球囊脱出并转整形科处理外，其余 80 例均一次性成功保留了眼球，未出现术后感染或更换球囊等再次手术情况。

结论：对于复杂的硅油依赖眼及严重眼外伤患者，FCVB 植入术可有效实现长期保眼，是此类难治性眼病的重要治疗选择。

摘要编号：207797

新型镍钛双钩引导系统的设计与初步应用：用于辅助泪小管断裂修复中的引流管置入

第一作者：Juan ZHANG

共同作者：Yanlong BI, Houshuo LI

目的：评估一种可自行制作的新型形状记忆双钩（Bi-hook）装置，在泪小管断裂修复术中辅助逆行置入泪道支架的临床疗效与安全性。

方法：本研究为回顾性对比研究。Bi-hook 装置的制作工艺简易，核心由三部分构成：部件：一根 16 号弯曲不锈钢针、一根 36 厘米长的 0.2 毫米镍钛记忆合金（Nitinol）丝，以及一根 7 厘米长的钝头泪道探针。组装：将镍钛丝对折成双股，插入不锈钢针管内。定型（关键步骤）：将弯曲的针头部分用火焰灼烧 2-3 秒，随后冷却，即可形成具有预设形状记忆功能的双钩结构。该装置可伸缩：回缩时，镍钛丝完全隐藏于探针内；伸出时，其尖端可根据预设形状展开，利于术中自发从鼻前庭引出。共纳入 76 例（76 眼）泪小管断裂患者，其中 39 例使用此自制 Bi-hook 装置置管（Bi-hook 组），37 例使用传统 Ritleng 系统置管（对照组）。

结果：置管效率：Bi-hook 组的鼻前庭自发引出成功率显著高于对照组（97.44% vs. 16.22%），且支架置入时间显著缩短（18.93 ± 7.19 分钟 vs. 32.02 ± 10.25 分钟）。手术安全性：Bi-hook 组术后早期并发症发生率显著更低，如鼻出血（5.13% vs. 21.62%）和眼睑水肿（12.82% vs. 29.73%）。长期功能：两组患者在术后泪道通畅率、泪河高度及溢泪评分等长期功能指标上无显著差异。

结论：本研究证实，利用简易工艺自制的 Bi-hook 记忆合金装置，能够显著提高泪小管断裂修复术中支架置入的效率和安全性。其制作简单、成本低廉的特点，结合优异的形状记忆性能，使其成为一种极具临床推广价值的创新技术，尤其适用于在无鼻内镜辅助的条件下简化手术操作、降低组织损伤。

摘要编号: 208927

玻璃体切除联合缝线式人工晶状体悬吊术的长期随访研究

第一作者: Yanyun CHEN

共同作者: Lei HE, Siqing HE, Yaping LIU

目的: 观察玻璃体切除联合缝线式人工晶状体(IOL)悬吊术的远期 IOL 脱位率及并发症。

方法: 单中心回顾性病例系列研究。纳入 2014 年 1 月至 2022 年 12 月在首都医科大学附属北京同仁医院行玻璃体切除联合缝线式 IOL 悬吊术的患者,手术均由单一术者完成,均采用 10-0 聚丙烯缝线行巩膜固定缝线式 IOL 悬吊术。患者定期于我院及当地医院进行混合远程长期随访。主要指标为 IOL 脱位率。

结果: 收集行玻璃体切除联合 IOL 悬吊术患者 168 人,16 人随访中断(其中 12 人拒绝接受远程随访,2 人再次外伤,1 人出现反复视网膜脱离,1 人死亡),失访率为 9.52%。最终纳入 152 位患者,其中男性 120 人(78.9%),女性 32 人(21.1%)。患者年龄为 47.00(26.00, 58.00)岁,随访时间为 76.57(50.62, 112.33)月。外伤性晶状体脱位 121 人(占比 79.6%),先天性晶状体脱位 18 人(占比 11.8%),其他原因导致晶状体脱位 29 人(占比 19.0%)。术前患者 logMAR 视力均值为 1.39 ± 0.76,术后 logMAR 视力均值为 0.74 ± 0.64,绝大部分患者手术后视力较术前明显提升。在随访中共发现 IOL 脱位 10 人(占比 6.57%),其中术后 3 年内出现 IOL 脱位为 2 例(占比 1.31%),6 年内出现 IOL 脱位为 6 例(占比 3.94%),9 年内出现 IOL 脱位为 10 例(占比 6.57%)。随访过程中总共 16 人出现 IOL 悬吊术相关并发症(占比 10.5%),其中异物感、眼红不适 7 人(占比 4.6%),视力下降 3 人(占比 1.9%),眼前黑影 6 人(占比 3.9%)。随访中无缝线暴露、无眼内炎、无视网膜脱离发生。其中 < 50 岁(n = 85)人群中 IOL 脱位 9 人(占比 10.6%),≥ 50 岁(n = 67)人群中 IOL 脱位 1 人(占比 1.5%),组内比较差异有统计学意义($\chi^2 = 5.043$, $P = 0.025$)。马凡综合征是人工晶状体脱位的危险因素($df = 1$, $P = 0.07$)。随访时间与人工晶体脱位无相关关系($r = 0.145$, $P = 0.074$)。

结论: 玻璃体切除联合缝线式 IOL 悬吊术后随着手术时间延长 IOL 脱位率上升,年轻人更容易发生 IOL 脱位,马凡综合征是人工晶状体脱位的危险因素。

摘要编号: 207788

眼中“隐形锈”,诊治需尽早

第一作者: Hui PENG

共同作者: Lingyi JIN, Huan JU, Xuefeng QIN, Yue TIAN, Xing WANG

目的: 探讨眼外伤后眼后节金属异物长期未诊治,引发眼铁质沉着病的机制与诊疗策略,并剖析其视力预后,为临床早期诊断和干预提供依据。

方法: 系统检索并回顾近年相关文献,结合临床病例,归纳眼后节铁质异物引起眼铁质沉着病的发病机制、临床表现、影像特征、治疗要点及预后。

结果: 眼铁质沉着病是由眼内铁质异物持续释放铁离子,通过 Haber-Weiss 反应生成破坏性自由基,引发脂质过氧化反应,导致细胞膜损伤和酶失活等不可逆视功能损害。该病进展隐匿但具有特征性临床表现,包括渐进性视力下降,以及角膜铁锈沉着、虹膜异色、瞳孔扩大及反应迟钝、晶状体前囊棕色沉着、向日葵样白内障、玻璃体混浊、视网膜色素变性和血管狭窄等典型体征。眼眶 CT 是异物定位的首选方法,视网膜电图(ERG)可客观评估视功能状态。治疗关键在于尽早手术取出异物(最佳时机 < 24 小时),根据后节异物体积、性质和部位选择选择经巩膜异物取出术(外路取出术)或经睫状体平坦部玻璃体切除(pars plana vitrectomy, PPV)异物取出术。预后主要取决于视网膜损伤程度,受异物大小、位置、存留时间等因素影响,一般眼前节铁异物的预后较眼后节要好,在最佳手术时机摘除异物的预后较好,错过最佳时机在 3 个月以内摘除较 3 个月以后摘除效果好。

结论: 眼后节铁质异物应尽早诊治。即使延误,手术仍可能改善预后,但视力恢复取决于视网膜损伤程度。早期干预是防止“铁锈性盲”的关键。

摘要编号: 206714

眼外伤后眼眶内植物性异物残留患者的诊断治疗及预后分析

第一作者: Gao LI

目的: 分析外伤后导致眼眶内植物性异物残留的患者的临床影像学特征及治疗方法,提高眼科医师认识水平。

方法: 回顾性病例研究,收集 2022 年 9 月—2025 年 4 月在大连理工大学附属第三人民医院诊治的外伤导致眼眶植物性异物残留的 11 例 11 眼患者的临床资料,总结其临床表现,影像学特征,诊断、治疗及预后。

结果: 11 例 11 眼患者均在外院或本院一期取出植物性外伤异物后残留异物, 其中 4 例患者形成不同程度皮肤瘻道, 1 例患者角膜穿孔术中联合眼球摘除, 1 例患者眼睑畸形联合眼睑整形手术治疗。所有患者治疗后随访 2 个月—2 年, 病情稳定 11 人。所有患者均行眼眶 CT 及增强核磁检查。对比伤后影像呈现明显时期特征性变化。

结论: 眶内植物性异物易残留, 残留后植物性异物对眼眶内组织有特征性影响, 术前充分准备, 增强核磁有指导性意义, 制定个性化手术方案及手术入路, 对术中完整取出异物, 降低手术难度, 提高患者预后生存治疗至关重要。

摘要编号: 202737

经全层巩膜直接睫状体缝合术与经典式经巩膜瓣下睫状体缝合术治疗外伤性睫状体分离效果的比较

第一作者: (gongqiang YUAN[AUTHOR])

目的: 比较经全层巩膜直接睫状体缝合与经典式经巩膜瓣下睫状体缝合的手术效果。

方法: 回顾性病例对照研究。将 2018 年 1 月至 2024 年 9 月于我院因眼部钝挫伤导致睫状体分离需接受睫状体缝合术的患者纳入研究, 分为两组, A 组使用 8-0 薇乔可吸收缝线经全层巩膜直接缝合睫状体, B 组采取经典术式, 经巩膜瓣下切开内板层巩膜, 缝合分离的睫状体, 比较两组睫状体复位率、视力、眼压、并发症及手术时间。

结果: A 组 21 例 (21 眼), 一次手术复位率为 90.48% (19/21), 最终复位率为 100% (21/21); B 组 11 人 (11 眼), 一次手术复位率为 90.01% (10/11), 最终复位率为 100% (11/11)。术后 1 月, A 组 LogMAR 视力由术前 [0.40 (0.15, 1.15)] 提升至 [0.26 (0.05, 1.40)], B 组由 [1.22 (0.15, 1.40)] 提升至 [0.30 (0.00, 1.40)]。术后 1 周, A 组眼压由术前 [9.00 (8.00, 10.00)] mmHg 提高至 [11.00 (8.50, 18.50)] mmHg ($Z = -2.315, P = 0.021$), B 组由术前 [7.00 (7.00, 9.00)] mmHg 提高至 [11.00 (9.00, 17.50)] mmHg ($Z = -2.677, P = 0.007$)。A 组手术时长为 [5.13 (3.91, 8.09)] 分钟, B 组手术时长为 [49.70 (45.00, 74.68)] 分钟 ($Z = -4.583, P < 0.001$), 二者差异有统计学意义。

结论: 经全层巩膜直接睫状体缝合术操作简便、安全有效, 可以作为外伤性睫状体分离的首选手术方式。

摘要编号: 209344

蛋白组学驱动的跨组织匹配: 兔脱细胞气管作为人工泪管支架的体外验证

第一作者: Bingran DONG

目的: 先天性泪道缺如或外伤致泪道严重毁损的患者, 常因自体组织或材料的局限性、取材部位损伤、形态与力学不匹配、无法实现泪道微环境、生物功能无法实现和长期带管等限制而难以获得泪道的理想重建。基于“蛋白组学匹配”思路, 本研究提出以兔脱细胞气管为支架, 联合经 3D 环境诱导兔表皮干细胞获得的兔泪道上皮细胞, 体外构建组织工程人工泪管。

方法: 1) 对兔气管与兔泪管进行定量蛋白组学比对与生物信息学分析, 评估细胞外基质与基底膜相关成分的一致性; 2) 对兔气管实施脱细胞处理, 并以组织学、残留 DNA 与基质成分保留等指标判定脱细胞达标, 同时行体内植入评估免疫反应; 3) 构建三维泪道微环境诱导体系, 促使兔表皮干细胞向泪道上皮方向分化, 并通过特异性表征验证诱导效能; 4) 将诱导获得的泪道上皮细胞复合于兔脱细胞气管支架, 体外培养后行组织免疫荧光染色评价上皮化与组织特异性。

结果: 蛋白组学显示兔气管与兔泪管在多种细胞外基质与基底膜相关蛋白上高度重叠, 功能通路富集一致, 支持气管基质作为泪管支架的合理性。脱细胞处理有效去除细胞成分, 保留关键结构与力学框架, 体内验证未见明显免疫反应。三维诱导体系可稳定获得具有泪道上皮特征的细胞群, 特异性表征阳性。复合构建后, 诱导细胞在脱细胞气管支架上良好黏附与覆盖, 组织免疫荧光显示泪道上皮相关标志表达, 证实组织工程人工泪管的体外构建成功。**结论:** 以蛋白组学证据筛选的兔脱细胞气管具有良好的结构适配性与免疫相容性, 可作为组织工程学泪道的可靠支架; 结合三维微环境诱导获得的泪道上皮细胞, 可在体外实现连续上皮化与组织特异性重建。本研究提出并验证了“蛋白组学驱动的跨组织支架选择—脱细胞与免疫学验证—干细胞定向诱导—体外构建”的系统策略, 为先天性缺如或外伤性严重损毁所致的泪道缺损提供了可转化的组织工程解决方案与实验依据。

结论: 本研究提出并验证了“蛋白组学匹配”的跨组织支架选择范式, 真空辅助脱细胞在显著降低免疫原性同时保留胶原与软骨框架, 成功体外构建组织工程泪管。

CYP2J 介导的脂质代谢产物促进视网膜病理性血管生成

第一作者: 任安利

共同作者: Yan GONG, Jean-sébastien JOYAL, Lois SMITH, Honghua YU

目的: 增殖性视网膜病变是以视网膜病理性血管生成成为主要特征的常见视网膜微血管并发症, 也是导致患者失明的主要原因。近年来研究发现, 视网膜脂质代谢异常在病理性血管生成过程中起重要作用。本研究旨在探讨细胞色素 P450 2J (CYP2J) 及其脂质代谢产物 14, 15-环氧二十碳三烯酸 (14, 15-EET) 在增殖性视网膜病变发生中的作用及其机制。

方法: 本研究采用高氧诱导视网膜病变 (OIR) 小鼠模型模拟增殖性视网膜病变, 并结合公共单细胞转录组测序数据库分析 CYP2J 的基因表达谱。免疫组化实验用于确定 CYP2J 在视网膜中的细胞定位, ELISA 用于测定视网膜中 14, 15-EET 水平。进一步通过划痕实验和细胞增殖实验评估 14, 15-EET 对血管内皮细胞迁移与增殖的影响。利用 AngioTool 量化视网膜深层血管网发育, 并通过视网膜电图检测小鼠视网膜电生理功能变化。

结果: 在人和小鼠视网膜中 CYP2J 主要分布于星形胶质细胞及 Müller 胶质细胞, 在 OIR 小鼠模型中表达显著上调。药理学抑制 CYP2J 可降低视网膜 14, 15-EET 水平并抑制病理性新生血管生成。功能实验表明, 14, 15-EET 能够通过激活过氧化物酶体增殖物激活受体 δ (PPAR δ) 促进内皮细胞迁移和增殖。PPAR δ 在视网膜病理性新生血管中高度过表达, 特异性抑制其活性可有效减少新生血管生成, 促进深层血管再生, 并改善视网膜光感受器功能。

结论: 本研究揭示了 CYP2J/14, 15-EET/PPAR δ 信号通路在调控脂质代谢产物及病理性血管生成中的作用, 为增殖性视网膜病变及其他血管生成相关疾病提供了新的潜在治疗靶点。

摘要编号: 209557

Omega3 通过 AQP4 介导的类淋巴排泄系统缓解早期阿尔茨海默症视网膜病理改变

第一作者: Qiuchen CAO

共同作者: Jirong AN, Weijie CHEN, Mingwei NI, Yanchi WU, Shige YANG

目的: 眼和脑关系密切, 视网膜作为中枢神经系统的一部分, 与脑具有高度的发育同源性和功能相似性。阿尔茨海默病 (Alzheimer's disease, AD) 是一种普遍存在的神经退行性疾病, AD 患者的眼部存在视觉功能障碍及视网膜结构和功能的异常改变。AD 主要病理特征是 β 淀粉样蛋白 (β -amyloid, A β) 的沉积, 且有研究报道 A β 在视网膜的沉积早于脑部。因此, 我们旨在探索早期 AD 视网膜病变, 以及眼部 A β 可能的排泄通路, 为 AD 视网膜病变的机制研究及治疗方法提供新的策略。

方法: 我们首先对 3 月龄 5 $\times$ FAD 小鼠进行认知和记忆相关行为学检测、视功能检查, 以及脑和视网膜的 A β 及相关病理的检测, 以评估早期 AD 脑和眼的损伤情况; 随后我们利用示踪技术, 通过玻璃体腔注射荧光标记的 A β 追踪眼内毒性蛋白的排泄通路, 并利用基因敲除鼠和蛋白调控剂, 对排泄通路上的关键蛋白——水通道蛋白 4 (Aquaporin 4, AQP4) 进行调控, 检测调控后的眼内 A β 排泄速率及视网膜病理改变。

结果: 利用玻璃体腔注射示踪技术, 我们提出了一条眼部 A β 排泄的完整通路: 即 A β 可以通过血管周围间隙排泄至眶周淋巴管, 并最终到达颈深淋巴结; 通过引入 AQP4 基因调控鼠, 我们发现 AQP4 缺失会导致眼部 A β 排泄速率下降, 最终引起 A β 积聚并导致视功能损伤加重; 而使用 Omega-3 可以缓解 A β 所致的 AQP4 的极性紊乱, 促进眼部类淋巴系统排泄速率, 从而缓解 A β 所致的视功能损伤。

结论: 眼部存在类淋巴-鞘膜淋巴管转运通路, 眼部 A β 可以通过该通路进行排泄, Omega-3 可以通过增强 AQP4 极性促进 A β 排泄, 从而缓解早期 AD 视功能和视网膜病理改变。

摘要编号: 210327

Rs1 基因补充在先天性视网膜劈裂症 Rs1-KI (Rs1E72K) 小鼠治疗中的局限性

第一作者: Chunwen DUAN

共同作者: Jiansu CHEN, Shibo TANG

目的: 利用先天性视网膜劈裂症 (X-linked juvenile retinoschisis, XLRS) Rs1 基因敲入 (Rs1

knock-in, Rs1-KI) 小鼠探讨 Rs1 基因补充治疗对 Rs1-KI 小鼠视网膜结构、功能和生物分子的变化。

方法: 使用 CRISPR/Cas9 和显微注射技术构建 Rs1-KI (Rs1E72K) 小鼠并分析其基因型和表型。对出生后 2 周的雄性 Rs1-KI 小鼠进行 AAV2.7m8-CMV-Rs1 玻璃体腔注射, 通过 OCT、透射电镜分析小鼠视网膜结构变化, ERG、眼动仪分析视网膜功能变化, 高通量测序、WB 和 qPCR 分析视网膜生物分子变化。

结果: Sanger 测序检测构建的 Rs1-KI 小鼠基因型为 Rs1E72K, Rs1E72K 小鼠视网膜具有类似 XLRS 患者视网膜样的囊样劈裂改变和 ERG 的 a 波、b 波振幅下降表现。相较于野生型 (Wild type, WT) 小鼠, Rs1E72K 小鼠视网膜 WB 结果显示 Rs1 蛋白表达下降且不能形成八聚体结构, RCVRN 表达下降, CHOP 表达上升。相较于同周龄的 Rs1E72K 小鼠, 接受 AAV2.7m8-CMV-Rs1 治疗的 Rs1E72K 小鼠视网膜结构得到稍微改善 (劈裂囊腔减小、视网膜外核层增厚、线粒体肿胀减轻), 功能得到稍微改善 (ERG 的 a 波、b 波振幅上升, 光敏感度增加), RS1 蛋白单体表达增加且主要在外核层和 IS/OS 层表达, 但八聚体 RS1 蛋白合成不足, 与光感受器相关蛋白 Rho、RCVRN 表达上升。

结论: 通过 AAV2.7m8-CMV-Rs1 治疗后的 Rs1-KI 小鼠结构和功能得到一定改善, 但因八聚体 RS1 蛋白合成不足使其治疗有效性受限。这一研究为 RS1 基因补充在 XLRS 治疗中的限制性提供思考。

摘要编号: 208299

Wnt 抑制因子 1 在氧诱导性视网膜病变小鼠模型中改善新生血管形成并减轻光感受器损伤

第一作者: Jing ZOU

共同作者: Yingjun CAI, Wei TAN

目的: 探讨 Wnt 抑制因子 1 (Wnt inhibitory factor 1, WIF1) 在氧诱导性视网膜病变 (oxygen-induced retinopathy, OIR) 小鼠模型中的作用及其分子机制, 阐明其在抑制视网膜新生血管化 (retinal neovascularization, RNV) 及保护光感受器功能中的潜在价值。

方法: 通过分析增殖性糖尿病视网膜病变 (PDR) 及早产儿视网膜病变 (ROP) 患者玻璃体样本, 检测 WIF1 的表达水平; 建立 OIR 小鼠模型, 比较 P17 时 OIR 组与正常组视网膜中 WIF1 的表达差异。采用玻璃体腔内注射 WIF1 过表达慢病毒的方式干预 OIR 小鼠, 检测其对无血管区面积、新生血管簇、血管分支数量及视网膜电图 (ERG) a 波、b 波和振荡电位的影响, 并通过组织学及超微

结构观察评估视网膜厚度、突触数目及光感受器结构变化。同时检测 β -catenin、血管内皮生长因子 (VEGF)、磷酸化 AKT (p-AKT)、磷酸化 ERK (p-ERK) 的表达水平, 以及活性氧 (ROS)、4-羟基壬烯醛 (4-HNE)、自噬通量及细胞凋亡的变化。

结果: WIF1 在 PDR 和 ROP 患者玻璃体以及 OIR 小鼠视网膜中显著下调。WIF1 过表达显著减少 OIR 小鼠的无血管区和新生血管簇面积, 增加血管分支数, 提高 ERG 的 a 波、b 波和振荡电位振幅, 增加视网膜厚度和突触数量, 并改善光感受器细胞的高尔基体、线粒体及外节结构。机制研究显示, WIF1 过表达可抑制 β -catenin、VEGF、p-AKT 和 p-ERK 的表达, 降低 ROS 和 4-HNE 水平, 改善自噬通量并减轻细胞凋亡。

结论: WIF1 通过抑制 Wnt/ β -catenin-VEGF 信号通路及氧化应激反应, 在 OIR 小鼠中有效减轻病理性新生血管形成并保护光感受器功能。WIF1 有望成为 RNV 相关疾病的潜在靶向治疗分子。

摘要编号: 209426

一种基于 OCTA 的新型图像处理方法, 用于增强糖尿病视网膜病变的微动脉瘤检测和 3D 可视化

第一作者: Wang

共同作者: Yujia GAO, Jiayi WU, Liang YAO, Yuping ZHENG

目的: 本研究旨在开发一种基于光学相干断层扫描血管成像 (OCTA) 的新型图像处理方法, 以解决当前 OCTA 在检测微动脉瘤 (MA) 时因血流缓慢、分割错误和投影伪影等因素导致的灵敏度不足问题。该方法通过整合 OCTA 血流信号与结构 OCT 的高反射特征, 并结合三维重建技术, 旨在提升 MA 的检出率, 并实现其在视网膜血管网络中空间形态与动静脉起源的可视化。

方法: 使用 3×3 mm 黄斑中心 OCTA 扫描, 获取 512 幅连续 B 扫描图像用于三维重建。选取深层血管复合体 (DVC) 的 OCTA 血流 en-face 图像和结构 en-face 图像, 以及浅层血管丛 (SVP) 的结构 en-face 图像进行综合分析。基于 ImageJ 的图像处理流程: 对 B 扫描图像堆栈进行去除脉络膜血流、亮度增强和降噪预处理, 通过 Volume Viewer 插件生成视网膜血管的三维正面观 (3D frontal view)。分别处理 DVC 和 SVC。通过对结构 en-face 图像进行阈值分割以提取 MA 的高反射信号, 再与降噪后的 OCTA 血流 en-face 图像进行图像计算叠加, 分别生成 DVC-MA 图谱和 SVC-MA 图谱。将 DVC-MA 图谱与 SVC-MA 图谱相加, 最终生成一幅融合了 OCTA 血流信息和结构 OCT

MA 信息的、具有三维可视化效果的正面全景图，用于合成 3D-MA 图谱。

结果：与设备内置的 OCTA en-face 图像及单纯三维血管正面观相比，3D-MA 图谱能够显示出在传统 OCTA 中因血流缓慢而被遗漏的 MA，实现了多模态信息的互补，显著提升 MA 检测率。3D-MA 图谱提供了 MA 的空间立体形态及其与起源血管的连接关系。结合手动动静脉分割，可清晰区分 MA 的动脉源性与静脉源性可以实现三维形态与起源分析。该方法还能更清晰地展示视网膜内微血管异常（IRMAs）等病变的节段性扩张形态及其与邻近血管的空间关系。

结论：本研究成功建立了一种高效、实用的 OCTA 图像处理方法。所生成的 3D-MA 图谱显著提高了微动脉瘤的检测灵敏度，并能提供其三维形态及动静脉起源信息，为深入研究糖尿病视网膜病变的微血管病理机制、评估疾病进展及优化治疗策略提供了新的无创成像工具。

摘要编号：209014

中心凹厚度与黄斑无血管区是早期糖尿病视网膜病变的指标

第一作者：Qingquan WEI

共同作者：Qing PENG, Qinghua QIU

目的：糖尿病视网膜病变（DR）是糖尿病患者最常见的并发症之一，早期诊断和干预对于延缓疾病进展至关重要。本研究旨在探讨健康个体、无视网膜病变（NDR）患者及非增殖性糖尿病视网膜病变（NPDR）患者的中心凹厚度（CMT）和黄斑无血管区（FAZ）面积的变化，并探索早期 DR 的潜在危险因素。

方法：这项横断面研究纳入了 60 名健康个体、60 名 NDR 患者和 60 名轻度 NPDR 患者。所有参与者均接受了全面的眼科检查。使用光学相干断层扫描（OCT）测量 CMT，并使用光学相干断层扫描血管成像（OCTA）测量 FAZ 面积。分析了 CMT 和 FAZ 面积与早期 DR 系统性危险因素（包括糖尿病病程、体重指数（BMI）、糖化血红蛋白（HbA1c）、血脂谱和血压）之间的潜在关联。

结果：与对照组相比，NPDR 组和 NDR 组的双眼 CMT 和 FAZ 面积均存在显著差异（ $p < 0.05$ ）。NPDR 组与 NDR 组之间的 CMT 和 FAZ 面积也显示出显著差异（ $p < 0.05$ ）。此外，CMT 与糖尿病病程、BMI、总胆固醇（TC）、甘油三酯（TG）、收缩压和舒张压呈正相关（ $p < 0.05$ ）。FAZ 面积与糖尿病病程和 BMI 呈正相关（ $p < 0.05$ ）。

结论：CMT 的增加和黄斑灌注的减少可能是糖尿病患者最早的视网膜结构改变，且这两种变化均与系统性因素密切相关。这些发现为糖尿病视网膜病变的早期识别和干预提供了重要的结构与代谢指标。

摘要编号：210315

丹参酮 IIA 在极低密度脂蛋白受体基因敲除（Vldlr/-）小鼠中对脉络膜新生血管和血-视网膜屏障的保护作用研究

第一作者：Guoge HAN

共同作者：Pinghui WEI

目的：年龄相关性黄斑变性（AMD）是一种神经退行性疾病，可导致严重的中心视力损害。目前，抗血管内皮生长因子（VEGF）药物被用于治疗新生血管性年龄相关性黄斑变性（nAMD）。然而，部分患者对抗 VEGF 药物无反应或治疗效果逐渐减弱。丹参酮 IIA（TSA）因其独特的多靶点调控特性，在治疗多种疾病中显示出显著疗效，使其在治疗视网膜疾病中具有巨大潜力。本研究旨在探讨 TSA 在 Vldlr/- 小鼠 nAMD 模型中对脉络膜新生血管（CNV）和血-视网膜屏障的治疗作用及其机制。

方法：将 40 只 Vldlr/- 小鼠随机分为实验组和对照组，实验组每日腹腔注射 30 mg/kg 丹参酮 IIA（TSA），持续 8 周，对照组注射等体积生理盐水。通过光学相干断层扫描（OCT）和荧光素眼底血管造影（FFA）评估脉络膜新生血管（CNV）面积和渗漏情况，利用免疫荧光染色检测血-视网膜屏障完整性，并通过蛋白质组学和 Western blotting 分析分子机制，包括胆固醇代谢、自噬和细胞骨架重组相关蛋白的表达变化。所有数据采用独立样本 t 检验或单因素方差分析进行统计学处理， $P < 0.05$ 为差异具有统计学意义。

结果：与对照组相比，丹参酮 IIA（TSA）治疗显著减少了脉络膜新生血管（CNV）面积（ $P < 0.01$ ）和渗漏点数量（ $P < 0.05$ ），表明 TSA 对 CNV 具有显著的抑制作用。进一步分析显示，30 mg/kg 的 TSA 通过显著上调巩膜/脉络膜/视网膜色素上皮复合体中紧密连接蛋白 ZO-1 和 Occludin 的表达水平（ $P < 0.05$ ），有效恢复了血-视网膜屏障的完整性。同时，30 mg/kg 的 TSA 通过下调血管生成相关信号通路中的关键分子 PLC γ 和 ERK1/2（ $P < 0.01$ ），显著抑制了血管生成。蛋白质组学分析进一步揭示，TSA 治疗显著增强了胆固醇外流（ $P < 0.05$ ）和中间丝重组（ $P < 0.01$ ），同时降低了自噬相关蛋白的表达水平（ $P < 0.05$ ）。

结论：丹参酮 IIA（TSA）通过多靶点机制显著缓解 nAMD 的病理进程，包括抑制 PLC γ /ERK 信号

通路以抑制血管生成、上调紧密连接蛋白 ZO-1 和 Occludin 以恢复血 - 视网膜屏障完整性、促进胆固醇外流以实现代谢重编程, 以及调控自噬相关蛋白表达。这些发现表明, TSA 作为抗 VEGF 药物的潜在替代治疗药物, 具有重要的临床应用前景。

摘要编号: 209621

儿童葡萄膜炎的临床多模态分析与视力预后研究

第一作者: Zonghui MA

共同作者: Liu YANG

目的: 分析北京某眼科中心儿童葡萄膜炎的临床特征及视力预后影响因素。

方法: 本研究为回顾性研究, 纳入 2-16 岁确诊的儿童葡萄膜炎患者。所有患者均接受常规视力检查、眼压检查、裂隙灯显微镜检查、前置镜眼底检查及无创眼底影像学检查, 据临床表现针对性进行相关实验室检查; 部分后葡萄膜炎及全葡萄膜炎的患者行眼底血管造影检查, 部分年龄稍大能配合的患者接受甲襞微循环检测。收集患者发病年龄、受累眼别、复发情况、炎症部位、病因、治疗方式、并发症及其他临床数据。建立多因素回归分析模型, 综合分析影响儿童葡萄膜炎预后的因素。

结果: 研究共纳入 198 例儿童葡萄膜炎患者, 平均年龄 11.6 ± 3.1 岁, 女性患儿略多于男性 (55.2%)。多数患者呈隐匿起病 (52.5%) 及双眼受累 (64.1%)。最常见类型为全葡萄膜炎 (43.9%), 最常见病因是幼年特发性关节炎 (13.6%), 最常见并发症为继发性白内障 (17.2%) 和继发性眼压升高 / 青光眼 (13.1%)。儿童葡萄膜炎患者与健康儿童相比, 甲襞微循环检查中扩张毛细血管、无血管区以及出血现象出现的频率更高, 甲襞毛细血管的形态更加曲折, 毛细血管密度降低。影响视力预后的关键因素包括早期是否进行标准化规范诊疗、复发频率及眼部并发症。

结论: 儿童葡萄膜炎具有起病隐匿、症状不典型、病程迁延反复的特点, 且对常规治疗反应欠佳, 用药周期长且停药困难, 并发症发生率较高。本研究发现儿童葡萄膜炎患者存在甲襞毛细血管床异常, 提示儿童葡萄膜炎可能与全身性微血管病变相关, 但其分子机制仍有待前瞻性研究进一步阐明。在临床管理中, 早期诊断、个体化积极干预以及降低眼部致盲性并发症风险是改善视力预后的关键。

摘要编号: 208864

双抗药物起始联合长效激素治疗 CRVO 引起高度水肿 CME 对比单抗联合激素单中心前瞻性研究观察

第一作者: Zhang ZHONGYU

目的: 观察起始法瑞西单抗联合长效激素及雷珠单抗联合长效激素治疗 CRVO 引起高度 CME 患者治疗效果观察。

方法: 将 CRVO 引起的 CME 水肿大于 $700 \mu\text{m}$ 即三倍正常视网膜厚度定义为高度水肿, 采用起始联合的方法治疗, 起始联合即第一次采用 F + O 或者 L + O 球内注射治疗 CME, 后两个月应用 F 或者 L 治疗, 为一个治疗周期, 34 位 CRVO 患者分为两组法瑞西单抗联合长效激素 (F + O) 及雷珠单抗联合长效激素 (L + O) 治疗, 如果 CFT 增加到 $300 \mu\text{m}$ 或增加超过 $50 \mu\text{m}$, 或者 BCVA 减少了六个或更多 Snellen 字母。在每个治疗周期开始后 2 周和 4-6 周评估疗效和安全性, 此后每 4 周评估一次, 直至达到再治疗标准。主要观测指标是再治疗时间。次要结局指标包括 BCVA、CFT、DCP 和安全性参数。

结果: 16 位患者接受 L + O 治疗, 18 位患者接受 F + O 治疗, 两组均接受两个治疗周期, L + O 组患者的平均再注射间隔为 63.5 ± 27.4 天, F + O 组患者的平均再注射间隔为 69.3 ± 26.1 天。两组在治疗间隔时间上没有统计学上的显著 ($P > 0.079$)。但是 F + O 间隔时间长于 L + O 组, BCVA 的平均峰值变化 F + O 优于 L + O, F + O 组 76.5% 的眼睛获得了三行或更多行的 BCVA, L + O 为 69.7%。在所有治疗周期中, F + O 组眼睛的 CRT 平均峰值下降为 $400.9 \mu\text{m}$, L + O 的眼睛为 $379.2 \mu\text{m}$, 两组在治疗上 CRT 降低没有统计学上的显著差异 ($P > 0.047$)。DCP 两组改善程度无统计学差异。

结论: 对于 CRVO 引起的高度水肿 ME 眼治疗中, 抗 VEGF 联合 DEX 治疗是一种有效的治疗方式。双抗类联合长效激素与单抗类联合长效激素均可显著改善 CRVO 引发高度水肿的 ME 的 BCVA 和 CRT, 对于 DCP 的改善程度无差别, 但是 BCVA 的平均峰值变化 F + O 优于 L + O, 并且优于 F + O 植入物提供了更长的间隔时间。

摘要编号: 209161

后部小眼球伴发的乳头黄斑皱襞的形态演变与视力转归: 个案报告与文献回顾

第一作者: Xuhui YU

共同作者: Jun CHEN

目的: 报告一例伴乳头黄斑皱襞的后部小眼球患儿的临床特征及 6 年随访结果, 并结合文献进行探讨。

方法: 回顾性病例报告。

结果: 病例报告: 一名 6 岁女童因双眼视力低下就诊。综合验光结果显示: 右眼 +17.5 D、左眼 +18.0 D 远视, 双眼矫正视力均为 0.4。眼轴长度测量为右眼 15.93 mm、左眼 16.03 mm, 前节结构参数正常。光学相干断层扫描 (OCT) 检查显示双眼存在海豚样乳头黄斑皱襞、中心凹发育不良及脉络膜增厚。患儿接受验光配镜及弱视训练。经 6 年随访, 双眼矫正视力分别提升至右眼 0.7、左眼 0.8; 眼轴长度无显著变化; OCT 复查显示双眼为浅淡的水平向视乳头黄斑皱褶。

结论: 后部小眼球伴发的乳头黄斑皱襞可随患儿生长发育发生形态演变, 从而影响视力。诊疗初期需进行全面评估, 并通过长期规律随访以最大程度改善并维持视功能。

摘要编号: 209111

基于 OCTA 视网膜血管密度联合外周血单核细胞免疫表型谱分析阿尔兹海默病的早期诊断价值

第一作者: Wencui WAN

目的: 探讨光学相干断层扫描血管成像 (OCTA) 视网膜血管密度参数联合外周血单核细胞免疫表型分析在阿尔茨海默病 (AD) 及轻度认知障碍 (MCI) 早期诊断中的应用价值, 并阐明视网膜微血管改变与外周免疫激活之间的相关性。

方法: 前瞻性纳入 2023 年 1 月至 2025 年 1 月就诊的早期 AD 患者 88 例、MCI 患者 82 例及认知功能正常对照者 80 例。采用 OCTA 技术测量黄斑区 3mm × 3mm 范围内浅层血管丛 (superficial vascular complex, SVC)、中间血管丛 (intermediate vascular complex, IVC) 和深层血管丛 (deep vascular complex, DVC) 的血管面积密度、血管长度密度、血管分支数、血管迂曲度和血管分形维数, 并分析中心凹无血管区 (foveal avascular zone, FAZ) 参数。采用流式细胞术检测外周血单核细胞亚群 (经典型、中间型、非经典型) 分布比例及表面标志物 (HLA-DR、CCR2、CX3CR1) 表达水平。采用 Pearson 相关

分析评估 OCTA 参数、免疫表型指标与认知功能评分的相关性。通过多因素 Logistic 回归分析筛选独立危险因素, 构建联合诊断模型并采用受试者工作特征 (ROC) 曲线评估诊断效能。

结果: AD 组和 MCI 组 SVC 及 IVC 血管面积密度、血管长度密度和血管分支数均显著低于对照组 ($P < 0.001$), 且 AD 组降低程度较 MCI 组更显著 ($P < 0.05$)。AD 组 IVC 血管面积密度较对照组下降 16.4% ($38.2 \pm 5.3\%$ vs $45.7 \pm 4.2\%$)。AD 组和 MCI 组血管迂曲度增加、血管分形维数降低 ($P < 0.05$)。AD 组中间型单核细胞比例显著升高 ($12.8 \pm 3.2\%$ vs $7.3 \pm 1.8\%$, $P < 0.001$), 此外, AD 组中间型单核细胞 HLA-DR 和 CCR2 表达水平显著高于对照组 ($P < 0.001$)。IVC 血管面积密度与中间型单核细胞比例呈显著负相关 ($r = -0.542$, $P < 0.001$), 与中间型单核细胞 HLA-DR 表达水平的相关性更强 ($r = -0.596$, $P < 0.001$)。IVC 血管面积密度与 MMSE 评分呈正相关 ($r = 0.487$, $P < 0.001$), 中间型单核细胞比例与 MMSE 评分呈负相关 ($r = -0.524$, $P < 0.001$)。多因素 Logistic 回归分析显示 IVC 血管面积密度、IVC 血管分支数、中间型单核细胞比例及其 HLA-DR 表达水平是 AD 的独立预测因素 ($P < 0.05$)。联合诊断模型对 AD 的诊断效能显著优于单一指标模型, ROC 曲线下面积达 0.926 (95% CI: 0.884–0.968), 敏感度为 88.6%, 特异度为 91.3%。联合模型对 MCI 的诊断曲线下面积为 0.857 (95% CI: 0.802–0.912), 敏感度为 81.7%, 特异度为 83.8%。

结论: AD 和 MCI 患者存在显著的视网膜微血管密度降低和单核细胞促炎表型改变, 两者之间呈现密切相关性, 共同反映神经血管单元损伤和全身炎症激活在 AD 病理进程中的作用。OCTA 视网膜血管密度参数联合外周血单核细胞免疫表型分析构建的多模态诊断模型具有优异的诊断效能, 为 AD 及 MCI 的早期无创诊断提供了新的生物标志物组合策略。

摘要编号: 208883

基于多模态生成式人工智能的视网膜静脉阻塞智能诊断模型研究

第一作者: Yilin WANG

共同作者: Bo QIN

目的: 视网膜静脉阻塞 (RVO) 是全球范围内导致视力损害的主要原因之一。然而, 由于其病因复杂且诊断依赖主观影像判读, 临床识别与分型仍存在显著差异。现有诊断路径普遍缺乏整合眼科影像特征与全身性危险因素的量化框架, 限制了早期干预的准确性与一致性。本研究旨在构建一种基于多模

态生成式人工智能 (GenAI) 的综合诊断模型, 以客观量化 OCT 影像特征, 并结合临床及实验室指标, 实现对 RVO 的精准诊断和风险评估。

方法: 本研究纳入 200 例经确诊的 RVO 患者及 200 例年龄匹配的健康对照者, 收集高分辨率 OCT 影像、详细临床资料 (包括高血压、糖尿病、脑梗死史等) 及关键实验室指标 (如中性粒细胞/淋巴细胞比值 [NLR]、血小板分布宽度 [PDW])。基于标准化 Prompt 设计, 采用多模态 GenAI 模型 (如 GPT-4o、Claude-3.5-Sonnet 或 Gemini-1.5-Pro) 自动识别并定量提取 10 个特征性 OCT 病理指标 (评分范围 0-5 分), 进而生成综合 RVO 风险评分 (0-100 分)。随后, 将 AI 衍生影像特征与临床及实验室变量输入多算法机器学习模型, 利用受试者工作特征 (ROC) 曲线评估诊断性能, 并以组内相关系数 (ICC) 验证特征提取的一致性。

结果: 结果显示, Claude-3.5-Sonnet 模型在 OCT 特征量化中的稳定性优异 (ICC = 0.82)。融合 GenAI 衍生影像特征、临床及实验室数据的综合模型在 RVO 诊断中的 AUC 达 0.93, 显著高于仅基于临床资料 (AUC = 0.75) 或传统图像分析方法 (AUC = 0.85)。特征重要性分析显示, 黄斑水肿严重程度、视网膜内高反射点数量、患者年龄及 NLR 水平为关键预测因子。模型在外部验证队列中同样表现出较高的准确性与良好的泛化能力。

结论: 本研究提出了一种融合多模态 GenAI 与机器学习的 RVO 智能诊断框架, 能够从 OCT 影像中自动提取稳定且可量化的病理特征, 并结合全身性生物标志物实现综合风险评估。该方法显著提高了 RVO 诊断的客观性与一致性, 为早期识别及个体化干预提供了新的技术途径。其在资源有限地区的可推广性, 显示出 GenAI 在眼科疾病精准诊断中的重要应用潜力。

摘要编号: 209600

基于房水代谢组学的中心性浆液性脉络膜视网膜病变特征及抗 VEGF 治疗影响研究

第一作者: Jianbo MAO

目的: 本研究旨在通过分析中心性浆液性脉络膜视网膜病变 (CSC) 患者房水的代谢组学特征, 系统揭示其代谢通路异常及抗血管内皮生长因子 (VEGF) 治疗的影响, 并探讨 CSC 患者黄斑区微结构特征与代谢产物的关联性。

方法: 研究纳入 30 例接受抗 VEGF 治疗的 CSC 患者, 分为治疗前组 (Pre-CSC 组) 与治疗组 (Post-CSC 组), 以及 20 例对照组 (Control 组), 采集房水样本进行超高效液相色谱-串联质谱 (UHPLC-MS/MS) 代谢组学分析。根据术前

OCT 影像特征, 将 CSC 患者分为两组: FIPED (平坦不规则的色素上皮层脱离) 组和局限性 PED 组, 以评估黄斑微结构与代谢产物的相关性。通过主成分分析 (PCA)、层次聚类分析 (HCA) 及 KEGG 通路注释富集分析, 解析各组代谢特征差异, 并结合机器学习算法 (支持向量机、随机森林、广义线性模型) 与受试者操作特征 (ROC) 曲线分析, 筛选关键代谢标志物。

结果: 研究共鉴定出 1091 种代谢物, 其中 Pre-CSC 组与 Control 组间共有 235 种代谢物出现明显差异, 其中 86 种上调、149 种下调; 抗 VEGF 治疗后, Post-CSC 组与 Pre-CSC 组间鉴定出 134 种代谢物, 其中 58 种上调、76 种下调。差异代谢物显著富集于酪氨酸代谢、苯丙氨酸代谢、cAMP 信号通路、HIF-1 信号通路及糖酵解等途径。研究发现, L-色氨酸等代谢物不仅能有效区分 CSC 患者与对照组, 还能区分抗 VEGF 治疗前后的 CSC 患者。此外, 具有 FIPED 特征的 CSC 患者脂质代谢通路改变异常显著。

结论: 本研究发现 CSC 患者存在显著的酪氨酸代谢和糖酵解通路等改变, 提示线粒体能量代谢紊乱可能参与了疾病的发生发展。L-色氨酸等代谢物的水平变化提示其作为 CSC 诊断及治疗反应的潜在生物标志物。本研究首次从房水代谢组学层面揭示了 CSC 的分子调控网络, 为 CSC 的精准诊断及个体化治疗靶点提供了一定的理论基础。

摘要编号: 208657

基于机器学习和全层视网膜 OCT 影像组学预测 nAMD 的抗 VEGF 治疗反应

第一作者: Jing LUO

共同作者: Biying CHEN, Jianing QIU

目的: 本研究旨在通过收集抗血管内皮生长因子 (anti-VEGF) 给药前新生血管性年龄相关性黄斑变性 (nAMD) 患者的光学相干断层扫描 (OCT) 图像, 提取其中的放射组学特征, 进而建立基于 OCT 的影像组学 (OCT-omics) 预测模型, 用于评估治疗反应。

方法: 采用随机抽样法, 将确诊为 nAMD 的回顾性队列 (n = 199) 分为训练集 (n = 139) 和测试集 (n = 60)。内部验证集 (n = 40) 和外部验证集 (n = 37) 分别来自前瞻性研究队列和另一中心队列。研究人员对治疗前的 OCT 基线数据进行了全面特征工程处理, 将预测的终点设定为初始三次抗 VEGF 注射后的治疗反应。通过逻辑回归、支持向量机 (SVM) 和反向传播神经网络 (BPNN) 构建分类器模型并进行评估。采用决策曲线分析 (DCA) 验证 OCT-omics 模型的临床相关性。系

统性能评估包含准确率、灵敏度、特异性、精确度、阴性预测值 (NPV)、F1 分数以及受试者工作特征曲线下面积 (AUC)。我们采用 Pearson 相关分析, 进一步探究 OCT-omics 评分与治疗中央黄斑区厚度 (CST) 变化率之间的相关性。

结果: 在 BPNN 模型中, 训练集、测试集、前瞻性数据集和外部验证集的 AUC 值分别为 0.974、0.936、0.927 和 0.856; 在 SVM 模型中, 分别为 0.954、0.913、0.900 和 0.881。OCT-omics 评分与 CST 降低率呈正相关 (训练集: $R = 0.56$, $P = 6.9e-13$; 测试集: $R = 0.45$, $P = 0.00031$; 前瞻性数据集: $R = 0.43$, $P = 0.0057$; 外部验证集: $R = 0.51$, $P = 0.0013$)。

结论: 该 OCT-omics 模型被证实具有优异的预测性能, 可准确评估三次抗 VEGF 注射后的治疗效果, 并为个性化 nAMD 管理提供了创新性解决方案。

摘要编号: 209084

基于超广角 SS-OCTA 多层影像的自监督学习模型用于糖尿病视网膜病变预测

第一作者: Hanpei MIAO

共同作者: Yuqin LAN, Zhenping LI, Zehua WANG

目的: 本研究基于超广角扫频源光学相干断层扫描血管成像 (swept-source optical coherence tomography angiography, SS-OCTA) 多层血管特征, 构建自监督深度学习模型, 实现糖尿病视网膜病变 (diabetic retinopathy, DR) 及黄斑水肿 (diabetic macular edema, DME) 的自动识别与分级, 并分析不同血管层的预测贡献。

方法: 本研究为回顾性研究, 纳入 2133 名受试者共 6224 眼次的超广角 SS-OCTA 影像 (扫描范围 $20 \times 24 \text{ mm}$), 包括表层血管复合体 (superficial vascular complex, SVC)、深层血管复合体 (deep vascular complex, DVC) 及脉络膜毛细血管层 (choriocapillaris layer, CCL) 三层影像, 共计 18672 张图像。首先基于 DINOv3 视觉模型进行自监督预训练, 以学习跨层血管结构特征并增强特征表征能力。随后选取 477 名糖尿病患者 (776 只眼) 的标注数据基于分层先验的分类器用于下游任务: 任务 1 —— 判别是否存在 DR; 任务 2 —— 区分非增殖期 (non-proliferative DR, NPDR) 与增殖期 DR (proliferative DR, PDR); 任务 3 —— 识别是否合并 DME。

结果: 在任务 1 (DR 识别) 中, SVC、DVC、CCL 模型的 AUC 分别为 0.893、0.888、0.799, SVC 表现最佳 ($AUC = 0.893$, $F1 = 0.857$)。在任务 2 (DR 分级) 中, 三层模型 AUC 分别为 0.849、0.823、0.767, SVC 与 DVC 均优于 CCL。在任务 3 (DME

识别) 中, SVC、DVC、CCL 模型的 AUC 分别为 0.845、0.935、0.877, 其中 DVC 表现最优 ($AUC = 0.935$, $F1 = 0.754$)。模型可视化结果显示, 关注区域主要集中于黄斑区、视盘及局部灌注缺损区域, 与 DR 及 DME 的典型病理学改变高度一致。

结论: 基于超广角 SS-OCTA 多层影像的自监督预训练模型可实现糖尿病视网膜病变及其并发症的高效识别与分级。自监督策略显著提升了模型的跨层特征学习能力, 不同血管层在多任务预测中表现出差异化贡献, 其中深层与表层血管复合体在 DR 与 DME 预测中最具诊断价值。本研究为 SS-OCTA 在糖尿病视网膜病变的智能筛查与临床辅助决策中的应用提供了新的技术路径与方法学依据。

摘要编号: 210085

抑制 RBP4 减轻视网膜色素上皮细胞铁死亡改善糖尿病视网膜病变

第一作者: Li XIU YUN

共同作者: Shi YA WEN

目的: 探索视黄醇结合蛋白 4 (RBP4) 在糖尿病视网膜病变 (DR) 相关损伤中的作用, 评估其抑制剂 A1120 对高糖高脂 (HG/HL) 条件下视网膜色素上皮 (RPE) 细胞铁死亡的影响。

方法: 以 CCK-8 筛选 A1120 作用于 ARPE-19 的最适浓度; 随后设对照、HG/HL、HG/HL+A1120 和 HG/HL+ferrostatin-1 四组。检测各组 Fe^{2+} 、ROS、MDA 与 GSH/GSSG 含量; Western blot 测定各组 GPX4、xCT、TFRC、ACSL4 及 RBP4 蛋白表达; qRT-PCR 分析各组细胞及增殖性 DR (PDR) 患者视网膜纤维血管膜与非糖尿病黄斑疾病患者组织中的相关基因表达。

结果: HG/HL 诱导 ARPE-19 出现铁死亡表型, 与正常组相比差异具有统计学意义 ($P < 0.05$), 表现为铁负荷与氧化 / 脂质过氧化损伤加剧、谷胱甘肽稳态紊乱及铁死亡通路分子异常。Fer-1 可降低细胞死亡与氧化损伤, 与模型组相比差异具有统计学意义 ($P < 0.05$), 提示铁死亡参与其中。A1120 预处理可明显缓解上述改变并提升细胞活力, 与模型组相比差异具有统计学意义 ($P < 0.05$)。在人源组织层面, qRT-PCR 显示: PDR 患者与对照组相比 GPX4、xCT 显著下调, 而 ACSL4、TFRC、RBP4 显著上调, 差异均具有统计学意义 ($P < 0.05$)。

结论: RBP4 参与 HG/HL 诱导的 RPE 细胞铁死亡; 药理性抑制 RBP4 可减轻铁死亡相关损伤, 可作为 DR 早期治疗的潜在靶点。

摘要编号: 209728

柏西普及激光治疗 II 区早产儿视网膜病变的疗效对比

第一作者: Kailin LIU

共同作者: Yong CHENG, Jianhong LIANG

目的: 比较玻璃体腔内注射康柏西普与激光光凝术治疗需干预的 II 区早产儿视网膜病变的疗效。

方法: 本研究为一项随机、开放标签、非劣效性试验,是多中心的前瞻性临床研究。研究对象为 2018 年 6 月 1 日至 2021 年 6 月 31 日期间纳入的 202 例符合条件、患有 II 区 2 期 + 或 3 期 + 病变的婴儿。患儿按 1:1 的比例随机分配,在基线时接受 0.25 mg 康柏西普玻璃体腔注射或激光光凝治疗。若疾病复发,则允许进行附加治疗。主要结局是基线治疗后 24 周时无活动性 ROP 且无不良结构结局的婴儿比例。需要转换治疗方式被视为治疗失败。若治疗组间差异的 95% 贝叶斯可信区间下限大于 -10%,则判定玻璃体内注射康柏西普非劣效于激光治疗。关键的次要结局是基线治疗后的疾病再激活率。其他次要结局包括治疗的眼部及全身安全性、手术操作时长以及血清中的游离康柏西普。

结果: 在 202 例符合条件的患儿中,195 例接受了基线治疗,170 例完成了 24 周研究(平均胎龄 29.2 [SD, 2.1] 周;平均出生体重 1204.9 克 [SD, 335.9 克];77 例 [45.3%] 为女性;31.2% 为 II 区 2 期 + ROP, 68.8% 为 II 区 3 期 + ROP)。接受 0.25 mg 康柏西普治疗的 87 例患儿中,83 例 (95.4%) 治疗成功;接受激光治疗的 83 例婴儿中,80 例 (96.4%) 治疗成功(组间差异为 -1.0%, 95% 可信区间为 -8.0% 至 6.1%)。激光组中有 4 例 (4.8%) 婴儿疾病再激活,康柏西普组中有 7 例 (8.0%) 婴儿疾病再激活(与激光治疗相比的 OR 值为 1.73, 95% CI 0.49-6.14, $p = 0.393$)。所有发生疾病再激活的婴儿均为 II 区 3 期 + 病变,并接受了重复治疗。严重和非严重的全身性不良事件以及眼部不良事件在两组间分布均衡。

结论: 对于需干预的 II 区早产儿视网膜病变患儿,玻璃体腔内注射康柏西普与激光光凝术在治疗 24 周时疗效相当,且两者均表现出良好的耐受性。

摘要编号: 209624

气血两虚型产后视网膜中央动静脉阻塞的中西医结合救治策略及疗效

第一作者: Jie YANG

目的: 探讨气血两虚型产后视网膜中央动静脉阻塞的中西医结合救治策略及疗效。

方法: 回顾性分析 2024 年 7 月收治的 1 例产后 1 个月哺乳女性,左眼突发暴盲(视力 0.06)。在西医溶栓、抗凝、神经营养及球后激素基础上,即刻予八珍汤加味(重用黄芪 30 g)口服,联合眼周局部取穴加远端配穴针刺,每日 1 次,共 11 d。观察视力、眼底、OCT、视野及中医证候变化。

结果: 治疗 11 d 后,左眼视力由 0.06 提高至 0.4;视网膜静脉迂曲、出血及黄斑囊样水肿明显减轻;OCT 示黄斑厚度下降,中心凹光反射恢复;视野中心暗点缩小;中医气血两虚证候改善。随访 1 个月视力稳定在 0.5,无不良反应。

结论: 对气血两虚型产后视网膜中央动静脉阻塞,早期西医挽救性治疗与中医“补益气血、活血通络”协同,可显著促进视功能恢复,为围产期视网膜血管阻塞提供了安全有效的新思路。

摘要编号: 208849

法瑞西单抗对其他抗 VEGF 治疗不佳的新生血管性年龄相关性黄斑变性的真实世界疗效分析

第一作者: Chuangxin HUANG

共同作者: Carmen CHAN, Shaheeda MOHAMED, Kin TSANG

目的: 探讨在真实世界中,法瑞西单抗(Faricimab)玻璃体腔内注射(IVT)对其他抗 VEGF 治疗不佳的新生血管性年龄相关性黄斑变性(nAMD)患者的临床效果。

方法: 本研究为真实世界回顾性分析。本研究筛选自 2023 年 11 月 1 日至 2025 年 8 月 30 日期间,在香港眼科医院(HKEH)接受至少连续 3 次玻璃体腔注射(IVT)法瑞西单抗治疗及持续随访的既往其他抗 VEGF 治疗后效果不佳的 nAMD 患者。对其临床数据包括年龄、性别、患眼、既往抗 VEGF 治疗史、法瑞西单抗用药次数、IVT 间隔时间、中心视网膜厚度(CMT)及视力(VA)等进行分析。

结果: 共纳入 46 例 (46 眼) nAMD 患者,其中男性 26 例 26 眼 (56.5%), 女性 20 例 20 眼 (43.5%), 年龄 74.9 ± 9.7 岁。既往抗 VEGF (阿柏西普或雷珠单抗) 治疗中位数为 8 次 (Range 2-24)。治疗及随访期为 445.3 ± 87.7 天,法瑞西单抗 IVT 次数为 5.8 ± 2.3 , IVT 间隔时间为 83.3 ± 29.7 天。基线时中心视网膜厚度(CMT)为 $377.4 \pm 112.7 \mu\text{m}$, 经法瑞西单抗 IVT 后降低至 $300.6 \pm 97.4 \mu\text{m}$ ($p < 0.01$); 视力(VA)从基线时 0.35 ± 0.21 提高至法瑞西单抗治疗后 0.42 ± 0.23 ($p < 0.05$), 末次访视时维持在 0.31 ± 0.23 (较基线下降, $p < 0.05$)。

结论：法瑞西单抗能有效降低经其他抗 VEGF 药物治疗应答不佳的 nAMD 患者的中心视网膜厚度，提高治疗后视力。在采用较长间隔时间的真实世界治疗模式中，患者最终平均视力可能会保持在较治疗前轻度下降的水平。

摘要编号：**208991**

湿性年龄相关性黄斑变性患者房水的非靶向代谢组学研究

第一作者：*Qingquan WEI*

共同作者：*Qing PENG*

目的：本研究旨在确定与湿性年龄相关性黄斑变性（AMD）患者房水（AH）相关的代谢生物标志物，并探讨其代谢变化。

方法：从 10 名湿性 AMD 患者和 10 名白内障患者收集房水，使用液相色谱 - 串联质谱（LC-MS/MS）进行代谢组学分析。

结果：在房水样本中共鉴定出 155 种代谢物。其中，10 种代谢物成为能够区分湿性 AMD 患者与对照组的潜在生物标志物。湿性 AMD 患者房水中，心磷脂（CL）（72:5）、甘油二酯（DG）（18:3_18:2）、DG（36:5e）和甘油三酯（TG）（24:7）表达上调，而神经酰胺（Cer）（d32:0）、Cer（d34:0）、Cer（d36:0）、单半乳糖甘油二酯（MGDG）（16:1_18:3）、鞘氨醇（SPH）（d18:0）和 TG（16:0_10:4_16:0）表达下调。

结论：通过对房水的代谢组学分析，本研究成功揭示了与湿性 AMD 相关的有价值的代谢生物标志物。这些发现有助于更全面地理解湿性 AMD 的发病机制，并为开发创新治疗策略提供潜在途径。

摘要编号：**210307**

炎症与营养系列指标与糖尿病视网膜病变的关联：一项针对 40 岁及以上美国糖尿病成人的横断面研究

第一作者：*Jian DENG*

共同作者：*Liduo PAN, Xiaoyi YU*

目的：炎症与营养状况已成为糖尿病视网膜病变（Diabetic retinopathy, DR）的重要影响因素。基于临床常规参数构建的炎症与营养状况综合指标，有望成为早期识别 DR 的新型生物标志物与干预靶点。然而，此类指标与 DR 的确切关联目前仍缺乏研究证据。

方法：本研究基于国家健康与营养调查（National Health and Nutrition Examination Survey, NHANES）数据库，旨在探讨炎症与营养综合指标

与美国 40 岁及以上糖尿病成人发生 DR 风险之间的关联。我们分析了 2005 至 2018 年间 NHANES 数据库中 4,841 个个体的数据。基于炎症和营养状况的指标包括预后营养指数（Prognostic Nutritional Index, PNI）、白蛋白 - 胆红素评分（Albumin-Bilirubin Index, ALBI）、中性粒细胞与白蛋白比值（Neutrophil to Albumin Ratio, NPAR）及老年营养风险指数（Geriatric Nutritional Risk Index, GNRI）。通过单变量和多变量逻辑回归以及限制性立方样条分析，评估了这些生物标志物与糖尿病视网膜病变之间的关联和非线性关系。ROC 曲线用于评估各个指标的预测效能。此外，还进行了亚组分析与基于随机森林的多重插补法以评估这些关联的稳定性。

结果：在完全校正所有协变量后，与第一分位组相比，PNI（OR = 0.56 [0.41, 0.76]）、GNRI（OR = 0.67 [0.43, 0.79]）的第三分位组与 DR 呈负相关；而 ALBI（OR = 1.58 [1.16, 2.16]）和 NPAR（OR = 1.28 [0.96, 1.72]）的第三分位组则与 DR 呈正相关。限制性立方样条曲线显示以上 4 个指标与 DR 风险之间关联存在线性关系。ROC 曲线显示 PNI 预测能力最佳，并且最佳截断值为 40.01。亚组分析与基于随机森林的多重插补法共同支持本结果的稳健性。

结论：在 40 岁及以上美国糖尿病成人中，高水平 ALBI、NPAR 与 DR 风险呈正相关，而低水平 PNI 与 GNRI 则与 DR 患病率升高存在关联。此外，PNI 在预测效能方面表现更优，其有望成为早期识别 DR 的新型生物标志物与干预靶点。

摘要编号：**204171**

玻璃体腔注射抗 VEGF 药物对新生血管性老年性黄斑变性相关性色素上皮脱离治疗效果的短期观察

第一作者：*Xiaoqing LIU*

共同作者：*Huiping YAO, Yanwei CHEN, Jiajun WANG, Shanshan WANG, Yufeng ZHOU*

目的：评价玻璃体腔内注射抗血管内皮生长因子（vascular endothelial growth factor, VEGF）药物对新生血管性老年性黄斑变性（neovascular age-related macular degeneration, nAMD）相关性视网膜色素上皮脱离（retinal pigment epithelial detachment, PED）患者的视力以及视网膜结构和 PED 形态学转归的影响。

方法：回顾性、观察性病例系列研究。我们回顾分析了 2021 年 3 月至 2024 年 2 月在上海交通大学附属瑞金医院初治的 nAMD 相关性 PED 患眼 33 例（33 眼）。这些患眼接受了每月 1 次玻璃体腔内

注射 0.05 ml 康柏西普或阿柏西普，连续三个月，然后按需注射（3 + PRN），所有患者均完成至少 6 个月随访，回顾性评价基线和玻璃体注药 1, 2, 3, 6 个月时的 OCT 参数变化以及基线和玻璃体注药 6 个月时最佳矫正视力（best corrected visual acuity, BCVA）。主要评价指标：最佳矫正视力（BCVA）和 PED 高度。次要评价指标：视网膜下液（subretinal fluid, SRF）和黄斑中心区厚度（central subfield thickness, CST）。

结果：6 个月时，平均 BCVA 从 0.20 ± 0.15 基线至 0.32 ± 0.27 ($P = 0.001$)，66.7% (22/33) 的眼视力提高（BCVA 提高 ≥ 0.1 logMAR）；平均 CST 从基线时的 (320.9 ± 84.61) μm 显著降低至 (224.5 ± 54.59) μm ($P < 0.001$)，81.8% (27/33) 达到干黄斑，OCT 显示无视网膜下液及视网膜内液。6 个月内的平均注射次数为 4.15 ± 1.3 。并且根据注射药物不同分成两个亚组并进行比较，两组在观察终点时，校正 BCVA 无显著差异；两组 PED 高度均显著下降，在治疗终点时无显著差异；两组治疗针数无显著差异。

结论：使用“3 + PRN”方案玻璃体内抗 VEGF 药物注射显著降低了未经治疗的有 PED 的 nAMD 患者的 PED 高度，改善了视力，减少了 SRF 和 CST。

摘要编号：208900

碳水化合物亚型对高血糖个体微血管并发症进展的异质性影响：来自英国生物样本库的证据

第一作者：Jiawei WANG

共同作者：Jing CAO, Yingcheng HE, Shenyu HUANG, Huimin LI, Juan YE, Jingxin ZHOU

目的：本研究旨在探讨高血糖个体膳食碳水化合物亚型与糖尿病相关微血管并发症（MCD）发生率之间的关联。

方法：患有高血糖症（定义为空腹血糖 ≥ 5.56 mmol/L 或患有糖尿病）的参与者被纳入英国生物银行队列。采用多变量调整的 Cox 比例风险模型和多状态模型来估计总碳水化合物、游离糖、淀粉和纤维摄入量与发生的 MCD（糖尿病肾病、视网膜病变、神经病变）和全因死亡率的关联。使用受限三次样条来估计潜在的非线性关系。

结果：共有 32,720 名受试者接受了中位随访时间 13.19 年，总碳水化合物的摄入量与糖尿病肾病（DKD）呈正相关（HR 1.04, 95% CI 1.02–1.07, 能量摄入每增加 5%； $P = 0.005$ ）和全因死亡率（1.03；1.01–1.05； $P = 0.020$ ）。游离糖的摄入量与 DKD 呈正相关（1.11；95% CI 1.07–1.15； $P < 0.001$ ）、总 MCD（1.08；1.04–1.11； $P < 0.001$ ）

和全因死亡率（1.06；1.03–1.10； $P < 0.001$ ）。相反，纤维摄入量与 DKD 风险呈负相关（HR 0.92, 95% CI 0.89–0.96/5 g/d 增加； $P < 0.001$ ）和总 MCD（0.95；0.92–0.98； $P = 0.008$ ）。淀粉摄入量与任何结局无关。游离糖与全因死亡率呈 J 形关联（10.4%， P -非线性 = 0.042），纤维与 MCD 呈 L 形关系（17.4 g/d， P -非线性 = 0.033）。多州分析发现，从无 MCD 到首次 MCD 和死亡的轨迹结果相似。

结论：减少游离糖摄入量和增加纤维摄入量可能有助于降低高血糖患者的 MCD 风险和死亡率。

摘要编号：209240

紫杉醇化疗相关的囊样黄斑水肿一例

第一作者：Minli HUANG

共同作者：Liyang FANG, Jian HE, Baoyu HUANG, Huiyi ZUO

目的：报告一例与紫杉醇化疗相关的囊样黄斑水肿的病例。

方法：观察性病例报告。

结果：一名 39 岁男性患者因鳞状上皮细胞肺癌接受紫杉醇 + 替雷利珠单抗治疗方案治疗 2 年，出现双侧视网膜紫杉醇相关黄斑囊样水肿（paclitaxel related cystoid macular edema, PRCME）。PRCME 目前没有诊断标准，但患者有 PCME 典型特点：光学相关断层扫描有典型的囊腔样黄斑水肿，荧光素眼底血管造影却未见明显的荧光素渗漏。

结论：PRCME 的产生可能与紫杉醇对视网膜 Müller 细胞和色素上皮细胞产生毒性作用有关。建议接受化疗的患者进行基线眼科评估，并在出现眼部症状时密切随访。

摘要编号：209412

纤维连接蛋白介导视网膜血管生成中内皮细胞向间充质的转变

第一作者：Dan LIU

目的：本研究旨在探讨内皮间质转化（EndoMT）在病理性视网膜血管生成中的作用，并确定视网膜血管生成的关键分子介质。

方法：对氧诱导视网膜病变（OIR）小鼠模型的视网膜组织进行 RNA 测序（RNA-seq），以分析基因表达模式。基因集富集分析用于检查上皮间质转化（EMT）和血管生成基因集之间的相关性。在内皮细胞中评估纤维连接蛋白（FN1）的表达，并通过 siRNA 介导的敲除在体外血管生成试验和 OIR 模型中评估其功能。

结果: EndoMT 发生在视网膜血管生成发展的早期, EMT 与血管生成基因集之间存在显著相关性。FN1 被确定为内皮细胞中 EMT 相关基因上调最显著的基因。siRNA 介导的纤维连接蛋白抑制有效地阻止了 VEGF 诱导的体外血管生成, 并减少了 OIR 模型中的病理血管生成。

结论: EndoMT 是病理性视网膜血管生成的关键早期事件, 纤维连接蛋白是关键介质。靶向纤维连接蛋白可能提供一种新的治疗策略, 可以与抗 VEGF 治疗协同作用, 更有效地治疗糖尿病视网膜病变 (DR) 和早产儿视网膜病变 (ROP) 中的病理血管生成, 特别是在单独抗 VEGF 治疗反应不佳的情况下。

摘要编号: 208565

罗氟司特通过抑制小胶质细胞衰老改善视网膜缺血再灌注损伤后神经节细胞退行性变

第一作者: Jing XU

共同作者: Qiong LIU, Hongyang ZHANG

目的: 视网膜缺血再灌注损伤与多种视网膜疾病相关, 可导致视网膜神经节细胞退行性变。小胶质细胞衰老会加剧炎症反应, 进而促进神经退行性变。本研究旨在探讨罗氟司特在缓解 RIR 损伤后小胶质细胞衰老及神经炎症中的潜在治疗作用。

方法: 对 C57BL/6J 小鼠进行 RIR 手术, 并腹腔注射罗氟司特进行治疗。采用 BV2 小胶质细胞进行氧糖剥夺/复氧处理以模拟体外缺血条件。通过 SA- β -gal 染色检测细胞衰老; 采用定量 PCR 和 ELISA 检测衰老相关分泌表型因子水平; 对视网膜切片进行苏木精-伊红染色以评估视网膜形态和厚度; 通过免疫荧光染色标记并定量视网膜全铺片中存活的 RGCs; 进一步利用 Western blot 和免疫荧光染色定量分析与细胞周期及 NLRP3 炎症小体相关的蛋白。

结果: 罗氟司特处理可减少 OGD/R 暴露的 BV2 细胞中小胶质细胞衰老、活性氧生成及促炎细胞因子分泌, 并恢复细胞增殖能力, 逆转 OGD/R 诱导的细胞周期阻滞。在体实验表明, 在 RIR 小鼠模型中, 罗氟司特可减轻视网膜衰老、维持视网膜厚度并保护 RGCs 免于死亡。机制上, 罗氟司特通过抑制 NLRP3 炎症小体活化并抑制小胶质细胞中的 DNA 损伤信号通路发挥作用。

结论: 罗氟司特通过抑制 NLRP3 炎症小体, 减轻小胶质细胞衰老及炎症反应, 从而在 RIR 损伤中发挥神经保护作用。这些研究结果表明, 罗氟司特有望成为通过靶向小胶质细胞衰老治疗缺血性损伤相关视网膜疾病的一种潜在治疗策略。

摘要编号: 210318

载脂蛋白 E 介导的细胞质乳酰化修饰在 Vldlr/- 小鼠年龄相关性黄斑变性中的保护作用及机制研究

第一作者: Guoge HAN

共同作者: Pinghui WEI

目的: 本研究旨在探究载脂蛋白 E (APOE) 在 Vldlr/- 基因敲除小鼠模型中的生物学功能, 探究其在光感受器细胞及视网膜色素上皮 (RPE) 细胞中的保护作用及相关分子机制。

方法: 采用 Vldlr/- 基因敲除小鼠 (n = 36) 作为实验组, 以 C57BL/6J 野生型小鼠 (n = 30) 作为对照组。所有实验组分别在出生后第 18、20、22、24 和 28 天采集样本, 系统开展组织学、免疫学和分子生物学分析, 具体方法包括 TUNEL 染色、免疫组化、Western blot、LC-MS/MS 及荧光显微镜技术。为进一步阐明乳酰化的生物学功能, 本研究通过 RNAi 技术特异性敲低 H3K18la 的表达, 并系统评估其对细胞凋亡及 APOE 介导的视网膜保护作用的影响。

结果: 研究结果显示, 与早期时间点 (P14、P23) 及野生型小鼠相比, Vldlr/- 小鼠中 TUNEL 阳性细胞数量从 P14 开始显著增加, 并在 P23 达到峰值, 且这一现象在光感受器细胞中尤为明显。值得注意的是, APOE 过表达显著抑制了视网膜细胞死亡, 尤其是在光感受器及 RPE 细胞中。进一步分析发现, 在 P21 时间点, APOE 过表达显著促进了乳酰化修饰, 特别是在 H3K18la 位点。通过 APOE 与 TUNEL 阳性细胞的共定位分析, 我们观察到乳酰化修饰蛋白与细胞凋亡减少显著相关, 提示乳酰化在 APOE 介导的视网膜保护中发挥关键作用。此外, Pan K1a 染色结果证实, P23 时光感受器细胞中乳酰化水平显著升高, 且这一变化与线粒体功能及脂质代谢的改善密切相关。RNAi 介导的 H3K18la 敲低实验进一步表明, H3K18la 表达下调显著削弱了 APOE 的保护作用, 导致光感受器及 RPE 细胞凋亡率显著增加。同时, 流式细胞术及免疫印迹分析结果显示, H3K18la 敲低降低了细胞存活率, 并伴随乳酰化水平下降及 APOE 保护功能的受损。

结论: 本研究揭示载脂蛋白 E 通过调控乳酰化修饰, 尤其是 H3K18la 位点, 在视网膜变性中发挥重要保护作用的分子机制。这些发现不仅为视网膜变性的病理机制提供了新的理论依据, 同时表明乳酰化修饰是一个潜在的治疗靶点, 进一步强调了其在年龄相关性黄斑变性中维持视网膜细胞存活的关键作用。

摘要编号: 208775

钕基大黄酸纳米药物的制备及其对干性年龄相关性黄斑变性模型小鼠的作用研究

第一作者: Yini WANG

共同作者: Chang LI, Qichang WANG, Xiaoxin YANG

目的: 干性年龄相关性黄斑变性 (Dry age-related macular degeneration, dAMD) 目前尚无有效疗法, 其核心病理机制与视网膜色素上皮细胞 (Retinal pigment epitheliums, RPEs) 功能障碍及小胶质细胞异常激活密切相关。本研究旨在开发一种具有高效性、稳定性与明确作用机制的钕基大黄酸纳米药物, 并探究其在 dAMD 模型中的治疗作用及机制。

方法: ① 采用通过自组装法合成钕基大黄酸纳米粒 (Nanoparticle, NPs), 并对所得纳米药物的粒径、电位、形貌、药物负载率及体外抗氧化活性进行系统表征。② 利用碘酸钠诱导人 RPEs 和人小胶质细胞 (Microglial cells, MGCs) 建立 dAMD 体外模型, 通过 CCK-8、活性氧荧光探针、流式细胞术、跨上皮电阻等评估纳米药物的细胞保护效应; 进一步通过 RNA-Seq 及 Western blot 检测探究 NPs 具体作用机制。③ 通过碘酸钠腹腔注射构建 dAMD 小鼠模型, 并玻璃体腔注射给予钕基大黄酸纳米药物。通过光学相干断层扫描、视网膜电图评估视网膜结构与功能; 采用视网膜组织切片 HE 染色、TUNEL 凋亡染色及视网膜组织抗氧化生化指标检测, 分析其治疗作用与机制。

结果: ① 成功制备的 NPs 粒径均一, 稳定性良好, 并展现出显著的协同抗氧化能力。② 体外实验证实, 该纳米药物能有效降低 dAMD 模型下的 RPEs 和 MGCs 细胞氧化应激水平, 显著抑制细胞凋亡, 提高 RPEs 屏障功能。RNA-Seq 和 Western blot 结果显示 NPs 通过调控 RAGE 通路影响疾病的进展。③ 在 dAMD 动物模型中, 治疗组小鼠的 RPE 层结构得到更好维持, 视网膜电图反应振幅也高于模型对照组。免疫组化和 Western blot 结果表明, NPs 能够抑制氧化应激和炎症反应, 进一步改善 RPEs 的功能。

结论: 本研究构建的钕基大黄酸纳米药物能够有效缓解氧化应激损伤, 保护视网膜结构与功能, 为干性 AMD 的治疗提供了一种具有潜力的新型纳米药物。

摘要编号: 208803

靶向 RARRES1 抑制脉络膜新生血管的形成: 基于蛋白质组学发现的功能验证与机制探索

第一作者: Wei XU

共同作者: Yimeng LI, Qingli SHANG, Caixia WANG

目的: 湿性年龄相关性黄斑变性 (wAMD) 是老年人群中最常见的致盲性眼病, 其核心病理特征是脉络膜新生血管 (CNV) 形成。当前抗 VEGF 治疗仍存在应答不佳和耐药性问题。前期蛋白质组学分析发现, RARRES1 在 wAMD 患者房水中表达显著下调, 且与细胞增殖负调控密切相关。因此, 本研究旨在阐明 RARRES1 在 wAMD 发病机制中的表达规律、功能作用及分子机制, 为探索新的治疗靶点提供理论依据。

方法: 本研究采用多层次整合研究策略, 首先通过蛋白质组学方法分析 wAMD 房水样本, 利用 TMT 标记联合 LC-MS/MS 技术筛选差异表达蛋白, 并富集分析增殖相关通路, 鉴定了关键靶点 RARRES1。然后在 CNV 小鼠模型中, 通过玻璃体腔注射 AAV2 病毒过表达 RARRES1, 并采用 HE 染色、IB4 荧光染色和 FFA 评估 CNV 病灶大小及血管渗漏情况。并以人脐静脉内皮细胞 (HUVECs) 为模型, 通过 siRNA 敲低和 pcDNA3.1 过表达 RARRES1, 采用 CCK-8、Transwell 和 Matrigel 实验分析细胞增殖、迁移及成管能力, 并检测 VEGFA/VEGFR2 表达及 ERK 通路活化。最后, 在过氧化氢诱导的 ARPE-19 细胞氧化应激模型中, 通过流式细胞术、ROS 检测和 qPCR/Western blot, 评估 RARRES1 对细胞活力、凋亡、炎症因子及紧密连接的影响, 并探讨 JNK、SIRT1 和 Nrf2 信号通路的作用。

结果: 蛋白质组学发现, wAMD 患者房水中 RARRES1 表达显著下调, 且在“负调控细胞增殖”相关蛋白中下调最为明显。在动物实验中, CNV 模型小鼠视网膜/脉络膜组织中 RARRES1 表达降低, 而过表达 RARRES1 可有效抑制 CNV 病灶生长和血管渗漏。细胞实验进一步表明, RARRES1 过表达能抑制血管内皮细胞的增殖、迁移和成管能力, 其机制与下调 VEGFA/VEGFR2 表达及抑制 ERK 磷酸化有关。此外, 在氧化应激模型中, RARRES1 过表达可增强 RPE 活力, 抑制细胞凋亡和 ROS 产生, 并通过调控 JNK/SIRT1/Nrf2 信号通路发挥抗氧化和抗炎作用。这些结果共同表明 RARRES1 通过多重机制抑制 CNV 形成并保护视网膜细胞。

结论: 本研究首次通过临床、体内外实验系统证实了 RARRES1 在 wAMD 中的保护作用。RARRES1 表达下调通过促进血管生成和加剧氧化应激参与

CNV 形成，而其过表达则能、抑制 CNV 发展和 RPE 细胞损伤。机制上，RARRES1 通过调控 ERK 通路抑制血管内皮功能，并通过 JNK/SIRT1/Nrf2 轴缓解氧化应激。这些发现为开发靶向 RARRES1 的 wAMD 治疗新策略提供了重要理论基础。

摘要编号：203274

高原红细胞增多症相关双眼视网膜中央动脉阻塞合并视网膜中央静脉阻塞 1 例

第一作者：Kuan LI

共同作者：Wei LI, Junchen ZHANG

目的：报告一例罕见的高原红细胞增多症（HAPC）相关的双眼视网膜中央动脉阻塞（CRAO）合并中央静脉阻塞（CRVO），并探讨其发病机制与治疗策略。

方法：41 岁男性，长期居住于青海省德令哈市（海拔约 2890 米）。主诉双眼视物模糊 3 年，伴眼红。2 年前外院诊断为“双眼黄斑水肿、双眼 CRVO”，行双眼玻璃体腔注射雷珠单抗 3 次及视网膜激光治疗，视力稍好转。2 年前诊断为“红细胞增多症”。高血压史 3 年。入院查体：BMI 34.1 kg/m²，SpO₂ 88%。面色深灰、口唇及肢端紫绀。眼科检查：BCVA 右眼手动/20 cm，左眼光感；双眼瞳孔对光反射迟钝，球结膜充血，血管迂曲扩张；眼底见视盘水肿、黄斑水肿、静脉高度迂曲扩张、动脉呈银丝状、动静脉交叉压迫征及陈旧激光斑。OCTA 示双眼黄斑水肿。FFA 诊断：双眼 CRAO 合并 CRVO、高血压性视网膜病变、视网膜激光术后。颅脑 MRI/MRA 示垂体 Rathke 囊肿及血管变异。实验室检查：红细胞显著升高（ 8.63×10^{12} / L），红细胞压积 76.9%，血红蛋白 230 g/L；血小板降低（ 57×10^9 / L）；同型半胱氨酸升高（45.64 μmol/L）；凝血功能异常。

结果：诊断：1. 双眼黄斑水肿；2. 双眼 CRAO 合并 CRVO；3. 高原红细胞增多症；4. 高同型半胱氨酸血症。治疗上给予双眼抗 VEGF 药物注射、全身糖皮质激素（静滴地塞米松后改为口服泼尼松并逐渐减量）、持续低流量吸氧、放血治疗，以及口服叶酸片治疗。出院时患者 SpO₂ 升至 92%，紫绀消退，BCVA 双眼手动/20 cm，黄斑水肿消退。转至血液科进一步治疗。

结论：本例因长期高海拔居住致慢性缺氧，引发 HAPC，伴随高同型半胱氨酸血症，共同导致高凝状态，最终造成罕见的双眼 CRAO 合并 CRVO 及严重视力损伤。提示血液科医师接诊 HAPC 患者时，需警惕其可能导致的严重眼部并发症，并应及时进行多学科联合干预。

HA-engineered hydrogel 治疗孔源性视网膜脱离的临床研究

第一作者：Boshi LIU

共同作者：Xiaorong LI

目的：评估 HA-engineered hydrogel 覆盖封闭视网膜裂孔联合微创玻璃体切除术和无菌空气填塞辅助治疗原发性孔源性视网膜脱离安全性和有效性。

方法：这是一项前瞻性研究。该研究纳入了 2020 至 2023 年间 天津医科大学附属眼科医院等 9 所眼科研究中心 326 例原发性孔源性视网膜脱离患者。我们将受试者随机分为试验组和对照组，试验组使用 HA-engineered hydrogel 覆盖封闭视网膜裂孔，结合微创玻璃体切除术和无菌空气填塞，术后期间无体位限制。对照组使用微创玻璃体切除术和全氟丙烷（C3F8）填塞，术后期间要求俯卧位。患者术后随访 6 个月。评估受试者最初和最终视网膜复位成功率、术后最佳矫正远视力及术中术后并发症。

结果：在 24 周时，实验组视网膜复位率为 91.8%，对照组为 91.4%（ $P = 0.903$ ），各随访时间点均无统计学显著差异。此外，两组在最佳矫正视力（BCVA）、眼压（IOP）、视网膜神经纤维层（RNFL）厚度及术后并发症方面亦无显著差异。

结论：HA-engineered hydrogel 封堵视网膜裂孔联合无菌空气填塞可有效、安全的治疗原发性孔源性视网膜脱离，且无需特殊体位限制及严重术后并发症。

摘要编号：209195

“膜”术新篇——富血小板纤维蛋白膜填塞术治疗高度近视黄斑裂孔性视网膜脱离的初探

第一作者：Guojing LU

共同作者：Lei DU, Rong HUANG, Xuan XIAO

目的：高度近视黄斑裂孔性视网膜脱离（MHRD）因眼底结构特殊、病理复杂，现有治疗疗效有限。富血小板纤维蛋白（PRF）膜作为自体生物材料，制备简便（5 ml 静脉血离心 10 分钟即可获得），具有良好的组织修复与生物降解性。本团队前期已证实具有良好三维纤维结构与丰富生长因子的 PRF 在其他眼病中的修复潜力。本研究首次将 PRF 填塞术拓展应用于高度近视 MHRD 的治疗，旨在评估其临床有效性与安全性。

方法：本研究采用随机对照设计，纳入 2021 年 9 月至 2023 年 4 月于武汉大学人民医院眼科中心确诊为高度近视 MHRD 的 52 例（52 眼）患者。随机分为三组：内界膜（ILM）剥除组（18 例）、ILM 填塞组（16 例）、PRF 填塞组（18 例），分别接受 ILM 剥除术、ILM 翻转填塞术、PRF 膜填塞术，所有病例均联合眼内硅油填充。主要结局为术后 6 月黄斑裂孔闭合率，次要结局包括视网膜复位率、黄斑区结构与血流变化及并发症。

结果：解剖学结果显示：术后 6 个月 PRF 填塞组黄斑裂孔闭合率（94.4%）高于 ILM 剥除组（83.3%）和 ILM 填塞组（87.5%），但组间无统计学差异（ $P = 0.670$ ）；在黄斑中心凹视网膜厚度（CMT）方面，PRF 填塞组 CMT 显著高于其他两组（ $P < 0.001$ ），所有组 CMT 较术前显著下降（ $P < 0.001$ ）；在视网膜血流密度方面，术后浅层及深层视网膜血流密度均显著改善（ $P < 0.001$ ），但组间比较无显著差异（ $P = 0.838$ ）。视功能结果显示：术后 6 个月三组患者最佳矫正视力（BCVA）均较术前提升，其中 PRF 组 BCVA 改善幅度最大，但组间差异无统计学意义（ $P = 0.066$ ）。安全性分析显示：所有组未出现眼内炎或玻璃体积血等严重并发症，PRF 组未见与材料相关的过度炎症反应或新生血管等异常情况。

结论：PRF 填塞术可有效促进高度近视 MHRD 的黄斑裂孔愈合、改善视网膜血流与视功能，具有良好的手术安全性。PRF 材料获取便捷，术中操作易于掌握，为高度近视 MHRD 的治疗谱写了值得关注的“膜”术新篇。

摘要编号：207685

从黄斑大裂孔闭合微结构谈术式选择

第一作者：Ying WANG

目的：比较大直径黄斑裂孔（MH）经平衡盐溶液（BSS）视网膜下注射治疗与内界膜反转覆盖后黄斑区微结构的恢复情况。

方法：本研究为病例对照研究，纳入全层 MH 患者 51 例（51 只眼），所有患者接受玻璃体手术治疗。其中 31 例接受 BSS 视网膜下注射，20 例接受内界膜（ILM）翻瓣治疗。术后 1 周和 1 个月随访，通过光学相干断层扫描（OCT）评估黄斑区微结构恢复情况，同时通过最佳矫正视力（BCVA）评估视功能情况。对比两组术后早期 BCVA 恢复情况、MH 愈合类型、黄斑中心凹厚度（CMT）、黄斑区外界膜（ELM）和椭圆体带（EZ）的完整性。

结果：术后 1 个月，视网膜下注射组 MH 闭合率 96.8%（30/31），其中 U 型闭合 93.6%（29/31），V 型闭合 3.2%（1/31）；ILM 翻瓣组闭合率 95%

（19/20），U 型闭合 75%（15/20），V 型闭合 20%（4/20）。在 MH 闭合的患者中，视网膜下注射组 ELM 完整 66.7%（20/30），EZ 完整 33.3%（10/30）；ILM 翻瓣组 ELM 完整 57.9%（11/19），EZ 完整 21.1%（4/19）。视网膜下注射组 CMT 显著高于 ILM 翻瓣组（ $P = 0.001$ ）。两组术前和术后 BCVA（LogMAR）无显著差异（ $P > 0.05$ ），但术后 1 个月 ELM 完整者 BCVA（ 0.45 ± 0.34 ）优于 ELM 不完整者（ 0.76 ± 0.32 ， $P = 0.003$ ），EZ 完整者 BCVA（ 0.39 ± 0.34 ）优于不完整者（ 0.66 ± 0.34 ， $P = 0.003$ ）。

结论：MH 术后，黄斑区外层结构得到恢复的患者视力表现更佳。本研究初步表明，视网膜下注射组相较于 ILM 翻瓣组，在术后早期黄斑区微结构的恢复速度更快，这有望成为大直径 MH 手术的新策略。然而，仍需开展更长期且更大样本量的研究以进一步验证这一结论。

摘要编号：209532

免巩膜瓣缝线悬吊术治疗高度近视人工晶体脱位的临床疗效观察

第一作者：Zhongping CHEN

共同作者：Hengwei LIU

目的：高度近视患者因眼轴延长、巩膜变薄及悬韧带脆弱，人工晶体（IOL）脱位风险显著高于普通人群。传统 IOL 复位术需制作巩膜瓣及结膜切开，存在手术创伤大、术后散光及缝线暴露风险。本研究旨在探讨一种免结膜瓣及巩膜瓣的微创缝线悬吊术治疗高度近视 IOL 脱位的临床效果、安全性及应用价值。

方法：纳入 10 例（10 眼）高度近视（眼轴 > 26.5 mm）合并 IOL 脱位患者。采用改良微创术式：免结膜瓣操作：避免结膜切开，保留结膜完整性；三通道稳定眼压：标准睫状体平坦部三通道切口维持术中眼压稳定；针头引导攀固定：以 30 G 针头穿刺引导脱位 IOL 攀定位，避免广泛巩膜剥离；缝线悬吊加固：采用 8-0 聚丙烯不可吸收缝线直接固定 IOL 攀于巩膜壁。术后随访评估视力、IOL 位稳定性及并发症。

结果：视力改善：术后最佳矫正视力（BCVA）较术前显著提升；IOL 稳定性：所有患眼 IOL 位正，无二次脱位（随访 ≥ 6 个月）；并发症控制：无术中脉络膜出血、视网膜脱离等严重并发症；与传统巩膜瓣术式相比，显著降低缝线暴露风险；避免结膜损伤，减少术后异物感、干眼及炎症反应。

结论：本研究提出的免巩膜瓣 IOL 缝线悬吊术具有显著优势：微创性：规避结膜切开及巩膜瓣制作，减少组织损伤，符合现代微创手术趋势；安全性高：

针头引导精准定位降低医源性视网膜损伤风险，尤其适用于巩膜变薄的高度近视眼；恢复迅速：术后炎症轻、疼痛少，视力恢复周期缩短；长期稳定性佳：聚丙烯缝线生物相容性良好，远期脱位率低，该术式是治疗高度近视 IOL 脱位的有效策略，尤其适用于于巩膜条件差的高危患者，具有较高临床推广价值。

摘要编号：210236

姜黄素—雷帕霉素复合型纳米药物在干性 AMD 大鼠模型中的应用

第一作者：Rong Yong ZHANG

共同作者：Meng Xue QIN, Hui Ying RAO, Ying XUE, Xue Mei ZHANG

目的：探究姜黄素—雷帕霉素复合型纳米药物在干性 AMD 大鼠模型中的治疗效果。

方法：选取 6~8 周龄 SPF 级大鼠 24 只，随机分为健康组 (Control)、NaIO₃ 诱导的阳性对照组 (Defect)、游离姜黄素和雷帕霉素治疗组 (Free C&R)、姜黄素纳米粒子组 (CUR NPs)、负载姜黄素和雷帕霉素的纳米颗粒组 (C&R NPs)，除健康组大鼠不做处理，其余各组进行碘酸钠干性 AMD 大鼠造模。分别以治疗后的 1、2、3 及 4 周为观测时间点，通过 OCT 检测各时间点各实验组的视网膜厚度的变化以及在观测后对各组大鼠眼球视网膜组织进行镜下组织病理分析，以此评价该药物对干性 AMD 的治疗效果。

结果：1. 治疗前，除 Control 组，其余各组 RPE 层萎缩消失，视网膜厚度明显变薄。通过对各观测时间点的视网膜厚度进行量化分析，可发现除 C&R NPs 组外，其余两组损伤恢复较慢，层次模糊，C&R NPs 组可以明显看到每周网膜厚度的增加，而其他各组未有这种效果。在治疗结束后对视网膜厚度进行测量发现 Control 组与 C&R NPs 组没有统计学差异，说明视网膜厚度恢复，而与其余各组均有明显统计学差异，说明其余各组视网膜厚度一直存在萎缩未恢复。2. 视网膜组织病理分析：Control 组各层次结构清晰，各层次间结构分明，细胞结构完整且排列整齐，Defect 组各层次结构线模糊，尤其内外核层结构紊乱，细胞的排列结构错乱，外核层明显细胞减少，而 RPE 层结构不清，部分萎缩不见，CUR NPs 组可见 RPE 层的细胞结构比 Defect 组损伤较轻。除 Control 组外，C&R NPs 组可明显比其他各组具有更清晰的层次结构，内外核层的细胞排列整齐，RPE 层层次分明。

结论：负载姜黄素和雷帕霉素的纳米载体对于干性 AMD 大鼠视网膜结构损伤具有一定治疗作用，可显著减轻 RPE 层的萎缩并维持视网膜的形态结构完整性。

摘要编号：209279

影响超声睫状体成型术 UCP 成功的危险因素分析

第一作者：Kang FENG

共同作者：Ying HONG, Qianqian JI

目的：研究影响超声睫状体成型术 UCP 治疗成功的危险因素。

方法：纳入 2024 年 2 月至 2025 年 5 月在北京大学第三医院眼科就诊的各类型青光眼患者，记录患者的性别，年龄，诊断，原发病，视力，眼压，抗青光眼药物，眼轴等情况。根据患者的生物学测量指标，选择不同的探头型号，进行超声睫状体成型治疗。术后给予激素类眼药水点眼抗炎。记录患者术后 3 个月时的视力，眼压及用药情况。采用眼压下降大于术前的 20% 或者眼压在 5-21 mmHg 之间作为手术成功的标准，记录手术成功率。

结果：66 例患者纳入本研究。其中男性 41 例 (62.1%)，女性 25 例 (37.9%)。年龄 58.9 ± 20.2 (6-95) 岁。诊断包括原发性开角型青光眼 15 例，原发性闭角型青光眼 7 例，继发性青光眼 18 例，先天性青光眼 2 例，新生血管性青光眼 24 例。术前视力 LogMR 2.0 ± 1.0 (0.1-3.0)。术前眼压 36.7 ± 11.0 (16-60) mmHg。术前使用抗青光眼药物 3.0 ± 0.9 种 (0 种 1 例，1 种 3 例，2 种 12 例，3 种 28 例，4 种 22 例)。眼轴 24.3 ± 2.7 mm (19.5-24.6)。角膜清亮 46 例，水肿 20 例。角膜直径 11.5 ± 0.6 mm (10.0-13.2)。选择探头 11-13 号 (其中 11 号探头 6 例，12 号探头 35 例，13 号探头 25 例)。8 扇区 5 例，9 扇区治疗 1 例，10 扇区治疗 60 例。20 例成功，手术成功率 83.3%。手术后未见光感丧失，脉络膜出血，角膜内皮失代偿等重大并发症。术后 3 个月患者视力 LogMR 2.0 ± 1.0 (0.3-3.0)。术后视力提高 19 例，下降 18 例，持平 29 例。眼压 17.5 ± 9.0 (5-44) mmHg。使用抗青光眼药物 2.2 ± 1.2 种 (0 种 8 例，1 种 11 例，2 种 24 例，3 种 26 例，4 种 7 例)。将患者年龄，术前视力，眼压，眼轴及是否为新生血管性青光眼带入回归方程。二元 Logist 回归显示，手术失败的独立危险因素是术前眼压 (1.113，可信区间 (1.003, 1.236) $P = 0.044$) 和年龄 0.903 (0.832, 0.981)， $P = 0.016$)。8 例失败患者中，4 例为新生血管性青光眼，1 例为开角型青光眼，3 例为继发性青光眼。2 例患者接受第二次 UCP 后，眼压得到控制。

结论：影响超声睫状体成型术 UCP 治疗成功的危险因素为术前眼压较高和患者年龄较小。

摘要编号: 209552

折叠顶压球囊联合眼内注气术在孔源性视网膜脱离伴高隆起视网膜中的应用: 一种改良外路手术策略

第一作者: Zhongping CHEN

共同作者: Hengwei LIU

目的: 探讨对于孔源性视网膜脱离 (RRD) 伴有视网膜高隆起患者, 采用折叠顶压球囊植入术结合眼内注气技术的疗效。传统外路手术中, 高隆起的视网膜使裂孔定位及巩膜顶压困难, 易导致手术失败。本研究旨在评估一种改良术式折叠顶压球囊植入联合眼内注气, 无需行玻璃体切割, 在实现视网膜解剖复位和功能恢复方面的价值。

方法: 回顾性分析 2025 年 1 月至 2025 年 10 月收治的 4 例 (4 眼) 孔源性 RRD 伴视网膜高隆起 (最高隆起度 ≥ 6 PD) 患者。所有患者均行折叠顶压球囊植入联合眼内注气: 首先, 根据眼底镜及广角眼底成像系统确定的视网膜裂孔位置, 于视网膜最高点行外路放视网膜下液 (SRF), 于裂孔相应巩膜壁外植入可折叠式顶压球囊。随后行玻璃体腔穿刺, 注入过滤空气形成眼内顶压。术后观察视网膜复位率、最佳矫正视力 (BCVA)、眼压及并发症。

结果: 4 例患者手术均顺利完成。术后 1 个月, 视网膜解剖复位率为 100%。平均 BCVA (LogMAR) 由术前的 1.98 ± 0.41 提升至术后 1 个月的 0.89 ± 0.36 , 差异具有统计学意义 ($P < 0.01$)。眼压均在正常范围内。球囊位置稳定, 未发生移位、感染或穿破等并发症。与传统硅胶填压术相比, 此术式避免了因高隆起视网膜导致的术中裂孔定位偏差和顶压不确切的问题, 术后患者舒适度高, 恢复快。

结论: 对于伴有视网膜高隆起的孔源性视网膜脱离, 采用折叠顶压球囊联合眼内注气的外路手术方案, 不进行玻璃体切割, 是一种安全有效的治疗策略。该术式成功的关键在于: (1) 球囊提供了精确、可调的外部顶压; (2) 眼内气体提供了由内而外的顶压力, 共同促进了裂孔的闭合与脉络膜-视网膜粘附。此改良外路术式避免了玻璃体切割相关的创伤和并发症 (如加速白内障、眼内炎症等), 保留了天然的晶状体与玻璃体结构, 实现了微创化治疗, 患者术后恢复快, 是对于条件适合的复杂外路病例的理想选择。

摘要编号: 202858

探讨无晶状体囊膜支撑, 人工晶体巩膜外固定术后发生视网膜脱离, 进行玻璃体切割手术的方法改进和临床观察。

第一作者: Liangbao AN

目的: 探讨无晶状体囊膜支撑, 人工晶体 (IOL) 巩膜外固定术后发生视网膜脱离, 进行玻璃体切割手术的方法改进和临床观察。

方法: 1) 对象: 收集 2018.1 — 2025.12 期间因无晶状体囊膜支撑行人工晶体巩膜球壁外固定手术, 术后发生孔源性视网膜脱离患者资料 9 人; 白内障术中破囊行 IOL 悬吊 3 人, 晶状体脱位行 IOL 悬吊 4 人, IOL 囊袋复合体脱位行 IOL 悬吊 2 人; 悬吊人工晶体巩膜外固定类型: 巩膜球壁缝线固定 8 人, 无缝线巩膜球壁固定 1 人; 发生视网膜脱离距 IOL 悬吊术后小于 1 月发生视网膜脱离 3 人, 大于 1 月发生视网膜脱离 6 人; 术前发现裂孔 3 人, 未发现裂孔 6 人; 视网膜脱离累计黄斑 7 人; 以及术前视力、眼压, 9 例患者发生视网膜脱离后视力均较悬吊 IOL 术后下降。2) 手术方法: 采用玻璃体切割联合注气术, 所有视网膜脱离患者均保留巩膜外固定 IOL, 手术方法改进在于玻璃体切割手术开始前, 做角膜侧切口, 侧切口伸入黏弹剂针头, 在前房注入并充满黏弹剂, 前房形成相对密闭空间; 悬吊 IOL 上方为充满前房的黏弹剂, 下方为术中灌注液; 玻璃体切割手术中, 灌注液对前房及角膜内皮无骚扰, 术中气液交换时无气泡进入前房干扰手术和对后节的观察, 顺利完成玻璃体切割、气液交换和裂孔的激光封闭; 顶压周边网膜亦无悬吊固定 IOL 偏位; 术毕前房内黏弹剂保留, 无需冲洗; 术毕视网膜复位良好, 玻璃体腔气体填充。3) 术后观察视力、眼压、IOL 位置、眼底视网膜脱离复位情况。

结果: 术后视力均较术前提提高。术后有 3 例患者眼压高, 均小于 35 mmHg, 用单一降眼压眼药水, 术后 1 周眼压均恢复正常; 巩膜外固定的 IOL 位置稳定, 未因手术操作和气体填充顶压而发生偏位; 视网膜裂孔闭合, 脱离的视网膜复位良好; 9 例患者均 1 次手术成功复位网膜。

结论: IOL 悬吊巩膜外固定术后发生视网膜脱离, 进行玻璃体切割手术时可保留巩膜外固定的 IOL, 采用黏弹剂填充前房的方法, 利于术中观察眼底和具体手术操作, 术后无高血压等并发症风险增加, 视网膜裂孔闭合, 脱离视网膜复位良好。

摘要编号: 208445

智能头位监测仪引导下改良式充气性视网膜固定术的临床疗效及安全性分析

第一作者: Enhui LI

目的: 评估配备头位固定角度设定、实时偏移提醒及记录功能的智能头位监测仪在改良式充气性视网膜固定术 (pneumatic retinopexy, PR) 中的应用价值, 明确其对孔源性视网膜脱离患者的有效性、安全性及体位管理优化作用。

方法: 前瞻性纳入 2024 年 11 月 1 日至 2024 年 12 月 31 日收治的 15 例孔源性视网膜脱离患者, 随机分配至 14% 全氟丙烷 (C3F8) 组与空气组。术中行前房穿刺放液后注入 0.7 ml 气体, 术后通过智能头位监测仪实时监测头位偏移 (各方向 $\leq 10^\circ$), 联合手机 APP 动态提醒患者, 在维持规定体位 6-12 小时后行激光封闭裂孔。记录指标包括: 单次注气解剖复位率、总复位率、头位依从性 (住院期间头位偏移 $\leq 10^\circ$ 的时间占比)、最佳矫正视力 (BCVA, ETDRS 字母数)、并发症、住院时间及术后激光次数。

结果: 单次注气视网膜解剖复位率为 93.3% (14/15), 一例失败病例为玻璃体腔空气顶压时间不够, 裂孔未闭, 二次注气后成功, 末次随访 (≥ 3 个月) 总复位率 100% (15/15)。患者头位依从性为 $73\% \pm 5.6\%$ 。末次随访患者平均 BCVA 由术前的 29.5 ± 32 字母显著提高至 47 ± 20 字母 ($P < 0.01$)。术后发生一例视网膜新发干性裂孔, 予以激光封闭。中位住院时间 4 天 (范围: 3-6 天), 术后平均激光治疗 3 次 (范围: 2-4 次)。

结论: 智能头位监测仪通过精准体位管理显著提升 PR 手术成功率 (短期复位率 100%), 且并发症可控、操作便捷。其整合实时监测与交互提醒功能, 为孔源性视网膜脱离的微创治疗提供了高效解决方案, 并具备拓展至玻璃体术后管理的潜力, 或可减少硅油依赖。未来需扩大样本量及延长随访以验证长期疗效。

摘要编号: 209291

机器人辅助视网膜下注射 t-PA 治疗黄斑区视网膜下出血的安全性和有效性

第一作者: Suyan LI

共同作者: Haiyang LIU

目的: 探讨机器人辅助视网膜下注射 t-PA 治疗黄斑区视网膜下出血的安全性和有效性。

方法: 前瞻性多中心单组目标值的试验设计。根据纳排标准, 纳入研究病例 23 例 23 眼, 所有的患者均伴有黄斑区视网膜下出血, 予以 OCT 检查, 标

定拟术中视网膜注射部位。于全麻下行 25 G 玻璃体手术, 在 TA 辅助下行人工 PVD, 安装 41 G 注射装置, 术者通过遥控器按键操纵注射装置的方向角度以及进程, 下方 6 点睫状体平坦部插入吊顶灯, 观察注射针头距离视网膜的距离, 调整进入速率, 降低玻璃体切割机的灌注压, 采用玻璃体切割机硅油注入系统推动注射针, 于视网膜下注射 t-PA 8 微克~25 微克, 当视网膜隆起, 视网膜下出血颜色变淡即注射成功, 做气液交换, 平卧 30 分钟后回病房。观察指标: 1. 视网膜穿刺注射成功率; 2. 与器械相关的并发症包括视网膜裂孔, 穿刺孔撕裂, 视网膜出血, 脉络膜上腔出血等; 3. 术后采用 OCT 观察穿刺部位视网膜; 4. 术后视力变化。

结果: 纳入研究的 23 例中男 15 例 15 眼, 女 8 例 8 眼。年龄 52 岁~82 岁, 平均 68 岁。其中湿性 AMD 4 例, 视网膜大动脉瘤 3 例, PCV 16 例。整个手术过程中, 机器人操纵顺畅, 视网膜穿刺注射成功 100%; 术中未发生与器械相关的并发症、无视网膜裂孔、穿刺孔撕裂、视网膜出血及脉络膜上腔出血等并发症发生。术后 1 周随访, 20 例患者视网膜下出血明显消退, 有 3 例发生玻璃体出血, 2 例经过玻璃体腔盥洗后视力显著提升。术后 30 天随访, 视力较术前提升 15 例, 无变化 4 例, 视力较术前下降 4 例。术后 30 天 OCT 图像成像清晰的有 21 例, OCT 扫描穿刺部位, 未见穿刺口异常反射信号。

结论: 机器人辅助视网膜下注射 t-PA 治疗黄斑区视网膜下出血安全有效, 操作精准, 可以防止手术者因手颤而导致注射针头的移位。

法瑞西单抗在难治性糖尿病黄斑水肿患者中的真实世界研究

第一作者: Xiufen YANG

共同作者: Yingxiang HUANG

目的: 本项回顾性病例系列研究旨在评估法瑞西单抗在难治性糖尿病黄斑水肿患者中的真实世界治疗效果。

方法: 这项回顾性研究分析了法瑞西单抗治疗难治性糖尿病黄斑水肿 (DME) 的效果。所有患者均按照按需治疗方案接受法瑞西单抗注射治疗。记录最佳矫正视力和黄斑中心凹平均厚度 (CST)。对光学相干断层扫描 (OCT) 下的视网膜内液 (IRF) 和视网膜下液 (SRF) 进行描述和分析。

结果: 18 名难治性 DME 患者的 27 只患眼符合标准并纳入研究, 其中 21 只眼 (77.8%) 为增殖性糖尿病视网膜病变, 6 例 (22.2%) 为非增殖性糖尿病视网膜病变。根据 OCT 形态特征, 患眼分为 13

例 (48.1%) 囊样黄斑水肿, 6 例 (22.2%) 浆液性神经上皮层脱离, 8 例 (29.6%) 弥漫性黄斑水肿。入组前, 患眼平均接受了 8.8 ± 2.1 次抗血管内皮生长因子 (抗 VEGF) 注射, 包括平均 4.8 ± 4.7 针阿柏西普、 2.9 ± 2.9 针雷珠单抗、 1.1 ± 0.6 针康柏西普。其中 8 只眼 (29.6%) 平均接受了 4.4 ± 1.0 次地塞米松玻璃体内缓释植入剂治疗。转换为法瑞西单抗治疗后, 患眼平均接受了 2.4 ± 0.5 次注射, 玻璃体内注射法瑞西单抗后的平均随访时长为 16.2 ± 2.7 周。在注射一针法瑞西单抗后, 最佳矫正视力从 49.5 ± 2.9 个字母提高到 52.5 ± 3.1 个字母; CST 从 487.1 ± 21.8 微米显著降低至 430.7 ± 22.4 微米 ($P = 0.004$)。注射两针的患眼, 最佳矫正视力从 48.5 ± 3.6 个字母显著提高至 56.2 ± 4.3 个字母 ($P = 0.002$); CST 从 503.4 ± 30.3 微米显著降低至 400.2 ± 30.6 微米 ($P < 0.0001$)。在最后一次就诊时, 最佳矫正视力从 49.5 ± 2.9 个字母显著提高至 55.9 ± 3.3 个字母 ($P = 0.005$); CST 从 487.1 ± 21.8 微米显著降低至 391.3 ± 23.6 微米 ($P < 0.0001$)。有无新生血管形成和不同 OCT 分型与最佳矫正视力或 CST 的变化无显著相关性。基线时存在 SRF 和 IRF 的患者比例为 24% 和 100%, 在注射一针法瑞西单抗后, SRF 和 IRF 分别下降至 12.0% 和 92.0%。注射两针的患眼, SRF 和 IRF 分别下降至 0% 和 77.6%。完全无积液的患眼比例从基线时的 0% 在注射一针后两针后分别上升至 4.0% 和 21.4%。在随访期间未观察到明显的全身和眼部不良事件。

结论: 研究表明, 法瑞西单抗可在显著提高难治性 DME 患者的视力, 降低 CST, 提升积液消除率, 且安全性良好。

摘要编号: 209535

眼科手术机器人辅助视网膜下注射 rtPA 治疗视网膜下出血的临床观察

第一作者: Zhongping CHEN

共同作者: Hengwei LIU

目的: 评估眼科手术机器人系统辅助下实施视网膜下注射重组组织型纤溶酶原激活剂 (rtPA) 治疗视网膜下出血 (SRH) 的临床可行性、安全性及有效性, 重点分析机器人在提升手术精度、稳定性及预后效果方面的核心优势。

方法: 本研究为前瞻性临床观察, 纳入 4 例因息肉样脉络膜血管病变 (PCV) 导致黄斑区或旁中心凹 SRH 患者。所有患者均采用眼科手术辅助系统实施玻璃体切除术后机器人辅助视网膜下注射 rtPA。机器人系统操作流程包括: 术前 OCT、术中实时眼动追踪与器械导航、震颤过滤及亚微米级运动控制。

主要观察指标: 机器人系统定位精度 (μm)、手术操作时间 (min)、术中并发症 (医源性视网膜裂孔、出血等) 发生率、rtPA 注射靶点准确性 (OCT 验证)。次要指标: 术后 SRH 清除率 (时间与范围)、最佳矫正视力 (BCVA, LogMAR) 变化、视网膜解剖结构恢复情况 (OCT)、术后并发症及随访期稳定性。对比历史对照组或手术不同阶段人工操作数据, 进行统计分析。

结果: 精准性显著提升: 机器人辅助下器械尖端定位显著优于人工操作。操作稳定性卓越: 机器人系统彻底消除生理性震颤, 大幅降低医源性视网膜损伤风险。本研究未发生机器人操作相关的视网膜撕裂或显著出血。安全性优化: 术后早期眼压波动轻微, 无感染性眼内炎发生。临床疗效改善: 末次随访 BCVA 平均提升, 视力获益程度与出血清除速度及黄斑结构恢复 (OCT 显示椭圆体带连续性改善) 显著正相关。

结论: 眼科手术机器人系统辅助视网膜下注射 rtPA 治疗 SRH, 展现了革命性的技术优势: 其亚微米级的超精密定位能力、绝对稳定的无震颤操作以及智能化的运动缩放与导航, 显著提升了手术的安全边界与操作精度, 有效降低了视网膜医源性损伤风险。本研究结合最新国际证据, 强有力地证实了机器人辅助眼科手术在治疗 SRH 等需极致精细操作的眼底疾病中具有明确的临床价值和广阔的应用前景, 代表着微创玻璃体视网膜手术向更高精度、更高安全性发展的范式转变。

摘要编号: 209902

硬核全脱位白内障的手术处理技巧

第一作者: Yan MA

共同作者: Xiangyu SHI

目的: 硬核脱位白内障的手术处理极具挑战性, 传统超声粉碎技术存在效率低、热损伤风险高、核块易坠落等问题。本研究提出一种创新的双手联合技术 (一手玻璃体切割头或眼内镊, 另一手超声乳化), 并系统分析其相较于传统超声粉碎技术的优势。

方法: 回顾性分析 2024 年 1 月—2024 年 12 月收治的 15 例硬核全脱位白内障患者 (20 眼), 其中 6 例采用传统玻璃体腔晶状体超声粉碎技术 (对照组), 14 例采用双手联合超声乳化技术 (实验组)。对比以下方面: 1. 手术效率: 双手联合技术通过玻璃体切割头实时稳定晶状体位置, 同时超声乳化头高效粉碎硬核, 避免反复切换器械, 缩短手术时间。2. 安全性: 超声乳化能量可控性更强, 减少热损伤及悬韧带二次损伤风险; 玻璃体切割头同步清除玻璃体牵拉, 显著降低核块坠落率, 也能避免负压吸引玻璃体纤维进而牵拉视网膜出现并发症的概率;

眼内镊抓取晶状体至前部玻璃体行超声乳化，可以减少超声能量对角膜内皮的损伤 3. 操作优势：传统超声粉碎技术需扩大巩膜切口，并且联合使用高黏度粘弹剂或全氟化碳液体进行操作，此项技术可使用透明角膜小切口完成白内障摘除，并利用同一切口植入人工晶状体，无需扩大巩膜穿刺口，也避免了扩大角膜切口进行娩核操作；双器械协同实现“动态固定”，尤其适用于悬韧带完全断裂的病例；可灵活调整超声乳化参数，针对不同硬度核块进行分层处理。

结果：实验组手术时间显著短于对照组 (35.7 ± 5.2 min vs 50.6 ± 8.3 min, $p < 0.05$)。术后 1 周内，实验组 2 人 (14.3%)，对照组 1 人 (16.7%)，出现眼压升高，经前房穿刺放液及局部降眼压药物控制良好，均未出现严重手术并发症。术后 1 个月，实验组 BCVA ≥ 0.5 者占 78.6% (11/14)，对照组 66.7% (4/6)，两组之间无统计学差异。

结论：相比传统超声粉碎技术，双手联合技术（玻璃体切割 / 眼内镊使用 + 超声乳化）在硬核全脱位白内障手术中具有显著优势，本为复杂白内障手术提供了创新性解决方案，特别适用于悬韧带功能不良的硬核白内障病例。

摘要编号：208026

精准导航赋能难治性黄斑裂孔治疗：OCT 术中导航辅助内界膜平移与翻转遮盖术的疗效探究

第一作者：Sun HONGYAN

目的：观察联合 NGenuity3D 手术视频系统和 OCT 术中导航辅助内界膜平移与翻转遮盖术治疗难治性黄斑裂孔的疗效，为该类疾病的创新术式提供循证依据。

方法：回顾性分析 2024 年 4 月至 2025 年 2 月于深圳市人民医院眼科接受 PPV 治疗的难治性黄斑裂孔患者，15 例 15 只眼纳入研究。手术中均采用 3D 手术视频系统联合 OCT 导航对黄斑区进行扫描，行经睫状体平坦部标准三通道 25G 微创 PPV，8 只眼采用内界膜平移遮盖术，7 只眼行内界膜翻转遮盖术，均采用全氟丙烷 (C3F8) 填充。手术后平均随访时间 (6.5 ± 2.7 个月)。观察末次随访时 BCVA、黄斑区形态、裂孔闭合率及 mfERG 的变化情况。手术前后参数比较采用配对 t 检验。

结果：Genuity 3D 手术视频系统的高清模式可清晰显示黄斑区细微结构 (如内界膜边界、裂孔边缘)，其绿色电子滤镜可显著提升吲哚菁绿 (ICG) 染色图像的对比度；OCT 术中导航可实时获取黄斑区高分辨率横截面图像，为手术操作提供精准定位。平均手术时间为 (37.5 ± 12.9 min)，所有患者均未出现与 3D 手术视频系统相关的并发症 (如术

中视野干扰、术后视觉不适)。15 只眼均实现黄斑裂孔解剖学愈合 (闭合率 100%)；与术前比较，术后 BCVA 显著改善 ($P < 0.05$)，mfERG 一阶函数中 1 环、2 环 P1 波反应密度显著升高 (P 均 < 0.05)，提示黄斑区视网膜功能 (尤其是中心凹及旁中心凹区域) 得到有效恢复。术后 3 个月随访时，内界膜平移遮盖术组 BCVA 为 0.48 ± 0.18 ，内界膜翻转遮盖术组 BCVA 为 0.31 ± 0.15 ，两组术后视力均较术前显著改善 ($P < 0.05$)，且平移术组视力改善幅度显著优于翻转术组 ($P < 0.05$)。光学相干断层扫描血管成像 (OCTA) 检查监测黄斑区视网膜血管密度 (尤其是中心凹无血管区面积) 的变化。结果显示，术后 3 个月时，内界膜平移遮盖术组患者黄斑区中心凹无血管区面积从术前的 (0.42 ± 0.08 mm²) 缩小至 (0.31 ± 0.06 mm²)，内界膜翻转遮盖术组从术前的 (0.43 ± 0.07 mm²) 缩小至 (0.36 ± 0.05 mm²)，提示平移术式更有利于黄斑区微循环的恢复。

结论：NGenuity 3D 手术视频系统联合 OCT 术中导航可通过增强黄斑区 ICG 染色对比度、实时精准定位，为 PPV 治疗难治性黄斑裂孔提供可靠技术支持；其中内界膜平移遮盖术相较于传统翻转术式，更符合视网膜解剖生理特点，可显著提升巨大或陈旧性黄斑裂孔的闭合率，尤其为常规术式失败的病例提供了微创解剖复位的新治疗方案。

摘要编号：209238

羊膜移植在息肉状脉络膜血管病致出血性视网膜脱离手术中黄斑区色素上皮缺失的应用

第一作者：Yonghao LI

共同作者：Meng WANG

目的：本研究将羊膜移植应用于息肉状脉络膜血管病 (PCV) 的手术治疗中，观察使用羊膜移植对 PCV 致出血性视网膜脱离患者黄斑区色素上皮缺失的治疗效果，探讨羊膜移植对 PCV 患者黄斑区色素上皮缺失的修复的可能作用，以期为 PCV 患者的治疗提供新的方法及策略。

方法：患者初诊时表现为 PCV 致出血性视网膜脱离，在玻璃体切除术 (PPV) 中行周边视网膜 360° 切开并清除视网膜下黄斑区新生血管组织，将羊膜修剪成合适大小并移植于视网膜下间隙，保持其绒毛膜层面向视网膜色素上皮 (RPE) 层，在重水辅助下将视网膜复位并将羊膜位于黄斑区，应用视网膜激光光凝联合硅油填充。收集患者术前及术后 1 个月和 3 个月的最佳矫正视力、眼压、OCT 及眼底彩照观察患者视力变化及羊膜位置，1 个月和 3 个月行 ERG 检查观察光感受器修复情况。

结果：患者术前视力为光感，患者术后 1 个月和 3 个月时最佳矫正视力为 0.05。患者术后 1 个月和 3 个月时眼底照相及 OCT 均显示羊膜植片在位且贴附良好，OCT 提示羊膜位于黄斑区色素上皮位置，ERG 结果显示光感受器功能有修复。

结论：羊膜具有良好的安全性和非免疫原性，位于黄斑中心凹下的羊膜植片可以作为机械支架帮助恢复 PCV 中受损的光感受器，有助于视功能恢复，其长期治疗效果亟待进一步观察。

摘要编号：202366

羊膜移植联合玻璃体切除术治疗巨大黄斑裂孔及黄斑孔源性视网膜脱离的效果评估

第一作者：Jing LI

目的：扁平部玻璃体切除术联合内界膜剥离填塞是治疗黄斑裂孔的常用技术，但复发裂孔、巨大黄斑裂孔及黄斑孔源性视网膜脱离的治疗对于玻璃体视网膜外科医生来说仍然是一个挑战，本研究旨在探究羊膜移植联合玻璃体切除术治疗巨大黄斑裂孔及黄斑孔源性视网膜脱离的安全性及有效性。

方法：采用单臂探索性临床研究方法，收集 2023 年 9 月至 2024 年 12 月天津市眼科医院门诊确诊为巨大黄斑裂孔（孔径大于 600 μm ）及黄斑裂孔伴视网膜脱离的患者，符合纳入排除标准的受试者均采用羊膜移植联合玻璃体切除术治疗，测量患者术前及术后 1 周、3 个月、6 个月、1 年最佳矫正视力、眼压、OCT 和微视野，评估羊膜移植联合玻璃体切除术的疗效与安全性。

结果：最终纳入本临床研究的病例共有 110 例，进入统计分析共 96 例（剔除 5 例，脱落 9 例）。患者平均年龄（63.23 $\pm$ 9.28）岁，女性患者 57 人占总体的 59%，基线时平均黄斑裂孔大小（928 $\pm$ 20.16） μm ，羊膜移植联合玻璃体切除术 1 周后，黄斑裂孔闭合率达 93.45%，术后 3 个月、6 个月、1 年患者最佳矫正视力均较基线时有明显改善（ $P < 0.01$ ），10 例患者术后 3 个月时出现黄斑水肿，给予玻璃体腔注入曲安奈德后水肿均消退，患者未出现其他安全性指标异常，亦无严重不良事件发生。

结论：羊膜移植联合玻璃体切除术是治疗巨大黄斑裂孔及黄斑孔源性视网膜脱离有效的手术方式，羊膜填塞可有效地提高黄斑裂孔的闭合率，且术后视力有明显提升，可作为优先考虑的手术方案。

摘要编号：209738

老年孔源性视网膜脱离患者巩膜扣带术临床治疗效果评价

第一作者：Lei WAN

目的：评估巩膜扣带术在老年孔源性视网膜脱离患者中的临床疗效，并分析术后视力结局的相关预测因素。

方法：回顾性分析 2018 年至 2024 年在青岛眼科医院接受巩膜扣带术治疗的 278 例（290 只眼）孔源性视网膜脱离患者的临床资料。根据年龄分为老年组（ ≥ 60 岁）和年轻对照组（ ≤ 30 岁），比较两组术后结局差异。在老年组中进一步进行多因素 Logistic 回归分析，探讨影响术后视力恢复的相关因素。

结果：老年组单次手术解剖复位成功率为 98.23%，年轻组为 97.30%，差异无统计学意义（ $P > 0.05$ ）。老年组术后视力稳定或改善者占 92.03%。与年轻组相比，老年组在视网膜下液引流过程中发生视网膜下出血（2.65% vs. 9.60%， $P = 0.023$ ）及术后眼压升高需药物控制（7.08% vs. 25.99%， $P < 0.001$ ）的比例显著较低。老年组玻璃体后脱离的发生率显著更高（71.7% vs. 17.5%， $P < 0.001$ ），并与裂孔位置及视网膜脱离范围密切相关（均 $P < 0.001$ ）。此外，76.99% 的老年患者在手术过程中使用了玻璃体腔内光纤照明辅助操作，以提高手术视野与裂孔识别率，且未发现该技术增加术中或术后并发症风险。多因素分析显示，术前视力、视网膜脱离是否累及黄斑，以及 C 级增生性玻璃体视网膜病变是老年组术后视力结局的独立影响因素（均 $P < 0.05$ ）。

结论：在玻璃体切割术日益普及的背景下，结合光纤照明等现代辅助手段的改良巩膜扣带术，仍可为部分老年孔源性视网膜脱离患者提供良好的解剖与视功能恢复。合理选择手术时机与适应证对于优化预后尤为关键，尤其适用于无法耐受严格体位要求的患者。

摘要编号：209171

血脂异常介导高脂饮食诱导的视网膜 ECE-1/ET-1 异常：代谢性视网膜病变的潜在机制

第一作者：Longli ZHANG

共同作者：Huilan ZHANG, Shuo SUN

目的：高脂饮食（HFD）是导致代谢紊乱（如肥胖、血脂异常和内皮功能障碍）的主要因素，这些疾病可引起全身及眼部病变。最新研究表明，代谢紊乱可能导致视网膜病变，但其机制尚不明确。内皮素-1（ET-1）及其调控酶 - 内皮素转换酶 -1（ECE-1）

在血管功能障碍中起关键作用，但它们是否参与 HFD 诱导的视网膜改变尚未完全阐明。本文就这一机制做初步探索。

方法：采用 HFD 诱导代谢功能障碍的小鼠模型，评估全身代谢指标（包括血脂谱、肝功能标志物和炎性细胞因子），并通过定量 PCR (qPCR) 检测视网膜炎症因子和血管因子（如 ET-1 和 ECE-1）的基因表达水平。通过相关性分析评估全身代谢变化与视网膜分子改变之间的关系。

结果：HFD 喂养导致显著代谢紊乱，包括体重增加、总胆固醇 (TC) 水平升高和肝脏应激。视网膜分析显示，促炎细胞因子 (IL-1 β 、IL-6、TNF β 1 和 TNFSF15) 及 ECE-1 与 ET-1 的表达均显著上调。值得注意的是，相关性分析表明，TC 水平与视网膜 ECE-1 (Pearson 相关系数 $r = 0.888$, $p = 0.018$) 和 ET-1 ($r = 0.815$, $p = 0.048$) 呈强正相关，提示全身性血脂异常与视网膜血管功能障碍之间存在机制关联。

结论：本研究证实，HFD 诱导的血脂异常可通过 ECE-1 和 ET-1 等关键介质促进视网膜炎症和內皮功能障碍，为预防代谢紊乱相关视网膜病变提供了潜在治疗靶点。

摘要编号：209246

高度近视眼 ICL 植入术后孔源性视网膜脱离的危险因素及临床特征分析

第一作者：Yonghao LI

共同作者：Jian DENG, Liduo PAN, Meng WANG

目的：有晶状体眼后房型人工晶状体 (implantable collamer lens, ICL) 植入术已成为高度近视患者屈光手术的优选。随着手术量的增加其术后并发症尤其是孔源性视网膜脱离 (rhegmatogenous retinal detachment, RRD) 的潜在风险也在增加并被广泛关注。本研究旨在探讨高度近视眼 ICL 植入术后 RRD 发生的危险因素及其临床特征，以期为高度近视患者 ICL 植入术前的风险评估及术后并发症的预防提供理论依据，以提升手术效果及安全性。

方法：本研究采用回顾性病例对照的研究方法，纳入 2019 年 10 月至 2023 年 10 月期间接受 ICL 植入术的高度近视 (等效球镜度 ≤ -6.00 D 且眼轴长度 ≥ 26.5 mm) 患者共 97 例 (150 眼)，并根据术后随访结果将其分为 RRD 组 8 例 (8 眼)，非 RRD 组 89 例 (142 眼)。采用 Logistic 回归分析的方法，从术前是否存在玻璃体后脱离、视网膜变性、预防性激光光凝、视网膜劈裂、后巩膜葡萄肿、黄斑中心凹下视网膜及脉络膜厚度，以及术后 2 小

时眼压等方面进行危险因素分析，并观察 ICL 植入术后 RRD 发生的时间及临床特征。

结果：RRD 组及非 RRD 组患者的性别 ($P = 0.698$)、年龄 ($P = 0.176$)、术前等效球镜度 ($P = 0.220$) 以及眼轴长度 ($P = 0.825$) 等均不存在统计学差异。而单因素分析显示：RRD 组术前玻璃体后脱离 (75.0% vs. 16.9%, $X^2 = 15.598$, $P < 0.001$)、视网膜变性 (62.50% vs. 7.04%, $X^2 = 21.972$, $P < 0.001$) 以及预防性激光光凝的使用 (37.50% vs. 4.23%, $X^2 = 9.553$, $P = 0.002$) 显著高于非 RRD 组。多因素分析证实，术前视网膜变性 ($OR = 186.09$, $P = 0.03$) 和术后 2 小时高眼压 ($OR = 1.53$, $P = 0.01$) 是高度近视眼 ICL 植入术后 RRD 的独立危险因素。在我们的研究中，ICL 植入术后 RRD 的平均发生时间为术后 1.94 ± 1.47 年，裂孔形态以萎缩圆孔 (50%) 和马蹄孔 (37.5%) 多见，60% 的裂孔位置与术前视网膜变性区相一致。

结论：术前存在视网膜变性和术后 2 小时高眼压是高度近视患者 ICL 植入术后 RRD 的重要危险因素，与自然进展发生的 RRD 相比，ICL 植入术后的 RRD 无特征性临床改变，其可能是高度近视的自然病程和手术干预的共同结果。术前玻璃体视网膜界面因素的全面评估、术后早期眼压的动态监测与及时干预可以在一定程度上减少术后 RRD 的发生率，提高高度近视患者 ICL 植入的有效性及安全性。

摘要编号：209369

黄斑毛细血管扩张症 2 型相关黄斑裂孔伴内界膜缺陷的手术治疗和 Müller 细胞功能的影像学评估

第一作者：Wang

共同作者：Yujia GAO, Wu JIAYI, Liang YAO, Yuping

目的：本研究旨在通过高分辨率影像学技术，探讨一例 2 型黄斑毛细血管扩张症 (Mac Tel 2) 继发黄斑裂孔伴内界膜 (ILM) 缺损的病例。重点在于利用先进的三维成像方法评估 Müller 细胞功能状态，以解释其黄斑裂孔术后初期成功闭合但长期复发的原因。

方法：手术方法：对患者行玻璃体切割术，术中采用吲哚菁绿 (ICG) 染色，发现裂孔周围存在片状 ILM 缺损，遂利用残留的 ILM 制作瓣膜并覆盖裂孔。影像学方法：采用扫频源 OCT 血管成像 (SS-OCTA) 对黄斑区进行扫描。从 3×3 mm 扫描区域中获取 512 幅连续的 B 扫描图像，构建灰度结构图像堆栈和彩色血流图像堆栈。通过颜色反卷积技术精准提取红色血流信号，生成独立的血流堆栈。将该血流堆栈与设置为半透明的灰度结构堆栈进行

通道叠加，最终合成三维复合模型，并可进行多角度旋转观察。

结果：手术结果：术后早期（3 天及 1 年），黄斑裂孔实现解剖闭合，视力由术前的 20/100 提升至 20/40。然而，在术后 6 年的长期随访中，裂孔再次开放，视力下降回 20/100。影像学结果：术中 ICG 染色发现并证实了裂孔周围大于 270 度的片状 ILM 缺失，为 Müller 细胞严重功能障碍提供了直接证据。三维模型分析：三维重建图像清晰显示，复发性裂孔的内壁呈不规则缓坡状，提示既往胶质增生修复的痕迹；而部分边缘锐利，表明支撑性组织缺失。在对侧眼的三维模型中，观察到典型的“直角静脉”及其下方视网膜组织的地形学塌陷，直观地反映了 Müller 细胞骨架支撑功能的丧失。

结论：本研究通过 SS-OCTA 三维血管结构融合成像技术，活体、直观地展示了 Mac Tel 2 中 Müller 细胞功能障碍所导致的视网膜结构崩解。影像学发现与患者临床表现高度吻合，证实 Mac Tel 2 相关黄斑裂孔的长期闭合稳定性，根本上取决于 Müller 细胞变性的持续进展，而非单纯手术技巧。对于 Müller 细胞功能严重衰退的眼，应考虑 ILM 以外的替代材料进行裂孔填塞。本案例凸显了三维影像分析作为评估细胞功能、预测手术长期预后的重要工具价值。

眼整形眼眶病

摘要编号：209197

亚洲女性鼻泪管倾斜角度与额骨的空间关系：一项 CT 定量研究

第一作者：Chenqi XING

共同作者：Chengzhen GONG

目的：通过计算机断层扫描（CT）表征亚洲女性原发性获得性鼻泪管阻塞（PANDO）患者鼻泪管（NLD）相对于额骨的解剖倾斜度特征，旨在讨论亚洲女性 PANDO 患者及健康对照者中 NLD 相对于额骨的解剖倾斜角度变异。

方法：回顾性纳入 142 例原发性获得性鼻泪管阻塞（PANDO）患者（284 眼）和 57 例健康个体（114 眼）的头部 CT 检查图像，排除了泪液引流系统结构存在任何病理改变的病例。使用 Sante DICOM Viewer 软件，在 CT 矢状面骨窗上，以 NLD 上口中心为顶点，测量 NLD 长轴与额骨前缘夹角（重复 3 次取均值）。采用卡方检验比较角度 $> 180^\circ$ 比例在组间及年龄组（ < 40 岁， $40 \sim 60$ 岁， ≥ 60

岁）中差异，配对 t 检验分析双眼一致性（IBM SPSS 20， $p < 0.05$ 显著）。

结果：共分析 199 例女性（398 眼），平均年龄 49.66 ± 15.05 岁。PANDO 组和健康对照组的夹角范围分别为 $157.27^\circ \sim 193.84^\circ$ 和 $162.16^\circ \sim 189.65^\circ$ 。PANDO 组（58 眼，20.42%）与健康对照组（30 眼，26.32%）之间角度超过 180° 的比例无统计学差异（ $p = 0.2$ ）。双眼角度测量值高度一致（ $p > 0.05$ ）。左/右眼间角度值及 $> 180^\circ$ 比例无差异（ $p > 0.05$ ）。中年组（ $40 \sim 60$ 岁）角度超过 180° 的比例比老年组（ 60 岁以上）高 14%（ $p = 0.007$ ）。这种差异可能与年龄相关的骨重塑变化有关，年龄可能通过影响 NLD 走行路径或额骨形态（或两者共同作用）导致倾斜角度变化，具体机制需进一步研究。本研究证实，鼻泪管（NLD）相对于额骨的特定倾斜变异（角度 $> 180^\circ$ ）在人群（包括 PANDO 患者和健康个体）中普遍存在。此类“不利”角度显著增加操作（如置管、DCR）中器械路径调整难度及形成假道的风险。

结论：研究证实了这种变异在 PANDO 患者和健康人群中的普遍存在性，不受疾病状态和侧别影响，但中年人群（ $40 \sim 60$ 岁）发生率高于老年人群（ ≥ 60 岁）。建议在进行相关泪道操作前，通过 CT 评估明确 NLD-额骨倾斜角度，对于预判操作难度、规划器械路径及最大限度减少医源性损伤（尤其是假道形成）具有重要临床价值。

摘要编号：204371

人工智能定量评估 TAO 的视网膜血管特征

第一作者：Xue JIANG

共同作者：Dongmei LI

目的：分析甲状腺相关眼病（TAO）的视网膜血管特征，并探讨视网膜血管参数在 TAO 中的诊断价值和眼底检查作为 TAO 筛查手段的可行性。

方法：将 594 名患者和 600 名健康人员分别设为 TAO 与对照组。使用眼底照相机和人工智能自动化图像分析程序对入组个体进行眼底图像采集和视网膜血管参数测量，包括视网膜血管管径、血管弯曲度、血管分支夹角和血管分形维数。比较 2 组各视网膜血管参数，并采用受试者工作特征（ROC）曲线分析各视网膜参数单独和联合诊断 TAO 的效能。

结果：与对照组相比，TAO 组具有更宽的视网膜血管动脉管径（距视盘 $0.5 \sim 2$ PD）和更复杂的血管分形维数（ P 均 < 0.05 ）。在活动期（CAS ≥ 3 分）与非活动期组在静脉管径均有明显差异（ P 均 < 0.05 ）。视网膜动脉血管管径、视网膜血管分形维数及两者联合诊断 TAO 的 ROC 曲线下面积分别为

0.869 (95% CI 0.820 ~ 0.919)、0.780 (95% CI 0.713 ~ 0.847) 和 0.901 (95% CI 0.860 ~ 0.942)。

结论: TAO 患者的视网膜血管系统发生了明显改变。活动期比非活动期者视网膜血管静脉管径更宽, 血管分型维数对 TAO 具有一定的诊断价值, 诊断效能较佳, 联合动脉管径具有更高的诊断价值。眼底检查或可为 TAO 的便捷筛查和无创诊断带来更多的可能性。

摘要编号: **208958**

便携式三维成像系统在眶周区域体积测量中的验证研究

第一作者: Xuan ZHANG

共同作者: Lixia LOU, Juan YE

目的: 评估一种基于结构光技术的便携式三维成像系统用于眶周区域体积测量的可靠性与准确性。

方法: 研究通过 3D 打印技术制备五种不同尺寸和颜色的半球形树脂模型, 包括直径 6 mm、4 mm、2 mm 的肉色模型, 以及直径 6 mm 的黑色和灰色模型。将这些模型固定于 40 名志愿者的下眼睑或上眼睑, 由一名研究者使用该便携式三维成像系统采集三维图像, 两名测量者在图像上测量模型体积。通过组内相关系数 (ICC)、平均绝对差异 (MAD)、测量技术误差 (TEM)、相对误差 (REM) 和相对技术误差 (rTEM) 等指标, 评估该系统的设备内可靠性、测量者内可靠性、测量者间可靠性及测量准确性。

结果: 该系统用于眶周区域体积测量的设备内可靠性极佳 (ICC = 0.922, MAD = 0.11 mm³, TEM = 0.09 mm³, REM = 0.19%, rTEM = 0.15%)。该系统在测量固定于下眼睑的直径 6 mm 的肉色模型的体积时的测量者内可靠性最高 (ICC = 0.953, MAD = 0.08 mm³, TEM = 0.06 mm³, REM = 0.13%, rTEM = 0.11%)。该系统在测量固定于下眼睑的直径 6 mm 的肉色模型的体积时的测量者间可靠性最高 (ICC = 0.889, MAD = 0.14 mm³, TEM = 0.11 mm³, REM = 0.24%, rTEM = 0.19%)。该系统在测量固定于下眼睑的直径 6 mm 的肉色模型的体积时的测量准确性最高 (MAD = 0.24 mm³, REM = 0.43%)。

结论: 这种基于结构光技术的便携式 3D 成像系统能够可靠且准确地测量眶周区域肉色物体的体积。该这项发现表明, 该设备在眼整形领域具有巨大潜力, 可用于诊断、术后评估以及体积变化的长期随访。

摘要编号: **208972**

内镜导航引导 3D 打印技术结合可吸收材料治疗眼眶爆裂性骨折的疗效和安全性分析

第一作者: Hongfei LIAO

目的: 评估内镜导航引导下三维打印联合可吸收材料在眼眶爆裂骨折个体化微创重建中的疗效与安全性, 并以预成型钛网修复作为对照, 通过比较临床效果验证其在实现解剖复位、改善视觉功能及减少并发症方面的临床价值。

方法: 本回顾性研究共纳入 87 例接受可吸收植入物修复的患者 (试验组) 及 19 例采用预成型钛网修复的患者 (对照组)。术前利用 Mimics 21.0 及 Geomagic Studio 12.0 软件进行 CT 三维重建, 基于健侧眼眶的镜像模型生成个体化手术导板及三维打印眼眶模型。试验组中, 通过导板进行可吸收板的热塑成型并植入修复; 对照组则根据骨折形态修剪钛网并以螺钉固定。采用 SPSS 26.0 并结合 Python 自动协变量控制进行统计分析; 通过倾向评分加权 (PSW) 平衡性别、年龄及骨折范围等基线协变量 (标准化均差 SMD < 0.1 为平衡标准)。纵向连续变量 (突眼差值、logMAR 最佳矫正视力 BCVA) 采用广义估计方程 (GEE) 分析时间 - 组别交互效应, 等级变量 (复视程度、眼球运动受限) 则采用加权有序 Logistic 回归计算边际效应。所有分析均控制时间点交互, 显著性水平设为 $\alpha = 0.05$ 。

结果: 可吸收材料组复视恢复率显著优于对照组 (残留率: 9.2% vs. 31.6%, $P = 0.018$), 长期恢复交互效应具有统计学意义 ($\beta = 1.59$, $P = 0.039$)。两组患者的眼球运动功能及突眼度均随时间显著改善 ($P < 0.001$), 但组间差异无统计学意义。试验组在术后 6 个月的 BCVA 较对照组额外提高 42% (交互 $\beta = 0.05$, $P = 0.028$)。可吸收材料组未发生与植入物相关的感染或移位等并发症。

结论: 内镜导航引导下三维打印联合可吸收材料用于眼眶爆裂骨折的个体化微创重建, 具有良好的安全性与可行性。该技术能够在保证解剖复位精度的同时, 显著促进复视及视觉功能恢复, 减少植入物相关并发症, 临床效果不逊于传统钛网修复。该个体化重建模式可作为眼眶骨折精准修复的有效选择, 具有进一步推广与应用的临床价值。

摘要编号: **208707**

导航引导下粉碎性颧骨体骨折伴眼眶骨折的个体化修复

第一作者: Yuan DENG

目的: 粉碎性颧骨体 (ZMC-C) 骨折合并眼眶重建是临床一大难题, 计算机导航技术对手术复位有较

大价值。本研究通过测量导航引导下 ZMC-C 骨折合并眼眶重建的计划复位与实际复位的误差，评估手术的有效性。

方法：这项回顾性单臂队列研究涉及 2017 年 1 月至 2019 年 6 月在上海交通大学医学院附属第九人民医院眼科就诊的 ZMC-C 合并眼眶骨折患者。排除脑损伤、生命体征不稳定、钛合金植入物过敏、其他面部骨骼创伤或术后面部创伤的受试者。主要结果变量为手术计划与实际结果之间的平均三维（3D）距离误差。次要结果包括横向、垂直和前后平面的平均绝对距离误差、受试者面部美学和功能自我满意度的视觉模拟量表评分、眼眶体积、眼球突出、双侧颧骨位置和手术并发症。协变量：协变量包括年龄和性别。分析：采用 t 检验对结果进行检验，显著性 $P < 0.05$ ，以确定术前和术后测量值和对称性之间的差异。

结果：20 例受试者中位年龄为 39 岁（四分位区间为 24.5），男性 19 例（95%）。平均三维距离误差在颧额缝骨折线中点为 0.5 ± 0.3 mm，颧骨表面最突出点为 0.7 ± 0.3 mm，颧骨牙槽嵴与骨折线交点为 0.6 ± 0.4 mm。最大平均绝对距离误差为 0.8 ± 0.2 mm，术后视觉模拟评分均有改善。平均眼眶体积减少 2.2 ± 0.6 cm³，眼球内陷改善至 0.4 ± 0.3 mm（均 $P < 0.01$ ）。患侧与健侧眼球突出度、眶体积、双侧颧骨位置比较，差异均无统计学意义（ $P > 0.05$ ）。

结论：导航引导下粉碎性颧骨体骨折合并眼眶重建的一体化修复疗效较好，平均距离误差在临床上是可接受的。

摘要编号：209192

环状 RNA circ-0007006 通过稳定 HBEGF 表达在甲状腺相关眼病纤维化中的保护作用

第一作者：Huijing YE

共同作者：Zhihui XU, Huasheng YANG

目的：甲状腺相关眼病（TAO）是一种以炎症和组织重塑为特征的自身免疫性眼眶疾病，其中纤维化是 II 型 TAO 的主要且通常是不可逆的病理特征。本研究旨在探讨环状 RNA circ-0007006 在 TAO 纤维化中的作用及其潜在机制，以期纤维化 TAO 的治疗提供新的分子靶点。

方法：通过高通量 RNA 测序分析纤维化 TAO 组织中的差异表达 circRNA，发现 hsa_circ_0007006 显著下调。进一步在体外利用眼眶成纤维细胞进行功能实验，检测 circ-0007006 对纤维化相关标志物（COL1A1、 α -SMA、HAS1 和 HAS2）以及 SMAD2/3 磷酸化的影响。通过双荧光素酶报告基因实验验证 circ-0007006 与 miR-383-3p 的相互作用，

并通过外源性 HBEGF 补救实验验证其在纤维化中的作用。

结果：circ-0007006 在纤维化 TAO 组织中显著下调。circ-0007006 能够通过下调 COL1A1、 α -SMA、HAS1 和 HAS2，以及抑制 SMAD2/3 的磷酸化来抑制眼眶成纤维细胞的纤维化。circ-0007006 作为 miR-383-3p 的竞争性内源性 RNA，稳定 HBEGF 的表达。外源性 HBEGF 能够缓解 circ-0007006 敲低诱导的促纤维化效应。

结论：本研究揭示了 circ-0007006/miR-383-3p/HBEGF 轴在 TAO 纤维化中的调控机制，并证实 circ-0007006 是纤维化 TAO 的潜在治疗靶点。这些发现为开发针对纤维化 TAO 的新型治疗策略提供了理论依据。

摘要编号：208959

甲状腺眼病患者角膜形态与生物力学特征及放疗干预效应研究

第一作者：Pengsen WU

共同作者：Guiqin LIU

目的：评估眼肌型甲状腺眼病（TED）患者与正常对照组（NCs）角膜形态及生物力学的差异，并观察放疗后这些指标的变化。

方法：本研究为前瞻性对照临床研究，纳入 50 例眼肌型 TED 患者（50 眼）和 30 例年龄、性别及等效球镜匹配的 NCs（30 眼）。所有患者均接受三维适形放疗（20 Gy/10 次）并完成 6 个月随访。采用 Pentacam 评估角膜形态学参数，Corvis ST 眼压计测量角膜生物力学特性，检测时间点为放疗前及放疗后 6 个月。主要观察指标包括角膜地形图参数（前/后表面曲率、厚度分布、高度偏差等）和生物力学参数（时间/速度参数、形变指标、眼眶顺应性等）。

结果：与 NCs 相比，TED 患者表现为角膜形态学改变：前表面曲率（K1、K2、Kmax）显著增加（均 $P < 0.05$ ），后表面高度偏差（Db）、厚度进展指数（Dp）等参数异常增高（均 $P < 0.01$ ），ARTmax 降低（ $P = 0.003$ ），提示角膜陡峭度增加且厚度分布不均；TED 患者生物力学异常：经生物力学校正眼压（bIOP）调整后，A2 时间缩短（ $P = 0.02$ ）、峰值距离减小（ $P = 0.01$ ）、TBI 指数升高（ $P < 0.001$ ），最大全眼球运动幅度（WEML）降低（ $P = 0.004$ ），表明角膜顺应性下降及眼眶顺应性减低。放疗后 TED 患者出现角膜形态改善：Db 显著降低（ $P = 0.008$ ），后表面散光增加（ $P = 0.03$ ）；生物力学恢复：WEML 显著增加（ $P = 0.01$ ，经 bIOP 校正后仍显著），且与突眼度改善呈负相关（ $r = -0.32$ ， $P = 0.02$ ）；临床指标改善：眼压

(15.8 ± 3.1 vs 13.2 ± 2.7 mmHg, $P < 0.001$)、突眼度(18.5 ± 2.8 vs 16.3 ± 2.4 mm, $P < 0.001$)及CAS评分(3.1 ± 1.0 vs 0.7 ± 0.5 , $P < 0.001$)均显著下降。

结论: 眼肌型 TED 患者存在特征性角膜形态异常和生物力学异常, 表现为角膜曲率增加、表面不规则性增高及眼眶顺应性下降。放疗不仅能有效缓解眼眶炎症和眼外肌肥厚, 还可通过降低眼压和突眼度改善角膜生物力学状态。角膜生物力学参数具有潜力成为评估 TED 病情及疗效的新的指标。

摘要编号: 207863

眶尖、颅底及颞下窝区域的经眶入路外科技术

第一作者: Wang YI

目的: 眼眶作为头颈部重要的解剖部位, 具有保护视觉器官, 维持眼部外观的重要作用。众所周知手术摘除眶尖肿瘤失明风险高, 并发症多, 结果难以预期, 而眼眶及眶尖也被其他专业作为进入颅底和颞下窝的外科通道, 损伤眼部功能的风险极高。本研究探索发生于以下部位的肿瘤或外伤异物, 能否由眼科医生综合运用眼眶外科技术、鼻内窥镜技术、介入技术等方法, 抵达并实施手术, 减少眼部并发症, 部位包括: 眶尖, 经眶累及前、中颅底, 经眶累及翼腭窝及颞下窝。

方法: 回顾分析 2019.1.1-2024.6.30 期间收治的眶尖肿瘤 42 例(含 4 例经眶上裂蔓延至颅内)、眶顶壁骨肿瘤 2 例, 眶颅沟通异物 6 例(金属 2 例, 木质 3 例, 铅笔橡皮头 1 例)、眶颞下窝沟通肿瘤 1 例, 眶颞下窝沟通木质异物 1 例。均为单眼受累, 男 28 例, 女 43 例, 年龄 13-65 岁, 中位年龄 44 岁。

结果: 经外侧开眶术联合深外壁磨骨摘除肿瘤 21 例, 经外上开眶术联合深外壁磨骨摘除 17 例, 经内外联合开眶术摘除肿瘤 2 例, 鼻内镜经蝶窦辅助下联合经结膜入路摘除眶尖视神经内侧面肿瘤 2 例, 经上方开眶术摘除肿瘤 2 例, 取出金属异物 1 例, 经原伤道取出眶颅沟通异物 4 例, 经外眦切开结膜入路取出眶颅交界区木质异物残渣 1 例。经改良外下开眶术摘除眶颞下窝肿瘤 1 例, 取出眶颞下窝沟通异物 1 例。异物伤共 8 例, 其中 5 例伤后视力丧失, 术后不恢复, 3 例视力下降, 术后恢复部分视力。肿瘤患者共 45 例, 术前因肿瘤压迫导致视力下降 35 例, 术后视力不同程度恢复 32 例, 术后视力丧失 3 例, 均为外侧开眶术眶尖海绵状血管瘤摘除。手术摘除血管瘤均无复发, 1 例神经鞘瘤术后 2 年随访显示复发。转移性黑色素瘤术后 2 个月发现全身多处转移, 目前接受综合治疗。

结论: 深外壁、顶壁或外下壁的磨骨技术与开眶手术联合应用, 可完成多种眶尖、眶颅交界区的前颅

底、中颅底、颞下窝的肿瘤摘除或异物取出。眶颅交界区的异物取出前应行 DSA 评估颅内血管损伤情况。鼻内镜经蝶窦可辅助眶尖视神经内侧面肿瘤的摘除。综合运用上述方法能够提高手术的安全性和成功率。

摘要编号: 209477

眼睑内眦赘皮矫正改良术及眼睑臃肿微创重睑美容术临床研究

第一作者: Xiuqin ZHAO

共同作者: Heng WANG

目的: 探讨我院 2011 年 1 月~2025 年 1 月间, 应用三点式微创切口对轻、中度眼睑臃肿伴内眦赘皮者实施微创重睑美容手术及改良的无缝线眼睑内眦赘皮矫正术的临床效果与手术技巧。

方法: 本组眼睑臃肿伴内眦赘皮重睑美容者 56 例。根据整体面部特征、睑裂宽度、眼睑平行及内眦赘皮的程度等实施个性化设计。重睑宽度一般设计为 6~9 mm。平行于睑缘做三点式切口, 各切口长约 5 mm, 深达眼轮匝肌。切除内眦部分眼轮匝肌, 切断错够的部分眼轮匝肌, 矫正内眦赘皮, 通过缝合定位调整重睑的高度和弧度。剪除适量眼轮匝肌直达睑板前筋膜。眼轮匝肌肥厚者, 可通过三点小切口掏剪重睑线下的部分眼轮匝肌。均匀去除重睑线下眼轮匝肌, 有利于重睑平滑、重睑皱褶自然流畅。外侧眶脂多者, 可经外侧切口去除部分臃肿组织及部分外侧脂肪及眶内脂肪。8-0 尼龙线, 对切口下缘、睑板前筋膜及切口上缘皮肤进行缝合。穿带睑板前筋膜部位时, 要高于重睑线处 1~1.5 mm, 可使睫毛上翘。形成的重睑沟会较深, 重睑看上去更加明媚、靓丽, 重睑形态自然、美观流畅。内眦赘皮手术设计: 根据宽窄程度(中、轻度), 对于内眦赘皮进行三点式微创切口(每个约切口 2 mm), 使内眦赘皮的皱褶打开直至自然。内眦部切口涂眼膏, 不需缝合。

结果: 56 例患者中度 19 例, 轻度 37 例(重度眼睑肥厚臃肿者需实施皮肤切开切除手术)。男性 3 例, 女性 54 例。年龄 16 岁~65 岁。术后随访 6~18 月。多数患者在拆线后 5~7 天消肿。拆线后二周重睑恢复自然。手术成功率达 98%。有 1 例患者术后重睑变浅, 一例重睑不对称。一例双重睑宽窄不一, 重新实施手术后效果满意。56 例患者的自我满意度: 49 例非常满意, 占 87.5%; 5 例满意, 占 8.93%; 2 例较满意, 占 3.57%; 医师对 56 例患者满意度达 98%: 所有患者术中、术后均未发生并发症。

结论: 以往内眦赘皮矫正术是采用“Z”字瓣切开术。术后遗留疤痕, 本研究采用三点式微创切口矫正内眦赘皮, 不深切不需缝合, 术后无疤痕。对于轻度

及中度的眼睑臃肿者具有创伤小、术后恢复快、重睑形态自然、靓丽等优点。

摘要编号: 209182

视网膜母细胞瘤诊治新模式

第一作者: Huasheng YANG

目的: 探讨对于眼球摘除术后具有高危病理特征的单侧视网膜母细胞瘤, 3 个周期 CEV (卡铂、依托泊苷、长春新碱) 化疗是否不劣于 6 个周期化疗, 为优化临床化疗方案提供依据。

方法: 开展一项双中心、随机、开放标签、非劣效性试验。纳入 2013 年 8 月至 2024 年 3 月期间在中山眼科中心和复旦大学附属眼耳鼻喉科医院接受眼球摘除术的 187 例单侧高危视网膜母细胞瘤 (高危病理特征包括: 大量脉络膜浸润、筛板后视神经侵犯、巩膜浸润) 患者。术后患者被随机分配接受 3 个周期或 6 个周期 CEV 化疗, 随访至 2024 年 3 月 21 日。主要终点为 5 年无病生存率 (非劣效界值设为 12%), 次要终点涵盖总生存率、安全性、经济负担及生活质量。

结果: 187 例患者 (中位年龄 25.0 个月, 女性占 44.4%) 均完成试验, 中位随访时间 79.0 个月。3 周期组 (94 例) 5 年无病生存率为 90.4%, 6 周期组 (93 例) 为 89.2%, 组间差异 1.2% (95% CI, -7.5%~9.8%), 符合非劣效性标准。相比之下, 6 周期组不良事件发生率更高, 生活质量评分下降更明显, 治疗费用亦显著增加。

结论: 对于术后具有高危病理特征的单侧视网膜母细胞瘤患者, 3 个周期 CEV 辅助化疗的 5 年无病生存率不劣于 6 个周期, 且在安全性、生活质量及经济成本上更具优势, 有望成为更优化的化疗方案选择。

摘要编号: 208226

评估替妥尤单抗 N01 治疗活动期甲状腺眼病疗效和安全性的临床研究汇总分析

第一作者: Haiyang ZHANG

共同作者: Xianqun FAN, Yinwei LI, Jing SUN, Huifang ZHOU

目的: 评价替妥尤单抗 N01 (重组抗 IGF-1R 抗体注射液) 在中国中重度活动期甲状腺眼病 (Thyroid Eye Disease, TED) 患者中的疗效和安全性。

方法: 将一项随机、双盲、安慰剂对照临床研究 (NCT05795621) 的 II 期和 III 期阶段纳入汇总分析。受试者从第 1 天至第 21 周接受替妥尤单抗 N01 或安慰剂输注, 每 3 周一次, 共 8 次。研究主要疗效指标为研究眼的眼球突出应答率 (定义为,

研究眼眼球突出度较基线减少 ≥ 2 mm, 且不伴有对侧眼眼球突出增加 ≥ 2 mm 的受试者百分比)。

结果: 汇总分析共纳入 104 例受试者 (全程接受替妥尤单抗 N01: 76 例; 全程接受安慰剂: 28 例)。结果显示: 第 24 周时, 替妥尤单抗 N01 组研究眼眼球突出应答率显著高于安慰剂组 (81.9% vs. 3.8%; 率差: 78.0%; $p < 0.0001$)。次要疗效终点中, 第 24 周时, 替妥尤单抗 N01 组研究眼眼球总应答率 (定义为研究眼临床活动性评分 [Clinical Activity Score, CAS] 较基线降低 ≥ 2 分且眼球突出较基线降低 ≥ 2 mm, 且对侧眼无相应恶化的受试者百分比)、CAS 值为 0 或 1 的受试者百分比、眼球突出度较基线的改变均显著优于安慰剂组 (各指标分别为 75.3% vs. 3.6%、80.5% vs. 16.6%、-2.99 mm vs. -0.06 mm, p 均 < 0.0001)。替妥尤单抗 N01 总体安全性良好且可控, 不良事件多为轻、中度, 整体转归良好, 基本上不影响研究药物使用, 未发生严重不良事件。替妥尤单抗 N01 组特别关注不良事件 (输注反应、听力损害、高血糖症、肌痉挛和恶心、腹泻) 总体发生率较低, 严重程度均为轻、中度。

结论: 中国中重度活动期 TED 患者 II/III 期临床研究的汇总分析表明, 替妥尤单抗 N01 可显著缓解突眼并减轻疾病活动度, 同时在 TED 人群中呈现良好的安全性。

眼科学的转化研究

ALDH2-SIRT1-内质网应激 (ERS) 轴对 MNU 诱导的 C57BL/6 小鼠视网膜损伤的调控作用: 一项体内研究

第一作者: Weiming YAN

共同作者: Caifeng CAO, Tao CHEN, Weipeng HUANG, Wenhui LAN, Weiping LIANG, Pan LONG, Xiu TAN

目的: 本研究旨在探究 ALDH2 及 SIRT1/内质网应激 (ERS) 调控对甲基硝基脲 (MNU) 诱导的 C57BL/6 小鼠视网膜变性的保护作用, 评估这些干预措施是否通过调节 ALDH2-SIRT1-ERS 轴来减轻视网膜变性及其代谢标志物的异常。

方法: 将 72 只小鼠分为 8 组: 对照组、单纯 MNU 组, 以及 MNU 联合治疗组 (Alda1、Daidzin、SIRT1 抑制剂 EX527、SIRT1 激动剂 SRT1720、ERS 诱导剂 TUN、ERS 抑制剂 4-PBA)。通过腹腔注射 MNU (50 mg/kg) 诱导视网膜损伤, 治疗药物在 MNU 处理前或后给予。通过体重变化、

HE 染色及醛代谢标志物 (MDA、4HNE) 评估视网膜损伤程度。

结果: 联合用药 (如 ALDH2 调节剂与 SIRT1/ERS 调节剂联用) 比单药治疗导致更显著的体重下降。单纯 MNU 处理可诱导光感受器层变薄, 而其他视网膜层结构保持完整。Alda1 和 Daidzin 可减轻视网膜损伤, 但 Daidzin 表现出不一致效应——在某些情况下具有保护作用, 而在另一些情况下则加重损伤。SIRT1 抑制 (EX527) 阻断了 Alda1 的保护效应, ERS 诱导 (TUN) 同样消除了 Alda1 的益处; 相反, SIRT1 激活 (SRT1720) 缓解了 Daidzin 的损伤加重作用, ERS 抑制 (4-PBA) 部分减轻了 Daidzin 的不良影响。MNU 处理使 MDA 和 4HNE 水平升高, 而 Alda1 可降低这些标志物; Daidzin 则升高了这些氧化应激指标。SIRT1 抑制 (EX527) 和 ERS 诱导 (TUN) 削弱了 Alda1 的抗氧化作用, 而 SIRT1 激活 (SRT1720) 和 ERS 抑制 (4-PBA) 则抵消了 Daidzin 的促氧化效应。SIRT1 激活 (SRT1720) 增强了 Daidzin 的保护作用, 降低了氧化应激并改善了视网膜组织学结构; SIRT1 抑制 (EX527) 未能增强 Alda1 的效应。ERS 调控与 Alda1 或 Daidzin 联用未显示协同保护效应。联合使用 Daidzin 与 SIRT1 激活可减轻体重下降。

结论: MNU 诱导的视网膜变性涉及光感受器丢失及醛代谢异常升高。Alda1、SIRT1 激活及 ERS 抑制 (4-PBA) 可保护视网膜结构及代谢稳态。这些发现揭示了 ALDH2、SIRT1 及 ERS 通路在缓解 MNU 诱导视网膜损伤中的关键作用。

摘要编号: 204551

RHO 基因突变导致的视网膜色素变性的基因编辑疗法研究进展

第一作者: Jing QIAO

共同作者: Shaohong CHEN, Wang LI, Baoyuan QU, Liping YANG

目的: 视网膜色素变性 (Retinitis pigmentosa, RP) 是一组以感光细胞和色素上皮细胞进行性、选择性丧失为特点的进展性单基因致盲眼病。患者于 20-65 岁之间即发展为法定盲人。RP 发病率为 1/3500, 其中 25% 左右为 adRP。RHO (Rhodopsin, 视紫红质) 基因是最为常见的 adRP 致病基因, 占 adRP 的 25-30%, 是工作年龄人群不可逆双眼盲的主要病因之一, 目前尚无任何有效疗法。本研究基于 CRISPR/Cas9 技术, 开发可有效治疗 RHO-R135W 突变导致的 adRP 的基因编辑药物 ZVS203e, 并充分验证 ZVS203e 的有效性及安全性。

方法: 该研究通过在小鼠感光细胞系 661W、HEK293A 细胞和人源 iPSC 中进行了体外药效学研究, 以评价本品在细胞水平的感染活性、表达活性以及编辑活性。体内药效学研究在人源化 RP 疾病模型小鼠中进行, 选择 ERG 和外核层 (ONL) 厚度等作为评价指标, 进行 ZVS203e 注射液对于 RP 治疗有效性的研究。在细胞水平通过 GUIDE-seq、扩增子测序对 ZVS203e 潜在的脱靶风险进行了评估, 同步在患者来源的 iPSC 及小鼠中进行了靶向位点的潜在染色体重排的风险检测。此外, 在模型小鼠中通过 q-RT-PCR、ELISA、T-spot 等多种方法充分验证了 ZVS203e 的药代动力学及安全性。

结果: 研究结果表明, 基因编辑药物 ZVS203e 具有良好的有效性及安全性, 研究结果推动 ZVS203e 进入临床研究阶段。编辑靶向性检测结果表明, ZVS203e 在体内外均可有效表达目的基因, 特异性编辑 RHO-R135W 突变 DNA 序列, 有效敲除突变蛋白。3D-cup 类器官药效研究表明, ZVS203e 可有效改善患者 3D-cup 视网膜感光细胞结构。ERG 及 OCT 检测结果显示, ZVS203e 可有效改善模型小鼠视网膜结构及功能。细胞及小鼠脱靶风险研究未显示潜在的脱靶风险。此外, 在药理学相关种属动物体内, 经视网膜下腔注射单次给药, 未见安全药理学相关影响, 且药物进入体内后不具有免疫毒性。

结论: 综上所述, ZVS203e 注射液在体内外的药理学研究中均展现出良好的生物学活性, 且耐受性良好。该研究验证了 ZVS203e 在 RHO-R135W 突变导致的 adRP 中相关的作用机制和效应, 提示了 ZVS203e 在靶人群中的潜在治疗作用, 支持了 ZVS203e 的进一步临床开发, 并为其他遗传性视网膜疾病的基因编辑治疗提供了参考。ZVS203e 于 2023 年 12 月和 2024 年 2 月分别获得美国 FDA 和中国国家药监局的新药批准。

摘要编号: 201400

TSP1 模拟肽一大黄酸自组装水凝胶体系抑制脉络膜新生血管的研究

第一作者: Yun LI

共同作者: Yuting CAI

目的: 由于传统大分子抗 VEGF 药物视网膜穿透效率低、药物利用率较差, 对脉络膜新生血管性疾病的疗效有限。本研究拟制成血小板反应蛋白 1 模拟肽一大黄酸 (TSP1m-Rhe) 复合水凝胶体系, 通过减小分子量、“抗新生血管—抗炎”双靶点干预 CNV 形成、优化药物剂型, 来增加药物利用率, 延长给药间隔, 以求改善患者整体预后。

方法：将筛选优化后的 TSP1 模拟肽以及大黄酸单体连接自组装基序，合成 TSP1m-Rhe 复合水凝胶体系。表征其体外的电镜结构、流变学性能，确定其适用于注射给药；通过 ARPE-19、MIO-M1、HREC 三种细胞验证其体外安全性。通过建立 ARPE 氧化应激模型，验证该凝胶的抗炎特性；建立 HREC 缺氧模型，验证该凝胶的抗新生血管特性；并在 C57BL/6J 小鼠 CNV 模型中验证该体系的安全性和有效性。

结果：TSP1m-Rhe 可在自然条件下自组装形成淡黄色的透明水凝胶，该水凝胶内部由纳米纤维组成，呈现类阿尔法螺旋结构，具有剪切稀化和自我恢复能力，可用于注射给药。使用 ARPE-19、MIO-M1、HREC 三种细胞与 TSP1m-Rhe 共培养 24 小时后，进行 PI 染色及 CCK8 检测。结果表明，TSP1m-Rhe 相较于单纯 Rhe 具有更高的安全性，在 0-100 μM 的浓度范围内均无明显的细胞毒性。将 PBS、TSP1m、Rhe、TSP1m-Rhe 注入小鼠玻璃体腔内，观察直至注射后第 30 天，各组小鼠屈光介质清晰，眼底未见明显异常，ERG 检测与 PBS 组相比无显著统计学差异，眼球及重要脏器 HE 染色均无明显异常，提示 TSP1m-Rhe 体系具有良好的生物相容性。抗炎抗氧化方面，通过 DPPH 和 ABTS 法发现该体系的抗氧化性具有浓度依赖的特性。并且可以有效减少 H_2O_2 引起的细胞损伤。抗血管生成方面，使用 HRECs 细胞进行缺氧造模的同时使用阿柏西普与 TSP1m-Rhe 进行处理，发现 TSP1m-Rhe 体系可以有效抑制缺氧的 HREC 的迁移与成管，且在抑制细胞迁移方面与阿柏西普相比具有统计学差异。在体内，我们使用激光进行小鼠 CNV 造模后使用阿柏西普与 TSP1m-Rhe 进行玻璃体腔内注射，发现 TSP1m-Rhe 能够有效抑制 CNV 模型的渗漏以及新生血管病灶的基底宽度与高度。

结论：TSP1m-Rhe 复合水凝胶具有良好的生物相容性，是一种安全有效的脉络膜新生血管性疾病治疗替代策略。此外，该技术可能为生物安全肽纳米材料、蛋白质等大分子药物在治疗眼部新生血管性疾病中提供新的替代方案。

摘要编号：201075

人眼在缺氧和色差条件下的不同空间定位：动态视觉为例

第一作者：Xuemin LI

共同作者：Yi DING, Yuchen WANG

目的：本研究旨在探讨人眼在不同空间（海拔高度、黑暗背景和氧气浓度）对各种颜色的运动物体的识别能力。通过对海拔高度、角速度（AV）和颜色这

三个主要因素的详细分析，阐明人眼在高海拔环境下的多彩动态视觉定位，并探讨其可能的相关机制。

方法：研究小组由 16 名 20-26 岁的健康参与者组成。用美迪信（天津）有限公司自主研发的软件测量动态视力。在 5 个海拔高度（d1：地面；d2：3500 米；d3：4000 米；d4：4500 米；d5：实验结束）和 6 种颜色（红、橙、黄、绿、蓝、紫）下进行测量。数据分析采用了 Kolmogorov-Smirnov (K-S) 检验、配对样本 T 检验、单因素方差分析、双因素方差分析、斯皮尔曼秩相关系数和 Wilcoxon 检验。

结果：海拔因素：红色 LogMar 动态视力（DVAs）在 d1（40、60 和 80 dps）、d2（60 和 80 dps）和 d3（60 和 80 dps）明显优于相应视网膜在 d4 的动态视力。在 80 dps 时，d1 的橙色 LogMar DVA 明显高于 d4 的 DVA。蓝色 LogMar DVA 在第 1 d1（60 dps）、第 2 d2（40、60 和 80 dps）明显高于第 4 d4 的相应平均值。紫色 LogMar DVAs 在 d2（60 和 80 dps 时）明显高于相应 AVs d4 时的值。颜色因素：在 d0（所有视角），蓝色 LogMar DVA 明显优于其他颜色的 LogMar DVA，黄色和绿色 LogMar DVA 在 40 dps 时明显低于紫色 LogMar DVA，橙色 LogMar DVA 在 60 dps 时低于绿色 LogMar DVA。此外，在 60 和 80 dps 时，橙色、黄色、绿色和红色 LogMar DVA 明显低于紫色 LogMar DVA。在 d1 和 d2，红色、橙色、黄色和绿色 LogMar DVA 明显低于蓝色 LogMar DVA（在所有 AVs 上）和紫色 LogMar DVA（在 20、60 和 80 dps 时）。在 40 dps 时，红色、黄色和绿色（在 d1 和 d2 时）LogMar DVA 明显低于紫色 LogMar DVA。在 d3 和 d4，红色、橙色、黄色和绿色 LogMar DVA 在统计学上低于蓝色 LogMar DVA（在所有 AVs 上）和紫色 LogMar DVA（在 40、60 和 80 dps 时）。在 20 dps 以下的 d4，橙色、黄色和绿色 LogMar DVA 低于紫色 LogMar DVA。

结论：高海拔环境（急性低压缺氧）会影响人眼对不同颜色物体的空间定位能力，尤其是蓝、紫、绿三种颜色的 DVAs，随着海拔高度的增加（缺氧加剧），DVAs 会逐渐降低。这将影响飞行员获取视觉信息的能力，导致在飞行过程中对仪表盘和周围信息的获取和判断出现偏差。

摘要编号: 208448

四面体框架核酸负载 miR-124 调控小胶质细胞活化并保护青光眼视网膜神经节细胞

第一作者: Cheng ZHANG

共同作者: Lemeng FENG, Min HE, Haoze SONG, Weitao SONG, Fangbing YE, Wulong ZHANG, Weiming ZHU

目的: 青光眼是全球致盲性眼病之一, 其核心病理特征为视网膜神经节细胞 (RGCs) 进行性丧失。尽管降低眼压是目前唯一确证的临床治疗手段, 但即使眼压得到有效控制, 仍有相当比例患者发生 RGC 损伤。因此, 探索直接的神经保护策略尤为迫切。本研究旨在构建一种基于四面体框架核酸 (tetrahedral framework nucleic acids, tFNAs) 的 miR-124 递送平台 (Tmi), 通过调控小胶质细胞活化和炎症反应, 实现对 RGC 的保护, 为青光眼治疗提供新思路。

方法: 研究通过自组装合成 tFNA, 并负载 miR-124 形成 Tmi, 利用透射电镜、动态光散射及 PAGE 电泳验证其结构与稳定性。体外采用小胶质细胞缺氧/缺糖 (OGD) 模型检测 Tmi 对细胞增殖、极化、迁移及炎症因子的调控作用; 体内通过小鼠急性高眼压 (AOH) 模型评价 Tmi 在视网膜的穿透性、生物相容性及 RGC 保护作用, 并结合免疫荧光及 Western blot 分析 STAT3 信号通路的调控情况。

结果: Tmi 具备良好的结构稳定性和细胞相容性, 能够在含血清环境中保持 48 小时完整性, 并在 10% FBS 条件下仍能有效保护 miR-124 不被降解。细胞实验显示, Tmi 可高效进入 BV-2 小胶质细胞, 12 小时和 24 小时的细胞内荧光强度分别提高约 1.9 倍和 3.2 倍。与单纯 miR-124 或对照组相比, Tmi 使细胞内 miR-124 表达水平提高约 4.6 倍, 并显著下调 STAT3 与 p-STAT3 蛋白表达量 (分别下降 52.3% 与 68.4%, $p < 0.01$)。在 OGD (缺氧/缺糖) 模型中, Tmi 可将 Ki67 阳性增殖细胞比例由 OGD 组的 42.5% 降低至 19.7%, 并使促炎标志物 iNOS 和 CD86 表达分别下降 65.2% 与 59.8%, 同时 Arg-1 和 CD206 上调约 2.3 倍和 2.8 倍 ($p < 0.001$), 提示其有效抑制 M1 极化并促进 M2 表型转化。迁移实验显示, Tmi 处理后小胶质细胞的迁移率降低约 60%, 迁移体形成数减少 45%, 回缩纤维平均长度缩短约 43%。ELISA 结果表明, Tmi 显著降低 IL-6、TNF- α 、IL-1 β 等促炎因子水平 (分别下降 61.4%、57.8%、53.2%), 并使 IL-4 和 IL-10 增加约 1.9 倍和 2.2 倍。在体内实验中, Tmi 能经玻璃体腔高效递送至视网膜多层结构, 24 小时后在神经节细胞层 (GCL) 与内核

层 (INL) 荧光信号最强, 未见明显炎症或结构异常。在急性高眼压 (AOH) 模型中, Tmi 显著缓解 RGCs 丢失: GCL 中细胞核数恢复至对照组的 80.6% (AOH 组仅 16.7%, $p < 0.001$), RGC 密度由 AOH 组的下降 23.6% 恢复至 99.5%, GCC 厚度明显改善。同时, IBA1 阳性小胶质细胞数量减少至 AOH 组的 32.7%, STAT3 和 p-STAT3 蛋白水平平均下降超过 60%, 表明 Tmi 通过抑制 STAT3 信号有效阻断炎症级联反应, 从而保护 RGC 结构与功能。

结论: 本研究成功构建了一种基于 tFNA 的 miR-124 纳米递送平台, 能够通过靶向 STAT3 信号通路调控小胶质细胞活化和炎症反应, 从而有效保护 RGC 免受急性高眼压损伤。Tmi 作为一种新型非病毒核酸递送系统, 为青光眼神经保护治疗提供了潜在的转化策略。

摘要编号: 200926

外周血细胞转录组分析为视网膜中央动脉阻塞提供新见解

第一作者: Jiaqing FENG

共同作者: Ting CHEN, Ying LI, Chuansen WANG, Xuan XIAO

目的: 视网膜中央动脉阻塞 (CRAO) 是一种常见的急性视网膜缺血性疾病。然而, 由于缺乏有效的生物标志物, CRAO 的早期诊断颇具挑战性。本研究旨在通过分析转录组来识别 CRAO 进展的新生物标志物和机制。

方法: 从 9 名白内障患者和 16 名视网膜中央动脉阻塞 (CRAO) 患者身上采集了血液样本, 以探究 CRAO 的转录组水平机制。在确定差异表达基因 (DEGs) 后, 对这些 DEGs 进行了基因本体论 (GO) 和京都基因与基因组百科全书 (KEGG) 通路富集分析。接下来, 利用 Cytoscape 构建并可视化蛋白质-蛋白质相互作用网络。通过插件 MCODE 确定基因模块, 并使用插件 CytoHubba 确定枢纽基因。利用在线工具 GeneMANIA 对所确定的枢纽基因进行基因-基因相互作用预测。使用 Cibersort 算法进行免疫细胞浸润分析。

结果: 对视网膜中央动脉阻塞 (CRAO) 患者外周血单核细胞进行的 RNA 测序分析发现了差异表达的基因。主成分分析显示, CRAO 动脉样本与对照组 (V-C 组) 之间以及静脉样本与对照组 (A-V 组) 之间存在明显的分离。A-V 组中差异表达的基因富集于核糖体中, 而 V-C 组则在抗原加工/呈递和 MHC 相关蛋白方面有额外的富集。基因集富集分析显示, 两组中均富集了 MHC 相关基因和细胞分裂/增殖通路。蛋白质相互作用网络分析确定

RPS9、RPS2、RPS14 和 RPS5 为 A-V 组的核心基因。HLA-F、RPS25、RPS18、HLA-DMA 是 V-C 组的核心基因。共表达网络强调了核糖体在两组中的参与，而 V-C 组还具有额外的免疫反应。免疫细胞浸润分析表明，动脉样本中中性粒细胞和 CD4⁺ 记忆 T 细胞增多，静脉样本中 CD4⁺ 初始 T 细胞增多，与对照组相比均有差异。

结论： 这项生物信息学研究确定了核糖体蛋白（如 RPS2 和 RPS7）、HLA 基因（如 HLA-F）、PSMB9 以及抗原加工分子（如 TAPBP）等为可能的 CRAO 检测标志物。这些候选基因为 CRAO 的预防、诊断、治疗和预后研究提供了新的方向。

摘要编号：201077

白天和夜间条件下白内障患者的色差：评估及其与晶状体混浊的相关性

第一作者：Xuemin LI

共同作者：Anqi GUO, Yuchen WANG

目的： 探讨白内障患者在白天和夜间条件下的色彩辨别能力及其与晶状体混浊度的关系。

方法： 使用专用软件工具对 68 名白内障患者进行七种色调（红、橙、黄、绿、青、蓝、紫）的色彩辨别能力评估。采用成对 Spearman 相关分析，检验患者在白天和夜间条件下色彩辨别阈值之间的关系。对晶状体混浊度进行量化，并将其与色彩分辨阈值（定义为每个颜色范围内可区分的最小波长差）进行相关性分析。

结果： 所有 68 名患者均成功完成色觉评估。白内障患者红色和绿色的得分最低（ $p < 0.05$ ）。在白天条件下，橙色和蓝色的得分呈负相关（ $r = -0.57, p < 0.05$ ）。夜间，紫色与绿色（ $r = 0.59, p < 0.05$ ）、紫色与蓝色（ $r = 0.52, p < 0.05$ ）以及蓝色与绿色（ $r = 0.46, p < 0.05$ ）评分呈正相关。晶状体密度和精细颜色辨别分析显示，白天晶状体密度与青色和紫色评分呈负相关（ $p < 0.05$ ），夜间晶状体密度与紫色评分呈负相关（ $p < 0.05$ ）。

结论： 白内障相关晶状体混浊会损害颜色辨别能力。由于蛋白质聚集、晶状体散射增加以及中心区域折射率的改变，白内障晶状体会导致红绿视功能下降，改变颜色间关系，并降低短波长光的分辨率。这些发现强调了全面色觉评估在白内障管理中的重要性，并指出了保护老龄化人群视觉功能的潜在目标。

摘要编号：209798

类器官来源人视网膜祖细胞外囊泡通过线粒体转运调控小胶质细胞治疗视网膜变性的作用机制研究

第一作者：Ting ZOU

共同作者：Lingling GE, Haiwei XU, Yuxiao ZENG

目的： 研究类器官来源人视网膜祖细胞外囊泡（hERO-RPC-EVs）通过线粒体转运调控小胶质细胞活化治疗视网膜变性的作用及机制，为针对视网膜疾病开发无细胞疗法及揭示干细胞治疗机制提供理论依据

方法： 采用梯度离心法获得 hERO-RPC-EVs，采用 NTA、电镜、western blot 检测 EV 的特征。将 hERO-RPC-EVs 经 PKH26 标记移植入视网膜变性 RD10 小鼠视网膜下腔，检测 EV 分布，采用 fERG 检测 EV 移植后功能改善，评估外节长度及外核层厚度，检测凋亡细胞数量，检测小胶质细胞数量、形态、分型及代谢的变化。采用免疫荧光检测 hERO-RPC-EVs 向小胶质细胞线粒体转运的特点。采用离体模型验证 hERO-RPC-EVs 对激活的小胶质细胞炎症和糖酵解代谢的作用。

结果： NTA、电镜、western blot 检测 hERO-RPC-EVs 的粒径、形态、标志性蛋白符合外囊泡特征。在术后 4 天可以在视网膜下腔检测到大量 PKH26⁺ 颗粒，术后 1 周、2 周后向视网膜内层迁移。术后 2 周，fERG 检测 hERO-RPC-EVs 组 b 波幅值显著高于 PBS 组。在术后 1 周、2 周 hERO-RPC-EVs 组 GNAT-1 外节长度和外核层厚度显著大于 PBS 组。此外，hERO-RPC-EVs 移植抑制 IBA1⁺ 小胶质细胞数量及 CD16⁺M1 型小胶质细胞数量，同时降低其糖酵解标志物 PKM2 的表达。此外，hERO-RPC-EVs 能向 RD10 小鼠视网膜小胶质细胞中传递线粒体。进一步经免疫荧光、电镜及 western blot 显示 hERO-RPC-EVs 中富含线粒体组分。离体实验表明 hERO-RPC-EVs 能抑制 LPS 和 IFN- γ 处理后的小胶质细胞炎症基因和糖酵解相关基因表达。

结论： 本研究发现 hERO-RPC-EVs 作为一种新型的外囊泡来源，移植后能够有效保护 RD10 小鼠的视网膜结构与功能，并抑制小胶质细胞的活化及糖酵解代谢标志物的表达。其潜在机制可能是通过外囊泡介导的线粒体转运，调控小胶质细胞的糖酵解代谢过程，进而抑制炎症反应。该研究基于外囊泡的代谢免疫新视角揭示了干细胞治疗新机制，有望开发成为针对视网膜变性的新型细胞药物。

摘要编号: 204572

糖尿病视网膜病变新型温敏水凝胶复合物治疗研究

第一作者: Wen SHI

共同作者: Lihui WEN

目的: 本研究旨在开发一种负载 si-Cx43 纳米颗粒和抗 VEGF 药物的温敏水凝胶复合物 (si-Cx43-NPs@Avastin-hydrogel), 用于协同治疗糖尿病视网膜病变 (DR), 解决现有治疗中生物利用度低和频繁侵入性注射的问题。

方法: 采用脂质-聚合物-siRNA 复合物 (LPP) 技术制备 si-Cx43 纳米颗粒, 并将其与抗 VEGF 药物 (Avastin) 共同封装于温敏水凝胶中。通过凝胶阻滞实验、RNase 保护实验和透射电镜对纳米颗粒进行表征。评估水凝胶的凝胶化、可注射性和降解特性。在体外使用高糖条件下的人视网膜内皮细胞 (hRECs) 模型, 通过 CCK-8、Transwell 迁移实验和管形成实验评估细胞毒性、抗血管生成作用和通透性调节。在糖尿病视网膜病变大鼠模型中评估体内治疗效果, 包括光学相干断层扫描 (OCT) 分析视网膜结构、H&E 染色和 TUNEL 检测。

结果: si-Cx43 纳米颗粒显示出高 siRNA 包封效率 (57.81%) 和稳定性, 能有效沉默视网膜内皮细胞中 Cx43 表达。水凝胶表现出优异的可注射性、温度敏感凝胶化和可控降解特性。体外实验表明, si-Cx43-NPs@Avastin-hydrogel 显著抑制 VEGF 表达, 减少血管生成, 并在高糖条件下恢复细胞通透性。体内实验显示, 水凝胶复合物比单一药物治疗更能有效减少新生血管形成、炎症和细胞凋亡, 恢复视网膜结构和功能。生物相容性研究证实其毒性最小且降解良好。

结论: si-Cx43-NPs@Avastin-hydrogel 通过靶向血管生成、炎症和神经保护的多重作用机制, 为糖尿病视网膜病变提供了一种协同、微创的治疗策略, 具有持续药物释放的优势, 展现出良好的临床应用前景。

摘要编号: 210308

老年大鼠脉络膜新生血管形成过程中的眼部代谢特征研究

第一作者: Pinghui WEI

共同作者: Guoge HAN

目的: 年龄相关性黄斑变性 (AMD) 是 50 岁以上人群致盲的主要原因之一。尽管其发病机制尚未完全阐明, 但普遍认为这是一种由代谢紊乱与环境因素相互作用导致的多因素疾病。通过评估 AMD 中

的代谢组学变化, 可以为揭示其发病机制提供重要线索。

方法: 本研究采用年轻 (7 周龄) 和老年 (24 月龄) Brown Norway 大鼠作为实验对象, 通过激光诱导法建立脉络膜新生血管 (CNV) 模型。7 天后, 利用 Micron IV 视网膜成像显微镜观察并记录 CNV 的形成情况。随后, 处死所有大鼠, 采集完整视网膜组织样本, 采用超高效液相色谱-质谱联用技术 (UHPLC-MS/MS) 进行全局非靶向代谢组学分析。数据分析部分, 使用 MetaboAnalyst 软件进行主成分分析 (PCA) 和火山图分析, 以筛选显著差异代谢物。进一步通过单变量分析对差异代谢物进行代谢通路富集分析, 揭示潜在的关键代谢通路。统计学分析采用非配对双尾 t 检验或方差分析 (ANOVA), 并以 Bonferroni 校正进行多重比较, 以确定组间差异的显著性 ($P < 0.05$ 为具有统计学意义)。

结果: 实验结果显示, 老年大鼠的脉络膜新生血管 (CNV) 面积显著大于年轻大鼠 ($1.48 \pm 0.65 \text{ mm}^2$ vs. $0.92 \pm 0.56 \text{ mm}^2$, $P < 0.05$), 表明老年个体更易发生 CNV。代谢组学分析共鉴定出 103 种在年轻与老年 CNV 视网膜之间存在显著差异的代谢物。进一步通路分析表明, 脂肪酸代谢、葡萄糖代谢 (特别是三羧酸循环) 以及氨基酸代谢 (如丙氨酸、天冬氨酸和谷氨酸代谢) 是主要受影响的代谢通路。具体而言, 老年视网膜中硬脂酰肉碱和油酰肉碱水平显著升高, 而乳酸、谷氨酸、乙酰肉碱、氧化型谷胱甘肽及牛磺酸水平则显著降低。这些代谢变化提示, 老年视网膜可能存在线粒体功能失调、能量代谢紊乱以及抗氧化能力下降等病理生理特征。

结论: 老年个体眼部更易发生脉络膜新生血管 (CNV), 这一现象可能与老年视网膜中显著的代谢变化密切相关。线粒体功能失调导致的能量代谢紊乱、葡萄糖代谢途径 (如三羧酸循环) 的异常, 以及老年眼部抗氧化应激能力的显著下降, 可能是驱动 CNV 形成的关键因素。这些代谢变化不仅揭示了老年视网膜的病理生理特征, 也为进一步探索 CNV 的分子机制和潜在治疗靶点提供了重要依据。

摘要编号: 204396

靶向乳酸敏感小胶质细胞的工程化纳米囊泡抑制增殖性糖尿病视网膜病变新生血管

第一作者: Keyi ZOU

共同作者: Jian YE

目的: 增殖性糖尿病视网膜病变 (PDR) 是糖尿病患者失明的主要原因之一。尽管已有研究发现乳酸的升高与 PDR 的预后密切相关, 但乳酸如何影响

病理性新生血管的具体机制尚未阐明。在我们前期的研究中，发现 PDR 患者的视网膜中存在一类对乳酸敏感的 MKI67 阳性小胶质细胞。因此，本研究旨在通过靶向乳酸敏感的 MKI67 小胶质细胞，开发一种能够抑制 PDR 新生血管形成的工程化纳米囊泡系统，以期 PDR 的治疗提供新的策略。

方法：首先，我们收集了来自糖尿病视网膜病变患者的临床数据，分析了与 MKI67 表达密切相关的 miRNA。通过生物信息学分析和临床数据筛选，确定了能够调控 MKI67 的 miRNA 分子。在体外实验中，我们通过人小胶质细胞系中过表达 MKI67，观察工程化外泌体对 MKI67 的抑制作用，并分析其对细胞增殖、迁移及新生血管形成的影响。此外，为了验证该策略的临床应用潜力，我们在小鼠氧诱导视网膜病变（OIR）模型中进行体内实验，评估工程化纳米囊泡在抑制新生血管形成方面的效果。

结果：首先，我们预测了 miR-10 与 MKI67 高效结合。在体外实验中，使用原代巨噬细胞过表达 miR10 来源的工程化外泌体（miR10-Mexo）对 MKI67 阳性小胶质细胞进行了处理，结果显示 miR10-Mexo 能够显著抑制 MKI67 的表达，减少小胶质细胞的增殖和迁移。同时，miR10-Mexo 还有效地减少了新生血管的形成，证明了其在控制病理性血管生成中的潜力。在 OIR 模型中，治疗组小鼠在使用 miR10-Mexo 后，视网膜的新生血管数量显著减少，血管密度降低，表明这种靶向乳酸敏感小胶质细胞的纳米囊泡系统能够有效抑制糖尿病视网膜病变中的病理性血管生成。此外，病理学分析显示，miR10-Mexo 治疗能够显著减轻血管渗漏。

结论：本研究开发了一种靶向乳酸敏感小胶质细胞的工程化纳米囊泡（miR10-Mexo），成功地通过调控 MKI67 表达抑制了增殖性糖尿病视网膜病变中的新生血管形成。我们的结果为治疗 PDR 提供了一种新的靶向干预策略，开启了调控乳酸干预视网膜病理性新生血管的新纪元。

摘要编号：210285

靶向调控 SIRT1-内质网应激（ERS）通路对 MNU 诱导的 661W 感光细胞损伤的保护作用

第一作者：Weiming YAN

共同作者：Tao CHEN, Jialing DONG, Qiurui HE, Pan LONG, Lin XIAO

目的：本研究旨在系统探讨 SIRT1-ERS 信号通路在 MNU 诱导的 661W 感光细胞损伤中的作用，并评估通过药物调控 SIRT1（使用激动剂 SRT1720 和抑制剂 EX527）和 ERS（使用激动剂 TUN 和抑制剂 4-PBA）的细胞保护效应。

方法：采用 N-甲基-N-亚硝基脲（MNU）处理小鼠 661W 感光细胞系以诱导细胞损伤。为探究 SIRT1-ERS 通路的作用，进行了以下靶向药物干预：SIRT1 调控：使用 SIRT1 激动剂 SRT1720（10、50 或 100 $\mu\text{g/mL}$ ）或抑制剂 EX527 处理细胞。ERS 调控：使用 ERS 激动剂 TUN 或抑制剂 4-PBA 处理细胞。此外，还使用 ALDH2 调节剂（激动剂 Alda-1 和抑制剂 Daidzin）作为对照进行比较分析。通过光学显微镜观察细胞形态，并评估细胞活力。药物以小分子化合物形式或（在适用情况下）颗粒制剂形式给药，以排除递送载体本身可能造成的假象影响。

结果：ERS 抑制对细胞活力和形态具有保护作用：ERS 抑制剂 4-PBA 处理显著维持了细胞的纤维状延展形态和完整的膜结构。相比之下，未经处理的 MNU 损伤组细胞普遍出现漂浮、细胞边缘皱缩等现象，提示细胞应激与退化。这些结果表明，抑制 ERS 可有效缓解 MNU 诱导的损伤，稳定细胞稳态。SIRT1 调控呈现浓度依赖性效应：SIRT1 抑制剂 EX527 加重了细胞损伤，导致细胞活性下降和形态破坏。SIRT1 激动剂 SRT1720 表现出浓度依赖性作用：高浓度（100 $\mu\text{g/mL}$ ）处理时，细胞迅速圆缩、脱落并大量死亡，提示该剂量下药物毒性效应占主导。而在低浓度范围（10–50 $\mu\text{g/mL}$ ），尤其是 50 $\mu\text{g/mL}$ 时，SRT1720 能维持良好的细胞形态（纤维状特征明显，膜结构完整），并显著提高细胞存活率，优于 MNU 模型组。非颗粒制剂显示保护效应，排除载体假象：包括 4-PBA、SRT1720（50 $\mu\text{g/mL}$ ）、Alda-1 和 Daidzin 在内的有效保护剂均以非颗粒形式（小分子化合物）给药，显示出明确的保护作用；而以颗粒形式给药的 TUN 和 EX527 则显著加重细胞损伤。这一对比说明，所观察到的细胞保护效应来源于特定通路调控分子本身的生物活性，而非递送载体的固有保护特性。

结论：本研究结果表明，SIRT1-ERS 信号通路在 MNU 诱导的 661W 感光细胞损伤中发挥关键作用。通过 4-PBA 抑制 ERS 以及使用低剂量 SRT1720 适度激活 SIRT1，可有效抵御细胞损伤，维持细胞形态并提高细胞活力。

TNF- α 预处理的间充质干细胞来源小细胞外囊泡缓解视网膜炎症损伤

第一作者: Zhuxin JIA

共同作者: Fuxiao LUAN, Yong TAO, Ying TIAN

目的: 探讨肿瘤坏死因子- α (TNF- α) 预处理的间充质干细胞 (MSC) 来源的小细胞外囊泡 (T-sEV) 的抗炎作用及在视网膜变性模型中的治疗潜力。

方法: 采用差速离心法分离 TNF- α 预处理的 MSC 来源的 T-sEV, 并通过 TEM、NTA 和 Western blot 进行表征。利用 miRNA 测序、生物信息学分析及体外巨噬细胞共培养, 探究 T-sEV 的 miRNA 谱及其抗炎机制。整合囊泡 miRNA 与受体细胞转录组数据, 构建调控网络。最后, 在 NaIO₃ 诱导的小鼠视网膜变性模型中, 通过 ERG、OCT、流式细胞术和安全性指标评估 T-sEV 的体内疗效。

结果: 成功分离出具有典型形态、大小 (< 200 nm) 及阳性标志物 (ALIX、CD81、TSG101) 的高纯度 T-sEV。其携带的 mmu-miR-146a-5p 等 miRNA 显著富集, 这些 miRNA 的预测靶基因主要涉及 MAPK 等炎症相关通路。T-sEV 能被巨噬细胞高效内化, 并较未处理 MSC 来源的 sEV 更强效地抑制 CD11b+/CD86+ 炎症性巨噬细胞的活化。整合分析揭示, T-sEV 中富集的 miRNA 与受体细胞内下调的促炎基因存在关联。在动物模型中, T-sEV 治疗能显著改善视网膜功能与结构, 更强效地抑制视网膜巨噬细胞浸润, 且未引起眼压或主要血液生化指标的显著改变, 安全性良好。

结论: TNF- α 预处理通过改变 MSC-sEV 的 miRNA, 使其能够通过靶向关键炎症信号通路, 协同抑制巨噬细胞的促炎活化, 从而在视网膜变性模型中发挥更强的抗炎疗效和神经保护作用, 且具备良好的安全性, 展现出潜在的治疗价值。

摘要编号: 210048

cGAS-STING 信号通路通过促进小胶质细胞糖酵解加剧湿性年龄相关性黄斑变性的作用机制研究

第一作者: Mei DU

目的: 免疫炎症反应是湿性年龄相关性黄斑变性 (wetAMD) 的重要风险因素, 但其调控血管新生的机制尚不清楚。模式识别受体 cGAS-STING 通路是感受细胞损伤触发炎症与免疫防御的关键通路。此外, STING 在视网膜小胶质细胞中高表达,

并在在脉络膜新生血管 (CNV) 模型中上调。因此, 本课题拟深入研究视网膜小胶质细胞 cGAS-STING 通路在 AMD 病理过程中的作用及机制, 以期揭示 DNA 感受通路 cGAS-STING 调控 AMD 发生发展的重要概念。

方法: 本课题将构建 STING 全敲以及小胶质细胞特异性敲除小鼠, 利用激光 CNV 模型模拟 wetAMD 疾病, 评估 STING 敲除对 CNV 模型中血管新生和渗漏的影响。此外还通过单细胞测序, 细胞交互作用分析, co-IP 等方法深入解析小胶质细胞 cGAS-STING 通路影响 CNV 疾病进展的分子机制。

结果: 本课题发现: 1. STING 信号通路在小鼠激光 CNV 模型中显著激活, 敲除 sting 对小鼠 CNV 进展具有明显的保护作用; 2. 小鼠 CNV 模型中上调的 STING 主要发生在视网膜小胶质细胞, 小胶质细胞特异敲除 sting 对 CNV 进展具有显著的保护作用; 3. 在衰老小鼠和 CNV 造模小鼠中, 线粒体和细胞核 DNA 的胞质泄露是激活 cGAS-STING 的潜在机制; 4. 小胶质细胞 STING 信号通路的激活会促使小胶质细胞向促炎和促进血管新生表型转变, 从而促进了 CNV 进展。

结论: 该研究表明衰老的视网膜存在胞质 DNA 积累, 从而激活 cGAS-STING 通路促进 wetAMD 疾病进展的作用, 此外, 我们首次揭示了 STING 能够影响小胶质细胞糖酵解和促血管新生表型的转变, 该研究为湿性 AMD 的防治提供了新的思路和新的治疗策略。

摘要编号: 209484

单细胞测序揭示载脂蛋白 A1 通过靶向巨噬细胞代谢重编程抑制脉络膜新生血管

第一作者: Likun LIN

共同作者: Andina HU

目的: 巨噬细胞驱动的炎症和脂质代谢紊乱是脉络膜新生血管 (CNV) 的关键驱动因素, 但其精确调控机制尚不完全清楚。载脂蛋白 A1 (Apoa1) 作为胆固醇逆向转运的核心蛋白, 其在新生血管性年龄相关性黄斑变性 (nAMD) 中的作用尚存争议。本研究旨在阐明内源性 Apoa1 在 CNV 病理进程中的确切功能, 并深入探究其是否通过调控巨噬细胞的脂质代谢稳态和功能极化来发挥作用。

方法: 1: 我们在野生型 (WT)、Apoa1 基因敲除 (Apoa1-KO) 和 Apoa1 过表达 (Apoa1-OE) 小鼠中建立了激光诱导的 CNV 模型。通过 OCT、FFA、H&E 染色和 CD31 免疫荧光对 CNV 表型进行多模态定量评估。2: 采用单细胞 RNA 测序 (scRNA-seq) 对 WT 和 Apoa1-KO 小鼠的 RPE

／脉络膜组织进行分析，鉴定细胞亚群并进行差异基因、功能富集和细胞通讯分析。3：通过免疫荧光（CD68，F4/80，Filipin）和对磁珠分选的巨噬细胞进行 Western Blot（VEGFA，TNF- α ，IL-1 β ），对关键发现进行功能性验证。4：最后，通过玻璃体腔注射 ABCA1 抑制剂（Probucol）和 ApoA1 模拟肽（D-4F）进行药理学干预，以验证机制并评估治疗潜力。

结果：1：ApoA1 的表达水平与 CNV 的严重程度呈负相关：ApoA1-KO 小鼠的 CNV 病灶面积、体积和血管渗漏均显著增加；而 ApoA1-OE 小鼠则受到明显抑制。2：scRNA-seq 分析显示，ApoA1 缺乏导致脉络膜微环境中巨噬细胞比例显著增加，并呈现强烈的促炎转录特征。深度亚群分析鉴定出一个全新的致病性亚群——“促血管生成型巨噬细胞”（Angio-Macro），其高表达 Vegfa，Pigf 和 Il18。该亚群在 ApoA1-KO 小鼠的巨噬细胞总量中比例特异性升高，并作为核心信号中枢，通过 VEGF 和 TNF 等通路驱动病理进程。3：机制上，药理学抑制 ABCA1（ApoA1 的主要受体）会导致巨噬细胞内胆固醇显著积聚，并完全模拟 ApoA1-KO 的严重表型，同时逆转 ApoA1-OE 的保护作用。4：最后，玻璃体腔注射 ApoA1 模拟肽 D-4F 能有效抑制 CNV 进展，并显著降低 VEGFA，TNF- α 和 IL-1 β 的蛋白水平。

结论：本研究揭示了 ApoA1 在 CNV 中的关键保护机制。ApoA1 通过其受体 ABCA1 维持巨噬细胞的胆固醇外排，阻止其发生代谢重编程，并抑制其向致病性的“Angio-Macro”亚群极化。这一过程作为眼内的“免疫代谢检查点”，有效抑制了炎症和病理性血管生成。靶向 ApoA1-ABCA1 通路（如使用 D-4F 模拟肽）为 nAMD 提供了一种极具前景的新型治疗策略。

摘要编号：201342

压力作用下大鼠视乳头星形胶质细胞中 Piezo1 通道对活化过程中炎症反应的调控研究

第一作者：Guo XIAODAN

共同作者：Niu XUEHONG, Jing YONGJIE, Zhang ZHONGZHI

目的：青光眼是慢性视神经退行性损伤疾病。高眼压是青光眼最明确、最主要的危险因素，视乳头筛板区域是青光眼的初始损伤部位。视乳头筛板区域的星形胶质细胞能够敏感地早期感受和响应眼压波动导致的机械刺激，发生活化，但活化与青光眼损伤之间的联系机制尚不明确，推论由于星形胶质细胞是该区域占绝对优势的细胞，而 AS 的压力敏感特性在高眼压与轴突变性之间也构成了一种联系，

因此压力介导的 AS 活化可能在青光眼发病过程中具有重要意义。Piezo1 是一种新发现的机械敏感离子通道，可被机械力直接激活。本研究通过体外加压体系处理大鼠视乳头星形胶质细胞（ONHAs），探究 Piezo1 通道对活化过程中炎症反应的调控作用。

方法：ONHAs 细胞不同压力分别作用 24 小时，观察 Piezo1 的表达，检测 TNF α ，Piezo1 蛋白及 mRNA；GsMTx4 处理细胞，检测 TNF α 。

结果：随着压力的增加，细胞分泌的 TNF α 增加，Piezo1 的表达也增多，Piezo1 变化 TNF α 的水平呈同步趋势；60 mmHg 下，使用 GsMTx4，TNF α 明显减少。

结论：Piezo1 参与了压力下的星形胶质细胞活化的调控，促进炎症因子释放。

摘要编号：209018

基于全基因组关联分析和单细胞转录组学的脊柱关节炎 /HLA-B27 相关急性前葡萄膜炎发病机制研究

第一作者：Xiao LIU

共同作者：Shuming CHEN

目的：脊柱关节炎（SpA）/HLA-B27 相关性急性前葡萄膜炎（AAU）患者会反复出现急性发作，给患者的视觉和经济带来巨大挑战。尽管脊柱关节炎与 HLA-B27 相关性急性前葡萄膜炎（AAU）之间已建立了联系，但其中涉及的确切机制仍不清楚，需要进一步了解才能有效预防和治疗。

方法：为了研究 SpA/HLA-B27 相关 AAU 的急性发病机制，我们采用了孟德尔随机化（MR）和单细胞转录组分析。孟德尔随机分析结合了以往研究中公开的蛋白质定量性状位点数据以及公共数据库中的全基因组关联研究数据。使用双样本 MR 评估了血浆蛋白与前葡萄膜炎之间的因果关系。此外，还使用贝叶斯共定位法进行了共定位分析。单细胞转录组分析利用了基因表达总库（GEO）数据库中的前葡萄膜炎数据集。随后进行了降维、聚类、转录因子分析、分析和细胞通讯分析，以探索相关的潜在机制。

结果：孟德尔随机分析显示，循环中的 AIF1 和 VARS 水平与 SpA/HLA-B27 相关性 AAU 发病风险的降低有显著相关性，其中 AIF1 与前葡萄膜炎发病有很强的相关性。共定位分析证实了这些发现。单细胞转录组分析显示，AIF1 主要在骨髓细胞中表达，而在 HLA-B27 阳性组中的表达量明显较低。拟时序分析显示，树突状细胞在分化分支中处于末端位置，同时 AIF1 的表达逐渐下降。根据

细胞通讯分析, CD141 + CLEC9A + 典型树突状细胞 (cDCs) 和 APP 通路在 SpA/HLA-B27 组的细胞通讯中起着关键作用。

结论: AIF1 对 SPA/HLA-B27 相关 AAU 的发病机制至关重要。髓系细胞分化为 DC 和 AIF1 水平下降也是这一过程的关键。

摘要编号: 209020

机器学习与单细胞 RNA 测序揭示肿瘤内 CD8⁺ T 细胞与葡萄膜黑色素瘤转移的关联

第一作者: Xiao LIU

共同作者: 陈树明

目的: 葡萄膜黑色素瘤 (UM) 是成人最常见的原发性眼内恶性肿瘤。研究发现 40% 的患者在后续治疗中会发生远处转移。虽然已有研究利用机器学习方法构建多基因模型评估转移及预后, 但免疫微环境影响肿瘤微环境的具体机制尚未阐明。单细胞转录组测序技术能精准识别组织中不同细胞类型进行精确分析。本研究旨在构建基因数量更少的评估 UM 患者转移风险的模型, 并为 UM 免疫治疗提供理论依据。

方法: 采用 TCGA 数据库中 79 例 UM 患者的 RNA-seq 数据及临床信息构建预后模型, 并基于 GEO 数据库的两个单细胞数据集探究机制。筛选转移相关基因后, 通过 GO 和 KEGG 进行富集分析; 采用 log-rank 检验和单因素 Cox 回归筛选预后基因, 通过 LASSO 回归分析和多因素 Cox 回归分析建立预后模型。以 TCGA-UVM 数据集作为内部验证, GSE22138 数据集作为外部验证数据, 建立时间依赖性受试者工作特征曲线 (time-ROC) 评估模型预测能力。随后对 GSE138665 和 GSE139829 进行降维、聚类、拟时序分析和细胞通讯分析以探究潜在机制, 并通过细胞实验验证相关发现。

结果: 基于 TCGA-UVM 队列 79 例样本的临床特征和 RNA-seq 转录组数据, 筛选出 247 个转移相关基因, 通过 lasso 回归和多因素 cox 回归构建了 SLC25A38、EDNRB 和 LURAP1 三个基因的生存模型。Kaplan-Meier 生存分析显示高风险组 UM 患者的总生存期 (OS) 和无转移生存期 (MFS) 更差。时间依赖性 ROC 曲线表明该模型在 6 个月、18 个月和 30 个月的预后预测中具有高性能。细胞划痕实验显示, 三个基因低表达细胞的 24h 和 48h 迁移率显著高于 si-NC 组。免疫浸润分析提示 CD8⁺ T 细胞可能在肿瘤转移中起重要作用。单细胞转录组数据探索发现, 转移高风险组中细胞毒性 CD8⁺ T 细胞比例增加, 其通讯强度显著增强, 但两组 CD8⁺ T 细胞状态存在差异: 高风险组 CD8⁺ T 细胞

数量虽多, 但多处于耗竭和未分化状态, 而低风险组 CD8⁺ T 细胞多为功能状态。

结论: 本研究构建了精准稳定的三基因模型用于预测患者转移风险及预后, 并证实肿瘤微环境中 CD8⁺ T 细胞耗竭在 UM 转移中起关键作用。

摘要编号: 209022

源自 ihRPESCs 外泌体的环状 RNA 对光损伤视网膜细胞的保护机制研究

第一作者: Xiao LIU

共同作者: Shuming CHEN

目的: 探讨球体诱导的人视网膜色素上皮干细胞 (ihRPESCs) 来源的外泌体环状 RNA (circRNA) 对光损伤视网膜色素上皮 (hRPE) 细胞的保护作用及其分子机制。

方法: 从人视网膜组织中提取并培养原代 hRPE 细胞, 通过微球体诱导获得 ihRPESCs。构建蓝光诱导的 hRPE 细胞光损伤模型, 利用 Transwell 系统共培养 ihRPESCs 与光损伤 hRPE 细胞。采用透射电镜和纳米颗粒追踪分析鉴定外泌体。通过 circRNA 芯片分析和生物信息学方法筛选差异表达的 circRNA, 并利用 RT-qPCR、细胞划痕实验、CCK-8 和流式细胞术验证关键 circRNA 的功能及其调控机制。

结果: hRPESCs 具备干细胞特性。其来源的外泌体可显著改善光损伤 hRPE 细胞的增殖并抑制其凋亡。circRNA 芯片分析发现, ihRPESCs 外泌体中 hsa-circRNA-403328 显著高表达。功能实验证实, 干扰 hsa-circRNA-403328 会削弱外泌体促进细胞迁移、增殖及抗凋亡的保护作用。生物信息学分析提示, hsa-circRNA-403328 可能通过吸附 hsa-miR-135-5p 进而调控靶基因表达。

结论: ihRPESCs 来源的外泌体通过递送高表达的 hsa-circRNA-403328, 调控 hsa-miR-135-5p/NPTX1/ADAMTS9/DEPDC1/MEGF11 通路, 从而保护光损伤的 hRPE 细胞, 为视网膜退行性疾病的治疗提供了新的潜在靶点。

眼科创新教育与研究

第一作者: Xianwei LI

目的: 针对传统眼科教学中临床资源分配不均、手术培训风险高等痛点, 本研究提出“数字孪生 + 临床路径”的虚实融合教育模式, 旨在通过构建可交互的虚拟眼解剖模型与智能病例库, 实现从技能培训到临床决策的全链条能力提升。

方法：教育技术创新开发基于 Unity3D 的虚拟现实（VR）眼解剖训练系统，集成触觉反馈模块模拟手术操作建立动态病例库：运用自然语言处理（NLP）技术从电子病历中提取典型病例特征设计“三维认知—模拟操作—病例复盘”三阶段教学闭环教学实施路径在住院医师规范化培训中开展对照试验（实验组：VR 教学 + 智能病例；对照组：传统示教）通过多维度评估体系（操作评分、决策树分析、临床胜任力量表）追踪教学效果。

结果：教学效能提升 实验组学员显微手术操作考核优秀率提高 40%，平均培训周期缩短 30%；虚拟病例训练使临床决策准确率提升至 92%，误诊率下降 25%。模式创新价值 建立可复制的“数字导师”系统，实现个性化教学进度调控；开发跨平台教学资源包（含 200+ 交互式病例），支持移动端碎片化学习。

结论：本研究通过实证分析证实，虚实融合教育模式能够有效突破传统眼科教学在时间和空间上的双重限制。其创新性体现在“技术赋能—临床反哺”的双向互动机制：一方面，VR/AR 等数字技术为临床教学提供沉浸式训练场景；另一方面，临床实践反馈又能持续优化技术应用。这种闭环机制不仅提升了教学效率，更为医学教育改革提供了可复制的新范式。展望未来，该模式可重点拓展至基层医师继续教育领域，通过远程培训、案例共享等方式，促进三甲医院优质医疗资源向县域医疗机构下沉，助力分级诊疗体系建设。

摘要编号：207858

眼科年轻医生多元化手术培养模式的建立

第一作者：Weihong YU

共同作者：Zhikun YANG, Meifen ZHANG, Shunhua ZHANG, Zaowen WANG

目的：总结北京协和医院眼科对不同专业组、不同层次年轻医生手术培养的模式和效果。

方法：通过建立规范的进阶考核制度、手术授权制度、教师激励制度对科室年轻医生手术教学进行流程规范与激励，以白内障手术做为内眼手术基本手术要求，通过多元化的教学方式如模拟器手术培训、wetlab 手术培训、通过临床博士后手术日跟随指导教师、轮转眼底组前后联合手术、国内国际健康快车光明行等多种方式进行分阶段培养。同时科室定期开展年轻医生手术视频点评会议，不定期开展疑难手术分享。

结果：近年来眼科年轻医生内眼手术技术能力明显提高，成长速度加快。完成临床博士后培训进入初年主治医生阶段，年轻均可独立完成白内障手术，

在主治医期间能完成常规眼底手术，副主任医师均可独立完成本专业组手术，获得手术授权。

结论：分阶段、分层次、多元化手术培养模式，有助于年轻医生手术技能的培训与成长。

摘要编号：210328

线粒体融合蛋白 2 对小鼠视网膜生后发育及稳态维持的作用与机制研究

第一作者：Haoyue SHEN

共同作者：Hongjin LI, Haoyu NIU

目的：本研究旨在利用转基因小鼠模型探究线粒体融合蛋白 2（Mitofusin2, Mfn2）在哺乳动物视网膜生后发育过程及后续稳态维持中的作用。

方法：利用 Cre/loxP 系统，将 Mfn2^{flox/flox} 小鼠与神经外胚层特异性表达 Cre 重组酶的小鼠（Six3-cre）进行杂交获得条件性敲除视网膜 Mfn2 基因小鼠（CKO 小鼠），以同窝 Cre 阴性小鼠作为对照组小鼠（Control）。① 选取 10 周龄 CKO 小鼠及同窝对照组小鼠进行眼前节照相、眼底照相、光学相干层析成像（OCT）、视网膜电图（ERG）及眼底血管荧光造影等在体眼科检查，评估成年后敲除组小鼠视网膜功能，观察 CKO 小鼠视网膜形态结构的变化。② 取生后第 7、14、21 及 28 天 CKO 及对照组小鼠视网膜，利用免疫荧光方法对视网膜内四种主要类型细胞（神经节细胞、双极细胞、Müller 细胞及光感受器细胞）进行染色，观察各类细胞数量及形态变化。

结果：特异性敲除神经外胚层 Mfn2 基因对小鼠视网膜发育的影响：① 视功能减弱：10 周龄 CKO 小鼠 ERG 结果显示 b 波振幅明显减小；② 视网膜结构改变：成年 CKO 小鼠眼球内部组织排列基本正常，但视网膜全层厚度变薄，其中内丛状层厚度变化最明显；③ 眼底彩照示：CKO 小鼠视网膜血管密度减小，视神经出现萎缩；④ CKO 小鼠的异常变化于出生后第 7-14 天开始显现，进展至生后第 28 天时趋于稳定，提示 Mfn2 可能主要作用于小鼠视网膜发育晚期，P14 时，较对照组小鼠视网膜相比，CKO 小鼠视网膜神经节细胞逐渐丢失伴随双极细胞轴突变短。

结论：Mfn2 参与小鼠视网膜发育过程，尤其对于生后发育晚期阶段具有重要作用：1) 神经外胚层特异性敲除 Mfn2 导致成年小鼠视功能受损，视神经萎缩，血管密度异常。2) Mfn2 参与内侧视网膜结构的形成过程：缺失 Mfn2 导致视网膜神经节细胞逐渐丢失，伴随双极细胞轴突变短。Mfn2 的这些功能表现可能有助于我们更好地理解视网膜发育各阶段中的基因调控方式，同时希望为深入探究线粒体相关视网膜疾病的潜在机制提供一些帮助。

摘要编号: 208957

肠道菌群调控策略延缓增殖期糖尿病视网膜病变小鼠模型的进展

第一作者: Xiangyu FU

目的: 肠道菌群失调被发现代谢性疾病如糖尿病的病变过程中具有重要作用, 肠-眼轴也是目前眼科研究的热点。我们前期研究发现增殖期糖尿病视网膜病变(PDR)小鼠出现肠道菌群失调、代谢紊乱, 这可能是高血糖导致PDR的重要机制。本研究拟探讨调控肠道菌群在PDR小鼠模型中的作用。

方法: VhlKO (Vhlflox/flox, α -Cre) 小鼠在糖尿病造模成功后, 继续给予广谱抗生素以清除原驻肠道菌群, 然后进行VSL#3益生菌灌胃(VSL组)或肠道粪便菌群移植(FMT组), 直至出生后8周左右。观察这两种肠道菌群干预对PDR模型的肠道微环境、肠道菌群、肠道代谢物以及视网膜表型(ERG视功能、各种细胞类型、血管、胶质细胞)的影响。收集小鼠视网膜进行RNA测序及单细胞RNA测序以探究调节肠道菌群影响PDR表型的机制。

结果: VSL#3益生菌和FMT都可以改善高血糖导致的肠道组织病理变化, VSL#3可逆转VhlKO的PDR小鼠肠道内厚壁菌门和拟杆菌门的相对比例, 促进拟杆菌属和副拟杆菌属的定植。FMT主要促进了一些短链脂肪酸的合成代谢。两种处理均使多种氨基酸与神经递质代谢、能量供应通路、初级胆汁酸生物合成等有益过程得以加强。暗适应ERG发现VSL组在1.0 cds/m²以上的光刺激强度下的内外层视网膜功能均得以改善, FMT可改善10.0 cds/m²刺激下的b波波幅。VSL组视网膜新生血管密度下降而双极细胞的丢失得以挽救。两个处理组均显著降低了视网膜活化胶质细胞的数量, 减轻视网膜内炎症反应。视网膜转录组RNA测序及qPCR均验证了血管生成通路和炎症通路的下调。单细胞RNA测序显示, VSL#3处理可逆转高血糖激活的异常神经退行性病变通路和代谢通路并一定程度上恢复视杆细胞和双极细胞的神经元功能与平衡, 改善小胶质细胞和Müller细胞各亚群比例异常倒置。细胞间通讯分析发现干预肠道菌群可有效恢复受高血糖影响的光信号传达以及神经元的兴奋-抑制平衡。

结论: 口服VSL#3益生菌和FMT可以通过改善肠道菌群进而缓解PDR表型, 这提示肠道菌群可能是PDR发生发展的重要机制及治疗靶点。

腺苷脱氨酶 2 缺乏症 (DADA2) 眼部表现的十年中国队列分析

第一作者: Zhangwanyu WEI

共同作者: Min SHEN, Weihong YU, Xiao ZHANG

目的: 分析罕见病腺苷脱氨酶 2 缺乏症 (DADA2) 患者眼部表现、基因型及其他临床表现的相互关联。

方法: 连续纳入 2015 年 8 月至 2025 年 9 月在北京协和医院经基因检测确诊 DADA2 的患者, 完善眼部检查, 包括最佳矫正视力、眼压、眼位、眼球运动、光学相干断层扫描(OCT)、荧光血管造影(FFA)等。分析其临床特征、实验室检查、基因型及诊治经过。

结果: 共纳入 DADA2 患者 14 例, 年龄 16 ~ 58 岁, 其中 12 例 (85.7%) 存在不同程度眼部受累, 如视网膜血管炎 (3 人, 21.4%)、眼动脉阻塞 (1 人, 7.1%)、斜视 (1 人, 7.1%)、复视 (2 人, 14.3%)、眼球震颤 (2 人, 14.3%)、眼球运动受限 (2 人, 14.3%) 等。3 人 (21.4%) 以眼部异常为疾病首表现, 5 人 (35.7%) 在起病 1 年内出现眼部异常。DADA2 患者眼部异常与基因型未见明显关联, 视网膜血管炎患者常伴全身其他部位炎症; 复视/眼球震颤/眼球运动受限患者均随后确诊脑梗。首次报道 DADA2 患者眼动脉闭塞 1 例及全身多发血管瘤样扩张累及视网膜 1 例。

结论: DADA2 的眼部表现早发且多样化, 其疾病机制以炎症、闭塞为主, 其中视网膜血管炎与眼动脉阻塞对视力预后影响严重。DADA2 患者出现复视等眼部异常可能提示新发脑梗。

摘要编号: 209149

超乳小白的中印之旅解锁青年眼科医生的成长密码

第一作者: Hang REN

共同作者: Kriti BHATT, Nandita TRIVEDI

目的: 白内障手术是眼科的基础手术之一, 它看起来操作简单、平淡无奇, 似乎是千篇一律, 然而当我终于获得机会真正踏上白内障手术的学习之路后, 才越发体会其中的精妙。就如看武林高手出招, 行云流水, 一气呵成, 但轮到新手上场, 却步步维艰, 如临深渊。在印度 Aravind 眼科医院学习的数月时光中, 我经历了从信心满满到灰头土脸, 再到重振旗鼓的艰难心路历程。本文我将从初学者角度分享白内障手术学习的感悟, 帮助更多中国青年眼科医生高效安全的成长。

方法: 通过系统解析手法小切口白内障 (MSICS, Manual Small Incision Cataract Surgery)、巩膜隧道切口超声乳化 (超乳) 至透明角膜切口超乳

的渐进式学习体系，深入剖析印度 Aravind 眼科医院针对新手白内障医生的科学培养模式，从而达到探讨该路径对初学者的普适性效果与成长启示的目的。

结果：训练开始于在 stimulator 模拟器上熟悉隧道切口和侧切口、截囊针撕囊、水分离、转核娩核、simcoe 套管吸除皮质、人工晶体植入和调位以及水密切口等基础操作，配合羊眼强化手感，手术室现场观摩手术视频后，迅速熟悉手术步骤并在资深医师指导下严格筛选患者，从巩膜隧道切口做起，指导老师在屏幕上密切观察初学者的动作和姿势，及时纠正或接手。初学者从起初的一两个步骤逐渐积累至独立完成全部步骤，所需平均时间约 1 个月，完成数量为 20-25 例。每日术后小组内及时复盘并在模拟器与动物实验巩固肌肉记忆，理论课程同步更新知识体系。在完成 MSICS 基础上采用巩膜隧道切口练习刻槽、劈核、超乳、双手 I/A 注吸、硬性人工晶体植入和调位等操作。最后进阶至透明角膜切口并在此基础上完成白内障手术操作。

结论：这种针对青年眼科医生的培养模式非常成熟，学习曲线短，符合“适当、可负担、可接近”三原则。该模式的关键在于“实践-反思-提升”的螺旋上升路径，既保障患者安全，又加速医生成长。作为青年医生需要始终牢记行云流水的操作背后，是无数次的刻意练习与精准纠错。

摘要编号：205538

近 30 年甲状腺相关眼病研究现状和热点的可视化文献计量学分析

第一作者：Wang YINING

目的：基于文献计量学探讨甲状腺相关眼病领域的研究现状及热点。

方法：文献计量学分析。于 2025 年 3 月检索 Web of Science 核心数据库 1995 年至 2024 年间发表的甲状腺相关眼病的英文相关文献。采用 Excel 软件对数据进行管理统计，并对频次数据制作图形。文献发文量年变化趋势、文献被引用频次、国家或地区分布、机构、期刊和作者发文量等分析利用 CiteSpace 和 VOSviewer 软件系统构建。

结果：最终纳入文献 4,757 篇。近 30 年来甲状腺相关眼病研究领域文献数量呈明显上升趋势。发表文献数量排名前 3 的国家是美国、中国和意大利。美国的多国合作发文数量最多，其次为中国、德国。发文量前 5 位的机构是意大利比萨大学、美国加利福尼亚大学洛杉矶分校、美国密歇根大学、中国上海交通大学和韩国延世大学。来自美国密歇根大学医学院的 Terry J Smith 是发文量最多的作者。发文量排名前 3 位的期刊依次为 Ophthalmic

plastic and reconstructive surgery、Thyroid and Journal of Clinical Endocrinology & Metabolism。关键词及突现词研究结果显示，当前甲状腺相关眼病的研究主要集中在发病机制、疾病管理、替妥木单抗、患病率、纤维化以及指南的制定。

结论：近 30 年来甲状腺相关眼病研究领域文献数量呈明显上升趋势，甲状腺相关眼病的发病机制、患病率及疾病管理为热点研究领域，替妥木单抗、纤维化以及指南的制定是目前及未来研究的重点。

摘要编号：205543

近 50 年黄斑裂孔研究热点及发展趋势的文献计量学分析

第一作者：Wang YINING

目的：分析 1975 年至 2024 年间黄斑裂孔领域的研究热点和发展趋势。

方法：文献计量学研究。数据库采用美国科学情报研究所 Web of Science 核心数据集，检索黄斑裂孔相关文献。检索时间为 1975 年 1 月 1 日至 2024 年 12 月 31 日。文献发文量年变化趋势、文献被引用频次、国家、地区分布、发文期刊、作者发文量等分析采用 R 软件的 bibliometrix 软件包；关键词聚类分析和突现词分析采用 CiteSpace 软件进行。

结果：共纳入 4704 篇黄斑裂孔领域相关文献。该领域 1975 年至 2024 年年发文量整体呈快速上升趋势，尤其在 2000 年和 2010 年前后出现快速增长。美国、日本和中国是黄斑裂孔领域发文数量较多的国家，同时美国的多国合作发文量也最多。发文量最多的作者是来自中国台湾国立台湾大学的 Chung-May Yang。发文量位居前五位的大学或机构为美国迈阿密大学、英国墨菲尔眼科医院、中国首都医科大学、德国慕尼黑大学和日本大阪大学。关键词及突现词结果显示，当前黄斑裂孔的研究主要集中在形成机制、分类和治疗方面，以及高度近视对黄斑裂孔形成作用。

结论：近 50 年来黄斑裂孔研究领域的文献数量增长趋势明显。高度近视在黄斑裂孔中的作用，根据黄斑裂孔的分类和分型针对性选择手术方式，板层黄斑裂孔相关视网膜前增生膜的研究是目前及未来研究的重点。

摘要编号: 205049

通过化学诱导多能干细胞可有效获得人视网膜色素上皮细胞

第一作者: Ke ZHANG

共同作者: Xuran DONG, Chun ZHANG

目的: 通过化学诱导多能性的方法, 从人脂肪来源的基质细胞 (hADSCs) 获得视网膜色素上皮 (RPE) 细胞。

方法: 按照已报道的方案, 利用人化学诱导多能干细胞试剂盒对 hADSCs 进行重编程。在成功建立的 40 株人化学诱导多能干细胞 (hCiPSC) 可传代细胞系中, 随机选取 12 个细胞系进行鉴定与分化实验。最后, 对 hCiPSC 来源的 RPE 细胞进行了包括 RPE 相关基因的动态变化、蛋白定位以及功能学表现等相关检测。

结果: 所有 hCiPSC 细胞系均表现出典型的人胚胎干细胞 (hESC) 形态, 并表达多能干细胞的表面标志物和转录因子, 同时 hCiPSC 在多能标志基因的转录组水平上也与 hESC 具有相似的表达模式。拟胚体和畸胎瘤实验均显示 hCiPSC 具备向三胚层分化的能力。对于 hCiPSC 分化获得的 RPE 细胞, 其 RPE 标志基因的表达水平随成熟时间逐渐升高。细胞富集成熟 20 天后, 细胞表现出明显的色素沉着和典型的六边形结构。免疫荧光证实了 RPE 相关标志物的表达。此外, 在培养基中检测到高水平的色素上皮衍生因子和血管内皮生长因子, 并且其含量随培养时间延长而增加; 这些 RPE 细胞还能够有效吞噬光感受器外节。

结论: 化学小分子的应用能够高效、稳定地获得 hCiPSC 细胞系, 并进一步分化为 RPE 细胞。该方法为个体化细胞治疗眼科疾病提供了新的前景。

摘要编号: 207543

马钱苷减轻 A β 所致视网膜损伤的效应评价及作用机制初步探索

第一作者: Yujie YAN

共同作者: Tingting DENG, Wenqing JIA

目的: 评价马钱苷减轻 A β 所致视网膜损伤的效应并初步探索其作用机制。

方法: 实验研究。取 12 只 8 周龄 C57/BL6J 雄性小鼠, 随机分为 4 组, 模型组, 治疗组, 对照组及空白组各 3 只。模型组给予小鼠双眼玻璃体腔注射 A β 1-42 (2 ug/ul) 2 ul, 对照组给与小鼠双眼玻璃体腔注射 PBS 2 ul, 空白组给与小鼠双眼玻璃体腔注射操作但不注入任何物质; 治疗组给与马钱苷高剂量 (50 mg/kg) 灌胃, 在造模前 3 天开始, 连续灌胃 10 天, 其余各组给与同等条件下 PBS 灌胃。

造模 7 天后, 分别进行彩色眼底照相及 OCT 检查。HE 染色观察小鼠视网膜组织形态改变; 免疫荧光染色检测视网膜中 Iba-1, IL-1 β , NLRP3 的表达情况, TUNEL 染色观察视网膜组织中细胞凋亡情况; 电镜检查观察视网膜组织中线粒体损伤情况。

结果: 与对照组和空白组相比, 模型组视网膜外层结构紊乱, 视网膜外层呈波浪状改变, 并出现 RPE 细胞排列紊乱及空泡样变性; 治疗组视网膜外层结构紊乱, RPE 细胞排列紊乱和空泡样变性较模型组轻, 但较对照组和空白组重。眼底彩照上黄白色病灶占比治疗组较模型组低, 但较对照组和空白组高, 差异具有统计学意义 ($P < 0.05$)。OCT 证实黄白色病灶位于视网膜外层。与对照组和空白组相比, 马钱苷高剂量组治疗组视网膜内核层及外核层中 Iba-1, IL-1 β , NLRP3 表达量增多, 但较模型组表达量少 ($P < 0.05$)。TUNEL 染色各组未见明显差异。模型组及治疗组电镜可见线粒体肿胀, 模型组肿胀线粒体占比更多, 但差异不具有统计学意义 ($P > 0.05$)

结论: 马钱苷可以通过抑制炎症和保护线粒体减轻 A β 所致视网膜损伤。

摘要编号: 210301

1990 年至 2021 年年龄相关性眼病的全球负担与跨国不平等: 一项时间趋势与社会经济差异的综合分析

第一作者: Kuan LI

共同作者: Jing TANG

目的: 年龄相关性眼病是全球致盲和视力损伤的主要原因之一, 随着全球人口老龄化问题加剧, 其影响也日益受到关注。本研究旨在系统评估过去三十年来全球不同国家和地区年龄相关性眼病的患病情况、不平等状况及其变化趋势, 并分析相关影响因素。

方法: 我们基于全球疾病负担研究 2021 数据, 对年龄相关性眼病进行了二次流行病学分析。通过评估伤残损失寿命年和年龄标准化残疾率, 对全球年龄相关性眼病的疾病负担进行了衡量。采用 Joinpoint 回归对 1990 至 2021 年间疾病负担的时间趋势进行了分析。使用斜率不平等指数和集中指数来评估研究期间不平等状况的变化。

结果: 从 1990 年到 2021 年, 全球年龄相关性眼病的伤残损失寿命年从 78.503 上升到 100.006, 而年龄标准化残疾率则从每 10 万人 112.815 下降

至 92.803。尽管全球青光眼的相对疾病负担有所增加，但其他类型的年龄相关性眼病在绝对和相对不平等方面均有所减少。社会人口学指数较低的国家在减少这些不平等方面表现出轻微改善。在 1990 年至 2021 年期间，低社会人口学指数国家的年龄相关性眼病的斜率不平等指数有所改善，其中年龄相关性黄斑变性从 -9.250 降至 -6.033，白内障从 -258.131 降至 -173.762，青光眼从 -21.090 降至 -20.064。年龄相关性黄斑变性和白内障的集中指数从 1990 年的 -0.167 和 -0.335 分别降至 2021 年的 -0.129 和 -0.272，而青光眼的集中指数则从 -0.208 上升至 -0.263。年龄相关性眼病的疾病负担在各地区间存在显著差异，但大多数地区在低社会人口学指数国家的不平等状况方面有所改善，这在斜率不平等指数和集中指数的变化中得到了体现。

结论：尽管全球范围内 AREDS 的相对疾病负担有所改善，但地区间仍存在显著差异，这强调了制定及时且有效的年龄相关性眼病预防和管理策略的重要性，尤其是在社会人口学指数较低的国家。

摘要编号：210133

40 岁及以上成年人估计葡萄糖处理率与眼部疾病的关联：来自两项大型人群调查的证据

第一作者：Jian DENG

共同作者：Liduo PAN, Xiaoyi YU

目的：由眼部疾病引起的视力损伤是全球重大公共卫生问题，胰岛素抵抗与眼部疾病密切相关。估计葡萄糖处理率（Estimated Glucose Disposal Rate, eGDR）作为一种评估胰岛素抵抗的无创工具，或可具备识别多种眼病并预测其预后的临床价值。本研究旨在基于美国与韩国的两项大规模人群调查数据阐明这一关系，并利用中介分析深入探讨其潜在机制。

方法：这项横断面研究选取了来自美国（n = 5058, NHANES 2005-2008）和韩国（n = 4841, KNHANES 2008-2012）的 40 岁及以上具有代表性的人群样本。采用加权多变量逻辑回归、限制性立方样条与亚组分析，深入探讨了 eGDR 与白内障、青光眼、年龄相关性黄斑变性、糖尿病视网膜病变（Diabetic retinopathy, DR）、以上任一眼病等多种眼部疾病之间关联。为明确 eGDR 与 DR 的特异性关联，本研究在全体人群分析基础上，专门在糖尿病患者亚组中进行了针对性分析。通过受试者工作特征（Receiver operating characteristic, ROC）曲线评估了 eGDR 的预测效能，并采用中介分析深入探究了影响该关联的潜

在中介变量。E 值分析、亚组分析及基于随机森林的多重插补法用于评估结果的稳健性。

结果：在两个数据库中，初步分析显示较高的 eGDR 水平与五种眼部疾病的患病风险降低存在关联。在完全校正协变量后，最高 eGDR 水平对 DR 显示出显著保护作用（NHANES: OR 0.65, 95% CI: 0.55-0.78; Q4 VS Q1, OR 0.34, 95% CI: 0.14-0.86; KNHANES: OR 0.56, 95% CI: 0.44-0.70; Q4 VS Q1, OR 0.07, 95% CI: 0.01-0.62）。在糖尿病患者亚组中完全校正协变量后，同样发现最高 eGDR 水平对 DR 具有显著保护作用。此外，eGDR 对任一眼部疾病也呈现保护效应（NHANES: OR 0.80, 95% CI: 0.69-0.92; KNHANES: OR 0.56, 95% CI: 0.44-0.70）。限制性立方样条分析证实 eGDR 与 DR 及任一眼部疾病风险之间存在线性负相关关系。ROC 曲线显示 eGDR 的预测最佳截断值分别为 6.50（NHANES）和 6.97（KNHANES）。中介分析表明，空腹血糖、TyG 指数和 TyHbG 指数部分介导了该保护性关联。E 值分析、亚组分析及基于随机森林的多重插补法共同验证了本研究结果的稳健性。

结论：在 40 岁及以上美国与韩国成年人中，较高的 eGDR 水平与眼部疾病风险降低存在保护性关联，这一关联在糖尿病视网膜病变中尤为明显。在全球老年化的大趋势下，eGDR 有望成为眼部疾病预测与干预的新靶点。

摘要编号：208068

AI 辅助糖尿病性视网膜病变远程阅片模式下的县域眼科医共体建设

第一作者：Cong ZHANG

目的：探索 AI 辅助糖尿病性视网膜病变远程阅片模式下，以重庆大学附属沙坪坝医院为主体，以社区卫生服务中心为依托的县域眼科医共体建设的必要性和可行性。

方法：使用北京依未科技的人工智能眼底阅片软件，建设重庆大学附属沙坪坝医院眼科糖尿病视网膜病变远程阅片中心，联通沙坪坝区基层社区卫生服务中心，通过基层社区卫生服务中心对糖尿病建档患者定期行免散瞳眼底照相，计算糖尿病视网膜病变阳性率和转诊率，探索 AI 辅助糖尿病视网膜病变远程阅片模式下县域眼科医共体建设的必要性和可行性。

结果：2023 年 4-2024 年 10 月，已成功构建重庆大学附属沙坪坝医院眼科糖尿病视网膜病变远程阅片中心，8 家基层社区卫生服务中心参与。共筛查糖尿病患者 6327 人，糖尿病性视网膜病变阳性人数 778 人，阳性率（778/6327）为 12.30%，其

中转诊到我院的人数 188 人，转诊率 (188/778) 24.16%，占糖尿病建档患者比例为 (188/6327) 3.00%。转诊患者需要外科（眼底激光、玻璃体腔注射、玻璃体切割手术）干预者 109 人，占转诊人数的 (109/188) 57.98%，需要定期随访者 79 人，占转诊人数的 (79/188) 42.02%。

结论：AI 辅助糖尿病性视网膜病变远程阅片县域眼科医共体模式可以提高糖尿病性视网膜病变的早期检出率 (3.00%)，通过精准转诊、早期治疗，能降低患者及社会的经济负担。AI 辅助糖尿病性视网膜病变远程阅片县域眼科医共体模式通过互联网 + 医疗破解基层医疗卫生机构缺乏眼科专科医师的瓶颈，持续提升基层社区卫生服务中心的医疗服务能力。AI 辅助糖尿病性视网膜病变远程阅片县域眼科医共体模式下转诊率偏低 (24.16%)，需向基层医务人员和患者进一步普及糖尿病性视网膜病变的危害。AI 辅助糖尿病性视网膜病变远程阅片县域眼科医共体模式需要政府、医疗机构、企业共同参与。

摘要编号：210270

不同年龄段人群角膜散光的差异性研究

第一作者：Jiawei SONG

共同作者：Dongmei LIU

目的：通过分析近 5 年我院白内障患者前表面角膜散光 and 全角膜散光在度数、轴向和类型等数据，探讨角膜散光在不同年龄段人群中的差异。从而对不同年龄段角膜散光变化趋势进行预测，达到科学推测角膜散光变化的目的。

方法：回顾性研究。本研究收集近 5 年接受白内障治疗的患者检查数据，选取数据完整且无角膜病变的眼为研究对象，共计 163 例 (319 只眼)，以年龄为依据十岁为一段分为十组。由 IOL-master700 测得全角膜散光、前表面角膜散光大小和轴向，使用 SPSS 21.0 分析上述数据，因各样本是互相独立的随机样本且符合正态分布，多组间相互比较使用方差分析。

结果：以十岁为一个年龄段，从 0 岁到 99 岁十个年龄段各年龄段全角膜散光的数值分别为 -1.49 ± 0.81 ， -1.76 ± 1.13 ， -1.60 ± 0.87 ， -1.10 ± 1.02 ， -0.94 ± 0.81 ， -0.74 ± 0.47 ， -0.78 ± 0.53 ， -0.98 ± 0.64 ， -1.43 ± 0.69 ， -2.25 ± 1.51 。可得全角膜散光在 50 至 59 岁之前呈下降趋势，平均每十年下降 0.125 D，之后开始增加，平均每 10 年增加 0.378 D。从类型上说，总角膜散光发生转折的年龄段为 35 至 45 岁，角膜前表面散光为 55 岁至 65 岁，其趋势为向逆规散光发展。全角膜散光在该转折年龄段前以每十岁逆规散光比重增加 4.55% 的速度发展，在之后以 9.47% 的速度发

展。各年龄段角膜前表面散光的数值分别为 -1.67 ± 0.86 ， -1.76 ± 1.13 ， -1.59 ± 0.87 ， -1.21 ± 1.09 ， -0.90 ± 0.95 ， -0.72 ± 0.46 ， -0.66 ± 0.51 ， -0.86 ± 0.52 ， -1.05 ± 0.82 ， -1.98 ± 1.38 。可得角膜前表面散光在 60 至 69 岁之前呈下降趋势，平均每 10 年下降 0.144 D，之后平均每 10 年增加 0.44 D。从类型来说，角膜前表面散光以每十岁逆规散光比重增加 5.55% 的速度发展，在之后以 11.67% 每 10 年的速度发展。角膜后表面散光在 50 至 59 岁之前整体呈下降趋势，平均每 10 年下降 0.02 D，之后平均每 10 年整体增加 0.065 D。全角膜散光和角膜前表面散光在不同年龄段均具有差异性。

结论：全角膜散光随年龄增长呈现向逆规散光发展的趋势，并且在青少年和老年中趋势较缓，中年趋势较大，该趋势应当在矫正散光的白内障手术中予以考虑。

摘要编号：210263

不同年龄段白内障患者瞳孔大小差异性研究

第一作者：Jiawei SONG

共同作者：Dongmei LIU

目的：研究不同年龄段白内障患者瞳孔大小及 Kappa 角差异性，探讨瞳孔及 Kappa 角的变化及影响因素。

方法：采用回顾性病例研究，收集 2017 年 9 月至 2023 年 2 月在我院行 OPD-Scan III、IOL-Master 700 检查的 129 例 (156 眼) 患者的临床资料，年龄 5 ~ 95 岁 (平均 58.78 ± 25.64 岁)，将患者依据年龄分为 30 岁以下、30 ~ 39 岁、40 ~ 49 岁、50 ~ 59 岁、60 ~ 69 岁、70 ~ 79 岁、80 ~ 89 岁及 90 岁以上的八个组，分析瞳孔大小及 Kappa 角在不同年龄段白内障患者中的分布特点及改变，Pearson 相关分析瞳孔及 Kappa 角与其他眼球生物测量参数的相关性。

结果：① 不同年龄段患者的明视 Kappa 角、暗视瞳孔直径、暗视 Kappa 角、明视 Kappa 角与暗视 Kappa 角之间差值的差异性均有统计学意义 (P 均 < 0.05)，八组患者的明视瞳孔直径平均为 3.51 ± 0.88 mm，差异无统计学意义 ($P = 0.241$)。明视瞳孔直径与年龄的线性回归方程不显著 ($P = 0.486$)，即明视瞳孔直径与年龄没有相关关系；明视 Kappa 角与年龄的线性回归方程 $Y = 0.001 \times X + 0.194$ ， $P = 0.009$ ， $R^2 = 0.043$ ；暗视瞳孔直径与年龄的线性回归方程 $Y = -0.025 \times X + 6.686$ ， $P < 0.001$ ， $R^2 = 0.345$ ；暗视 Kappa 角与年龄的线性回归方程 $Y = 0.002 \times X + 0.204$ ， $P = 0.001$ ， $R^2 = 0.067$ ；明视 Kappa 角与暗视 Kappa 角之间的差

值与年龄的线性回归方程 $Y = -0.001 \times X + 0.244$, $P = 0.019$, $R^2 = 0.035$ 。② 明视瞳孔直径、暗视瞳孔直径、明视 Kappa 角、暗视 Kappa 角、明视 Kappa 角与暗视 Kappa 角之间差值与屈光度均无明显相关性 ($r = -0.057, 0.053, 0.124, 0.097, -0.015$, P 均 > 0.05) ; 明视瞳孔直径、暗视瞳孔直径、明视 Kappa 角、暗视 Kappa 角、明视 Kappa 角与暗视 Kappa 角之间差值与眼轴长度均无明显相关性 ($r = 0.145, 0.064, -0.01, -0.001, 0.031$, P 均 > 0.05) ; 明视瞳孔直径、明视 Kappa 角与暗视 Kappa 角之间差值与前房深度均无明显相关性 ($r = -0.056, -0.047$, P 均 > 0.05) , 暗视瞳孔直径与前房深度呈中等正相关 ($r = 0.339$, $P < 0.001$) , 明视 Kappa 角、暗视 Kappa 角与前房深度呈中等负相关 ($r = -0.346, -0.349$, P 均 < 0.001) 。

结论: 白内障患者随着年龄的增长, 暗视瞳孔直径有减小的趋势, 明视 Kappa 角与暗视 Kappa 角有增大的趋势。随着年龄的增长, 前房深度逐渐变浅, 暗视瞳孔直径也逐渐缩小, 而明视 Kappa 角与暗视 Kappa 角逐渐增大。瞳孔大小及 Kappa 角与屈光度和眼轴长度无相关性。

摘要编号: 207665

两例经基因确诊的 Knobloch 综合征 1 型患者临床特征与手术干预分析

第一作者: Wenting WANG

目的: 报道两例经基因检测确诊为 Knobloch 综合征 1 型 (KNO1) 的患儿, 分析其眼部临床表现的异同, 探讨早期诊断及手术干预的时机、方式与效果, 提高临床医生对此罕见病的认识。

方法: 病例 1: 2 岁女性, 主诉“自幼视力差”。查体: 视力不配合。检影验光: 右眼 $+1.00 / -2.50 \times 160$, 左眼 -7.00 。右眼虹膜后粘连, 晶状体局限性后囊混浊; 左眼周边晶状体后囊混浊。眼底: 右眼后极部视网膜脱离 (RD), 颞侧视网膜前增殖膜; 左眼视网膜萎缩变薄, 黄斑结构不清。诊断: 右眼孔源性 RD (考虑牵拉性因素), 双眼先天性白内障。行右眼玻璃体切割术 (PPV) 联合硅油填充术。病例 2: 4 岁男性, 主诉“自幼发现视力差”。视力: 双眼均 0.03, 矫正无助 (右眼: $-13.00 D$, 左眼: $-11.00 D$)。双眼眼球震颤。晶状体混浊。眼底: 双眼视网膜萎缩; 右眼颞侧及下方视网膜劈裂样改变, 左眼颞侧视网膜劈裂样改变。诊断: 双眼视网膜劈裂, 双眼先天性白内障。先后行双眼 PPV + 视网膜激光光凝 + 白内障超声乳化吸除 + 人工晶状体植入术 (IOL)。

结果: 基因诊断 两例患儿均通过全外显子组测序 (WES) 或目标基因 panel 检测, 确诊为 COL18A1 基因致病性突变导致的 Knobloch 综合征 1 型。病例 1 (术后): 右眼硅油填充状态下视网膜平伏。术后视力 (行为观察) 较术前似有改善 (具体定量困难)。术后 6 个月取出眼内硅油。病例 2 (术后): 双眼视网膜劈裂范围未进一步扩大, 激光斑清晰。白内障术后屈光介质透明。双眼矫正视力仍为 0.15。术后随访稳定。共同特征 两例均自幼视力低下, 伴有显著屈光不正 (高度近视倾向), 双眼先天性白内障, 视网膜发育不良/萎缩。病例 1 以 RD 为主要表现, 病例 2 以视网膜劈裂为主要表现。

结论: 本报告展示了两例经基因确诊的 Knobloch 综合征 1 型患儿: 临床表现异质性: 虽共享核心特征 (视力差、白内障、视网膜异常、高度近视倾向), 但具体视网膜病变 (RD vs. 劈裂) 及严重程度存在差异。基因诊断价值: 基因检测 (COL18A1) 是确诊此罕见综合征的金标准, 对明确诊断、遗传咨询至关重要。

摘要编号: 209558

中国人群遗传性视网膜纤毛病: 基于 2602 例患者队列的基因谱系与临床表型关联研究

第一作者: Shicheng YU

共同作者: Liping YANG

目的: 遗传性视网膜纤毛病 (IRCs) 是一组由纤毛结构或功能缺陷导致的遗传性视网膜变性疾病, 具有高度的遗传异质性和临床多样性。目前已知超过 200 个基因与遗传性视网膜疾病相关, 其中许多与纤毛功能有关。本研究旨在通过大样本队列研究, 系统分析中国 IRCs 患者的致病基因突变频谱、临床表型特征及其关联, 为精准诊断和遗传咨询提供依据。

方法: 对临床表现为遗传性视网膜变性疾病的就诊患者进行基本信息的采集、整理, 抽取其外周静脉血进行基因检测, 并进行相应的眼科专科检查。基因检测主要采用芯片捕获高通量测序方法以及直接 Sanger 测序验证两种技术, 以受检者静脉血液标本为材料进行基因测序。

结果: 从本课题组检测的 2602 个 IRD 患者中, 检出 1199 例纤毛病相关基因突变的患者, 共涉及 45 种不同基因。数据库中以 CYP4V2 突变患者最为常见, 符合以往研究结果。在检出的纤毛病患者中, 又以 USH2A 突变患者占比最高, 占 24.9%, 其中以 exon13 突变发生频率最高, 占 12.1%。检出纤毛病突变基因中, 如 USH2A、ABCA4、EYS 等多与纤毛功能相关。

结论: 本研究完善了中国遗传性视网膜纤毛病的突变频谱与基因特点, 且与其他种族有着显著差异。为后续治疗靶点的筛选提供有效的参考方向。

中国住院患者机械性眼外伤的发病率、危险因素及预后分析: 基于中国眼外伤研究 2021-2023 年数据

第一作者: Han HAN

共同作者: Yongjie CHEN, Hua YAN

目的: 基于中国眼外伤登记系统 (China Ocular Trauma Study, COTS), 采用多中心横断面研究设计, 系统分析了中国机械性眼外伤的流行病学特征及其预后影响因素, 为完善我国眼外伤防治体系提供了重要的循证医学依据。

方法: 本研究基于中国眼外伤研究 (China Ocular Trauma Study, COTS) 开展多中心横断面分析, 纳入 2021 年 1 月至 2023 年 12 月全国 99 家医院的机械性眼外伤住院患者。按每 10 万人口计算发病率, 并将损伤类型分为开放性眼球损伤 (Open-globe injury, OGI) 和闭合性眼球损伤 (Closed-globe injury, CGI)。术后不同时间点评估患者视力恢复情况。

结果: 眼外伤累积发病率为 1.77/10 万, 其中男性 (2.9/10 万) 和 50-54 岁人群 (7.11/10 万) 发病率最高。纳入的 21 个省份的 OGI 与 CGI 分布中, 福建省 (13.69/10 万) 和河南省 (7.26/10 万) 眼外伤发病率居全国前列。OGI 发病率显著高于 CGI (1.26 vs. 0.30/10 万)。老年患者 (60-79 岁)、合并角膜或视神经损伤者及需硅油填充术者视力预后较差。影响视力预后的关键因素在 OGI 中为硅油依赖、玻璃体损伤及损伤类型, 在 CGI 中为玻璃体损伤、黄斑损伤及角膜损伤。

结论: 本研究首次提供了中国眼外伤的全国性分析, 揭示男性及 50-54 岁人群高发率特征, 且开放性眼外伤预后更差。研究结果强调需针对高危人群制定预防策略, 并通过及时干预改善眼外伤患者预后视力。

中国成都大规模研究: 青少年近视足矫正率随近视度数增加而下降

第一作者: Jing WEI

目的: 近视是全世界儿童青少年日益严重的健康问题。本研究调查了中国西部城市成都市学生近视相关情况, 分析近视戴镜率和近视足矫率及其影响因素, 了解近视预防现状。

方法: 这项以学校为基础的横断面研究调查了 2020-2022 年中国成都市 7 区 1,582 所学校, 共纳入 6-18 岁 (小学、初中、高中) 学生共 417,337 名。检查项目包括裸眼远视力、裂隙灯检查和非散瞳电脑验光。非睫状肌麻痹近视定义为 $SE \leq -0.50 D$ + 未矫正视力 (UCVA) $> 0 \log MAR$ (对于 6 岁儿童或更大年龄), 近视戴镜率定义为在研究的人群范围中, 近视戴镜的人数 / 近视的人数 (%), 近视足矫定义为近视配镜后视力正常 (6 岁及以上 $\leq 0 \log MAR$)。在政府的支持下, 本项目每年将进行 1-2 次。进行统计学分析以确定近视与各种参数之间的关联。

结果: 整个调查对象平均年龄为 (10.96 $\pm$ 3.5 岁), 小学生 248,194 名, 初中生 99,300 名, 高中生 69,843 名, 总体近视患病率为 48.7%, 其中近视戴镜率为 65.7%, 近视足矫率为 50.5%。随着年龄和教育程度的增加, 中高度近视患病率、戴镜率和足矫率增加, 低度近视的足矫率 (46.5%) 高于中度近视的足矫率 (47.1%), 高于高度近视的足矫率 (39.6%)。男生戴镜率小于女生戴镜率 (63.4% vs 68.0%), 但是近视足矫率男生高于女生 (51.2% vs 49.8%), 近视眼镜的正确利用率为 33.17%, 随着年龄和教育程度的增加而增加, 中度近视人群眼镜的正确利用率最高, 为 40.7%。

结论: 成都市儿童青少年近视患病率相对较低, 戴镜率和足矫率有待提高, 发现随着近视度数的增加, 青少年近视足矫率反而降低。

摘要编号: **203003**

人工智能在眼科防盲及患者教育中的应用研究

第一作者: Xianwei LI

目的: 探讨人工智能技术在眼科防盲筛查和患者健康教育中的实践价值, 解决基层筛查覆盖率低、公众眼健康意识不足等问题, 为构建智能化眼健康管理提供依据。

方法: 1. 技术路径 智能筛查系统: 基于 12 万张眼底照片训练的 RAIDS 模型, 可识别 10 种眼底疾病, 敏感度达 89.8%。教育平台: 采用 ChatZOC 大语言模型构建数字患者系统, 模拟临床问诊场景。2. 实施场景 防盲筛查: 在基层社区部署便携式眼底相机 + AI 诊断系统, 实现糖尿病视网膜病变等早筛。患者教育: 通过智能问答系统提供个性化术后指导, 提升患者依从性。

结果: 防盲成效: 鹰瞳 AI 系统在 65 家体检机构验证中, 筛查效率提升 75%, 误诊率降低至 1% 以下。青光眼 AI 筛查系统使早期检出率提升 40%, 干预时机提前 2-3 年。教育效果: 数字患者教学系统使医学生病史采集能力提升 20%, 65% 反馈交互

更真实高效。智能宣教平台术后复诊率提高 30%，并发症发生率下降 25%。经济效益：基层筛查成本降低 60%，单例检查耗时从 15 分钟缩短至 3 分钟。

结论：1. AI 技术显著提升防盲筛查效率和教育效果，尤其适用于资源匮乏地区。2. 需加强数据标准化建设和伦理审查，确保算法公平性与安全性。3. 未来应推进“筛查—诊断—教育”全链条 AI 整合，构建智能化眼健康生态。

摘要编号：204445

从血液到视觉：地中海贫血中铁过载的眼部生物标记物

第一作者：Danna CHEN

共同作者：Shitong HUANG, Yunxia LENG, Ningfeng LI, Yingying LIANG

目的：输血依赖性地中海贫血患者（TDT）反复输血引发的体内铁过载，可导致多器官损伤。目前其早期诊断和监测手段为有创性或价格高昂。本研究旨在探索 TDT 患者铁过载相关的眼部生物标记物，为铁过载早期诊断和动态监测提供线索。

方法：本研究采用横断面研究设计，纳入 29 例 TDT 患者（58 眼）作为实验组及 29 例健康志愿者（58 眼）作为对照组，利用光学相干断层扫描等影像学技术检测眼部结构与功能变化，收集研究对象的临床资料、血液及眼部生物参数 85 个（包含角膜及视网膜、脉络膜）、血清铁蛋白评估全身铁负荷水平。通过相关分析、多元回归及 ROC 曲线等统计方法评估标记物的诊断价值，建立铁过载预测模型。

结果：与对照组相比，TDT 患者黄斑中心区神经节细胞层、视网膜神经纤维层和神经节细胞复合体（GCC）厚度显著变薄（所有 P 值均 < 0.05 ），视盘区的表层血管复合体、深层血管复合体、神经节细胞层的毛细血管网、视盘视网膜最深部（通常在内核层）的毛细血管网、脉络膜毛细血管的血流密度、脉络膜厚度增加（所有 P 值均 < 0.05 ），而脉络膜血管指数（CVI）平均升高 6%（ $P = 0.035$ ）。Pearson 相关分析显示，中央区 GCC 厚度与铁螯合治疗持续时间呈正相关（ $r = 0.280$, $P < 0.05$ ）；视盘深部血管从 DCP、视盘 AC、MRV7 及 CVI 与血清铁蛋白水平呈显著正相关（ $P < 0.01$ ）。Logistics 回归分析结果表明，角膜内皮细胞面积、视盘鼻侧的层血管丛 SVPb、ACn、Cpz、MRV8、CVI 是铁过载的独立影响因素，MVR5 为非独立影响因素，其中仅角膜内皮细胞面积属于保护因素，其余都是危险因素，以 CVI 影响最大。以上影响因素联合检测的 ROC 线下面积为 0.95，灵敏度达

83.5%，特异度为 81.2%，较单一指标具有更高的诊断效能；铁螯合治疗持续时间是中央区 GCC 厚度的独立影响因素（ $\beta = 0.306$, $P = 0.011$ ）。此外，62.30% 的 TDT 患者存在视盘倾斜，34.43% 表现为豹纹状眼底，6.56% 伴有弹性纤维假黄瘤。

结论：本研究证实 TDT 患者铁过载可导致显著的眼部结构与功能损害，筛选出数个潜在生物标记物具有良好的诊断价值，构建的基于眼部参数的铁过载预测模型可能有助于铁过载的早期诊断和病情监测。

摘要编号：210250

儿童黄斑区脉络膜厚度三维分布随年龄与近视的变化模式

第一作者：Luxiao CHEN

共同作者：Ziyao WANG, Jixuan YUAN

目的：分析儿童黄斑区脉络膜厚度（ChT）三维分布模式及其与年龄和眼轴长度（AL）的关联。

方法：横断面研究。该研究以分层整群抽样方法在内蒙古巴彦呼舒地区抽取 2 所小学和 2 所中学，对 4 所学校的全部学生进行全面眼科检查，包括利用谱域光学相干断层成像（SD-OCT）技术对黄斑区进行水平扫描。每张扫描图像采用改进的开源深度学习算法（Choroidalyzer）对脉络膜区域进行自动分割和厚度测量。取受检者右眼进行图像和统计分析，最终生成由 12×12 网格构成的覆盖 6×6 mm 黄斑区域、以中央凹为中心的三维脉络膜厚度分布图谱。并评估该厚度分布模式与年龄和眼轴长度的关系。

结果：共纳入 3508 名儿童（平均年龄 13.6 ± 3.0 岁，范围 7–18 岁，男性 47.7%）。总体黄斑区域平均脉络膜厚度为 $271.8 \pm 56.1 \mu\text{m}$ ，在不同近视程度组（无近视、低度、中度、高度近视）间差异具有统计学意义（ $P < 0.001$ ）。研究观察到与年龄相关的颞—鼻方向不对称分布模式：鼻侧区与年龄呈最强负相关（ $r = -0.1$, $P < 0.001$ ），而颞侧则基本稳定（ $r = 0.0$, $P = 0.258$ ）。其中中央区和鼻侧脉络膜的变薄速度分别较颞侧快 6.6 倍和 7.8 倍。而随眼轴长度增加脉络膜则出现同心性变薄模式，表现为中央凹区变薄更为明显（ $r = -0.5$, $\beta = -29.7 \mu\text{m}/\text{mm}$, 均 $P < 0.001$ ），而外围区的变化相对较小（ $r = -0.4$, $\beta = -19.4 \mu\text{m}/\text{mm}$, $P < 0.001$ ）；与外围区相比，中央凹和旁中央区的变薄速度分别快约 1.5 倍和 1.3 倍。

结论：基于脉络膜厚度三维分布，我们揭示了儿童两种主要的脉络膜厚度时空变化模式：随年龄增长的颞—鼻不对称模式以及随眼轴增长的同心性变薄模式。该结果反映了生理生长和近视相关重塑在

空间和时间上的动态特征，并为早期识别近视进展及基于脉络膜的近视管理决策提供了潜在影像学标志。

摘要编号：209547

基于基线和纵向临床数据建立个性化糖尿病视网膜病变进展的风险预测模型

第一作者：Bing LIU

目的：基于基线和纵向临床数据建立个性化糖尿病视网膜病变（DR）进展的风险预测模型，协助基层医生对 DR 患者分层管理，及时转诊 / 干预，提升转诊效率。

方法：采用 SPSS 26.0 和 R 4.4.1 版本进行统计分析。应用免散瞳眼底照相机（Topcon TRC. NW 400）连续 2 年采集眼底视网膜图像并应用量化人工智能辅助诊断系统进行分析。任一眼睛 DR 分期增加和 / 或同一分期眼底病变数量增加为 DR 进展组（273 例），眼底病情无增加为 DR 无进展组（328 例）。数据集按照 7: 3 的比例随机分为训练组和验证组。通过 lasso 回归结合 logist 多因素分析识别与结局的危险因素，建立预测模型。利用受试者工作特征（ROC）曲线评估模型性能，AUC 量化模型的诊断能力。通过绘制校准曲线验证模型校准的效果。采用决策曲线分析（DCA）评估模型的临床实用性。统计显著性水平设定为 $P < 0.05$ 。

结果：可调控因素 HbA1c（OR = 1.473, 95% CI: 1.249–1.739, $P < 0.001$ ）、BMI 差值（OR = 1.457, 95% CI: 1.214–1.747, $P < 0.001$ ）、腰围差值（OR = 1.083, 95% CI: 1.039–1.128, $P < 0.001$ ）和不可调控因素年龄（OR = 1.047, 95% CI: 1.021–1.073, $P < 0.001$ ）、高血压年数（OR = 1.041, 95% CI: 1.012–1.071, $P = 0.006$ ）、糖尿病年数（OR = 1.05, 95% CI: 1.016–1.085, $P = 0.004$ ）是显著的危险因素，建立预测模型。在训练集中，模型的 AUC 为 0.799（95% CI 0.757–0.841），在验证集中的 AUC 为 0.788（95% CI 0.722–0.853），具有较好的预测能力及净收益。

结论：积极主动管理可调控因素是阻止 DR 进展的核心，个性化预测模型可提升基层医生对 DR 患者的有效转诊性，为破解社区 DR 患者随访困境提供一个方案。

摘要编号：208110

基于江苏省中小学生近况的流行病学筛查策略研究

第一作者：Xiyao ZHANG

目的：近视已成为影响我国学生眼健康的重大公共卫生问题。江苏省作为经济发达与近视高发地区，中小学生人数近千万，近视防控形势严峻。前期研究已证实 13–18 岁中学生群体可采用简化筛查策略，但针对 6–12 岁小学生这一关键预防年龄段，尚缺乏高效且精准的筛查方案。本研究旨在系统比较江苏省现行的多种近视筛查方案与金标准的检测结果，评估其筛查效能，以期建立适用于本省低学段人群的优化筛查策略，为公共卫生决策提供科学依据。

方法：本研究于 2020 年与 2023 年共调查了 3500 名 6 ~ 12 岁的江苏省汉族小学生，所有纳入对象均无其他严重眼病。研究系统性地比较了七种近视筛查方案与金标准的一致性。筛查方案包括：方案 1（非睫状肌麻痹等效球镜度 $SE < -0.50 D$ ）、方案 2（裸眼远视力 < 5.0 ）、方案 3（轴率比 AL/CR > 3 ）、方案 4（两两组合：4.1 为方案 1 + 2，4.2 为方案 1 + 3，4.3 为方案 2 + 3）以及方案 5（方案 1、2、3 三者联合）。所有方案均以睫状肌麻痹后 $SE \leq -0.50 D$ 作为诊断近视的金标准进行比对。

结果：金标准检查结果显示，所调查的 3500 名学生的总近视率为 50.0%，且近视率随年龄增长呈现显著上升趋势，从 6 岁组的 16.8% 递增至 12 岁组的 78.0%。将各筛查方案与金标准比较发现，所有方案均与金标准存在统计学差异（ $P < 0.001$ ）。其中，方案 2（裸眼视力 < 5.0 ）的阳性检出率最高（合计 64.0%），在所有年龄段均显著高估了近视率。方案 1（非睫状肌麻痹 $SE < -0.50 D$ ）和方案 3（AL/CR > 3 ）的合计阳性率与金标准最为接近，分别为 49.9% 和 48.3%。各类组合方案（方案 4.1、4.2、4.3 及方案 5）的阳性检出率普遍低于金标准，呈现出更高的特异性但灵敏度有所降低，其中方案 5（三联合）的阳性率最低（合计 39.1%）。

结论：在条件允许时，6 ~ 8 岁学生推荐使用金标准（睫状肌麻痹验光）；9 ~ 12 岁学生推荐采用方案 4.1（非睫状肌麻痹 $SE < -0.50 D$ 联合裸眼视力 < 5.0 ）进行筛查；若仅能采用单一手段，则推荐方案 1（非睫状肌麻痹 $SE < -0.50 D$ ）。组合筛查方案未显著优于两种手段联合。本研究基于大样本实证比较，构建了适用于江苏省小学生群体的近视筛查策略体系。

摘要编号: 208601

心血管—肾脏—代谢综合征 0-3 期人群中葡萄糖处置率与年龄相关性眼病的关联: 大样本前瞻性队列研究

第一作者: Linge JIAN

目的: 探讨心血管—肾脏—代谢 (CKM) 综合征 0-3 期人群中, 葡萄糖处置率 (eGDR) 与年龄相关性眼病——包括黄斑变性、青光眼、白内障、糖尿病视网膜病变 (DR) 及视网膜脱离 (RD) ——发病风险的关系。

方法: 基于 UK Biobank 的前瞻性队列研究, 共纳入 223,120 名受试者。依据肥胖程度、代谢危险因素及亚临床心血管疾病确定 CKM 分期; eGDR 越低提示胰岛素抵抗越严重。研究终点为黄斑变性、青光眼、白内障、DR 及 RD 的新发事件。采用 Cox 比例风险模型估计风险比 (HR) 及其 95% CI, 并以限制性立方样条探索非线性关系。

结果: 黄斑变性 (HR 0.92, 95% CI 0.87-0.97, $P = 0.001$) 与青光眼 (HR 0.91, 95% CI 0.87-0.95, $P < 0.001$) 均与 eGDR 呈线性负相关; 白内障与 eGDR 呈 U 型关联 (P 非线性 = 0.001), DR 呈 L 型关联 (P 非线性 = 0.018)。按 eGDR 四分位分层后, DR (Q4 vs Q1: HR 0.15, 95% CI 0.04-0.52, $P = 0.003$) 与 RD (Q4 vs Q1: HR 0.65, 95% CI 0.47-0.89, $P = 0.007$) 的风险差异具有统计学意义。分层效应分析显示, 上述关联在 CKM 综合征晚期阶段更为显著。

结论: eGDR 与 CKM 综合征患者的眼病风险密切相关, 且在晚期阶段尤为突出。该指标有望用于 CKM 管理中的眼科筛查分层。

摘要编号: 203386

新生儿疾病导致的全球失明负担: 现状评估与未来趋势预测

第一作者: Lianqun WU

共同作者: Shanhong LI

目的: 失明是新生儿疾病及其四个主要亚型引起的重要并发症, 严重影响患者的生活质量。本研究旨在系统评估全球范围内由新生儿疾病引起的失明负担变化趋势, 为公共卫生政策的制定提供依据。

方法: 本研究数据来源于《全球疾病负担研究 2021》。分析指标包括年龄标准化患病率和伤残调整生命年, 结合年度变化百分比和 Joinpoint 回归模型评估疾病负担趋势。健康不平等状况通过社会人口学指数 (SDI)、不平等斜率指数和集中指数进行评估。采用分解分析明确疾病负担变化的成因,

并利用贝叶斯年龄—时期—队列模型预测至 2040 年的发展趋势。

结果: 2021 年, 全球由新生儿疾病引起的失明患者超过 426 万人, 较 1990 年分别增长了 60.92% (患病人数) 和 61.33% (伤残年)。年龄标准化患病率和伤残年率均呈上升趋势, 年均变化率分别为 0.29% (95% 置信区间 [CI]: 0.26~0.32) 和 0.31% (95% CI: 0.28~0.34), 主要由人口增长和流行病学变化驱动。低 SDI 地区的疾病负担更高, 全球健康不平等现象仍然存在。2005 年至 2021 年间, 45~54 岁人群的失明患病率达到峰值。2040 年预测显示: 若延续 1990 至 2021 年的趋势, 失明率将下降; 但若依据 1990 至 2019 年 (新冠疫情前) 趋势, 未来或仍有小幅上升。

结论: 由新生儿疾病引起的失明全球疾病负担依然严峻。低 SDI 地区负担尤为严重, 同时因疾病缓慢累积所导致的迟发性失明风险可能被低估。亟需优化医疗资源配置, 加强对新生儿疾病幸存者的长期视力健康随访和干预管理。

摘要编号: 210040

早年体型轨迹与原发开角型青光眼风险: 一项队列研究

第一作者: Jianqi CHEN

共同作者: Zhidong LI, Yingting ZHU, Yehong ZHUO

目的: 原发性开角型青光眼 (Primary Open-Angle Glaucoma, POAG) 是全球范围内导致不可逆失明的主要原因之一。尽管体型已被认为可能与 POAG 风险相关, 但既往研究结果并不一致, 这可能部分归因于身体质量指数 (Body Mass Index, BMI) 测量时间点的差异, 目前尚缺乏针对早年体型变化轨迹与 POAG 风险的系统研究。

方法: 本研究基于英国生物银行共 467,768 名参与者的数据。儿童期体型通过与同龄人比较分为低、平均和高三类; 成年期体型则依据 BMI 经性别分层的年龄与年龄平方回归模型的残差进行分类。根据儿童期与成年期体型的组合, 构建了九种早年体型轨迹。采用 Cox 比例风险模型评估儿童期体型、成年期体型及其轨迹与 POAG 发病风险的关联, 计算风险比 (HR) 及 95% 置信区间 (CI)。

结果: 在 467,768 名参与者中, 与平均—平均轨迹相比, 成年期体型较低的个体 POAG 风险显著升高 (低—低: HR = 1.35, 95% CI: 1.17-1.55, $P < 0.001$; 平均—低: HR = 1.35, 95% CI: 1.18-1.53, $P < 0.001$; 高—低: HR = 1.49, 95% CI: 1.17-1.91, $P = 0.001$)。独立分析中, 成年期体型较低者较平均体型者 POAG 风险更高 (HR = 1.30, 95% CI: 1.19-1.43, $P < 0.001$), 而儿童期体型较高者

POAG 风险则略增(HR = 1.14, 95% CI: 1.00–1.29, P = 0.046)。根据儿童体型的分层分析显示, 儿童期体型较小但成年期达到平均(HR = 0.79, 95% CI: 0.68–0.93, P = 0.004)或高体型(HR = 0.58, 95% CI: 0.44–0.77, P < 0.001)的个体, POAG 风险显著降低。相反, 儿童期体型较高但成年期显著减重者, POAG 风险明显上升(HR = 1.66, 95% CI: 1.19–2.32, P = 0.003), 而中度减重至平均体型者风险无显著增加(HR = 1.25, 95% CI: 0.95–1.65, P = 0.111)。

结论: 通过早年体型轨迹分析, 体型与 POAG 风险之间的关联得到了进一步的阐明。研究结果提示, 成年期低体型与 POAG 风险升高密切相关, 应避免早年过度减重, 这对于降低 POAG 发病风险及疾病负担可能具有重要意义。

摘要编号: 206431

系统性炎症反应指数与年龄相关性黄斑变性风险的相关性研究

第一作者: Huimin SHAN

共同作者: Yong TAO

目的: 近年来的研究表明, 慢性轻度全身性炎症可能促进年龄相关性黄斑变性(AMD)的发生。系统性炎症反应指数(SIRI)作为一种新型炎症标志物, 已被验证可作为疾病的潜在预测指标。然而, 关于 SIRI 与 AMD 风险之间的相关性尚未有报道。本基于人群的研究旨在利用美国国家健康与营养调查(NHANES)的数据, 探究 SIRI 与美国人 AMD 风险之间的关联。

方法: 我们对 2005 年至 2008 年的 NHANES 数据进行了横断面分析。纳入了年龄在 40 岁及以上且有 SIRI 和 AMD 数据的参与者。SIRI 计算公式为(外周血中性粒细胞计数 × 单核细胞计数 / 淋巴细胞计数。AMD 则根据视网膜照片的标准化分级来定义。采用多因素 Logistics 回归模型评估 SIRI 与 AMD 风险之间的关联, 并对潜在的混杂因素进行了调整。同时, 还进行了敏感性分析和亚组分析。此外, 通过限制性立方样条(RCS)曲线探讨了 SIRI 与 AMD 风险之间的关系。

结果: 该研究共纳入 5365 名参与者, 其中 425 人(7.9%)患有 AMD。患有 AMD 的参与者中 SIRI 的中位数显著高于未患 AMD 的参与者(1.23 vs 1.04, P < 0.001)。在调整了潜在的混杂因素后, 较高的 SIRI 与 AMD 发病几率的增加独立相关(调整后的比值比 [OR]: 1.18, 95% 置信区间 [CI]: 1.07–1.29; P = 0.001)。SIRI 水平处于最高分段的个体比处于最低分段的个体, 其完全调整后的 OR 为 1.36 (95% CI: 1.05–1.77; P for trend =

0.006), 同时, RCS 分析也揭示了 SIRI 与 AMD 风险之间的剂量反应关系(P = 0.002)。亚组分析显示, 男性参与者(OR tertile3 vs tertile1: 1.48, 95% CI: 1.01–2.15; P = 0.043)、患有高血压的参与者(OR tertile3 vs tertile1: 1.47, 95% CI: 1.06–2.04; P = 0.020)、肥胖的参与者(OR tertile3 vs tertile1: 1.64, 95% CI: 1.02–2.62; P = 0.040)以及从未吸烟的参与者(OR tertile3 vs tertile1: 1.71, 95% CI: 1.14–2.57; P = 0.009)中, SIRI 与 AMD 风险之间存在显著的正相关关系。在针对总样本中 SIRI 评分低于 5% 或高于 95% 的个体进行的敏感性分析中。在敏感性分析中对所有混杂变量进行调整后, SIRI 与 AMD 风险之间的正相关关系仍保持显著(OR: 1.27, 95% CI: 1.03–1.56; P = 0.023)。

结论: 我们的研究表明, 在美国人群中, SIRI 升高与 AMD 风险增加独立相关。这些结果强调了 SIRI 作为识别 AMD 高风险个体的生物标志物的潜在价值, 从而促进 AMD 的早期干预和预防。未来, 需要进一步的前瞻性研究来验证这些发现, 并阐明全身性炎症与 AMD 发病机制之间的潜在机制。

摘要编号: 210330

表观遗传时钟在年龄相关性眼部疾病的预测和因果关系的作用研究

第一作者: Guoge HAN

共同作者: Pinghui WEI

目的: 表观遗传学时钟是指源自 DNA 甲基化(DNA_m)信息数据的重要衰老遗传指标。证据表明, 表观遗传学时钟 PhenoAge 和 GrimAge 的 CpG 位点的 DNA_m 水平加速改变和年龄相关疾病的风险增加相关。本研究探索表观遗传学时钟加速是否在年龄相关性眼病(包括老视、白内障、糖尿病视网膜病变、高血压视网膜病变、青光眼、年龄相关性黄斑变性)等中的因果关系和可能的生物标记物。

方法: 我们进行两样本的孟德尔随机化(MR)研究, 以检查表观遗传年龄加速的遗传预测效应, 这些效应通过 HannumAge (10 个单核苷酸多态性(SNPs))、Horvath 固有年龄(22 个 SNPs)、PhenoAge (10 个 SNP) 和 GrimAge (5 个 SNPs), 对年龄相关性眼病(老视、白内障、糖尿病及高血压眼底病变、青光眼、黄斑变性)进行测量。我们从荟萃分析中获得了生物衰老的全基因组关联数据(N = 35710), 并从 UKB (N 例 = 2565–12470; N 对照 = 163445–340202)、FinnGen (N 例 = 833–142011; N 对照 = 15861–105974) 获得全基因组相关数据。主要分析使用乘

法随机效应逆方差加权 (IVW) MR 进行。使用固定效应荟萃分析合并个体研究估计值。敏感性分析包括 MR Egger、加权中值、加权模式和使用汇总效应估计 (CAUSE) 方法的因果分析。

结果: 孟德尔随机化 IVW MR 结果表明, GrimAge 和 PhenoAge 加速率越高, 罹患白内障、黄斑变性以及老视的风险越高 ($OR = 1.19$; 1.17 ; 1.16 , GrimAge 加速率每年增加, $95\% CI$ $1.05-1.19$, $p = 0.0001$)。遗传预测效应的方向在敏感性 MR 分析中一致。与其他年龄相关性眼病相比较, PhenoAge 加速对 AMD 遗传预测效果 (IVW $OR = 1.13$, $95\% CI$ $1.08-1.21$, $p = 0.002$) 最强。

结论: 表观遗传学时钟 PhenoAge 和 GrimAge 加速在年龄相关性眼病中 (白内障、黄斑变性以及老视) 等中存在因果关系。PhenoAge 中 CpG 位点的 DNAm 加速对 AMD 有显著的遗传预测效果。

摘要编号: 208411

西安市儿童青少年屈光发育的区域差异及近视进展关联性研究

第一作者: Ye ZHANG

共同作者: Zhaojiang DU

目的: 为了解西安市儿童青少年屈光发育的区域差异及近视进展情况, 并分析导致近视进展的相关影响因素, 评价眼轴与轴率比诊断近视的准确性, 为西安市儿童青少年近视防控提供新策略。

方法: 采用分层整群随机抽样, 参与本研究的所有学生进行裸眼远视力 (UCVA)、最佳矫正视力 (BCVA) 及非睫状肌麻痹下的电脑验光检查, 并随机选取学生进行眼生物学测量, 其中包括角膜曲率、眼轴长度、眼轴长度与角膜曲率半径之比 (轴率比, AL/CR) 检查, 邀请连续 3 次参加眼生物学测量的学生测量身高和体重。采用 SPSS 软件进行数据的统计分析, 计量数据为采用 K-S 方法检验符合正态分布, 采用 t 检验, 检验不符合正态分布, 将使用秩和检验。采用 Pearson 相关分析探讨近视率与轴率比、眼轴长度、等效球镜增长的相关性, 等效球镜与轴率比、眼轴长度增长的相关性。采用 ROC 曲线判断评估近视的准确性。计数资料采用 n (%) 表示, 组间比较采用卡方检验。

结果: 1. 西安市的儿童青少年总近视率、总远视储备不足率、总散光率均具有区域差异性; 2. 西安市的儿童青少年的屈光发育具有年龄差异以及发育突增期, 8-9 岁为近视发展加速期, 8 岁前为远视储备不足率高峰, 初中九年级学生的散光率最高, 三年级升四年级时屈光参数进展较快; 3. 西安市的儿童青少年的屈光发育具有性别差异, 女生总近视率、总视力储备不足率及总体眼轴长度、总轴率比的平

均累计增长值均高于男生, 但总体屈光参数和散光率方面, 男生则高于女生; 4. 顺规散光是西安市儿童青少年散光最常见的类型; 5. 轴率比可作为提高近视筛查准确性的屈光参数之一。

结论: 西安市儿童青少年屈光不正具有区域差异、年龄差异及发育突增期、性别差异, 应为该地区采取针对性管理, 同时应用轴率比在筛查中评估近视的重要方式。

摘要编号: 207708

近视人群户外日光暴露与原发性开角型青光眼的关联研究

第一作者: Jianqi CHEN

共同作者: Zhidong LI, Yingting ZHU, Yehong ZHUO

目的: 作为重要的环境影响因素, 户外日光暴露在眼科学研究领域中受到广泛关注。既往研究表明, 适度的户外日光暴露有助于延缓近视的发生与进展。然而, 部分研究亦提示, 日光暴露可能通过多种机制对眼组织造成损伤, 从而增加青光眼的发病风险。原发性开角型青光眼是中老年近视人群的重要并发症之一, 目前尚不清楚长期户外日光暴露是否会增加近视个体发生原发性开角型青光眼的风险, 本研究旨在近视人群中探究这一关联。

方法: 本研究基于英国生物样本库数据, 基线纳入近视参与者, 基线存在青光眼的个体被排除, 户外日光暴露时长通过标准化触摸屏问卷进行评估。采用 Cox 比例风险模型计算风险比 (HR) 及其 95% 置信区间 (CI), 并对多项潜在混杂因素进行调整, 并根据人口学特征及近视程度 (高度近视与轻/中度近视) 进行亚组分析, 以评估潜在的交互效应。此外, 在基线人群中进一步分析户外日光暴露时长与角膜补偿眼压 (IOPcc) 及神经节细胞复合体厚度 (GCC) 之间的横断面关联, 基线存在其他类型青光眼的参与者在横断面分析中被排除。

结果: 在校正所有协变量后, 结果显示年平均户外日光暴露时长与原发性开角型青光眼发病风险呈显著正相关 ($HR = 1.15$, $95\% CI$: $1.04-1.27$, $P = 0.008$)。亚组分析结果表明, 不同年龄、性别、种族及近视程度的人群中, 日光暴露时长与原发性开角型青光眼风险之间的交互作用均未达统计学显著性, 提示户外日光暴露的风险效应应在各亚组间相对一致。基线横断面分析进一步发现, 年平均日光暴露时长较长的个体具有更高的 IOPcc ($\beta = 0.05$, $95\% CI$: $0.03-0.07$, $P < 0.001$), 但与 GCC 厚度之间无显著相关 ($\beta = 0.03$, $95\% CI$: $-0.08 \sim 0.14$, $P = 0.594$)。

结论: 本研究结果表明, 较长的户外日光暴露时间与近视人群原发性开角型青光眼发病风险的增加相

关，其机制可能与眼内压升高有关。该结果提示，应重视户外光照暴露在近视人群中可能带来的原发性开角型青光眼风险。

摘要编号：204057

陕西省 2021 年儿童青少年近视患病率及相关风险因素的流行病学研究

第一作者：Lu YE

共同作者：Yi-ming GUO, Yijin HAN, Jiaqi WANG, Junhan WEI, Kexin WU

目的：近视已成为全球健康问题，尤其在中国的儿童和青少年中更为突出。本研究旨在调查陕西省儿童和青少年群体的近视患病率，并探讨性别、教育水平和地域等因素对近视的影响，期望为制定地区性、针对性的近视防控策略提供依据。

方法：本研究为 2021 年在陕西省开展的大规模横断面研究，涵盖了来自关中、南部陕西和北部陕西的 261,504 名 6 至 20 岁的儿童和青少年。通过标准化的眼科检查和非睫状肌麻痹屈光度检测法评估屈光状态，结合结构化问卷调查收集人口学信息。研究采用多阶段分层聚类抽样方法，以确保样本的代表性。使用多元回归分析探讨影响近视的主要因素。

结果：陕西省儿童青少年的总体近视患病率为 67.4%，其中高度近视患病率为 4.63%。女性的近视及高度近视患病率显著高于男性，且随着教育水平的提高，近视患病率逐渐上升。陕北地区的近视和高度近视患病率最高。回归分析显示，性别、教育水平和地域是近视的重要风险因素，女性、教育年级较高的学生以及陕北地区的学生患近视的风险较大。

结论：陕西省儿童青少年近视的高患病率及其与性别、教育水平和地区的显著差异，为未来的近视防控政策提供了重要参考。研究表明，女性、高年级学生及陕北地区的青少年是近视的高危群体，这些群体应成为防控措施的重点。为有效应对近视流行趋势，建议结合不同群体特点，制定针对性强的干预策略，特别是在学校和社区层面普及视力保护知识，改善用眼习惯，同时倡导户外活动的增加，促进青少年群体视力健康的全面提升。

2 例玻切术后晶状体后囊前纤维机化膜的处理和思考

第一作者：Yanwen SONG

目的：探讨玻切术后晶状体后囊前纤维机化膜的形成机制、临床特点及处理方法，以提高对该病变的认识和手术效果。

方法：通过回顾 2 例临床病例及手术资料，分析晶状体后囊前纤维机化膜的形成原因及易发因素，总结其与后极性白内障的鉴别要点。介绍三种主要处理方法：1) 用撕囊镊环形撕除；2) 结合截囊针辅助剥离后撕除；3) 采用玻切头切除并后囊切开。同时，评估术后 YAG 激光后囊切开的局限性及玻切技术的优缺点。

结果：晶状体后囊前纤维机化膜的形成主要与晶状体上皮细胞增殖、移行及纤维化生有关，易发因素包括玻切术后、年轻患者、高度近视及硅油填充等。该病变需与后极性白内障鉴别，后者常伴后囊发育异常。术中撕囊镊或截囊针操作可有效处理较薄的机化膜，而致密或范围较大的机化膜需采用玻切技术。术后 YAG 激光可能因机化膜过厚而效果不佳，且可能引发并发症。

结论：晶状体后囊前纤维机化膜是玻切术后并发性白内障的常见表现，术前准确判断和术中合理选择处理方法至关重要。对于复杂病例，玻切技术是一种有效但费用较高的解决方案。未来需进一步优化手术技术以减少并发症并提高视觉质量。

摘要编号：208637

348 例眼附属器淋巴瘤的临床病理分析

第一作者：Weimin HE

目的：探讨眼附属器淋巴瘤 (ocular adnexal lymphomas, OAL) 的临床病理特征，提高眼科医生的认识水平，促进早期诊断和治疗，改善患者预后。

方法：收集 2010 年 1 月至 2023 年 7 月在四川大学华西医院眼科手术并经病理学检查确诊为 OAL 的患者资料，分析其症状、体征、影像学表现、病理学特征、治疗方法及预后。

结果：共纳入 348 例 OAL 患者，其中男性 206 例，女性 142 例，男女比约为 3: 2。发病年龄 5-91 岁，平均 58.00 ± 14.02 岁。眼部病程 2 周至 20 年，平均 20.63 ± 33.47 月。单眼受累 284 (81.61%) 例，

双眼受累 64 (18.39%) 例。主要受累部位包括眼眶内软组织 277 (79.60%) 例, 眼外肌 107 (30.75%) 例和结膜 82 (23.56%) 例。最常见的临床表现前三位为眶周包块 (212 例, 60.92%)、眼睑肿胀 (142 例, 40.80%) 和眼球突出 (110 例, 31.61%)。病变在影像学上大多数呈弥漫性生长 (190 例, 54.60%) 及边界不清 (293 例, 84.20%), 主要位于肌锥外间隙 (198 例, 56.90%)。病理类型多样, 以 MALT 淋巴瘤 (286 例, 82.18%) 为主, 其次是弥漫大 B 细胞淋巴瘤 (23 例, 6.61%)、结外鼻型 NK/T 细胞淋巴瘤 (15 例, 4.31%) 和套细胞淋巴瘤 (11 例, 3.16%), 其余淋巴瘤病理亚型少见。262 例患者确诊为 OAL 后继续在我院接受了进一步的检查治疗和随访。根据 Ann Arbor 临床分期标准, IE 期患者 170 (64.89%) 例, IIE 期患者 42 (16.03%) 例, IIIE 期患者 13 (4.96%) 例, IVE 期患者 37 (14.12%) 例。在治疗方面, 63 (24.05%) 例患者术后观察、127 (48.47%) 例患者术后放疗, 48 (18.32%) 例患者术后化疗, 24 (9.16%) 例患者术后放疗 + 化疗。通过 Kaplan-Meier 法及多因素 cox 回归分析发现, 临床分期、病理类型、术后治疗为影响患者无进展生存率的独立危险因素。

结论: OAL 好发于男性及老年患者, 临床表现多样, 病理类型复杂, 以 MALT 淋巴瘤最为常见。临床症状结合影像学检查可协助该病的诊断, 但确诊有赖于病理学检查。OAL 的治疗需要多学科协作及个性化方案, 准确的病理分型和临床分期对于治疗选择和早期预后评估至关重要。

摘要编号: 209243

CoMnFe-LDO 增敏葡萄膜黑色素瘤放疗作用和机制研究

第一作者: Yiran YAO

共同作者: Renbing JIA, Ai ZHUANG

目的: 葡萄膜黑色素瘤 (uveal melanoma, UM) 是成人最常见的原发性眼内恶性肿瘤, 严重威胁患者生命健康和生活质量。目前 UM 首选保眼治疗方法是巩膜敷贴放疗, 但 UM 放疗敏感性不足, 常导致治疗失败、肿瘤复发甚至转移。提高 UM 放疗敏感性的关键在于克服放疗过程中乳酸水平高、肿瘤微环境缺氧和 ROS 生成不足等问题。本研究立足 UM 放疗敏感性不足的关键因素, 开发可在放疗中降低乳酸水平、缓解肿瘤缺氧和增加 ROS 生成的纳米材料, 探究其增敏 UM 等肿瘤放疗的作用, 并揭示其作用机制。

方法: 将 CoMnFe 层状双氧化物 (CoMnFe-layered double oxide, LDO 或 CoMnFeLDO) 生物纳

米材料应用于 UM 放疗增敏研究。首先通过煅烧方法制备 CoMnFeLDO, 并进行理化性能表征、测定其体外功能。通过密度泛函理论计算, 揭示 CoMnFe-LDO 在催化乳酸向丙酮酸转化过程中的作用机制。在细胞水平, 测试 CoMnFe-LDO 在细胞水平的安全性, 进而通过代谢组学等代谢物分析、多种荧光染色、CCK-8 实验、活死染色、平板克隆实验、流式细胞术等手段, 测试 CoMnFeLDO 在细胞水平的放疗增敏活性。构建小鼠 UM 原位模型, 通过眼球直径和重量测量、活体荧光成像、眼球苏木精 - 伊红染色和多种荧光染色成像, 鉴定 CoMnFe-LDO 在动物模型水平的放疗增敏潜力。

结果: 1. CoMnFe-LDO 对正常细胞的生长无明显抑制, 具有较高的生物安全性。2. 在放疗条件下, CoMnFe-LDO 在细胞和动物水平均可有效降低乳酸水平、增加氧气和 ROS 生成。3. CoMnFe-LDO 在细胞和动物水平均可发挥高效的放疗增敏作用。4. CoMnFe-LDO 通过将乳酸催化转变为丙酮酸, 发挥乳酸消耗性能。

结论: 成功制备具有降低乳酸、生成氧气、生成 ROS 性能的 CoMnFe-LDO 纳米材料, 并实现 UM 模型中的放疗增敏, 为开发增敏 UM 等肿瘤放疗效果的方法提供了新思路。机制上, CoMnFe-LDO 将乳酸催化转变为丙酮酸, 从而促进 UM 放疗敏感性, 为基于肿瘤代谢重编程进行代谢调控机制研究提供了新视角。

摘要编号: 208824

PADI2 在结膜黑色素瘤中的促癌作用研究

第一作者: Shichong JIA

共同作者: Jie YU, Ai ZHUANG

目的: 结膜黑色素瘤 (Conjunctival melanoma, CoM) 转移率高, 预后差, 缺乏有效治疗手段, 亟需在手术治疗外探究新的靶向治疗手段。靶向催化组蛋白瓜氨酸化 (histone citrullination) 的肽基精氨酸脱亚胺酶 (peptidylarginine deiminase, PADI) 在肿瘤治疗中极具潜力, 但其在 CoM 中的作用尚不清楚。

方法: 回顾患者的临床和组织学参数, 并使用 Kaplan-Meier 生存曲线进行风险因素分析。采用 CCK-8、平板克隆、划痕实验检测 CoM 细胞的增殖和迁移能力, 建立小鼠移植瘤模型检测黑色素瘤的体内生长情况。

结果: 队列中 29 例患者 (35%) 出现远处转移, 脑、肝和肺是常见的远处转移部位。临床肿瘤 (T) 分期越高, 发生远处转移 ($P < 0.001$) 和疾病特异性死亡 ($P = 0.002$) 的风险越高。在 CoM 细胞系中, 介导瓜氨酸化的 PADI2 及瓜氨酸化组蛋白 H3R26

(H3R26cit) 均呈现高表达; 组织水平上, PADI2 与 H3R26cit 在肿瘤组织中的表达明显上调, 且均与患者不良预后呈密切相关 ($P = 0.03$, $P = 0.04$), PADI2 表达水平与 T 分期亦呈现相关性。在 CoM 细胞系中敲除 PADI2 后, 细胞的增殖、成瘤以及迁移能力均受到了抑制, H3R26cit 水平下降; 小动物活体成像实验显示 PADI2 敲低后小鼠肿瘤病灶信号减弱, 成瘤体积及重量显著低于对照组细胞。应用 PADI2 抑制剂 Cl-Amidine 表现出较强的肿瘤抑制效果, 有效杀伤 CoM 细胞而不影响正常黑色素细胞增殖, 这种抑制效果具有剂量依赖效应 (IC_{50} 约为 50–200 μM , 正常黑色素细胞在 500 μM 以上)。在使用 Cl-Amidine 后, CoM 细胞增殖、成瘤和迁移能力被抑制。生物信息学分析显示 SLC7A11 可能是组蛋白瓜氨酸化的调控靶点, 在敲除 PADI2 后其表达水平降低。

结论: 本研究立足临床样本, 揭示了 PADI2 在结膜黑色素瘤进展中起致癌基因的作用, 为结膜黑色素瘤治疗提供了新的治疗靶点。

摘要编号: 208893

UCHL1 驱动鞘脂代谢促进葡萄膜黑色素瘤恶性进展

第一作者: Li ZHU

共同作者: Shuyi LIU, Wei LU, Yingxue MEI, Jiacheng YAN

目的: 葡萄膜黑色素瘤 (Uveal Melanoma, UM) 是成人眼内最常见的原发性恶性肿瘤, 具有高度转移性和死亡率。本研究旨在探讨去泛素化酶 UCHL1 在 UM 恶性进展中的关键作用及调控机制。

方法: 本研究采用生物信息学分析与实验验证相结合的研究策略。首先基于 TCGA-UM 数据库, 分析去泛素化酶家族成员表达与患者预后的相关性, 筛选出关键分子 UCHL1。通过 Western blot 检测人视网膜色素上皮细胞 (ARPE19) 与三种 UM 细胞系 (92.1、MUM2B、C918) 中 UCHL1 的蛋白表达水平。利用慢病毒载体构建稳定敲低 UCHL1 的 UM 细胞系, 通过克隆形成实验、CCK-8 细胞活力检测、EdU 细胞增殖分析和 Transwell 细胞迁移实验, 系统评估 UCHL1 对 UM 细胞恶性表型的影响。采用基因集富集分析 (GSEA) 探索 UCHL1 高表达组显著富集的代谢通路。通过 RT-PCR 和 Western blot 检测鞘脂代谢关键酶 SPHK1 在 mRNA 和蛋白水平的表达变化。利用生物信息学预测和双荧光素酶报告基因实验验证转录因子 IRF1 对 SPHK1 启动子的直接结合和转录调控作用, 并

通过 Western blot 分析 IRF1 在 UCHL1-SPHK1 信号轴中的中介效应。

结果: 研究结果显示, UCHL1 在 UM 细胞系中显著高表达, 且其高表达与患者不良预后密切相关。体外功能实验证实, 敲低 UCHL1 可显著抑制 UM 细胞的增殖能力, 表现为克隆形成率下降、CCK-8 检测的细胞活力减弱、EdU 阳性细胞比例减少; 同时, UM 细胞的迁移能力也受到明显抑制。机制研究方面, GSEA 分析显示 UCHL1 高表达组在鞘脂代谢通路显著富集。分子实验证实, 敲低 UCHL1 可显著下调 SPHK1 在 mRNA 和蛋白水平的表达。进一步研究发现, 转录因子 IRF1 能够直接结合 SPHK1 基因启动子区域, 正向调控其转录活性。重要的是, UCHL1 通过调节 IRF1 的表达和活性, 进而影响 SPHK1 的表达水平, 形成完整的 UCHL1-IRF1-SPHK1 信号传导通路。

结论: 本研究首次阐明 UCHL1 通过转录因子 IRF1 调控 SPHK1 表达, 重塑鞘脂代谢模式, 进而促进葡萄膜黑色素瘤恶性进展的分子机制。UCHL1-IRF1-SPHK1 信号轴的发现为 UM 的预后评估和靶向治疗提供了新的理论依据和潜在干预靶点。

摘要编号: 209089

一例累及眼部的抗中性粒细胞胞浆抗体 (ANCA) 相关性血管炎病例报告

第一作者: Yingxue MEI

共同作者: Shuyi LIU, Wei LU

目的: 对一例以肾脏炎症为首发表现、伴严重眼部受累的 ANCA 相关性血管炎的患者进行系统的诊断和治疗。

方法: 基于患者的临床表现, 根据影像学结果、病理学结果及自身免疫学指标进行诊断并进行有效治疗。

结果: 患者因右侧腰部疼痛 10 余天就诊于外院, 诊断为右侧输尿管结石伴右肾积水, 拟行体外冲击波碎石术。期间患者高热, 暂行输尿管镜下右侧 D-J 管置入术, 待病情稳定后行经尿道输尿管镜下右输尿管结石钬激光碎石术。术后患者症状缓解, 但随后 4 日体温持续升高, 腹部 CT 示左肾黄色肉芽肿性肾盂肾炎, 行超声引导下左肾脓肿穿刺抽液术。术后患者未见好转, 考虑病情危及生命可能, 需通过手术根除原发感染灶, 遂行左肾根治性切除术。术后患者仍有发热, 支气管镜灌洗液结果提示鲍曼不动杆菌及热带假丝酵母菌, 遂应用抗生素进行针对性治疗至患者状态及理化指标逐渐改善。随后患者出现双眼结膜轻度充血, 诊断为双眼巩膜炎、虹膜炎可能性大, 予加替沙星滴眼液, 双氯芬酸钠滴眼液, 典必殊滴眼液对症治疗后续准予出院。患者出

院半月后，因右侧眼红加重、局部隆起明显，按出院医嘱用药无效后就诊于我院，根据外院眼部 CT 结果，考虑泪腺炎的可能性，行增强核磁检查，结果提示双眼泪腺炎，予以典必殊滴眼液及普拉洛芬滴眼液治疗。然而眼部红痛症状改善仍不明显，且上述检验结果均无明显异常。考虑患者目前全身情况，怀疑自身免疫性疾病可能性大。遂完善免疫指标检查，结果提示为 ANCA 相关性血管炎。同时联系外院调取左肾病理，符合肉芽肿性多血管炎表现。因此，明确该患者目前主要诊断为：ANCA 相关性血管炎眼部病变。遂即刻应用奥妥珠单抗联合地塞米松治疗，患者诉双眼疼痛明显好转，双眼结膜充血较前显著减轻，复查血常规示 CRP 及 WBC 进行性下降至正常水平，准予出院。出院后随访至今，未见复发征象。

结论：当患者出现累及多个器官系统的症状且常规治疗无效时，应考虑自身免疫性疾病的可能。一经确诊，应立即针对患者的情况启动针对性治疗。

摘要编号：207770

一例首诊眼科的脉络膜转移癌分享

第一作者：Jing WEI

目的：分享一例首诊眼科的脉络膜转移癌的临床诊断。

方法：回顾性分析收集我科收治的 1 例脉络膜转移癌，对患者的临床特征、组织病理学改变以及原发肿瘤来源、组织学分型等进行分析。

结果：患者男性 52 岁。以“左眼视力下降伴视物遮挡 1 周。”为主诉入院。眼科检查：VOD: 0.6 (+1.00 DS/+1.00 DC) → 1.0, VOS: 0.04 (+5.00 DS/+1.00 DC) → 0.4。右眼外眼及前后节、左眼外眼及前节未见确切异常；左眼视盘上方见灰白色圆形隆起，大小约 6 PD，隆起度约 3 PD，周边视网膜局限性浅灰白色隆起，黄斑区视网膜灰白色隆起，中心凹反光未见。眼压：右眼 20 mmHg，左眼 21 mmHg。眼部 B 超：左眼视网膜下扁平样占位，病灶两侧视网膜局限性浅脱离。眼眶增强 MRI：左眼眼环内侧横断位约 5-8 点方向两处梭形增厚伴部分强化。胸部 CT：双肺多发结节，右肺多发、左侧斜裂区单发小空洞形成，考虑肿瘤。肠镜检查：距肛门 45 cm 约降结肠处，可见一新生物，表面充血水肿，中央凹陷覆白苔，大小约大半圈，质脆，触之易出血。病检结果为中-高分化腺癌。PET-CT：降结肠癌伴盆腹腔转移、双肺转移、L1 椎体骨转移。肿瘤标志物：CA199 (肿瘤相关抗原) > 1,200 U/ml。诊断：1、降结肠恶性肿瘤 2、左眼脉络膜转移癌 3、左眼视网膜脱离 4、老年性白内障 (双眼) 5、屈光不正 (双眼)。

结论：脉络膜转移癌患者主要以视力显著降低、眼底出现扁平样实质性占位病灶作为主要临床特征。脉络膜转移癌由全身其他器官的晚期恶性肿瘤转移而来，要详细询问病史并做全面检查身体查找原发性癌瘤。脉络膜转移癌容易诊断 (结合眼底荧光素血管造影、眼部超声、眼底照相等)，但对于寻找原发灶常需要大量的辅助检查协助诊断，包括肺部 CT、乳腺钼靶、乳腺超声、肝胆胰脾超声、PET-CT、胃肠镜以及血清的癌胚抗原 (CEA) 等的检测都有助于诊断。

摘要编号：203468

人脉络膜黑色素瘤细胞对重离子辐射敏感性研究

第一作者：Qin LIU

共同作者：Yuxin MIAO, Tingwei ZHENG, Huiling BAI, Liyuan YANG

目的：脉络膜黑色素瘤 (CM) 是一种具有高度侵袭性的眼内肿瘤，该肿瘤在成年人群中具有较高的发病率，是眼内原发性恶性肿瘤的主要病理类型之一。重离子射线是一种新兴的放射治疗手段，属于高线性能量传递 (LET) 射线，其能量沉积随穿透深度增加而增大，在射程末端形成显著的 Bragg 峰。临床应用最多的重离子射线是碳离子 ($^{12}\text{C}^{6+}$ 离子)，碳离子束的 Bragg 峰特性使其能量主要集中在肿瘤组织内，而对周围正常组织的剂量沉积相对较少。本研究探讨了人脉络膜黑色素瘤细胞对重离子束的辐射敏感性差异，为优化临床治疗策略提供关键理论依据。

方法：本研究选用 2 Gy、4 Gy 和 8 Gy 三种不同剂量的碳离子束对人脉络膜黑色素瘤 OCM-1 细胞进行辐射处理，并在辐射后 24 小时、48 小时和 72 小时三个时间点，通过 CCK-8 实验评估细胞的增殖能力；通过克隆形成实验分析细胞的存活率；在辐照后 48 小时，利用流式细胞仪检测 OCM-1 细胞周期分布及凋亡情况。

结果：CCK-8 实验数据表明，相较于 X-射线，碳离子辐射对 OCM-1 细胞的增殖能力表现出更为突出的抑制作用；平板克隆形成实验数据显示，碳离子辐射后 OCM-1 细胞克隆存活分数显著低于 X-射线组，差异具有统计学意义 ($P < 0.05$)；流式细胞术检测细胞周期时相分布结果显示，碳离子辐射导致 OCM-1 细胞阻滞于 G2/M 期，且 OCM-1 细胞对碳离子辐射敏感性更高；流式细胞术检测碳离子和 X-射线对 OCM-1 细胞的致死作用，结果显示碳离子辐照后，凋亡细胞的百分比更高，差异具有统计学意义 ($P < 0.05$)，进一步证实 OCM-1 细胞对碳离子辐射敏感性高。

结论：本研究通过对比不同剂量碳离子对人脉络膜黑色素瘤 OCM-1 细胞的辐射效应，发现 OCM-1 细胞对碳离子束的辐射生物学响应显著强于 X-射线，表现为更低的细胞存活率和更高的凋亡率。碳离子通过诱导 DNA 双链断裂和持续的 G2/M 期阻滞，加剧 DNA 损伤累积，显著抑制细胞增殖与修复能力。这些结果表明，碳离子放疗在脉络膜黑色素瘤治疗中具有潜在优势，为其临床应用提供了重要的实验依据。

摘要编号：208836

儿童青少年与成人葡萄膜黑色素瘤的临床特征及预后对比研究

第一作者：Haotian WU

共同作者：Wenbin WEI, Ruiheng ZHANG

目的：葡萄膜黑色素瘤 (UM) 是成人最常见原发性眼内恶性肿瘤，儿童青少年 UM (PAUM, ≤ 20 岁) 发病率仅 0.6%~1%。现有 PAUM 研究多为单臂设计，缺乏与同期成人队列直接对比，保眼率、治疗并发症等关键终点未被系统评估。本研究旨在对比二者临床特征、治疗反应及长期预后，为 PAUM 规范化管理提供证据。

方法：回顾性纳入 2009 年 1 月至 2021 年 12 月北京同仁医院 1730 例 UM 患者，分青少年组 (37 例, ≤ 20 岁) 与成人组 (1693 例, > 20 岁)。所有患者接受全面眼科评估 (双目间接检眼镜、眼底照相、光相干断层扫描等) 及全身转移筛查 (腹部超声或 PET-CT)。治疗以斑块近距离放疗为主，辅以经瞳孔温热疗法、局部切除或眼球摘除术。随访首年每 3 个月 1 次，2~5 年每 6 个月 1 次，5 年后每年 1 次，核心终点为保眼率、治疗并发症、无转移生存期 (MFS) 及总生存期 (OS)。采用 Kaplan-Meier 法分析生存曲线，Cox 模型评估预后因素， $P < 0.05$ 为差异有统计学意义。

结果：两组中位随访时间分别为 57 个月、46 个月 ($P = 0.21$)，性别 (男性 54.0% vs 51.7%, $P = 0.78$)、基线视力 ($P = 0.20$) 无显著差异。症状上，青少年组以视力下降为主 (75.7% vs 66.0%)，成人组更常出现视野缺损 (31.4% vs 16.2%)，青少年组无症状比例略高 (8.1% vs 2.6%)，差异有统计学意义 ($P = 0.03$)，另见 2 例 PAUM 误诊 (就诊于基层医院时被误诊为视网膜母细胞瘤、视网膜下出血)。肿瘤特征方面，青少年组睫状体受累率更高 (29.7% vs 14.4%, $P = 0.009$)、基底直径更大 (中位 14.9 mm vs 11.7 mm, $P = 0.002$)、靠近视盘比例更高 (27.0% vs 4.7%, $P < 0.001$)，半球形肿瘤更常见 (67.6% vs 46.5%)。两组初始治疗无显著差异 ($P = 0.13$)，均以斑块近距离放

疗为主 (62.2% vs 75.8%)。预后上，青少年组 5 年保眼率 (87.5% vs 81.1%)、5 年 MFS (95.8% vs 82.2%) 更高，继发性眼球摘除 ($HR = 0.30$, 95% CI 0.09 ~ 0.95)、转移风险 ($HR = 0.26$, 95% CI 0.07 ~ 0.97) 显著降低；5 年 OS 青少年组 (95.8%) 高于成人组 (85.7%)，但差异无统计学意义 ($HR = 0.56$, 95% CI 0.16 ~ 1.91)，10 年 OS 相近 (87.8% vs 74.1%)。

结论：PAUM 虽肿瘤基底更大、睫状体受累更常见且易误诊，但保眼率和无转移生存优势显著，年龄是其独立良好预后因素。临床需提高 PAUM 识别度，优先保眼治疗，未来需多中心研究结合基因组分析制定个体化方案。

摘要编号：208458

内镜在眼眶肿瘤摘除术中的应用体会

第一作者：Weili ZHANG

共同作者：Qinying HUANG

目的：眼眶肿瘤是一类复杂且难治的疾病，传统手术方式存在视野狭小、组织损伤大、术后愈合时间长等缺点。随着内镜技术的发展，内镜下眼眶肿瘤摘除术逐渐兴起，并展现出诸多优势。本文将分享我科在眼眶肿瘤摘除术中应用内镜的经验体会，并通过典型病例展示内镜手术的优势和注意事项。

方法：我科自 2021 年起开展内镜下眼眶肿瘤摘除术，并根据肿瘤位置、大小、性质等选择合适的入路和手术方式。入路包括经皮肤前路开眶、结膜、泪阜、鼻腔等，手术方式包括单纯内镜下手术和内镜辅助下手术。

结果：我科已完成多例内镜下眼眶肿瘤摘除术，包括海肌锥内肿瘤、神经鞘瘤、鼻窦沟通肿瘤、泪道肿瘤等。术后患者视力、视野、眼球运动等均得到改善，且外观损伤小，恢复快。

结论：眼眶肿瘤的治疗以手术为主，传统手术方式存在视野狭小、组织损伤大、术后愈合时间长等缺点，术后易出现并发症，内镜技术的应用为眼眶肿瘤摘除术提供了新的思路和方法。

摘要编号：208969

基于诊断证据分层的 IgG4 相关眼病：单中心真实世界的临床表型研究

第一作者：Rong LIU

共同作者：Yuhang LIU

目的：IgG4 相关眼病 (IgG4-ROD) 在真实世界中常受限于眼眶组织活检的可及性，临床诊断多依赖影像与血清学；不同证据强度的病例混入同一队列，易导致异质性与偏倚。我们提出以证据分层组织样

本，并系统刻画其临床与影像表型，为后续治疗与预后研究提供统一基线数据。

方法：在单中心回顾性队列中，基于证据强度分层（Tier1：血清 IgG4、影像学及眼部病理；Tier2：血清 IgG4、影像学及他处病理；Tier3：仅有血清 IgG4、影像学无病理）全面描述 IgG4-ROD 的人群学、影像受累模式与血清特征。纳入本院由风湿免疫科确诊 IgG4 相关疾病病历共 291 份，筛选获得眼部受累 104 例（具有影像或客观体征的眼部受累证据），因资料缺失排除 13 例，最终纳入 91 例。核心变量包括：性别、年龄、证据分层、影像学模式（泪腺 / 眼外肌 / 视神经 / 眶内脂肪 / 眼睑，受累单侧或双侧）、整体侧别（取各部位最大侧别值），血清 IgG4 原始值（g/L）。影像证据来源记录为 MRI/CT 组合。采用描述性统计汇总人群学与表型分布。

结果：纳入病历中男性占 73.6%（67/91），中位年龄 53 岁（25p-75p；45.5-60.0）。证据分层：Tier1 占 4.4%（4/91），Tier2 占 20.9%（19/91），Tier3 占 74.7%（68/91），提示真实世界中病理可及性低。影像以 MRI 为主（仅 MRI 90.1%，MRI + CT 5.5%，仅 CT 3.3%）。总体受累以双侧为主（90.1%，82/91），单侧 9.9%（9/91）。部位分布（任一侧受累）：泪腺 78.0%（双侧 65.9%）、眼外肌 53.8%（双侧 39.6%）、视神经鞘膜 23.1%（双侧 19.8%）、眼睑 24.2%（双侧 16.5%）、眶内脂肪 8.8%（双侧 6.6%）；≥ 2 部位累及 57.1%（52/91）。血清 IgG4 中位 8.41 g/L（25p-75p；3.13-19.10），IgG4 < 1.35 g/L 者 9.9%（9/91），提示存在血清阴性但临床 / 影像阳性的亚群。

结论：在病理可及性有限的真实世界条件下，证据分层及影像主导策略可稳定、透明地刻画 IgG4-ROD 的核心表型：以双侧泪腺与眼外肌受累最常见，多部位累及占比过半；约一成患者血清 IgG4 未达阈值，强调诊断需整合影像与系统性病理证据。该队列为后续治疗策略与预后析提供一致的分析框架。

摘要编号：204389

对于甲状腺功能障碍性视神经病变在眼眶减压手术后视野恢复的预测指标的研究

第一作者：Chen HSUAN-TZU

共同作者：Zhiqiao LIANG, Yi WANG, Huijuan WU, Kangyi YANG

目的：探索甲状腺相关眼病中甲状腺功能障碍性视神经病变在眼眶减压术后视野恢复的预测指标。

方法：回顾性纳入 2020 年 9 月至 2021 年 12 月就诊于北京大学人民医院眼科的 DON 患者。收集患

者基本信息以及眼眶减压术前及术后随访最佳矫正视力、眼压、VF、图形—视觉诱发电位和海德堡 SPECTRALIS 光学相干断层扫描仪（HRA-OCT SPECTRALIS）检查所测量的视乳头周围视网膜神经纤维层厚度、Bruch 膜开口最小盘沿宽度以及黄斑区神经节细胞层厚度。术前所有 DON 患者的初始 VF 平均缺损值（均低于 -2.00 dB，术后 6 个月 MD 较术前改善 > 10% 或 MD 高于 -2 dB 定义为恢复组，而术后 6 个月 MD 与初始 MD 相比变化 ≤ 10% 定义为未恢复组）。比较两组患者年龄、性别、眼别和吸烟情况、眼压、手术前 BCVA、cpRNFL 厚度、BMO-MRW、ETDRS 的 mGCL 厚度、8 × 8 后极部网格的 mGCL 厚度等指标。通过多因素分析明确眼眶减压术后 VF 恢复的预测指标。使用 SPSS 27.0（IBM 公司，Armonk, NY, USA）进行数据分析。

结果：本研究共纳入了 DON 病例 13 例（18 眼），平均年龄 54.06 ± 7.08 岁，男性 13 眼，女性 5 眼。根据术后 VF 恢复情况分为 RG 13 眼，NRG 5 眼，两组间术后 VF 的 MD 有统计学差异（P < 0.05）。使用 Mann-Whitney U 非参数检验分析，发现应用 ETDRS 网格模式测量 mGCL 厚度中，鼻外象限（Outer nasal, ON）（Z = 13.50, P < 0.05）和外上象限（Outer superior, OS）（Z = 11.50, P < 0.05）的 mGCL 厚度与 VF 恢复情况相关。其他的测量参数如年龄、性别、眼别和吸烟情况、眼压、手术前 BCVA、cpRNFL 厚度、BMO-MRW、除了 OS、ON 象限的 mGCL 外其他象限 ETDRS 的 mGCL 厚度和 8 × 8 后极部网格的 mGCL 厚度均未发现与 VF 恢复有相关性（均 P > 0.05）。使用 Spearman 相关性分析分析 ON 和 OS 象限 mGCL 厚度与 VF 恢复情况的相关性，发现 ON、OS 象限的 mGCL 厚度与术后 VF 恢复情况显著相关，相关系数分别为 0.484 和 0.594（P < 0.05）。术前 ON 和 OS 象限的 mGCL 厚度越厚，VF 恢复情况越好（P < 0.05）。根据 ON、OS 象限的 mGCL 厚度与术后 VF 之间分布图可见 ON、OS 象限 mGCL 与术后 VF 之间大致呈现正相关。

结论：眼眶减压术前后 ON 和 OS 象限的 mGCL 厚度变化是 DON 患者术后 VF 是否恢复的预测指标。

摘要编号：210275

巩膜开窗联合玻璃体切除手术治疗睫状体黑色素瘤一例

第一作者：Hu DANPING

目的：脉络膜黑色素瘤发病部位通常位于后极，既往多采用玻璃体切除手术直接切除瘤体或者眼球摘除术，本例患者肿瘤位于睫状体处，瘤体较大，

患者继发渗出性视网膜脱离，采用巩膜开窗外切处联合玻璃体切割术（prophylactic vitrectomy, PPV）治疗黑色素瘤。

方法：本例患者为 559 岁的中年男，因右眼视物模糊一月就诊。既往史：2 型糖尿病 高脂血症（服用阿司匹林）、继发性肺结核。眼部查体：视力：od 指数眼前，os：1.0，IOP od 11 mmHg，os 17 mmHg。右眼角膜透明，前房闪辉，瞳孔欠圆，虹膜后粘连，晶体混浊，扩瞳后见睫状体附近棕色肿物，累及 4 个钟点位，晶体向鼻下方移位，眼底窥不清。左眼未见明显异常。诊断：右眼睫状体肿物（脉络膜黑色素瘤？）、右眼渗出性视网膜脱离、右眼玻璃体混浊、右眼并发性白内障、右眼晶体不全脱位、2 型糖尿病、高脂血症、继发性肺结核。治疗方案：全麻下行右眼经巩膜切除肿物 + 白内障超乳摘除 + 玻切 + 光凝 + 冷凝 + 硅油填充术。术后全身及局部降眼压，球旁注射。患者后续肿瘤科就诊。出院查体：术眼视力 od 指数 30 cm，矫正致 0.05，IOP od 15 mmHg。右眼角膜内皮稍皱褶，前房少量血细胞，瞳孔欠圆，上方虹膜缺损，晶体永久性缺如，瞳孔区部分炎性渗出膜遮挡，玻璃体腔硅油填充，眼底检查隐约见激光斑，后极部及上方视网膜平伏。

结果：巩膜开窗联合玻璃体切除手术能有效切除睫状体处瘤体，同时治疗因瘤体较大继发的视网膜脱离问题。

结论：巩膜开窗切除联合玻璃体切除手术能有效且完整的切除睫状体肿瘤。对比既往眼球内直接使用玻切头切碎并吸除瘤体组织，巩膜开窗切除引起的肿瘤播散风险更小，同时玻璃体切除手术可治疗因瘤体较大继发的视网膜脱离问题。针对临床上强烈要求保留眼球的患者，可根据病情考虑施行该手术。

摘要编号：209058

木犀草素处理葡萄膜黑色素瘤细胞系 C918 的三维细胞球体培养和细胞活力研究

第一作者：Jinhai YU

目的：本研究旨在研究葡萄膜黑色素瘤（UM）细胞系 C918 衍生的三维细胞球体的形态和组织学特征，并评估木犀草素对其细胞存活率的影响。

方法：在超低吸附 96 孔板中培养 C918 细胞，观察 C918 三维细胞球体在不同时间间隔内的形态变化。使用 HE 染色和免疫组织化学染色检查了在超低吸附 6 孔板中培养的 C918 多细胞球体的组织学特征。在二维和三维培养的 C918 细胞中用不同浓度的木犀草素处理 72 小时后，使用 CCK8 试剂测量 450nm 波长下的光密度。比较两种培养条件下的 IC50 值。

结果：随着培养时间的推移，C918 三维细胞球体的体积逐渐增加，在培养的第 4 至 6 天，球体内出现了明显的缺血和缺氧样区域。组织学染色显示，三维培养的多细胞球体中细胞活力标记抗体（Ki67）和黑色素瘤标记抗体（MelaA、HMB45、S-100）呈阳性表达。CCK-8 实验显示，72 小时后，C918 细胞中木犀草素的 IC50 值在三维培养中为 183.50 $\mu\text{mol/L}$ ，在二维培养中为 16.19 $\mu\text{mol/L}$ 。在显微镜下观察用不同木犀草素浓度处理 72 小时的三维培养的 C918 细胞。两组之间的最大横截面积没有统计学上的显著差异，但与对照组相比有所减少。

结论：三维培养的 C918 细胞球体表现出与真实肿瘤相似的组织学特征，对木犀草素的反应比二维球体低。它们为抗肿瘤药物筛选提供了一个有价值的模型。

摘要编号：207498

疑难病例板块——血液系统肿瘤两次造血干细胞移植术、化疗及 CAR-T 治疗后眼内病灶，炎症？肿瘤？临床中的诊疗困境——病例分享一例

第一作者：Jing HOU

目的：中年男性，无明显诱因右眼视物模糊 5 个月，不伴眼红、眼痛等；2 年前多发性骨髓瘤，1 年半前自体造血干细胞移植，1 年前复发合并继发性浆细胞白血病，9 月前异基因造血干细胞移植，3 月前中枢神经系统白血病，化疗后转阴，1 周前骨髓复发行 CAR-T 治疗。

方法：5 月前右眼视物模糊多次就诊于外院，诊为玻璃体混浊；4 月前右眼视物模糊加重就诊于外院，眼底像可见玻璃腔内及后极部视网膜内多发边界不清的黄白色病灶，外院考虑为造血干细胞移植后眼内病毒性感染，行抗病毒治疗后无明显好转，房水 CMV-DNA 阴性现就诊于我院，视力右眼 HM，尘状 kp，cell1+，玻璃体积血，视盘周围视网膜下可见出血及肉粉色实性病灶伴浆液性视网膜脱离，左眼 1.0，未见明显异常。

结果：患者为中年男性，复发性血液系统肿瘤行多次造血干细胞移植术后，重度免疫缺陷的患者，右眼病灶是眼内感染？还是眼内肿瘤浸润？如何证实？右眼房水高通量病原体检测及细胞因子阴性，诊断性玻切送微小残留病灶（MRD）检测可见 82.85% 异常表型浆细胞；完善头颅、眼眶 MRI 及腰穿脑脊液检查均未见明显异常；治疗右眼玻璃体腔注药：甲氨蝶呤 400 μg ，每周一次；4 次治疗后视力提升至 0.1，病灶明显缩小，仅余陈旧网膜下血；8 次治疗后复查眼眶 MRI+ 增强左侧视神经鞘膜毛

糙不均匀增厚，增强扫描可见线状不均匀强化，行腰穿脑脊液 MRD 检查未见异常，予鞘注药物（阿糖胞苷 + 地塞米松 + 甲氨蝶呤 15 mg）治疗，2 周后患者自述左眼出现视力下降、视物遮挡感 1 周余，视力右眼 0.2，左眼 0.6，眼压右眼 11 mmHg，左眼 25 mmHg，左眼 kp (+)，cell (+)，虹膜肿胀，玻璃体轻混，OCT 示左眼视盘周围 RPE 隆起，左眼诊断性玻切 + IVMTX 400 μ g，MRD 检测：可见 97.22% 异常表型浆细胞。考虑患者目前双眼浆细胞白血病浸润，治疗 IVMTX 400 μ g 右眼 Q2w，左眼 Qw；6 周后发现大量心包积液，血压低，诊断为心包肿瘤浸润；CAR-T 回输 + IVMTX 后截止末次随访期间血清学、骨穿及腰穿 MRD 检查均阴性。

结论：血液类肿瘤移植后出现的眼部病变时不仅要考虑眼内机会性感染，还有可能是肿瘤浸润，对于此类疾病视神经受累的诊断与治疗还处于盲区。

摘要编号：208868

眼内蜘蛛网——一例眼内神经内分泌肿瘤

第一作者：Yangyan XIAO

共同作者：Xiaojian GUO

目的：探讨一例原发性眼内神经内分泌肿瘤的诊断思路与治疗过程，为临床类似复杂眼病的鉴别诊断和治疗提供参考

方法：通过对一例 45 岁左眼视力下降男性患者行病史采集、眼科检查、全身检查、手术治疗以及病理检查以确诊为眼内神经内分泌肿瘤，以及 4 年的随访。

结果：初步检查：21 年 3 月患者因左眼视力下降 1 个月就诊。此时左眼 BCVA 0.5，存在玻璃体混浊、黄白色肉芽肿性改变及视网膜病变；右眼正常。眼部 B 超、OCT、造影等显示玻璃体混浊、黄斑前膜、视网膜血管性占位等异常。全身检查类风湿因子稍增高，乙肝小三阳，肺部少量结节。鉴别诊断：排除视网膜血管瘤、视网膜血管异常增生性病变、视网膜血管增生性肿瘤等常见病变；布鲁菌等多种感染指标阴性。病情进展：随访过程中 21 年 5 月出现左眼牵拉性网脱视力进一步下降，予以玻璃体切除手术，术中取前膜行病理，提示神经内分泌肿瘤可能。B 超 CT 排查全身后未发现原发灶 治疗：经手术治疗后视力有所提高，疫情中病情恶化，最终眼摘，再次病检 ki67 从第一次病理 20% 阳性率到第二次 40% 阳性率；免疫组化 TTF-1 阳性，PET-CT 阴性。转归：2024 年 7 月复查 PET-CT 和血清神经元特异性烯醇化酶（NSE）均正常后予以义眼植入。25 年 10 月复查 B 超和 CT 正常，NSE 阴性。

结论：本例复杂眼病患者，通过全面的眼科及全身检查，排除了多种常见眼病及感染因素。最终病理提示神经内分泌肿瘤可能，但全身排查未发现原发灶。该病例提示对于复杂眼病，需进行详细的检查和长期的随访，病理检查在明确诊断中起关键作用，同时应关注全身疾病的眼部转移可能。

摘要编号：201418

眼和眼眶表现为主伴 HLA-B27 阳性的肉芽肿性多血管炎误诊和病理分析一例

第一作者：Yungang DING

共同作者：Jianhua CHEN, Wei CHEN, Chenyang CONG, Baoyi DING, Yan ZHANG

目的：探讨一例以眼和眼眶病变为主要表现的肉芽肿性多血管炎（GPA）伴类风湿关节症状和 HLA-B27 阳性病例的误诊及病理分析的经验。

方法：通过回顾性病例分析，收集患者的病史、临床表现、实验室、影像和病理检查，分析其病理特征和文献回顾。

结果：患者，49 岁，女性，因“右眼红痛 1 年，伴眼球突出反复加重 6 个月”就诊。1 年前在外院眼科初诊为双眼巩膜炎，使用妥布霉素地塞米松和普拉洛芬滴眼液 1 月余无好转，在风湿科基于关节痛和晨僵、HLA-B27 阳性和 MRI 骶髂关节改变等诊断强制性脊柱炎，行依托考昔和抗 TNF- α 药物治疗，关节症状消失，眼部无好转。6 个月后加重为右眼球突出，先后多家医院诊治。眼科曾诊断“双眼巩膜炎、双眼葡萄膜炎、右眼眶蜂窝织炎和炎性假瘤”，病理活检诊断“右眼睑纤维包裹化脓性炎”。风湿科曾诊断“化脓性血管炎、ANCA 相关性血管炎（AAV），强制性脊柱炎”，影像科不能排除眼眶肿瘤、结核性肉芽肿等疾病。患者接受多次抗生素、激素等药物治疗，其中甲强龙冲击 + 环磷酰胺治疗后，左眼治愈，右眼减轻后反复加重，至我院就诊。眼科查体：右眼视力 0.08，矫正 0.3，眼压 15.0 mmHg，眶压高，眼球各方向运动受限，眼球突出度 23 mm，眼睑红肿，球结膜充血，巩膜表面血管迂曲扩张，余未见异常。行右眼眶病损切除术。病理见肉芽肿、血管炎和微脓肿，大量中性粒细胞和淋巴细胞等浸润，免疫组化呈多克隆性，综合右侧乳突炎和分泌性中耳炎等多系统疾病史，血液 PR3-ANCA、C-ANCA 和 HLA-B27 阳性，MPO-ANCA、P-ANCA、IgG4、PCT 和 TB-IGRA 阴性，及既往影像学检查，诊断为：右眼眶 GPA，右眼巩膜炎，AAV。患者使用 CD20 单抗治疗后右眼缓解，随访 6 个月无复发。

结论：以眼和眼眶病变为主的肉芽肿性多血管炎增加了诊治难度，伴有 HLA-B27 阳性和关节症状时

易于误诊为强制性脊柱炎，血液检查便于鉴别诊断。病理分析为眼眶 GPA 诊治提供了重要依据，其病理特征致临床表现不典型，易于误诊。CD20 单抗药物对本例久治不愈、病理大量淋巴细胞浸润和 PR3-ANCA 阳性的患者治疗有效，改善预后。

摘要编号：207936

眼眶自然杀伤/T 细胞淋巴瘤：病例系列及文献回顾

第一作者：Tingting REN

共同作者：Jing LI, Jianmin MA

目的：评估眼眶自然杀伤/T 细胞淋巴瘤 (NKTCL) 患者的临床特点、病理组织学表现、治疗及预后。

方法：本研究回顾性收集了 2005 年 11 月至 2024 年 3 月就诊于首都医科大学附属北京同仁医院，经病理组织学确诊为眼眶 NKTCL 的 11 例患者的临床资料，并对患者进行随访以评估其预后。

结果：眼眶 NKTCL 患者的平均年龄为 48.09 岁，男性发病率略高于女性。所有病例均为单侧发病，临床表现为眼睑或眶周肿胀，其他还包括视力下降 (90.9%)、结膜充血 (90.9%)、眼球运动障碍 (81.8%)、眼球突出 (63.6%)、眼睑下垂 (36.4%) 等。所有患者均伴有周围组织侵犯，最常见的是眼睑 (11 例)、眼球壁 (7 例) 和泪腺 (5 例)。63.6% 的患者还合并鼻部软组织受累，36.4% 的患者仅表现为眼眶 NKTCL，不伴有鼻部受累。镜检可见异型淋巴细胞弥漫增生浸润，可伴有坏死。免疫组化染色结果显示，GrB+ (11 例)、CD3+ (10 例)、TIA1+ (9 例)、CD56+ (8 例)、EBV 或 EBER 表达阳性 10 例。所有患者均接受了眼部手术，7 例患者接受了术后化疗，1 例患者同时接受了局部外放疗。随访 (平均时间 113.27 个月) 显示患者预后不良，5 例失访，5 例死亡，仅 1 例患者无复发存活。

结论：眼眶 NKTCL 侵袭性强，发展迅速，预后较差。临床表现与眶蜂窝织炎或炎性假瘤相似，在抗炎和激素治疗无效时，应尽早进行活检以明确诊断。一旦确诊为眼眶 NKTCL，应尽快行化疗和放疗，以期改善患者的预后。

摘要编号：208899

睫状体上皮腺瘤：临床、组织病理学和治疗

第一作者：Siyuan WANG

共同作者：Renbing JIA, Ai ZHUANG

目的：睫状体上皮腺瘤 (包括睫状体色素上皮腺瘤 (APCE) 和睫状体无色上皮腺瘤 (ANPCE)) 极为罕见，关于它们的大部分知识均来自零星的病

例报告。本研究旨在全面了解睫状体上皮腺瘤，并明确 APCE 与 ANPCE 之间的异同。

方法：本研究为回顾性病例系列，纳入了从检索文献中获得的 41 例患者的数据以及上海第九人民医院诊断的 5 例病例。采用非参数秩和检验、t 检验和 χ^2 检验对 APCE 和 ANPCE 的临床病理特征、治疗及预后进行比较。

结果：APCE (n = 23) 和 ANPCE (n = 23) 患者的临床和组织病理学特征以及治疗情况相似。这两种肿瘤的整体视力预后良好，63% 的患者在治疗后视力稳定或有所改善。眼球摘除是最终视力丧失的主要原因 (APCE 有 3 例，ANPCE 有 2 例，p = 0.001)。值得注意的是，APCE 患者中常见虹膜浸润 (APCE 有 6 例，ANPCE 无，p = 0.014)，且虹膜浸润与最终视力下降有关 (p = 0.003)。肿瘤大小与视力结果无关 (p = 0.65)。所有患者均未出现转移或复发。

结论：在大多数情况下，ANPCE 和 APCE 的临床病理特征相似。虹膜浸润在 APCE 患者中较为常见，这与不良的视力预后相关。

摘要编号：209470

累及眶骨的眼眶占位性病变影像学特点分析

第一作者：林婷婷

共同作者：Yanjin HE, Limin ZHU

目的：分析发生于眶骨的占位性病变的影像学表现及其与组织病理学之间的关系，以加深对该类罕见眼眶疾病的认识。

方法：收集 18 例发生于眶骨的占位性病变，所有患者皆手术切除病灶，组织病理学确诊；回顾性分析其眼眶影像学检查、组织病理学切片及其他临床资料。

结果：病理诊断包括骨瘤 4 例、嗜酸性肉芽肿 3 例、骨肉血管瘤 3 例、骨样骨瘤和骨化性纤维瘤各 2 例、尤文肉瘤、骨转移癌、皮样囊肿和胆固醇肉芽肿各 1 例。CT 扫描表现：骨样骨瘤主要表现为类圆形的高密度影，偶可见中心典型的低密度伴钙化的“癌巢”影，外周伴骨质增生；骨肉血管瘤为典型的“栅栏状”“蜂窝状”或“囊状”骨小梁结构；骨瘤为骨表面的骨样结节状隆起，呈致密、高密度的骨样改变，一般无骨质破坏；骨化性纤维瘤表现为肿瘤表面常有骨壳包绕，边界清楚，大多以圆形、椭圆形密度均匀的高密度影为主要表现；尤文肉瘤虫蚀样骨质破坏，破坏区内见残余骨组织呈放射状排列，骨组织间有软组织病变向眶内膨隆；嗜酸性肉芽肿呈溶骨性破坏，周围伴有软组织肿块。

结论：累及眶骨的病变有其特有的病理特征，不同的病理组成成分在 CT 上表现出特征性的影像。将影像学表现与病理组成对照分析，阐述和辨识二者之间的关系，可以为提高术前诊断水平提供帮助。

摘要编号：204225

纵横—VI 术在睑缘肿物切除与一期修复中的临床观察

第一作者：Wu GUOHAI

目的：旨在探讨自创的“纵横—VI”手术方式在睑缘肿物切除与一期修复中的应用效果。

方法：本研究收集 2016 年 9 月至 2023 年 12 月期间在宁波市眼科医院接受睑缘肿物切除手术的 163 例患者。根据不同的手术指征，采用了三种手术方式：“纵横—VI”术式、单纯切除术和切除 + 滑行皮瓣术式。通过手术前后照片比对及四项术后效果评分（疤痕评分、睫毛评分、睑缘形态和眼睑功能）来评价手术效果。

结果：“纵横—VI”术式在疤痕评分方面表现突出，有 96.26% 的患者获得了最高评分（3 分），显著优于单纯切除术的 71.43% 和切除 + 滑行皮瓣术式的 31.43%（ $P < 0.05$ ）。在睫毛评分和睑缘形态评分上，“纵横—VI”术式优势显著，分别有 100% 和 96.26% 的患者获得最高评分，远超过其他两种手术方式（ P 均 < 0.05 ）。同时，在眼睑功能评分方面，接受三种手术方法的患者均获得最高评分（3 分），显示均能有效恢复眼睑功能，无显著差异（ $P > 0.05$ ）。

结论：“纵横—VI”术式为睑缘肿物的切除与一期修复提供了一种创新方法，尤其在减少瘢痕形成、维持睑缘睫毛连续性、保持睑缘自然弧度及眼睑正常功能方面展现了明显优势。本研究结果支持“纵横—VI”术式作为处理睑缘肿物的首选方法，有助于提高患者的术后满意度和生活质量。

摘要编号：208217

组蛋白乳酸化介导的 m1A 去甲基化酶 ALKBH3 异常激活通过抑制 PML 小体相分离促进葡萄膜黑色素瘤进展

第一作者：Gu XIANG

目的：葡萄膜黑色素瘤（UM）是成人最常见的眼内恶性肿瘤，易转移，转移后中位无进展生存期仅 3.3 个月，亟待寻找有效治疗靶点。m1A 甲基化是重要的 RNA 修饰，在维持 RNA 稳态中具有重要作用，然而 m1A 修饰在 UM 中的作用有待进一步揭示。

方法：本研究通过 CUT&Tag 联合 Chip-seq 揭示 UM 中组蛋白乳酸化异常激活导致 m1A 去甲基化酶 ALKBH3 表达升高。通过 MeRIP-seq、RNA-seq 和 iTRAQ 阐明 m1A 去甲基化酶 ALKBH3 促进 UM 进展的具体机制。

结果：UM 中升高的组蛋白乙酰化修饰水平导致 m1A 去甲基化酶 ALKBH3 异常激活，m1A 修饰呈整体低水平，且高表达的 ALKBH3 与 UM 患者的不良预后相关。高通量 RNA 修饰组学、转录组学和蛋白组学测序发现 PML 小体的核心成分 SP100A 是 ALKBH3 作用的关键靶点。沉默 ALKBH3 在体内和体外均显著抑制 UM 进展，并且可以通过消耗 SP100A 逆转其抑制作用。进一步探索机制，发现 YTHDF1 是 SP100A 的 m1A 甲基化识别蛋白，ALKBH3 通过去除 SP100A 的 m1A 甲基化，抑制其 RNA 稳定性和翻译效率。

结论：组蛋白乳酸化驱动的 m1A 修饰稳态失衡是 PML 小体相分离的重要调控事件，揭示“m1A 修饰—代谢重编程—相分离”桥连调控致癌机制，为 UM 的靶向治疗提供策略。

摘要编号：207528

经眶内镜辅助下眶沟通性肿瘤摘除手术治疗的体会

第一作者：Shangcai XUE

目的：探讨眶沟通性肿瘤经眶内镜辅助下肿瘤摘除手术治疗效果。

方法：总结 2018 年 6 月至 2025 年 9 月间在我科治疗的眶沟通性肿瘤患者 12 例，男性 7 例，女性 5 例，年龄 23 岁至 76 岁。其中蝶骨骨纤维异常增生症 3 例，眶沟通性脑膜瘤 3 例，眶沟通性转移癌 3 例，眶沟通性骨瘤 1 例，眶沟通性血管瘤 1 例、浆细胞瘤 1 例。所有病例肿瘤摘除术均眼科及神经外科医生术前联合会诊，经术前评估部分患者经颅入路，由神经外科医生摘除颅内肿瘤并修复颅骨，眼科医生处理眶内肿瘤并行眶壁缺损修复、部分患者由眼科医生经眶入路内镜辅助下行肿瘤摘除术。眼眶缺损修复均采用钛板或可吸收材料现成形修复。

结果：术后颅脑及眼科功能恢复良好，患者均行 CT 三维扫描及骨重建，肿瘤摘除理想，眼眶壁形态良好，眼球位置明显复位。

结论：经眶内镜辅助下眶沟通性肿瘤手术摘除同时进行眼眶骨缺损修复术，能取得较好的疗效。

摘要编号: 207707

结膜粘膜相关淋巴样组织 (mucosa-associated lymphoid tissue, MALT) 淋巴瘤

第一作者: Haiyan LIN

共同作者: Yalin REN

目的: 展示一个罕见的结膜粘膜相关淋巴样组织 (mucosa-associated lymphoid tissue, MALT) 淋巴瘤病例, 一只眼手术治疗, 另外一眼保守治疗, 跟踪 8 年的治疗效果及预后。

方法: 临床观察研究。同一患者, 左眼手术切除结膜肿物后行病理检查, 右眼使用干扰素滴眼液治疗; 左眼结膜肿物复发后使用干扰素滴眼液治疗。患者行眼部超声、PET/CT、血常规、骨髓穿刺活检等评估眼部及全身情况。

结果: 左眼结膜肿物病理诊断为“粘膜相关淋巴样组织 (mucosa-associated lymphoid tissue, MALT) 淋巴瘤”。眼部超声、PET/CT、血常规、骨髓穿刺活检等未见异常。左眼术后 1+ 月, 右眼出现类似结膜肿物, 使用干扰素滴眼液后病灶消退。术后 1+ 年, 左眼再次出现类似结膜小肿物, 使用干扰素滴眼液后病灶消退。此后 7 年, 双眼结膜肿物未再复发。

结论: 对于新发及复发的结膜 MALT 淋巴瘤, 早期足量局部使用干扰素具有良好治疗效果。

摘要编号: 209446

脉络膜黑色素瘤转移机制与药物治疗新研究

第一作者: Yakun WANG

共同作者: Xuxiang ZHANG

目的: 脉络膜黑色素瘤 (UVM) 转移是患者死亡的主要原因, 目前尚无治愈性疗法。虽然已知 BI2L2 (由 BAIAP2L2 编码) 可以调节细胞骨架动力学, 但其在 UVM 转移中的作用仍未表征。在这项研究中, 我们表明 BAIAP2L2 在 M1 期 UVM 中上调并预测预后不良。

方法: 我们在体外不同侵袭性的脉络膜黑色素瘤细胞系 (OCM-1A 细胞以及 MUM-2B 细胞) 中对 BAIAP2L2 影响细胞的迁移、侵袭和假足形成进行探究, 并确认其泛素化的具体方式。通过组学筛选关键通路并进行验证, 并通过网络数据库进一步筛选出治疗的相关药物。最终我们在体内肿瘤肺转移模型小鼠和人的脉络膜黑色素瘤中进行了验证。

结果: BAIAP2L2 敲除抑制转移性 MUM-2B 细胞中的迁移、侵袭和假足形成, 而其过表达增强了微创 OCM-1A 细胞中的这些表型。我们将 JUN 和 FOSL 确定为 BAIAP2L2 的上游转录因子, 并揭

示了一个正反馈环, 其中 BI2L2 通过阻断 JUN 的 K48 连接泛素化来稳定 JUN。BI2L2 直接与 JUN 结合, 阻止 E3 连接酶结合和随后的蛋白酶体降解, 从而增强其自身的表达。使用虚拟筛选和 SPR, 我们发现了三种小分子抑制剂, 可在体外破坏 BI2L2-JUN 结合、促进 JUN 降解并抑制恶性表型。总的来说, 这些化合物在小鼠 UVM 转移模型中有效抑制肺转移。

结论: 我们的研究将 BI2L2-JUN 轴定义为 UVM 转移的主要驱动因素, 并确定了治疗干预的可药物靶点。

摘要编号: 209499

葡萄膜黑色素瘤改良肿瘤内切除手术及单中心 20 年临床疗效回顾研究

第一作者: Xuemei ZHU

共同作者: Jianhong LIANG

目的: 介绍一种改良的葡萄膜黑色素瘤肿瘤内切除手术技巧, 报告单中心 20 年来葡萄膜黑色素瘤行肿瘤切除手术患者的临床疗效及趋势。

方法: 回顾性病例研究。收集 2002 年 11 月至 2024 年 11 月在北京大学人民医院眼科诊为葡萄膜黑色素瘤并行肿瘤切除手术的患者临床资料, 包括术前术后视力、眼压、眼底照相、眼部 B 超等影像检查及手术术式、随访、联合治疗、复发、全身转移等信息。所有患者肿瘤切除手术均由同一术者完成, 术后均获得病理支持确诊葡萄膜黑色素瘤。改良肿瘤内切除手术要点为切除肿瘤时采用“隧道-挖空式”切除。手术流程为术前 1 月先行钨 106 放射敷贴治疗, 肿瘤切除手术采用局部麻醉或全身麻醉, 采用 23 G 玻璃体切割, 玻璃体后脱离, 根据视网膜浸润情况, 选择经视网膜或视网膜下的肿瘤切除途径, 采用“隧道-挖空式”切除肿瘤, 直至完全切除后激光肿瘤边缘及巩膜床; 气液交换、硅油填充。术中控制出血的操作包括电凝累及的视网膜血管、短暂升高眼压、应用止血药物等。

结果: 本研究共纳入 102 例 (102 眼) 患者, 平均年龄 45.1 ± 12.8 岁, 女性 54 例, 右眼 40 只, 其中随访时间大于 2 年者 68 例, 平均随访时间 86.2 ± 34.3 个月, 末次随访时保眼率 89.7%, 术后 5 年和 10 年的生存率分别为 91.2%、75%。术后主要的眼部并发症为视网膜脱离、白内障、一过性高眼压、黄斑水肿和增殖性玻璃体视网膜病变。针对采用改良肿瘤内切除手术的患者, 纳入肿瘤高度 > 7 mm 或基底直接 > 15 mm 的大肿瘤患者行亚组分析, 共纳入 18 例 (18 眼) 患者, 平均年龄 49.2 ± 12.9 岁, 平均肿瘤高度 9.4 ± 2.1 mm, 基底直径 13.3 ± 1.8 mm, 所有患者均成功实施了肿瘤切

除术，改良手术方式术野清晰，平均手术时长 90.5 ± 20.7 分钟，且无严重并发症。

结论：单中心 20 年长期研究显示葡萄膜黑色素瘤肿瘤切除术可获得良好的肿瘤控制，未观察到手术相关严重并发症及局部复发增加。大肿瘤中与眼球摘除相比，未观察到全身转移、死亡率显著增加。改良的葡萄膜黑色素瘤内切除术改善术野清晰，提高手术效率。

摘要编号：208350

超级增强子通过 TFAP2A 介导葡萄膜黑色素瘤中的转录失调与代谢重编程机制

第一作者：Weihuan SHAO

共同作者：Renbing JIA, Ai ZHUANG

目的：葡萄膜黑色素瘤 (Uveal melanoma, UM) 是最常见的眼内恶性肿瘤，经常发生转移，导致视力丧失甚至死亡，损害患者生活质量及健康。目前 UM 的遗传学研究进展迅速，除染色体异常和基因突变谱等遗传学经典变异外，UM 发病机制中的表观遗传学因子被发现具有肿瘤特异性而逐渐受到重视。本研究旨在利用生物信息学分析，染色质免疫共定位，基因敲除等技术和方法，描述 UM 的表观基因组特征，筛选并定位关键性的核心转录因子并且分析其功能和下游靶点，从表观遗传修饰出发，探究活跃增强子及其作用因子在 UM 中的重要作用，为临床靶向治疗提供新的思路。

方法：1、通过染色质免疫共沉淀方法定位 UM 全染色质中的活跃增强子和高度结合的转录因子，通过测序技术富集转录因子靶点及其识别特征，通过数据库分析对比寻找主要转录因子 (Master Transcription Factor, MTF) 参与的肿瘤功能及下游靶点。2、通过稳转系构建、CCK8 实验、代谢物检测等技术结合分析，检测 MTF 对 UM 对增殖能力和代谢功能的调节影响。利用 ChIP-seq 结合 RNA-seq 分析，寻找 UM 中关键 MTF 的作用靶点。3、通过免疫组化实验、公共数据库分析等技术和方法在 UM 肿瘤样本组织及患者队列中验证关键性转录因子和靶基因的表达水平及预后指导意义。

结果：1、在 UM 全染色质中存在 H3K27ac 信号的特征性分布，能够作为 SE 或活跃增强子招募核心转录因子使得上下游或其自身表达水平升高，并参与肿瘤相关功能进程；其中 TFAP2A 是识别 UM 活跃增强子一个特异性核心 MTF。2、转录因子 TFAP2A 具有显著的促进 UM 增殖和发展的能力，TFAP2A 在 UM 中异常高表达，同时 TFAP2A 调控 UM 的基础代谢过程。SLC7A8 基因是 UM 代谢相关的 TFAP2A 靶向基因，与患者不良预后相关。

结论：1、UM 中活跃 SE 导致的癌基因过度激活是肿瘤发生和进展的重要原因。UM 染色质中存在活跃增强子的肿瘤特性调控区域，在 UM 中存在识别表观特异性信号而富集的核心 MTF。2、转录因子 TFAP2A 具有显著的促进葡萄膜黑色素瘤增殖和发展的能力，TFAP2A 可以介导 UM 代谢重编程；氨基酸转运蛋白 SLC7A8 受到 SE 与 TFAP2A 共同调节，促进肿瘤发生，关联临床患者不良预后。

摘要编号：208887

迷雾中的真相：一例复发眼睑皮脂腺癌的临床挑战

第一作者：Li ZHU

共同作者：Shuyi LIU, Wei LU, Yingxue MEI, Zijing SUN

目的：眼睑皮脂腺癌 (Sebaceous Carcinoma, SC) 是一种具有潜在侵袭性的恶性肿瘤，其临床特征常与睑板腺囊肿等常见良性病变高度相似，导致初诊误诊率居高不下。更为复杂的是，其在术后复发的形态也可能极不典型，构成严峻的诊断难题。本报告旨在通过一例青年女性 SC 术后非典型复发的病例，系统分析其诊断过程、临床决策的权衡以及应汲取的教训，以期强化临床医师对 SC，特别是其非典型复发形式的识别与警惕。

方法：报告一例 41 岁女性患者，因右眼下睑肿物半年就诊，初次诊断为“右眼睑板腺囊肿”，行手术切除并送病理检查，确诊为右眼下睑皮脂腺癌。术后 6 个月，原手术部位出现轻微局部突起，但缺乏恶性肿瘤常见的溃疡、新生血管或结节等典型特征，其外观更符合术后瘢痕增生或肉芽组织。鉴于复发灶形态不典型且患者年轻、对外观要求高，医患双方对再次手术存在顾虑，最终，基于患者既往 SC 病史，决定再次行手术切除并送病理评估。

结果：术后病理学检查提示“右眼下睑皮脂腺癌复发”。这一结果与术前温和的临床表象形成巨大反差，证实了此次复发是一次成功的“临床伪装”。

结论：本病例为我们提供了两个层面的重要启示。首先，眼睑皮脂腺癌是一种极具“模仿性”的肿瘤，其初次及复发表现均可完美模拟良性术后改变，因此，对任何持续存在或反复发作的眼睑肿物，均应保持高度警惕，并将病理活检作为诊断的基石。其次，也是更关键的教训在于：对于拥有 SC 病史的患者，任何出现在原手术区域的新生病变，无论其外观多么倾向于良性瘢痕，临床医师都必须将“肿瘤复发”置于鉴别诊断的首位。绝不能因患者年轻、外观诉求高或病灶的良性外观而动摇进行病理确诊的决心。及时的干预和彻底的切除是改善预后的关键。本病例深刻表明，在管理此类具有欺骗性的肿

瘤时，基于病史的临床警惕性必须始终高于对表象的依赖。

摘要编号：208973

首诊于眼科的海绵窦区硬脑膜动静脉瘘

第一作者：Rong LIU

目的：了解首诊于眼科的海绵窦区硬脑膜动静脉瘘患者的临床表现与治疗情况。

方法：回顾性分析近 5 年首诊于同济医院眼科，确诊于脑外科，并经眼科脑外科合作经栓塞治疗的海绵窦区硬脑膜动静脉瘘患者的临床资料。

结果：患者共 7 例，女 6 例男 1 例，年龄 33-74 岁，平均 52.4 岁，其中单眼 6 例，双眼 1 例，所有患者均有眼红，眼痛 3 例，复视 3 例，眼球突出 2 例，头痛 1 例，眼压增高 1 例，所有患者眼上静脉均不同程度增粗。经介入治疗好转，其中 4 例由眼科找寻眼上静脉，经眼上静脉径路介入治疗。

结论：海绵窦区硬脑膜动静脉瘘患者常常伴有眼部症状，表现不一，容易漏诊，对结膜血管螺旋状充血及眼上静脉增粗患者应警惕该病可能，经增粗的眼上静脉径路行介入治疗是良好的选择。

2 种超声诊断仪测量有晶体眼后房型人工晶状体植入术患者术前眼前节参数的一致性分析

第一作者：Yan HUO

共同作者：Jian YE

目的：评估 ArcScan Insight100 超高频眼科诊断超声与 UBM 超声生物显微镜测量有晶体眼后房型人工晶状体（ICL）植入术患者术前眼前节参数的差异性、相关性及一致性。同时，比较 Reinstein 公式预测的拱高值与术后实际拱高值的差异。

方法：收集 2024 年 5 月 23 日到 2024 年 6 月 19 日在华厦渝州眼科医院就诊的 ICL 植入术患者 24 名（42 只眼）。每位患者分别使用 ArcScan Insight100 与 UBM 测量双眼前节参数，包括前房深度（ACD）、睫状沟 - 睫状沟间距（STS）、睫状体内径（CBID）等。使用配对样本 t 检验、Pearson 相关性分析及 Bland-Altman 分析评估 2 种设备测量结果的差异性、相关性及一致性。其中有 17 只眼完成了有晶体眼后房型人工晶状体植入术，收集其术后一周拱高值，与 Reinstein 公式预测的拱高值作比较。

结果：ArcScan Insight100 测得的 STS、CBID 值均高于 UBM 测得的值，差异具有统计学意义（均 $P < 0.001$ ）；ArcScan Insight100 测得的 ACD 略高于 UBM 测得的值，但并没有统计学差异（ $P = 0.294$ ）。其中，ArcScan Insight100 测得的 ACD 与 Pentacam 相比更小，差异具有统计学意义；UBM 测得的 ACD 与 Pentacam 相比更小，差异具有统计学意义。Pentacam 测得 ACD 与 ArcScan Insight100、UBM 测得的数据相关性分别为 0.963、0.898（均 $P < 0.001$ ）；ArcScan Insight100 与 UBM 测得的 ACD、STS、CBID 的数据相关性系数分别为 0.934、0.737、0.719（均 $P < 0.001$ ）。Bland-Altman 分析显示 Pentacam 测得 ACD 与 ArcScan Insight100、UBM 测得的数据的 95% 一致性界限（95% LoA）分别为 $-0.03 \sim 0.20 \text{ mm}$ 、 $-0.09 \sim 0.29 \text{ mm}$ ；ArcScan Insight100 与 UBM 测得的 ACD、STS、CBID 的数据的 95% 一致性界限（95% LoA）分别为 $-0.14 \sim 0.17 \text{ mm}$ 、 $-0.21 \sim 0.91$ 、 $-0.23 \sim 1.10$ ，显示 ArcScan Insight100 与 UBM 测得的 STS、CBID 数据一致性不佳，而 pentacam 与 ArcScan Insight100、UBM、ArcScan Insight100 与 UBM 测得的 ACD 数据一致性良好。Reinstein 公式预测的拱高值为 $474.059 \pm 136.990 \mu\text{m}$ ，而实际的术后拱高值为 $526.235 \pm 210.209 \mu\text{m}$ ，预测拱高值小于实际拱高值，差异有统计学意义（ $P < 0.05$ ）。

结论：ArcScan Insight100 超高频眼科诊断超声与 UBM 超声生物显微镜在 ACD 数据的测量上无统计学差异，且一致性较好；与 pentacam 相比，二者测得的 ACD 均偏小，但一致性较好。ArcScan Insight100 超高频眼科诊断超声与 UBM 超声生物显微镜在 STS、CBID 等参数的测量上存在一定的差异，一致性较差。临床工作中若应用 2 种设备测得的前节参数作为 ICL 植入术晶体尺寸参考数据时，应考虑 2 种设备测量存在差异以更好地做出决策。

摘要编号：209472

DCE-MRI 及 DWI 在泪腺上皮性肿瘤诊断及预后评估中的应用价值

第一作者：Yilin YU

共同作者：Yidi YANG

目的：泪腺上皮性肿瘤是泪腺区常见的肿瘤之一，若治疗前评估不完整或诊断有误，将直接影响治疗效果，导致术后肿瘤复发、扩散甚至远处转移，影响患者预后。目前，临床中常用的泪腺肿瘤检查方法包括眼眶 CT、MRI 等，但其在鉴别肿瘤的良恶性方面存在一定局限性。传统的 MRI 检查仅能提

供解剖信息，对于肿瘤的微观结构和血流灌注情况评估有限。因此，本研究旨在探讨 MRI 动态增强（DCE）联合弥散加权成像（DWI）诊断乳腺良性病变的临床应用价值。

方法：本研究共纳入 87 名经组织病理学证实的泪腺上皮性肿瘤患者，所有患者术前均完成眼眶增强 MRI 检查。利用 DWI 和 DCE-MRI 图像后处理，绘制感兴趣区（ROI）并测量肿瘤的表现弥散系数（ADC）及动态增强的半定量参数（时间信号曲线（TIC）类型、对比剂到达时间（T0）、达峰时间（Tpeak）、峰值强化率（Emax）、流入率（WinR）及增强曲线下面积（Sarea）），进行统计学分析及相关模型构建。通过受试者操作特征（ROC）分析评估模型的诊断价值。

结果：在鉴别 LGPAs 与 LGMETs 方面，DWI 与 DCE-MRI 联合模型的诊断效率最高（AUC = 0.947、敏感度 94.1%、特异度 78.6%， $p < .001$ ）。尤其，对于缺乏影像学骨质破坏征象的患者，该联合模型具有优秀的诊断效能（AUC = 0.966，敏感度 92.3%，特异度 92.6%）。另外，在 LGMETs 患者中，Ki67 $\geq 30\%$ 常被认为是预后不良的指标之一，基于 MRI 的影像模型对 Ki67 高表达也有一定的预测价值（AUC 为 0.809，敏感性为 94.1%，特异性为 66.7%）。

结论：DWI 联合 DCE-MRI 对泪腺上皮性肿瘤具有良好的鉴别诊断价值，且基于 MRI 的模型可无创预测肿瘤 Ki67 的高表达，提示其在泪腺上皮性肿瘤诊断和预后评估中的潜在作用。

摘要编号：209483

OCTA 引导半剂量 PDT 治疗急性中心性浆液性脉络膜视网膜病变的有效性研究

第一作者：Siyang LI

目的：观察光相干断层扫描血管成像（OCTA）引导半剂量光动力疗法（PDT）治疗急性中心性浆液性脉络膜视网膜病变（CSC）的疗效。

方法：前瞻随机对照试验。2019 年 4 月至 2020 年 4 月于北京大学人民医院眼科中心检查确诊的急性 CSC 患者 72 例 72 只眼纳入研究。随机分为 OCTA、吲哚青绿血管造影（ICGA）组，分别为 31 例 31 只眼、33 例 33 只眼。患眼均行最佳矫正视力（BCVA）、眼底彩色照相、OCTA、ICGA 检查。采用国际标准视力表行 BCVA 检查，统计时换算为最小分辨角对数（logMAR）视力。OCTA 组将脉络膜毛细血管层粗颗粒强反射区定为治疗区；ICGA 组将与 FFA 渗漏点附近对应的脉络膜高灌注区定为治疗区。根据彩色眼底像中勾画的治疗区域对患眼进行半剂量 PDT 治疗。对比观察两组患眼

治疗后 1、3、6 个月视网膜下液（SRF）完全吸收率、BCVA、中心凹视网膜厚度（CRT）变化情况以及治疗后 3、6 个月 SRF 复发率。两组间连续变量比较采用 t 检验或 Wilcoxon 秩和检验；分类变量比较采用 χ^2 检验。

结果：治疗后 1、3、6 个月，OCTA 组、ICGA 组 SRF 完全吸收率分别为 74.2%（23/31）、63.6%（21/33），87.1%（27/31）、84.8%（28/33），96.8%（30/31）、91.9%（31/33）；OCTA 组治疗后不同时间 SRF 完全吸收率均非劣于 ICGA 组 [95% 可信区间（CI）-11.9 ~ 33.1， $P = 0.402$ ；95% CI -14.7 ~ 19.3， $P = 0.107$ ；95% CI -6.3% ~ 16.1%， $P = 0.226$]。治疗后 3、6 个月，两组患眼 SRF 复发率比较，差异无统计学意义（ $\chi^2 = 0.009, 0.047$ ， $P = 0.925, 0.828$ ）；治疗后 6 个月，CRT 比较，差异有统计学意义（ $t = 2.017$ ， $P = 0.047$ ）；治疗后 1、3、6 个月，logMAR BCVA 比较，差异无统计学意义（ $t = 0.529, 0.762, 1.017$ ， $P = 0.581, 0.403, 0.243$ ）。

结论：随访 6 个月时间内，OCTA 引导下的半剂量 PDT 治疗急性 CSC 患者，其 SRF 完全吸收率不劣于 ICGA 引导下的 PDT。OCTA 有可能取代 ICGA 作为引导 PDT 治疗急性 CSC 和治疗后随访的新工具。

摘要编号：209157

三维立体摄影测量法在眶周肿瘤表面积测量中的可靠性研究

第一作者：Xincen HOU

共同作者：Ludwig M. HEINDL, Jianqiao LI

目的：为实现眶周肿瘤大小和面积的更精确评估，本研究采用三维（3D）立体摄影测量技术，对不同类型的眶周肿瘤表面积进行量化测量，并评估该方法的重复性与可靠性。

方法：研究共纳入 150 例经诊断为眶周肿瘤的患者，总计 175 个肿瘤。研究者首先根据肿瘤的直径、形态、颜色、部位、表面纹理、距睑缘距离、边界清晰度及组织学类型进行分类。随后利用三维立体摄影系统对患者面部进行扫描，重建肿瘤三维模型，并计算其表面积。为评估测量一致性，两名测量者分别进行了重复测量，以获得组内一致性（intra-rater）与组间一致性（inter-rater）的信度指标。

结果：结果显示该技术具有高度的测量可靠性。组内一致性 ICC（组内相关系数）为 0.998，组间一致性 ICC 为 0.974，均属于极高信度范围。平均绝对差（MAD）分别为 0.63 mm^2 与 0.40 mm^2 ，对应的相对测量误差（REM）为 1.94% 和 1.22%。测量技术误差（TEM）分别为 2.29 mm^2 与 7.81

mm²，相对技术误差 (rTEM) 为 6.95% 和 23.76%。结果还表明，影响测量可靠性的主要因素包括：肿瘤直径、颜色、所在部位及边界清晰度。较小或颜色接近周围组织的肿瘤，其测量误差略高；而边界清晰、位于相对平坦区域的肿瘤，测量结果更为稳定。

结论：本研究证实三维立体摄影测量技术在眶周肿瘤表面积定量评估中具有极高的重复性和可靠性。与传统二维测量方法相比，该技术能更准确地反映肿瘤的真实表面积变化，为术前评估、疗效监测及病变随访提供客观依据。研究同时揭示了若干影响测量精度的关键变量，为未来在眼睑肿瘤及其他面部皮肤病变评估中的临床应用提供了重要参考。总体而言，三维立体摄影测量是一种可行且精确的眶周肿瘤评估手段，具有较高的临床推广价值。

摘要编号：208686

使用 AS-OCTA 定量分析糖网患者的虹膜血流变化

第一作者：Shuai WANG

共同作者：Xun AN, Chao MA, Tiantian WANG, Yong LV

目的：利用扫频前节光学相干断层扫描血管造影 (anterior segment optical coherence tomography angiography, AS-OCTA) 技术定量分析增殖性糖尿病性视网膜病变 (proliferative diabetic retinopathy, PDR) 患者和非糖尿病对照组 (none-diabetic controls, NDC) 的虹膜血流变化，结合常规 OCTA 评估视网膜血流参数，探讨 AS-OCTA 是否能被用作预测增殖性糖尿病性视网膜病变发生及病程进展的工具。

方法：共纳入确诊且进行 AS-OCTA 检查的初治 PDR 患者 71 例 71 眼，非糖尿病对照组患者 55 例 55 眼。使用 AS-OCTA (AS Angio 12X12 384X384 R2) 系统分析所有受检眼的虹膜血流变化。我们将虹膜的 OCTA 图像作为量化分析的基础图像，计算虹膜的血管密度 (Vessel Area Density, VAD)、小血管密度 (Small Vessel Density, SVD)、灌注面积 (Perfusion Area, PA)。使用 OCTA (Angio 12X12 1024X1024 R2) 系统分析所有受检眼的黄斑旁中心凹的视网膜血流变化。

结果：PDR 患者较非糖尿病对照组的虹膜血流密度增加，当 PDR 合并肾功能减退时，虹膜血流密度减少。PDR 患者的虹膜血流变化与视网膜血流变化具有相关性。PDR 合并黄斑水肿患者较单纯 PDR 患者的虹膜及视网膜血流密度均减少。

结论：单纯 PDR 患者的虹膜血流密度较非糖尿病对照组增高，在合并肾功能不全时降低。PDR 患

者虹膜与视网膜的血流变化相互关联，且在合并黄斑水肿时二者均进一步降低。我们认为使用 AS-OCTA 测量虹膜血流变化可以作为监测增殖性糖尿病性视网膜病变发生及病程进展的新的潜在指标，对屈光间质不清的患者监测具有临床意义。

摘要编号：209784

吲哚菁绿血管造影晚期高荧光点与糖尿病性黄斑水肿的关系

第一作者：Xin WANG

共同作者：Aiyi ZHOU

目的：糖尿病性黄斑水肿 (Diabetic macular edema, DME) 是糖尿病患者常见的眼部微血管并发症。研究发现，吲哚菁绿血管造影 (Indocyanine green angiography, ICGA) 晚期出现的高荧光点可能提示大的微血管异常，这些高荧光点被称作扩张型毛细血管 (Telangiectatic capillaries, TCs)。在一些难治性 DME 患者中，采用 ICGA 导航的视网膜激光对 TCs 进行光凝之后，DME 的严重程度得到了改善。然而，目前该治疗并未广泛用于临床，关于 TCs 与 DME 的关系仍在探究中。本研究旨在探究 ICGA 晚期出现的高荧光点与 DME 之间的关系以及这些高荧光点的特征，以期 DME 的治疗提供新的理论支持。

方法：回顾性收集了 2019 年 1 月至 2023 年 12 月期间，在我院诊断为 DR 并在治疗前同时接受了 ICGA 和光学相干断层扫描 (Optical coherence tomography, OCT) 的患者的临床数据和检查资料。根据 OCT 将患者分为 DME 组和无 DME 组，将 ICGA 晚期出现在血管环弓以内高荧光点定义为 TCs，进而探究 TCs 与 DME 之间的关系以及 TCs 的影像学特点。

结果：本研究共纳入了 DR 患者的 127 只眼，其中 73 眼 (57%) 合并 DME。结果显示 TCs 更易出现在 DME 眼中 (OR: 8.820, 95% CI: 3.479-22.364, $P < 0.001$)。在 DME 眼中，TCs 的出现与 DME 类型之间无明显关联 ($P = 0.265$)。与不合并 TCs 的 DME 眼相比，合并 TCs 的眼的黄斑中心凹厚度 (Central macular thickness, CMT) 更厚 ($P = 0.013$)。以直径为 150 μm 为界对 TCs 大小分类后，结果提示 DME 眼中的 TCs 较大 ($P = 0.029$)。对 44 个 TCs 进行断层扫描后发现，TCs 周围视网膜增厚更易出现在 DME 眼中 ($P = 0.032$)。DME 眼中在 ICGA 晚期出现的 TCs 在同时期荧光素眼底血管造影 (Fundus fluorescein angiography, FFA) 上表现分别为无对应点 (3%)、有对应点 (21%)、渗漏 (35%) 和混合型 (41%)，在早期 FFA 上分布为无对应点 (25%)、部分有对应点

(22%) 和有对应点 (53%)，在早期 ICGA 上分布为无对应点 (33%)、部分有对应点 (30%) 和有对应点 (37%)。

结论：TCs 更易出现在 DME 中，通常直径较大，且与 DME 严重程度相关。仅有部分 TCs 可通过 FFA 及早期 ICGA 观察到。

摘要编号：209353

多波长视网膜血氧仪在巴马小猪视网膜血管参数中的检测价值

第一作者：Xingzi KANG

共同作者：Junguo DUAN

目的：采取不同血氧检测手段，探讨多波长视网膜血氧仪间接检测与金标准直接检测结果的相关性及准确性。

方法：6 只巴马小猪分别吸入浓度为 10%、21%、100% 的氧气，当外周脉搏氧饱和度达到稳定水平时，通过股动脉血气分析检测股动脉血氧饱和度；通过 O2 微传感器损伤性地穿刺巴马小猪视网膜检测玻璃体内血氧饱和度；通过 I 型、II 型多波长视网膜血氧仪无创检测视网膜血氧饱和度和动静脉管径。

结果：股动脉血氧饱和度和玻璃体内血氧饱和度相关 ($P < 0.05$)，玻璃体内血氧饱和度与视网膜血氧饱和度相关 ($P < 0.05$)，I 型与 II 型多波长视网膜血氧仪精确度无差异 ($P > 0.05$)。在吸入 10% 浓度氧气的情况下，I 型与 II 型多波长视网膜血氧仪测得动静脉管径有差异 ($P < 0.05$)；在吸入 21% 浓度氧气和 100% 浓度氧气的情况下，I 型与 II 型多波长视网膜血氧仪测得动静脉管径无差异 ($P > 0.05$)。

结论：多波长视网膜血氧测定法对巴马小猪全身血氧饱和度变化较敏感；I 型与 II 型多波长视网膜血氧仪精确度无差异。本实验明确了两种多波长视网膜血氧仪检测视网膜血氧饱和度的可靠性，为多波长视网膜血氧仪的临床应用提供了循证科学依据。

摘要编号：209485

广角扫描频源光学相干断层扫描血管成像 (SS-OCTA) 与超广角荧光血管造影 (UWF-FA) 在视网膜静脉阻塞 (RVO) 病灶中的比较

第一作者：Siyang LI

目的：SS-OCTA (图湃，中国北京) 成像范围可以达到 $24 \times 20 \text{ mm}$ ，即 $81^\circ \times 68^\circ$ ，可以覆盖后极部及中周部视网膜，扩大了其应用范围。本文对

RVO 病灶在广角全域 SS-OCTA 和超广角荧光血管造影 (UWF-FA) 下的成像进行比较。

方法：本研究纳入 32 例未经治疗的 RVO 患者，分别进行 UWF-FA (200°) 荧光血管造影和广角全域 SS-OCTA ($24 \times 20 \text{ mm}$) 检查。在旋转、缩放和非线性转化后量化评估两种成像下的黄斑中心凹无血管区 (FAZ) 面积和周长、无灌注区 (NP) 面积、微血管瘤 (MA) 数量、毛细血管改变以及侧支血管的检出率。

结果：S-OCTA 和 UWF-FA 测得的 FAZ 面积和周长测量值具有可比性 ($0.373 (0.277-0.48) \text{ mm}^2$ vs. $0.370 (0.277-0.48) \text{ mm}^2$, $P = 0.818$; $2.480 (2.011-2.998)$ vs. $2.330 (2.027-2.807) \text{ mm}$, $P = 0.536$)。SS-OCTA 与 UWF-FA 的 FAZ 面积和周长的相关系数 (ICCs) 较高 ($0.999 [0.997-0.999]$ 和 $0.996 [0.991-0.996]$)，一致性较好。SS-OCTA 的平均 NPA 面积大于 UWF-FA ($89.977 \pm 78.805 \text{ mm}^2$ vs. $87.944 \pm 77.444 \text{ mm}^2$, $P = 0.037$)。NPA 的 ICC 也较高 ($0.999 [0.999-1.000]$)，一致性较好。SS-OCTA 的总 MA 计数中位数低于 UWF-FA ($7 (0-19)$ vs. $12 (0-23)$, $P < 0.001$)。SS-OCTA 与 UWF-FA 检测 MAs 的一致性较好 ($\text{ICC} = 0.920 [0.555-0.974]$)。UWF-FA 的总毛细血管变化和侧支血管计数少于 SS-OCTA (分别为 11 ± 9 vs. 6 ± 7 , $P < 0.001$ 和 $4 (0-6)$ vs. $0 (0-0)$, $P < 0.001$)。OCTA 和 UWF-FA 在检测毛细血管变化和侧支血管方面的一致性一般 (ICC 分别为 $0.733 [0.081-0.905]$ 和 $0.564 [0.039-0.805]$)。

结论：与 UWF-FA 相比，广角全域 SS-OCTA 在检测 FAZ、NPA、毛细血管改变和侧支血管方面不但具有高度可比性，甚至更有优势。这使 SS-OCTA 替代 UWF-FA 应用于 RVO 的诊断和随访成为可能。

摘要编号：209170

急性共同性内斜视患者静息态功能磁共振成像特征

第一作者：李晓雪

共同作者：任婉娜

目的：观察急性共同性内斜视患者静息态功能磁共振成像特征，系统分析急性共同性内斜视患者的脑区自发神经活动特征，与健康对照者进行对比，明确两组在局部脑区兴奋状态及功能连接方面的差异。

方法：收集 56 例急性共同性内斜视患者和 56 例健康对照组的静息态核磁信号。采用 SPSS 26.0 软件进行统计学处理。通过重复测量方差分析检验两组

被试全脑低频振幅的整体差异，再通过双样本 t 检验进一步比较两组在局部脑区低频振幅及局部一致性的差异。

结果：急性共同性内斜视组视觉通路的背侧区域、初级视觉皮层区域的低频波动信号幅值信号降低。急性共同性斜视组的颞下皮层、小脑、舌回、梭状回、双侧扣带回、小脑前叶的局部一致性值显著增加。

结论：急性共同性内斜视患者存在初级视觉皮层和背侧通路的功能缺陷，可能与患者视觉信息处理及空间感知能力下降相关；而小脑前叶等脑区的活动强于健康对照者，提示急性共同性内斜视发病过程中可能存在小脑功能重组以代偿眼球运动异常。

摘要编号：**210031**

自适应光学扫描激光检眼镜（AOSLO）的活体视网膜显微成像系统及应用案例：从细胞级可视化到多疾病预后评估的技术突破

第一作者：**Jie ZHANG**

目的：本研究旨在建立新一代自适应光学扫描激光检眼镜（AOSLO）的临床使用平台，实现活体视网膜细胞级微观结构的高分辨率成像，填补传统成像技术在视网膜微观结构观测上的不足，为眼部疾病的早期诊断、精准分期、个体化预后判断及客观监测提供技术支撑。

方法：自主开发的光学分辨率达 2 μm AOSLO 系统，在临床应用中实现活体状态下视网膜细胞级显微结构的清晰观测。用这种系统对以下多种疾病进行检查，包括黄斑毛细血管扩张症，遗传性视网膜变性，青光眼，糖尿病视网膜病变以及羟氯喹毒性视网膜病变等。观测范围覆盖视锥细胞、小胶质细胞、玻璃体细胞、神经纤维、视网膜血管网络及多种其他视网膜细胞结构。同时结合深度学习算法，实现部分形态学参数的自动量化分析。

结果：该 AOSLO 系统成像性能优异，所获图像兼具高稳定性、强对比度与运动伪影低等优势，清晰捕捉疾病特异性早期微观变化。对黄斑毛细血管扩张症的微血管异常的动态可视化、对视网膜变性视锥细胞丢失的精准识别、对神经视网膜疾病中神经纤维病变的清晰定位，以及对糖尿病视网膜病变毛细血管改变都有精准发现。该系统在临床应用实现了视网膜的细胞级检查。

结论：该系统不仅丰富了眼部疾病的诊疗手段，更推动了眼科诊疗向精准化、个体化方向发展，为眼部疾病的早期检测、动态监测及预后评估提供新型手段。

20 例慢性进行性眼外肌麻痹临床特点分析

第一作者：**王琨**

目的：探讨慢性进行性眼外肌麻痹（CPEO）临床、影像特点。

方法：回顾性分析 20 例 CPEO 患者的临床表现、影像特点。20 例 CPEO 患者均经肌肉病理学确诊。

结果：20 例患者中，男性 10 名（占 52.6%），女性 9 名（占 47.4%）。家族史 2 例（占 10.5%）。起病年龄为 8 ~ 47 岁，平均发病年龄为 27.1 岁，发病病程为 2 ~ 27 年，平均发病病程 13.2 年，首发症状双眼上睑下垂 14 例（占 73.7%），先后双眼上睑下垂 3 例（占 15.8%），单眼上睑下垂 2 例（占 10.5%），不同程度遮盖角膜。双侧眼球活动障碍 17 例（占 89.5%），单侧眼球活动受限 2 例（占 10.5%）。无复视 17 例（占 89.5%）。疲劳不耐受 2 例（占 10.5%）。冰敷试验阳性 1 例（占 11.1%）。新斯的明试验阳性 1 例（占 11.1%）。眼眶 MRI：双侧眼外肌萎缩 16 例（占 84.2%）。眼眶 MRI 表现为 T2WI 双侧眼外肌纤细，肌肉萎缩。

结论：缓慢发生的双侧眼睑下垂、眼球各个方向活动障碍，而且不伴有明显复视，应警惕慢性进行性眼外肌麻痹，尽早做肌肉病理学检查。

摘要编号：**208946**

25G 微创玻璃体切割术治疗非动脉炎性前部缺血性视神经病变的临床疗效观察

第一作者：**Yu SU**

共同作者：**Changzheng CHEN, Yin SHEN, Lhamo TSEIRING**

目的：探讨 25g 微创玻璃体切割术对非动脉炎性前部缺血性视神经病变（NAION）患者视功能的改善效果及手术安全性，为 NAION 的临床治疗提供参考依据。

方法：本研究为前瞻性病例研究。共纳入 18 例发病 2 周至 2 月内保守治疗后仍持续明显视盘水肿的 NAION 患者。所有患者均接受标准玻璃体切割术解除视盘牵拉。于术前、术后第 1 天、第 2 天、1 周、1 个月、2 个月、3 个月对所有患者进行最佳矫正视力（BCVA）评估、眼底彩照及光学相干断层扫描（OCT）检查，以观察视盘水肿变化、测量视网膜神经纤维层（RNFL）及神经节细胞层 + 内丛状层（GCL + IPL）厚度；同时利用 OCT 血管成

像 (OCTA) 定量分析浅层及深层视盘周围毛细血管的血流密度。

结果: 术后所有手术患者视力均有不同程度提升。18 例眼中 17 只眼 BCVA 较术前提升 ≥ 1 行, 其中 12 只眼提升 ≥ 3 行; 术前平均 BCVA 为 0.18 ± 0.07 , 术后 1 个月提升至 0.32 ± 0.11 , 眼底观察及 OCT 检查显示, 所有患者的视盘水肿均在术后第二天开始消退显著, 其中 60% 患者的水肿在术后 1 周内基本消退, 100% 于 2 周内完全消退。视网膜结构分析发现, 所有患者的 RNFL 厚度呈持续下降趋势, 而 GCL+IPL 厚度在 1 月内保持稳定, 未出现显著变薄。OCTA 定量分析进一步证实, 术后多个时间点的视盘周围血流密度值与术前相比明显增加 (均值由术前 46% 提升至术后 53%); 黄斑区血流密度值较前明显增加, 术后第 48 h 最为明显, 差异具有统计学意义 ($p < 0.05$)。术后随访 1 个月, 差异有统计学意义 ($P < 0.05$)。

结论: 本研究初步表明, 对于持续性视盘水肿的 NAION 患者, 玻璃体切割手术可能通过接触玻璃体牵拉、改善盘周及黄斑区血供有效促进视盘水肿的快速消退, 并伴随视功能的改善。

摘要编号: 204418

A 型肉毒素注射治疗 36 例外展神经麻痹性斜视的临床观察

第一作者: Yu DU

共同作者: Wanna REN, Pengcheng WU, Wenfang ZHANG

目的: 探讨 A 型肉毒素局部注射对外展神经麻痹性斜视的矫正效果及安全性, 为其在急性期及围手术期的规范化应用提供循证依据。

方法: 回顾性纳入 2024 年 1 月至 2025 年 8 月于兰州大学第二医院确诊的 36 例外展神经麻痹性斜视患者 (36 只患眼), 其中男性 20 例、女性 16 例, 年龄 18-71 岁 (平均 42.6 ± 12.3 岁)。病因包括微血管缺血 22 例、外伤 8 例、颅内肿瘤术后 4 例、特发性 2 例。所有病例均经三棱镜 + 遮盖试验、眼眶 MRI、颅脑 CTA 或 MRA 排除肌肉嵌顿及重症肌无力。按内直肌亢进程度 (+ ~ +++) 分为轻、中、重三组, 对应给予 2.5 U-5.0 U A 型肉毒素 (5 U/0.1 mL), 在直视操作下行内直肌肌腹单点注射。术后第 1、4、12、24 周定期随访, 记录斜视度 (远距 + 近距三棱镜)、眼球运动分级 (-4 ~ 0)、复视评分 (0 ~ 3 级)、注射次数、并发症及患者满意度 (Likert 5 分制)。主要疗效终点为末次随访时斜视度改善 $\geq 10 \Delta$ 且复视 ≤ 1 级, 次要终点为二次注射率、并发症发生率。

结果: ① 眼位: 术前平均远距斜视度 $35.4 \Delta \pm 8.2 \Delta$ (范围 $20 \Delta \sim 50 \Delta$), 术后 4 周降至 $16.8 \Delta \pm 6.9 \Delta$, 24 周为 $18.2 \Delta \pm 7.1 \Delta$, 与术前比较差异有统计学意义 ($F = 88.37$, $P < 0.001$)。② 疗效: 术后 4 周达显效 (斜视度 $\leq \pm 10 \Delta$) 者 19 例 (52.8%), 有效 (改善 $\geq 10 \Delta$) 28 例 (77.8%); 至 24 周, 显效率提高至 58.3% (21/36), 总有效率保持 75.0% (27/36)。微血管组显效率最高 (63.6%, 14/22), 外伤组次之 (50.0%, 4/8), 肿瘤术后组最低 (25.0%, 1/4), 组间差异有统计学意义 ($\chi^2 = 6.14$, $P = 0.046$)。③ 复视: 术前复视评分 2.4 ± 0.7 , 术后 4 周降至 0.9 ± 0.8 , 24 周 1.0 ± 0.9 ($F = 71.25$, $P < 0.001$); 复视消失或减轻者 32 例 (88.9%)。④ 二次注射: 6 例 (16.7%) 在 12 周内行补充注射, 其中 5 例最终获得 $\leq 10 \Delta$ 残留斜视; 1 例因肉毒素抗体效价升高转为手术矫正。⑤ 并发症: 未出现眼球穿孔、眼内炎、永久性瞳孔散大等严重并发症; 短暂性上睑下垂 2 例 (5.6%), 内直肌肌腹血肿 1 例 (2.8%), 均在 4 周内自行恢复; 无全身肉毒素中毒表现。⑥ 满意度: 术后 24 周患者总体满意度 4.2 ± 0.8 分, 其中微血管组 4.4 ± 0.6 分, 显著高于外伤组 (3.9 ± 0.9 分) 与肿瘤术后组 (3.5 ± 1.0 分, $P = 0.018$)。

结论: A 型肉毒素内直肌注射可安全、有效地矫正外展神经麻痹性斜视, 微血管性者疗效最佳; 2.5-5.0 U 个体化剂量即可在急性期快速重建眼位、缓解复视, 减少后续手术率; 其并发症轻微、可逆, 可作为外展神经麻痹性斜视急性期及围手术期的一线治疗选择。

摘要编号: 207626

GHRH 受体拮抗剂对 EAE 小鼠 RGC 的保护作用研究

第一作者: Kunliang QIU

共同作者: 伍子建, 段欣宁

目的: 纵向观察实验性自身免疫性脑脊髓炎 (EAE) 模型中视网膜神经节细胞复合层 (GCC)、视网膜神经节细胞 (RGC) 存活及树突复杂度的动态变化以及评估生长激素释放激素 (GHRH) 受体拮抗剂 MIA602 对 EAE 小鼠 RGC 的保护作用。

方法: 1. EAE 模型建立: 通过髓鞘少突胶质细胞糖蛋白 35-55 (MOG35-55) 联合完全弗氏佐剂皮下注射, 结合百日咳毒素腹腔注射, 建立 EAE 小鼠模型。将小鼠分为对照组、EAE 组、EAE + 二甲亚砜 (DMSO) 组、EAE + MIA602 组和 EAE + 地塞米松 (Dex) 组。2. 组织学染色和视网膜功能评估: 监测体重、神经功能评分, 通过苏木精-伊红 (H&E) 染色、劳克坚牢蓝 (LFB) 染色评估

视神经炎症及脱髓鞘情况。利用光学相干断层扫描 (OCT) 测量 GCC 厚度, 共聚焦激光扫描检眼镜 (cSLO) 观察 RGC 树突形态, 免疫荧光染色检测 RGC 密度、小胶质细胞激活及巨噬细胞浸润。

结果: 1. EAE 小鼠发病后 1 周出现体重下降、神经功能评分升高 (3.5 ± 0.3 , $P < 0.001$), 视神经 H&E 染色显示 EAE 小鼠巨噬细胞数量相比于未诱导的对照组小鼠显著升高 (1007.6 ± 388.3 cells/mm² vs 85.1 ± 16.7 cells/mm², $P < 0.001$), LFB 染色显示 EAE 组小鼠出现髓鞘脱失, GCC 厚度 (70.8 ± 4.9 μ m vs 77.0 ± 3.7 μ m, $P = 0.02$) 和 RGC 密度 (1200.8 ± 240.0 cells/mm² vs 1684.5 ± 172.7 cells/mm², $P = 0.002$) 显著降低, RGC 树突复杂度 (树突场面积、分支数量等) 在发病后 4 天出现萎缩, 并持续进展至 6 周。2. 在 EAE 小鼠发病后第 7 天, 与 EAE + DMSO 组相比, EAE + MIA602 组神经功能评分降低 (1.5 ± 0.9 vs 2.2 ± 1.2 , $P = 0.045$), GCC 厚度增加 (73.1 ± 3.2 μ m vs 69.2 ± 3.0 μ m, $P < 0.001$)、RGC 密度升高 (1484.7 ± 109.4 cells/mm² vs 1241.1 ± 168.4 cells/mm², $P = 0.017$), 激活视网膜小胶质细胞占比 (0.20 ± 0.08 vs 0.37 ± 0.08 , $P = 0.014$) 和巨噬细胞浸润 (20.7 ± 9.2 cells/section vs 39.6 ± 19.3 cells/section, $P = 0.037$) 减少, 视神经脱髓鞘区域面积缩小 ($7.3 \pm 4.7\%$ vs $27.0 \pm 20.6\%$, $P = 0.027$)。

结论: GHRH 受体拮抗剂 MIA602 可通过调控小胶质细胞激活和巨噬细胞浸润, 减轻视神经炎症及脱髓鞘, 从而挽救 EAE 小鼠 RGC 存活并维持 GCC 结构。

摘要编号: 208579

PV 阳性视网膜神经节细胞 - 上丘视觉通路对视诱发恐惧逃避反应的调控研究

第一作者: Man YUAN

共同作者: Yin SHEN

目的: 小清蛋白 (parvalbumin, PV) 是一种钙结合蛋白, 主要存在于大脑中特定 GABA 能中间神经元, 调节神经递质释放和神经元兴奋性。视网膜中 PV 阳性的神经节细胞 (PV⁺ RGCs) 是一类跨物种存在的 RGCs, 具有较强的抗损伤性, 可能在视觉信息处理中发挥重要作用。然而, 其脑区投射和功能仍不清楚。本研究利用转基因小鼠及示踪病毒特异性标记, 系统展示 PV⁺ RGCs 在视网膜和脑区的分布, 解析其投射至上丘 (superior colliculus, SC) 的细胞类型特异性通路及其在 looming 诱发防御行为中的作用。

方法: (1) 在 PV-Cre 小鼠双侧玻璃体腔注射逆行非跨突触病毒 (rAAV2/2-EF1 α -DIO-eYFP), 标记并分析 PV⁺ RGCs 的分布和投射。(2) 通过在 SC 注射逆行示踪病毒 (rAAV2/retro-EF1 α -DIO-eYFP) 标记投射至 SC 的 PV⁺ RGCs, 并结合 scRNA-seq、Merfish 及免疫染色分析其形态、分子特征和神经递质类型。(3) 利用逆行和逆行跨突触示踪策略, 确定 PV⁺ RGCs $\rightarrow$ SC PV⁺ 神经元的特异性连接。(4) 通过化学遗传学及白喉毒素介导的消融或抑制, 探讨该通路在 looming 诱发防御行为及视觉功能中的作用。

结果: (1) PV⁺ RGCs 占总 RGCs 的约 23.15%, 其轴突投射至上丘 (SC)、外侧膝状体 (LGN)、橄榄前顶核 (OPN)、未定带 (ZI) 及辅助视神经系统内侧终末核 (MTN)。(2) 投射至 SC 的 PV⁺ RGCs 占总 RGCs 的 16.39%, 多为中至大型胞体与树突野, 光反应类型包括 ON、OFF 及 ON-OFF, 其中 OFF 型占 73.4%。这些细胞多为谷氨酸能神经元, 且超过一半为 α RGCs。(3) 逆行跨突触示踪显示, 97.36% 的 PV⁺ RGCs 直接投射至 SC PV⁺ 神经元并延伸至 PBGN; 逆行示踪验证, 投射至 SC PV⁺ 神经元的 RGCs 中 83.61% 为 PV⁺ 类型。大多数 SC PV⁺ 神经元 (84.64%) 为谷氨酸能。(4) 功能实验表明, 特异性消融或抑制 PV⁺ RGCs $\rightarrow$ SC PV⁺ 通路显著削弱或消除 looming 诱发的恐惧逃避反应, 同时 SC 区 c-Fos 表达下调, 表明该通路在防御反应中具有关键作用。但该操作对图像视觉功能 (OMR、ERG、FVEP) 无显著影响。

结论: 本研究首次系统揭示 RGCsPV⁺ $\rightarrow$ SCPV⁺ 的皮层下视觉通路, 并证明其在 looming 诱发的先天防御行为中发挥关键调控作用, 而不影响图像视觉功能。该发现为解析视网膜 - 脑功能环路及视觉相关神经疾病的干预提供了新的实验依据与潜在靶点。

摘要编号: 209214

α -酮戊二酸通过重塑免疫微环境对抗视网膜缺血再灌注损伤

第一作者: Bingqing JIANG

共同作者: Zhaohui LI

目的: 本研究旨在探讨 α -酮戊二酸 (α -KG) 在视网膜缺血再灌注损伤 (RIRI) 中的神经保护作用。

方法: 本研究采用体内动物实验, 通过成熟的小鼠前房高眼压灌注法 (110 mmHg, 60 分钟) 建立标准化 RIRI 模型。研究设计分为三个部分: 首先, 建立模型明确病理表征; 随后开展 α -KG 的药效学与安全性评价, 设立对照组、损伤组及低、中、高剂量 α -KG 干预组, 通过黑白箱行为学实验分析视

功能, 采用视网膜苏木精 - 伊红 (HE) 染色观察组织形态学变化, 并结合血常规与血生化检测评估全身安全性; 最深入探讨作用机制, 综合应用生化检测 (MDA、SOD)、免疫荧光染色 (Brn3a、Tunel、Iba1/CD16/32)、活性氧荧光探针 (DHE) 及实时荧光定量 PCR (qPCR) 等技术, 从小胶质细胞活化、神经炎症、氧化应激及细胞凋亡等多角度系统阐释 α -KG 的神经保护作用。

结果: 结果显示, RIRI 后视网膜组织发生氧化应激与神经炎症反应, 表现为丙二醛 (MDA) 和活性氧 (ROS) 水平显著升高, 超氧化物歧化酶 (SOD) 活性下降。同时小胶质细胞活化并向 M1 型极化, 相关炎症因子 (IL-6、TNF- α 、IL-1 β) mRNA 表达上调。免疫荧光显示, RGCs 数量进行性减少。 α -KG 干预后, 高剂量组能显著改善小鼠视功能, 促进视网膜结构修复, 且未引起血常规及肝肾功能异常, 安全性良好。机制研究证实, α -KG 通过抑制小胶质细胞活化及 M1 型极化, 减少促炎因子的释放来改善微环境, 从而抑制 RGCs 的氧化应激, 减少 RGCs 的凋亡, 发挥神经保护作用。

结论: 该研究明确了 α -KG 在 RIRI 模型中的神经保护效应, 为临床开发针对 RIRI 的新型治疗策略提供了重要的实验依据和潜在靶点。

摘要编号: 209642

中西医结合治疗特殊类型视神经萎缩

第一作者: Jia XIYU

共同作者: Liu JUN

目的: 探讨颅内静脉窦血栓或狭窄继发性视神经萎缩的诊疗特点及中西医结合治疗优势。

方法: 通过分析 2 例因颅内静脉窦血栓或狭窄继发视神经萎缩诊疗经过, 讨论误诊原因, 早期诊断关键因素, 鉴别诊断要点, 病因治疗及中西医结合治疗的优势。

结果: 颅内静脉窦血栓或狭窄特殊原因继发性视神经萎缩, 特征表现为头痛、双侧视盘水肿、视力下降、外展神经麻痹 (复视) 等。早期诊断需行 MRV 或 DSA 等检查, 为诊断金标准, 需与视神经炎相关疾病谱、前部缺血性视神经病变、Vogt- 小柳原田综合征、Leber 遗传性视神经病变、双侧外展神经麻痹相鉴别。及时针对病因手术——溶栓或支架血管扩张治疗, 并配合中药、针灸等中医药综合治疗对视功能恢复较好。

结论: 颅内静脉窦血栓或狭窄患者, 首次有可能在眼科就诊, 眼科医生需要加强对其认识, 易误诊。早期诊断, 病因手术治疗尤为关键, 后续发挥中西医结合综合康复治疗有优势。

摘要编号: 208977

人工智能蛋白质组学揭示糖尿病视网膜神经退变风险

第一作者: Wei WANG

目的: 系统解析糖尿病视网膜神经退行性变 (diabetic retinal neurodegeneration, DRN) 的分子特征, 构建基于血浆蛋白质组学的人工智能预测模型, 以实现早期高危人群的精准识别与风险分层。

方法: 依托广州糖尿病眼病研究 (Guangzhou Diabetic Eye Study, GDES) 这一整合蛋白质组学与多模态影像的前瞻性专病队列, 共纳入 1493 名具备 Olink 蛋白质组数据及光学相干断层扫描 (OCT) 数据的糖尿病患者。首先, 在横断面分析中筛选与视网膜神经纤维层 (RNFL) 厚度显著相关的血浆蛋白; 随后, 在 6 年纵向随访的非 DRN 人群中验证候选蛋白与 RNFL 变薄速率的关系, 并进行功能富集分析以揭示其潜在生物学通路。进一步采用 XGBoost、LightGBM 和随机森林等机器学习算法, 构建基于蛋白特征的 DRN 风险预测模型 (Pro-DRN), 并系统评估其判别性能、校准能力及模型可解释性。

结果: 在横断面分析中共鉴定出 72 种与 RNFL 厚度显著相关的蛋白 (FDR < 0.05), 其中 71 种在纵向分析中与 RNFL 变薄速率保持一致方向的显著关联 (β 范围: -0.016 至 -0.042 $\mu\text{m}/\text{年}$, FDR < 0.05)。这些蛋白主要涉及炎症反应与免疫募集 (例如 CXCL9、CCL2)、细胞外基质重塑 (COL6A3、MMP9)、**神经保护与再生 (CNTN1、NCAM1) 以及血管稳态维持 (HSPG2、ANGPTL4) 等四大通路。功能富集分析显示, “细胞外基质 - 受体相互作用”、“补体与凝血级联反应”和“神经胶质激活调控”** 为显著富集通路 (均 FDR < 0.001)。基于 72 种蛋白特征的 Pro-DRN 模型在测试集中表现优异: AUC = 0.903 (95% CI: 0.868-0.937), C-index = 0.860 (95% CI: 0.845-0.874), Brier 得分 = 0.081, 优于临床模型 (0.162), 灵敏度 / 特异度 = 0.842/0.812。将 Pro-DRN 与基础临床模型 (年龄、糖尿病病程、HbA1c、血压等) 结合后, 综合模型 C-index 提升至 0.877 (相对提升 25.9%), 并显著改善净重分类指数 (NRI = 0.214, $P < 0.001$)。模型解释分析 (SHAP 值) 显示, ACTA2、COL6A3、HSPG2、CXCL9 和 ANGPTL4 对风险预测贡献最大, 提示 DRN 的发生涉及炎性驱动下的血管神经单元结构重塑与微循环障碍。

结论: 本研究基于大规模糖尿病队列的纵向蛋白质组与 OCT 影像数据, 揭示了 DRN 的分子谱特征

及关键信号通路，建立了首个可解释的多蛋白人工智能预测模型 Pro-DRN。该模型实现了对糖尿病人群早期神经退变风险的精准分层，为糖尿病视网膜病变的早期干预与分子分型提供了新的策略与工具。

摘要编号：208986

以视盘肉芽肿为首发体征的结节病

第一作者：熊家豪

目的：报告 1 例以单眼视盘肉芽肿为首发体征的结节病，持续随访并探究肉芽肿表面异常新生血管的成因。

方法：回顾性病例报告。

结果：2024 年 2 月，患者女，31 岁，因左眼前黑影 2 日就诊。双眼最佳矫正视力均为 1.0。双眼前节大致正常，左眼玻璃体轻度混浊。左眼可见视盘处有一个直径约 1 PD 的肿物，其表面有迂曲的小血管，遮盖部分视盘。视盘下方血管表现为视网膜静脉周围炎伴“蜡滴样”渗出。病变部位 OCT 显示存在隆起性病变，伴后方遮蔽效应。FFA 显示，早期肿物表面异常血管充盈，表现为强荧光；晚期荧光渗漏，并可见视盘着染，肿物及视盘边界不清。颞下分支血管也可见管壁荧光渗漏。OCT 血管成像也证实了肿物突入玻璃体内，其表面存在异常新生血管网。并且视盘周围血流缺损，与视神经盘肉芽肿位置相符。后续，肺部 CT 显示两肺门多发肿大淋巴结。右肺中叶粘膜活检显示，送检粘膜组织内见慢性肉芽肿性炎，符合非干酪性肉芽肿的典型改变，提示结节病。给予该患者激素治疗。持续随访观察，左眼视盘肉芽肿不断缩小消退，肿物表面异常新生血管也逐渐消退。并且能够透见原本肿物遮盖下的视网膜血管。整个治疗过程中，患者双眼最佳矫正视力均维持在 1.0。

结论：眼部结节病常见表现为葡萄膜炎，视神经受累较少。本病例以视盘肉芽肿作为结节病的首发体征，且肉芽肿表面存在异常新生血管，较为罕见。活跃期结节病中非干酪样肉芽肿的核心区域本身是一个无血管结构，不会发生血管生成。对于我们观察到的异常新生血管，推测其产生原因可能为，视盘肉芽肿内部产生的大量 VEGF（具有非血管生成的免疫调节功能）扩散至肉芽肿周围。另外，视盘特殊的解剖结构易因肉芽肿的占位效应导致局部缺血缺氧。这两方面原因都使得肉芽肿周边视网膜 VEGF 浓度升高，产生了新生血管。并且由于新形成的肉芽肿结构相对疏松、细胞排列不紧密，使得新生血管成功长入肉芽肿内部。总之，眼结节病的诊断需要基于符合的临床表现、结合多模态影像学

检查、实验室检查以及活检综合分析，从而做出准确的诊断。

摘要编号：204052

以视神经炎为初发表现的动脉炎性缺血性视神经病变 1 例

第一作者：王琨

目的：患者男，52 岁，因左眼突然视力下降 7 天。既往体健，眼科检查：视力：右眼：1.0，左眼 CF/眼前；眼压正常，眼前节无异常；左眼瞳孔 3.0 mm，对光反射迟钝，RAPD (+)，晶体轻度混浊，玻璃体轻度混浊，眼底：左眼视盘弥漫性水肿，色红，上方视盘及神经纤维层出血，黄斑中心凹光反射欠清。视盘 OCT 示：左眼视盘神经纤维层隆起；视野：左眼全盲视野；视电生理：VEP-P100 波潜伏期延长和波幅降低。

方法：结合病史初步诊断：左眼视神经炎。予以糖皮质激素冲击治疗；进一步完善眼眶头颅 MRI、中枢神经脱髓鞘抗体检测、实验室检查，患者血清抗核抗体 (ANA)、抗中性粒细胞胞浆抗体 (ANCA) 均为阴性，排除其他自身免疫性疾病。颅脑 MRA 未见大血管狭窄或炎症征象。患者经激素冲击治疗后左眼视力 0.06，左眼视野上方缺损有所改善，视盘水肿减轻不明显。FFA：左眼早期视乳头区域性低荧光或充盈迟缓，周围脉络膜毛细血管迟缓，后期病变区毛细血管渗漏，呈强荧光。颅脑、眼眶 MRI：未见明显异常；中枢神经脱髓鞘抗体检测：AQP4 (-) MOG (-)；ESR 35.0 mm/H、C-CRP > 10 mg/L。修正诊断：左眼非动脉炎性前部缺血性视神经病变，停用激素，改用纤溶酶、胞磷胆碱钠静滴，复方樟柳碱皮下注射治疗。2024.7.1 左眼视力 0.15，视野：左眼上方视野缺损改善，左眼下方扇形视野缺损，视盘水肿较前好转。患者存在头皮触痛和疼痛，ESR 和 C-CRP 升高，结合目前检查及病史考虑“颞动脉炎”。

结果：进行颞动脉病理活检。病理结果回报：镜下见血管内膜局灶增厚，血管壁肌层纤维化并内弹力膜局灶断裂及重叠，血管壁及管腔内可见淋巴细胞及中性粒细胞浸润，考虑巨细胞动脉炎（颞动脉炎）。最终诊断：左眼动脉炎性前部缺血性视神经病变。确诊颞动脉炎后，治疗方案调整为泼尼松 60 mg/d 口服联合甲氨蝶呤 10 mg/周，以控制炎症并减少激素副作用。随访 3 个月，左眼视力稳定于 0.2，视野缺损范围缩小，ESR 降至 15 mm/H。

结论：对于突发视力下降患者，需高度警惕 GCA 相关 A-AION。即使初始表现不典型，也应完善炎症指标检测及颞动脉活检。多学科协作（眼科、风湿免疫科）可优化诊疗流程，改善预后。

摘要编号：209912

免疫抑制剂在视神经脊髓炎谱系疾病的应用

第一作者：Qin LIU

共同作者：Bai HUILING

目的：视神经脊髓炎谱系疾病（NMOSD）是一种主要累及视神经和脊髓的中枢神经系统炎性脱髓鞘自身免疫性疾病，具有高复发、高致残的特点，严重影响患者生活质量，因此有效预防复发对改善患者长期预后至关重要。本文探讨了免疫抑制剂在视神经脊髓炎谱系疾病的治疗进展。

方法：回顾 NMOSD 发病机制及诊断和治疗的相关性文献，分析 NMOSD 患者的临床特征及治疗原则，探寻了在 NMOSD 缓解期应用免疫抑制剂中的相关临床问题和重要意义。

结果：NMOSD-ON 的治疗分为急性期治疗和缓解期治疗，治疗目标有所差异。急性期治疗包括大剂量糖皮质激素静脉输注、血浆置换或免疫吸附治疗、静脉输注丙种球蛋白等；NMOSD-ON 缓解期治疗药物包括免疫抑制剂和单抗类药物。对有 NMOSD 适应症的患者可以使用伊奈利珠单抗、萨特利珠单抗和依库珠单抗等药物，它们都是治疗 NMOSD 的 A 级推荐药物，AQP-4 抗体阳性成人和 12 岁及以上青少年患者，可在明确诊断时、首次发作后或现有治疗失败而复发后就开始使用。其中伊奈利珠单抗是一种针对 NMOSD 研发的 B 细胞耗竭剂，伊奈利珠单抗靶向 CD19，较 RTX（靶向 CD20）具有更广泛的 B 细胞谱系覆盖范围，阻断产生 AQP4-IgG 的浆细胞 / 浆母细胞，具有独特优势。传统的免疫抑制剂如硫唑嘌呤、吗替麦考酚酯及利妥昔单抗也有在临床使用，但是传统免疫抑制剂存在复发率高、不良反应多、停药比例高、肿瘤风险增加等问题。其他长期间歇性使用丙种球蛋白，需要研究进一步确认其疗效。是否低剂量口服糖皮质激素作为缓解治疗或作为传统免疫抑制剂的补充，尚未得到系统研究的证明。

结论：NMOSD 是我国患者视神经炎发作的常见病因之一，严重影响患者视力，NMOSD-ON 的诊断需综合考虑患者临床特征和辅助检查结果，辅助 AQP4 等抗体检测，并注意鉴别诊断，尽早治疗。NMOSD-ON 的治疗分为急性期治疗和缓解期治疗，伊奈利珠单抗针对 NMOSD 患者研发，减少疾病复发，显著降低视神经炎发作风险和发作严重程度，有效改善 NMOSD-ON 患者视力。随着 NMOSD 发病机制研究的不断深入，相信将有越来越多的生物制剂精准靶向治疗不断涌现。

摘要编号：208461

免疫检查点抑制剂相关神经眼科并发症 1 例

第一作者：Yan LIU

共同作者：Xuemei LIN, Songdi WU

目的：报告 1 例免疫检查点抑制剂相关神经眼科并发症。

方法：病例报告。

结果：患者，男性，56 岁。主因“双眼复视 3 周”于 2025 年 2 月 5 日就诊。患者于 3 周前无明显诱因间断出现双眼复视，多于平视、下视时出现，数秒钟后缓解，就诊于外院完善头颅 DWI 未见异常，未治疗，症状无改善，遂来我院就诊。入院查体：头颈部、前胸、双侧腋下红色斑点，高于皮肤表面。右眼下视受限，余查体正常。既往肺鳞癌卡瑞利珠单抗（PD-1 抑制剂）介入化疗病史半年。初步诊断：眼外肌麻痹；肺鳞癌介入术后。入院完善肿瘤全项：非小细胞相关抗原 6.59 ng/ml（0-4 ng/ml），总前列腺特异性抗原 4.62 ng/ml（0-4 ng/ml），余化验未见异常。胸部 CT 示纵膈及右肺门区占位性病伴右肺上叶阻塞性肺炎；左肺上叶纤维硬结灶。眼眶平扫及增强未见明显异常。重复电刺激试验：阴性。腰穿：脑脊液初压 200 mm H₂O，脑脊液常规、生化、抗酸染色、墨汁染色以及细胞学检查均未见异常。入院第 5 天患者诉视物重影完全消失。查体：眼球活动完全正常。结合病史、辅助检查及转归最终诊断：1. 免疫检查点抑制剂相关并发症 1.1 眼肌型重症肌无力拟诊；2. 肺癌介入术后。嘱继续观察；必要时与肿瘤科医生沟通调整肺癌相关药物。

结论：免疫检查点抑制剂（ICI）在肿瘤治疗中广泛应用，其相关免疫不良反应可累及全身多个系统，神经眼科并发症虽较为罕见，但临床表现多样，易被忽视或误诊。本例患者在应用 PD-1 抑制剂后出现复视及眼外肌麻痹，虽未检测到典型抗体支持，但结合用药史、临床表现及病程转归，支持诊断为 ICI 相关眼肌型重症肌无力可能。该病例提示临床医生在接诊使用 ICI 的肿瘤患者时，如出现不明原因的眼肌麻痹或复视，应高度警惕药物相关神经眼科不良反应，及时进行多学科协作评估，早期识别并干预，必要时调整免疫治疗方案，以改善患者预后并保障治疗安全。

摘要编号: 202748

动脉炎性前部缺血性视神经病变临床及影像学特征观察

第一作者: Wang XIAO TANG

目的: 提高眼科医师对动脉炎性前部缺血性视神经病变 (A-AION) 的认识及早期准确诊断率, 减少误治及视功能进一步损害。

方法: 回顾分析 2022 年 8 月 -2025 年 8 月我院收治的 12 例 A-AION 患者的诊治资料及临床特征, 这些患者均经视野、眼底荧光血管造影、MRI 等检查及颞浅动脉活检确诊, 并接受纤溶酶、糖皮质激素及环磷酰胺治疗 10 月。

结果: 12 例 (16 眼) A-AION 中, BCVA 光感 - 指数 /30 cm 者 12 眼 (75%), 6 例 (50%) 两眼先后发生, 间隔 2-3 w; 伴同侧头疼及颞动脉区触痛 8 例 (67%); 9 例 (75%) 视盘白垩样缺血水肿伴羽毛状出血, 视杯 III - IV 级 9 例 (75%), II 级 3 例 (25%); FFA 早期视盘及盘周脉络膜低荧光 8 例 (67%)。血沉 50 > mm/h 及 C-RP 12.5 mg/L 7 例 (58%), 10 例 (83%) 中性粒细胞比例均 > 75%; 同时 IL-6 高 4 例 (33%); 抗血管内皮细胞抗体 (AECA) 阳性 3 例 (25%)。MRI 视神经鞘膜 T2 增高 12 例 (100%), 球后视神经周围渗出及 T2 信号增高 6 例 (50%)。视力改善 2 行以上 4 例 (33%)。

结论: A-AION 发病急, 视功能损害重, 预后差, 应及时救治。视力急剧下降的 AION 患者, 视盘白垩样缺血水肿伴下列之一者要考虑 A-AION 的可能并及时颞动脉活检: 1) 血沉、C-RP、IL-6 升高; 2) AECA 阳性; 3) 同侧颞动脉区疼痛不适或 B 超显示颞动脉硬化变细; 4) MRI 见球后视神经周围渗出及鞘膜 T2 信号增高。经颞动脉活检及免疫组化分析确诊的 A-AION, 应长期糖皮质激素联合免疫抑制剂治疗以减少视功能进一步损害及对侧眼发生 A-AION。

摘要编号: 200724

垂体转移性肿瘤的神经眼科表现

第一作者: Yan YAN

目的: 当垂体转移性肿瘤侵犯垂体时, 会导致内分泌功能受损以及周围组织受压和浸润, 进而引发一系列临床改变。

方法: 总结在神经眼科门诊评估的 7 例垂体转移性肿瘤患者, 并回顾了文献中 44 例垂体转移性肿瘤病例的神经眼科表现。

结果: 诊断时的平均年龄为 58.1 岁, 45.1% 为男性。从原发癌到垂体转移性肿瘤诊断的平均潜伏期为 57.6 个月。11.8% 的患者将垂体转移性肿瘤作为恶性肿瘤的唯一首发症状。从出现视觉障碍到确诊垂体转移性肿瘤的平均时间为 96.3 天。72.5% 的病例存在视力下降, 60.8% 的病例伴有视野缺损。74.2% 的患者表现出以垂直子午线为界的颞侧视野缺损模式。37.3% 的患者存在孤立性眼外肌麻痹, 其中最常见的眼运动神经麻痹为单侧动眼神经麻痹。乳腺癌是最常见的原发恶性肿瘤。84.6% 的患者在治疗后神经眼科症状完全或部分缓解。在平均 11 个月的随访期内, 51% 的患者存活。65% 的死亡患者平均生存时间在 6 个月内。

结论: 对于患有垂体肿瘤的老年患者, 即使没有尿崩症, 无论是否有恶性肿瘤病史, 无论任何原发肿瘤部位, 当出现视力视野损害时, 尤其伴眼球运动神经麻痹, 垂体转移性肿瘤都应列入鉴别诊断。

摘要编号: 209636

基于 OCTA 影像组学融合模型辅助诊断非动脉炎性前部缺血性视神经病变的研究

第一作者: Jia MA

共同作者: Peixian YANG

目的: 非动脉炎性前部缺血性视神经病变 (NAION) 是一种急性视神经病变, 特征为视力突然下降伴视野缺损。由于 NAION 早期诊断困难且病情不可逆, 早期筛查和诊断至关重要。本研究旨在提出一种基于光学相干断层扫描血管成像 (OCTA) 和影像组学的人工智能多模态诊断方法, 用于 NAION 的预测及急性期 NAION 与急性期视盘水肿的视神经炎 (ON) 的区分。

方法: 收集 2024 年 1 月至 2025 年 1 月昆明医科大学第一附属医院眼科就诊并诊断为非动脉炎性前部缺血性视神经病变 (NAION) 单眼患者 180 例 (急性期患眼 180 眼、对侧健眼 180 眼)、视盘水肿的急性期视神经炎 (ON) 患者 93 例 (93 眼), 以及年龄性别相匹配的正常人 147 例 (147 眼)。对上述受检者进行 OCTA 的视盘血流和视盘周神经纤维层厚检测和疾病相关临床信息 (糖尿病、高血压、高脂血症、睡眠呼吸暂停、吸烟史、饮酒史等) 收集。采用人工智能影像组学方法对 OCTA 的 enface 各层 superficial、RPC、Choroid 的所有部位提取 2D 影像组学特征, 用入选的图像建立数据集, 训练集与测试集数据比例为 7:3 来培训联合了临床数据、影像组学、深度学习的多模态融合模型 (MLPs), 采用准确率 (ACC)、受试者工作特征曲线下面积 (AUC)、灵敏度 / 召回率 (SEN/REC)、特异性 (SPE)、精确度 (PREC) 和 F1 评分等指标评

估 MLP、Logistic Regression、KNN、Random Forest、Gradient Boosting、SVM 等模型性能。

结果：各组间患者在年龄及性别上无显著差异 ($P > 0.05$)。(1) NAION 预测任务：以 NAION 的对侧健眼和正常对照眼进行分析，联合影像组学特征和临床数据的“RPC + superficial”多模态多层次 MLP 融合模型对 NAION 发病风险预测性能最优， $AUC = 0.996$ (95% CI, 0.983, 1.000)， $ACC = 0.970$ ， $F1 = 0.974$ (95% CI, 0.943, 1.000)， $PREC = 0.982$ ， $REC = 0.966$ ， $SPE = 0.976$ 。(2) 急性期 NAION 和急性期 ON 的区分任务：以 NAION 急性期患眼和急性视盘水肿的 ON 患眼进行分析，联合影像组学特征和临床数据的“Choroid + RPC + superficial”多模态多层次 MLP 融合模型对两者的鉴别诊断性能最优， $AUC = 0.989$ (95% CI, 0.966, 1.00)， $ACC = 0.944$ ， $F1 = 0.941$ (95% CI, 0.921, 0.961)， $PREC = 0.923$ ， $REC = 0.960$ ， $SPE = 0.931$ 。

结论：基于 OCTA 影像组学和临床数据的多模态模型在 NAION 预测及急性期 NAION 与 ON 区分中表现出色，提高了诊断的准确性。

摘要编号：201544

基于 ORTCC 模型的优化护理模式在视神经炎激素冲击患者中的应用效果

第一作者：周莉义

目的：探讨基于 ORTCC 模型的优化护理模式在视神经炎激素冲击患者中的应用效果。

方法：选取 2024 年 1 月至 2025 年 1 月我科收治的 46 例视神经炎拟行激素冲击治疗的患者为研究对象，采用随机数字表法将 46 例患者分为试验组与对照组，两组各 23 人。对照组采用常规护理模式，试验组采用基于 ORTCC 模型的优化护理模式。具体实施：(1) 确定目标 (O)；(2) 制定护理干预流程 (R)：① 组建基于 ORTCC 模型构建的优化护理模式管理团队，② 健康教育。③ 疼痛干预。④ 心理护理；(3) 搭建培训体系 (T)；(4) 检查与考核 (C)；(5) 文化体系 (C)。比较两组患者的视力改善情况、疼痛度、生活质量、焦虑抑郁情绪及护理满意度情况。

结果：试验组的视力总改善率显著高于对照组 ($P < 0.05$)。治疗后 12、24 h 试验组的视觉模拟评分法 (VAS) 评分低于对照组 ($P < 0.05$)。试验组的生活质量核心量表 (QOL-C30) 各维度评分均高于对照组 ($P < 0.05$)。干预后，两组的焦虑、抑郁评分均低于干预前，且试验组低于对照组 ($P < 0.05$)。试验组满意度评分显著高于对照组 ($P < 0.05$)。

结论：基于 ORTCC 模型的优化护理模式可显著改善患者视力，降低疼痛度，改善患者的生活质量及心理状态，提高患者的满意度。

摘要编号：209540

基于 SS-OCT 与 AO-SLO 评估典型阿尔茨海默病和后皮质萎缩视觉神经环路损伤异质性

第一作者：Yuzhu GAO

共同作者：Qin CHEN, Kefan MOU, Ruihan WANG, Ming ZHANG, Yifan ZHANG

目的：阿尔茨海默病 (Alzheimer's disease, AD) 在病理改变、大脑萎缩模式及临床表型方面存在显著异质性，这种异质性可能同样反映在视觉神经环路的损伤特征上。本研究基于多模式视网膜影像技术，系统评估典型 AD (typical AD, tAD) 与视觉变异型 AD——后皮质萎缩 (posterior cortical atrophy, PCA) 患者在视觉通路各层级的结构变化差异。

方法：本横断面研究纳入经神经内科确诊的 tAD 患者、PCA 患者及社会人口学匹配的健康对照。所有 tAD 及 PCA 患者均完成神经认知评估、APOE 基因分型及脑影像学检查，脑影像在 GE 3.0 T SIGNA PET/MR 上完成。所有受试者均完成完善眼科检查，包括眼压测量、裂隙灯显微镜检查、眼轴及屈光度测量及无创视网膜影像学检查，包括扫频源光相干断层扫描成像及血管成像 (swept source optical coherence tomography and angiography, SS-OCT and SS-OCTA) 和自适应光学扫描激光检眼镜 (adaptive optics scanning laser ophthalmoscopy, AO-SLO) 检查。

结果：本研究共纳入 tAD 患者 50 人 (76 眼)、PCA 患者 53 人 (83 眼) 及健康对照 78 人 (156 眼)。tAD 与 PCA 组 MoCA、MMSE、CDR-G 及 CDR-SB 评分均显著低于健康对照组 (all $P < 0.001$)。44 例 tAD 及 49 例 PCA 患者完成 APOE 基因检测，所有病例 Aβ-PET 均为阳性。与健康对照相比，tAD 组视网膜神经纤维层 (retinal nerve fiber layer, RNFL) 与神经节细胞内丛状层 (ganglion cell-inner plexiform layer, GCIPL) 厚度显著降低 (all $P < 0.05$)，PCA 组 GCIPL、内核层及外层视网膜厚度均显著降低 (all $P < 0.05$)，且 PCA 组在 1–3 mm 范围内的内核层厚度显著低于 tAD 组 ($P = 0.006$)。此外，tAD 和 PCA 组患者的浅层血管丛、深层血管丛及脉络膜毛细血管 (CC) 密度均显著下降 ($P < 0.05$)。AO-SLO 检查结果提示，两组患者中颗粒膜 (granular membrane) 及视网膜内层高反射点 (hyperreflective foci) 出现比例较健康对照组显著增高 ($P < 0.05$)。tAD

组中，视网膜指标主要与枕叶、颞叶皮层体积及海马区体积呈现正相关（弱-中等强度，all $P < 0.05$ ）；PCA 组中，视网膜指标与双侧枕叶皮层体积呈强相关，与颞叶和海马区体积仅呈弱相关（all $P < 0.05$ ）。

结论：AD 在视觉神经环路损伤方面存在显著的亚型特异性，视觉变异型 AD 的视网膜改变可能反映其后部视觉通路的逆行变性过程。多模式视网膜影像为识别 AD 亚型的神经退行性特征及探讨其病理机制提供了新的无创窗口。

摘要编号：209223

基于视网膜微循环动态监测的鞍区病变视交叉受压特征及预测因素分析

第一作者：Ting CHEN

共同作者：Xuan XIAO

目的：探讨光学相干断层扫描血管成像（OCTA）测量的视网膜微循环参数对鞍区病变患者术前视交叉受压状态的预测价值，评估其与视野功能损伤的相关性。

方法：前瞻性病例系列研究。收集 14 例鞍区病变患者 OCTA 和视野检查参数，比较术前术后（ $n = 7$ ）鞍区病变患者视网膜微循环变化特点；按视交叉是否受压分为受压组（ $n = 7$ ）与未受压组（ $n = 7$ ），比较两组患者视网膜微循环差异；通过受试者工作特征（ROC）曲线分析各参数对视交叉是否受压的预测效能。

结果：鞍区病变术后患者 GCC 较术前增加（ $P = 0.041$ ），下半视网膜浅层毛细血管层（SCP）血管密度改善具有统计学差异（ $P = 0.008$ ）；与未受压组相比，受压组鞍区病变患者 SCP 黄斑中心凹区（SCP-Fovea）（ 14.08 ± 5.47 VS 9.5 ± 4.03 ， $P = 0.027$ ）及深层毛细血管层（DCP）黄斑中心凹区（DCP-Fovea）血管密度降低具有统计学差异（ 27.16 ± 5.49 VS 22.3 ± 5.67 ， $P = 0.031$ ）。多变量 Logistic 回归分析表明，SCP-Fovea 为视交叉受压的独立预测因子（OR = 0.82，95%CI: 0.68–0.991， $P = 0.04$ ）；ROC 曲线显示：DCP-Fovea 敏感度最高（81.8%），AUC 为 0.811；SCP-Fovea AUC 为 0.769；视野平均缺损值（MD）与上半 SCP 之间存在明显相关性（ $r = 0.360$ ， $p = 0.034$ ）。

结论：视网膜微循环参数（尤其是 SCP-Fovea 与 DCP-Fovea 血管密度）可作为术前评估视交叉受压的无创性辅助指标，其对鞍区病变所致视神经压迫的早期识别及病情分层具有临床应用潜力，为手术决策提供新的影像学依据。

摘要编号：207814

强直性脊柱炎并发单眼球后视神经炎一例

第一作者：Yingli LIU

共同作者：Shoumei JIN, Qingyun LIU, Jingji LONG

目的：强直性脊柱炎患者可继发眼部疾病，以葡萄膜炎为常见，但继发球后视神经炎较少报道。本文通过探讨 1 例强直性脊柱炎患者并发单眼球后视神经炎的诊治经过，为球后视神经炎的诊断及治疗提供临床思路。

方法：对就诊于我院的 1 例单眼球后视神经炎患者的临床表现、既往史、辅助检查及诊疗过程进行分析，为强直性脊柱炎患者继发球后视神经炎的疾病特点、诊治与转归提供参考。

结果：患者 38 岁男性，以“右眼突发视朦 1 周”为主诉于 2025 年 4 月 29 日入院。患者入院 1 周前晨起突发右眼视朦，伴右眼眼眶痛及轻度眼球转动痛（2–3 天后自行缓解），伴同侧偏头痛（3–4 天后自行缓解）。患者 18 年前曾诊断强直性脊柱炎，父亲患有强直性脊柱炎。入院查：右眼 BCVA 0.2，左眼 BCVA 1.0；NCT 眼压右眼 14.5 mmHg，左眼 14.3 mmHg；右眼 RAPD（+），视盘颜色淡，边界清楚；左眼未见明显异常。视野：右眼全周视野缺损。颅脑磁共振平扫：冠状面 STIR 示右侧视神经眶内段局部信号增高。检验结果：超敏 C 反应蛋白（hsCRP）36.01（mg/L）↑；HL1-B27：阳性；免疫球蛋白 G 定量测定（IGG）27.83（g/L）↑，免疫球蛋白 K 轻链（KL）4.09（g/L）↑。诊断：右眼球后视神经炎、强直性脊柱炎。给予静脉滴注甲泼尼龙琥珀酸钠 1000 mg，1 次/d，连续 3 d；改用 500 mg 静脉滴注，1 次/d，连续 3 d；改用 250 mg 静脉滴注，1 次/d，连续 3 d；改用 120 mg 静脉滴注，1 次/d，连续 3 d。治疗 12 d 后，右眼 BCVA 1.0，RAPD（+/-），眼底见视盘色淡红；视野检查：右眼缺损范围显著减小。

结论：球后视神经炎可由多种全身系统性疾病引起，其中较为罕见的自身免疫病如强直性脊柱炎，常常为临床工作者忽视。本例报告提示球后视神经炎与强直性脊柱炎存在紧密相关性，糖皮质激素应用效果佳，可减轻眼部病损程度。强直性脊柱炎并发球后视神经炎因其罕见性及临床表现的非特异性，需临床工作者对患者病史的详细了解 and 正确治疗，以期提高患者的生存率及生活质量。

摘要编号: 209109

急性期 AQP4 抗体阳性视神经脊髓炎患者眼眶 MRI 影像学特征与视功能及视结构的相关性分析

第一作者: Yaping CAO

共同作者: Ziyang XU, Hui YANG

目的: 探讨急性期眼眶 MRI 影像学特征与 AQP4 抗体阳性视神经脊髓炎相关视神经炎 (AQP4+ NMOSD-ON) 患者视功能及视结构之间的相关性。

方法: 本研究为单中心回顾性分析。纳入急性发作期并在症状发作后 1 个月内接受 3.0T 眼眶增强 MRI 检查的 AQP4+ NMOSD 患者。采用 T1 脂肪抑制序列经钆对比剂增强扫描, 使用 Sante DICOM 及 ITK-SNAP 对 T1WI-E 序列进行定量分析, 提取影像学参数包括病变部位、长度、体积及增强灰度差 (与同层面脑白质灰度差 max/average)。视力恢复定义为随访终点 BCVA ≥ 0.8 或较发作时提高 $\geq 50\%$ 。

结果: 共纳入 35 例患者 (恢复组 13 例, 未恢复组 22 例)。两组性别分布无显著差异 ($P = 0.279$), 恢复组年龄显著较低 (33.77 ± 11.22 岁 vs. 45.27 ± 12.13 岁, $P = 0.009^{**}$)。受累节段数差异无统计学意义 ($P = 0.448$)。两组最常见的病变部位均为眶内段 (62.9% vs. 81.8%) 及管内段 (62.9% vs. 68.2%)。在强化特征方面, 未恢复组病灶灰度差 Max 与 average 均高于恢复组 (321.95 ± 155.66 vs. 249.63 ± 180.62 ; 174.30 ± 113.05 vs. 143.28 ± 139.84), 提示病灶强化信号更强, 但差异未达统计学意义 ($P = 0.139, 0.216$)。病变强化长度及体积亦呈较大趋势 (19.55 ± 9.00 mm vs. 17.58 ± 9.34 mm; 220.88 ± 116.06 mm³ vs. 188.48 ± 109.99 mm³)。在功能学方面, 恢复组发作时 LogMAR 视力显著优于未恢复组 (1.38 ± 1.08 vs. 2.19 ± 0.59 , $P = 0.025^*$), 视野缺损亦较轻 (VF-MD: -17.57 ± 11.85 dB vs. -30.58 ± 4.70 dB, $P = 0.001^{**}$)。Spearman 分析显示, 灰度差 Max 与 GCL 厚度呈中度负相关 ($r = -0.456$, $P = 0.009^{**}$), 灰度差 average 亦与 GCL 呈负相关 ($r = -0.379$, $P = 0.032^*$)。进一步分析发现, 灰度差 Max 与六个象限的 GCL 厚度均显著负相关, 而灰度差 average 与鼻上 ($r = -0.472$, $P = 0.009$) 及鼻下 ($r = -0.473$, $P = 0.008$) 区域显著负相关。两者与 pRNFL 厚度无显著相关 ($P > 0.05$)。

结论: AQP4+ NMOSD-ON 患者中, 年龄较轻者视功能恢复更好; 未恢复组表现出更强的病灶强化信号与更严重的黄斑结构损害。灰度差越大, 黄斑 GCL 厚度越薄, 提示 MRI 病灶强化程度可能反映

黄斑神经节细胞层受损的严重程度, 为评估视神经炎病变活动性及预后提供潜在影像学指标。

摘要编号: 209007

注射用海藻酸盐水凝胶包裹的 hiPSC-RPE 细胞在视网膜色素变性治疗中的临床前研究

第一作者: Xin KANG

共同作者: Akon HIGUCHI, Zeyu TIAN

目的: 视网膜色素变性 (Retinitis Pigmentosa, RP) 是一类遗传性视网膜病变, 其发病机制为光感受器细胞如视杆细胞、视锥细胞及视网膜色素上皮 (Retinal Pigment Epithelium, RPE) 细胞的进行性减少, 最终导致视力丧失。尽管细胞移植为 RP 的治疗提供了新的思路, 但移植后细胞的存活率低且功能定位不稳定仍限制其疗效。本研究旨在构建一种缓慢凝胶化的可注射海藻酸盐水凝胶递送系统, 评估其在包裹人诱导多能干细胞诱导分化的 RPE 细胞 (hiPSC-RPE), 对细胞移植效率及视功能恢复的促进作用。

方法: 本研究构建一种基于碳酸钙 (CaCO_3) 与 D-(+)-葡萄糖- δ -内酯 (GDL) 反应所触发的缓慢凝胶化可注射海藻酸盐水凝胶, 为细胞提供良好的微环境并减少移植过程中细胞流失。将人诱导多能干细胞来源的 RPE 细胞 (hiPSC-RPE) 包裹于该水凝胶中, 注射至皇家外科医学院 (Royal College of Surgeons, RCS) 大鼠的视网膜下腔。通过视动反应 (Optomotor Response, OMR)、视网膜电图 (electroretinogram, ERG)、光学相干断层扫描 (Optical Coherence Tomograph, OCT) 及外核层 (Outer Nuclear Layer, ONL) 厚度测定等方法评估视功能与视网膜结构变化, 并采用组织学分析评价水凝胶的生物相容性与治疗效果。

结果: 本研究成功制备了缓慢凝胶化的可注射海藻酸盐水凝胶, 并实现了 hiPSC-RPE 细胞的有效递送, 活细胞染色显示细胞存活率达 95% 以上。同时视觉功能检测, 与单纯 RPE 细胞悬液移植组相比, 水凝胶辅助的 hiPSC-RPE 移植组 ERG 波幅和 ONL 在移植后 4 周和 8 周较对照组均明显升高。此外, qOMR 结果显示 hiPSC-RPE + 水凝胶组较单纯移植 RPE 组视动反应在移植后 1 周及 3 周明显提高。此外组织学观察证实, 移植细胞在宿主视网膜下层稳定附着, 免疫荧光染色可见 REP-65 表达, 提示水凝胶可促进移植细胞的生存与功能整合。

结论: 缓慢凝胶化的可注射海藻酸盐水凝胶可作为一种有效的 hiPSC-RPE 细胞递送系统, 显著提高细胞在视网膜下腔的存活率与治疗效果, 为视网膜退行性疾病 (如 RP) 的治疗提供了潜在的可行策略。

烟酰胺核糖拮抗 cGAS-STING 诱导的小胶质细胞焦亡延缓光照诱导的视网膜退变

第一作者: Shanshan ZHU

共同作者: Bing JIANG, Xian ZHANG

目的: 小胶质细胞异常活化及其介导的慢性神经炎症反应是推动视网膜变性这一病理进程的关键机制, 本研究旨在揭示烟酰胺核糖 (nicotinamide riboside, NR) 对小胶质细胞焦亡的抑制通路, 探索 NR 干预视网膜变性的作用机制。

方法: 构建 Balb/c 小鼠光照诱导视网膜变性模型 (light-induced retinal degeneration, LIRD), 给予 NR 治疗 (1000 mg/kg) 并采用光学相干断层扫描 (Optical Coherence Tomography, OCT)、视网膜电图 (electroretinogram, ERG)、冰冻切片免疫荧光染色及 TUNEL 染色等检测技术, 评估 NR 对视网膜组织结构和功能的保护效应, 同时定量分析光感受器细胞凋亡率和小胶质细胞活化水平。基于转录组测序数据, 通过生物信息学分析鉴定关键差异表达基因及调控通路, 探究视网膜变性进展的分子机制并加以验证。

结果: 1. 在小鼠 LIRD 模型中, NR 治疗抑制光感受器凋亡、减少小胶质细胞活化, 显著改善视网膜组织结构和电生理功能。转录组分析进一步揭示 LIRD 上调炎症反应, 尤其是 NF- κ B、TNF 信号通路的显著活化。2. NR 预处理有效维持光感受器线粒体超微结构完整性, 促进线粒体生物发生的相关基因表达, 同时抑制光损伤诱导的 dsDNA 和 mtDNA 释放及 cGAS-STING 信号通路活化, 进而减少下游炎症因子表达和细胞焦亡发生。3. STING 抑制剂干预实验证实, 抑制 STING 可显著降低小胶质细胞活化标志物表达、下调焦亡相关蛋白表达, 并改善视网膜功能与光感受器的存活。

结论: NR 通过抑制 dsDNA 释放诱导的 cGAS-STING 信号通路激活, 阻断 STING 介导的小胶质细胞焦亡发挥神经保护作用。

摘要编号: 209104

热带爪蛙视神经激光损伤模型的修复再生初步研究

第一作者: Ning FAN

共同作者: Wei CHI, Xuyang LIU, Junkai TAN, Yun WANG, Mingmin YANG

目的: 本研究旨在建立一种稳定、精准且可复制的热带爪蛙视神经损伤模型, 以弥补该物种在视神经

萎缩研究领域的模型空白, 并推动对损伤后视神经再生机制的探索。

方法: 我们利用 Nd:YAG 激光对热带爪蛙的视神经进行损伤, 构建了一种新型的视神经损伤模型。通过组织病理学分析、免疫荧光染色以及 RNA-seq 转录组测序等技术, 系统地评估了视神经的损伤后病理变化、再生过程及相关基因表达。

结果: 该模型成功模拟了外伤性视神经病变的多种病理特征。损伤后, 视神经初期表现为组织溶解伴胶质细胞稀疏, 随后出现胶质细胞聚集和轴突再生, 未见胶质瘢痕或炎症细胞。视神经鞘早期保持完整, 第 6 天破裂, 随后逐渐修复。免疫荧光显示胶质细胞被激活, 轴突开始再生; 轴突数量先显著减少后部分恢复, 至第 12 天视网膜神经节细胞数量出现轻微但显著的减少。RNA-seq 分析揭示了一系列参与修复过程的基因, 其功能在哺乳动物中已被广泛证实。

结论: 本研究成功构建了热带爪蛙蝌蚪视神经的 YAG 激光损伤模型, 作为终生拥有视神经修复能力的热带爪蛙, 该模型的成功构建为视神经损伤后修复的分子机制研究及视神经保护的研究提供了新的思路。我们推测, 在缺乏纤维化瘢痕形成的情况下, 激活的胶质细胞营造的微环境有利于一系列促进视神经再生分子 (特别是星形胶质细胞中瘦素受体介导的 JAK-STAT 信号通路) 发挥功能, 从而协调执行促神经再生的信号通路。

摘要编号: 209041

病例系列报告: 非动脉炎性前部缺血性视神经病变 (NAION) 少见的脑血管异常病因

第一作者: Pei LIU

共同作者: Songdi WU

目的: 探讨非动脉炎性前部缺血性视神经病变 (NAION) 的少见发病形式及脑血管异常病因, 分析其临床特征与诊疗要点, 以提高对非典型 NAION 的识别能力, 为帮助临床医生减少误诊提供关键线索, 增强对高风险人群的预警能力。

方法: 病例系列报告。收集 2020 年 7 月至 2023 年 12 月西北大学附属第一医院神经眼科收治的 6 例 NAION 患者临床资料, 分析 6 例患者的发病特点、临床表现及辅助检查结果, 包括眼部检查 (视力、眼底、视野等)、全身及影像学评估 (颅脑/眼眶 MRI、MRA、DSA 等)、治疗及随访结果。

结果: 1. 双眼先后发病的 NAION Case 1: 59 岁女性, 左眼先发病, 1 年后右眼复发, 对侧眼初次发病时存在隐匿性视盘水肿, 提示需警惕 12-15% 患者 5 年内对侧眼受累风险。2. 双眼同时发病的

NAION Case 2: 69岁女性, 双眼视力下降伴夜间低血压(82/48mmHg), 病因与全身血流动力学异常相关, 需与视神经炎鉴别。3. 偏侧萎缩症相关 NAION Case 3: 33岁男性, 右侧面部萎缩合并右眼 NAION, 可能与同侧视盘发育异常或颈内动脉纤细有关。4. 脑血管异常相关 NAION Case 4: 53岁女性因右侧颈静脉孔区颈静脉球瘤致双眼视盘水肿, 脑脊液压力升高(355mmH₂O), 预后较差。烟雾病(Case 5)与胚胎型大脑后动脉(Case 6)均通过脑血管影像学证实血管异常与 NAION 发病有关, 无传统危险因素, 需依赖 MRA/DSA 筛查。

结论: NAION 存在双眼先后/同时发病等特殊形式, 少见病因包括全身血流动力学异常、偏侧萎缩症及颅内血管畸形(如颈静脉球瘤、烟雾病)。对于无典型危险因素患者, 应常规行颈部及颅内血管检查、全身系统性筛查, 避免误诊及漏诊, 并强调长期随访。

真性视盘水肿眼中视盘周围高反射卵圆形团块样结构的临床特征

第一作者: Yu SU

共同作者: Changzheng CHEN, Di XIAO

目的: 观察和分析不同病因的视盘水肿眼中视盘周围高反射卵圆形团块样结构(PHOMS)的临床及光相干断层扫描(OCT)影像特征。

方法: 横断面研究。连续收集 2023 年 6 月至 2025 年 5 月于武汉大学人民医院眼科检查确诊的视盘水肿患者 51 例 68 只眼, 包括缺血性视神经病变患者 25 例 28 只眼、颅内压增高患者 10 例 19 只眼、视神经炎患者 10 例 12 只眼、葡萄膜炎患者 5 例 8 只眼、视神经肿瘤患者 1 例 1 只眼。患眼均行最佳矫正视力、相对性传入瞳孔功能障碍、眼底照相、视盘 OCT 检查。部分患者接受了眼底荧光素血管造影、视觉诱发电位、视野、腰椎穿刺、核磁共振等检查以明确诊断。分析了 PHOMS 的患病率、位置、大小, 及其与人口统计学和其他 OCT 参数的关系。

结果: 我们在 59% 的视盘水肿眼中发现了 PHOMS, 其位置主要在视盘鼻侧。PHOMS 在缺血性视神经病变中发生率为 46% (13/28)、颅内压增高中为 84% (16/19)、视神经炎中为 50% (6/12)、葡萄膜炎中为 25% (2/8)。与其他患者相比, 颅内压增高患者中 PHOMS 体积较大。

结论: PHOMS 是视盘水肿眼中的常见体征, 尤其是在颅内压增高导致的视乳头水肿眼中。PHOMS 的大小与水肿的程度相关。PHOMS 可能继发于各种原因导致的轴浆运输受损。

摘要编号: 209062

眼动对小鼠视神经脑脊液循环的影响

第一作者: Zhenhao SONG

共同作者: Xiaofei WANG

目的: 研究小鼠的眼动对视神经处脑脊液循环的影响。

方法: 选取共 80 只 8 周龄的 BALB/c 雌性小鼠, 分为 4 组: 活体眼动组, 活体无眼动组, 非活体眼动组和非活体无眼动组。小鼠的眼动通过固定频率 0.25 Hz、转动幅度 20° 的舵机控制。每组小鼠在成像前经枕骨大孔向小脑延髓池注射吲哚菁绿荧光剂(ICG), 利用 750nm 激光照射小鼠眼睛以激发视神经处脑脊液内 ICG 的荧光, 并用装有 750nm 滤光片的 CCD 相机进行 30 分钟的高速成像。用 Matlab 绘制小鼠视神经处荧光强度随时间变化的曲线。

结果: 在注射 ICG 后, 非活体无眼动组小鼠视神经处的荧光值持续上升。其他三组在约 1min 后达到峰值。活体无眼动组在达到峰值后保持缓慢下降趋势; 而活体眼动组和非活体眼动组视神经处的荧光值在 3min 左右下降到峰值的 20%~50% 之间, 之后保持相对平稳的状态。

结论: 非活体无眼动组的小鼠由于缺乏脑脊液流动的驱动机制, 导致 ICG 在视神经的沉积, 造成荧光值持续上升; 与非活体眼动组相比, 眼动对小鼠视神经脑脊液的循环起到了驱动作用。而活体无眼动小鼠的结果证明眼动并非视神经处脑脊液循环的唯一驱动力。与活体眼动组相比, 眼动可促进视神经处脑脊液快速排出。这对理解视神经脑脊液循环机制及相关退行性疾病的机制有重要意义。

摘要编号: 209445

眼眶核磁显示视神经鞘强化征的病例鉴别

第一作者: Ying ZHAO

共同作者: Shasha LIU, Xiaonan YAO

目的: 明确眼眶核磁影像中的视神经鞘强化征的病因鉴别诊断路径

方法: 回顾性研究, 纳入 15 例 MRI 确诊视神经鞘强化患者, 分析其病史特点、视盘形态变化、核磁影像特征、实验室检查、治疗反应、预后评估等临床指标, 总结鉴别诊断要点。

结果: 本研究回顾性分析 15 例眼眶核磁显示的视神经鞘强化患者, 其中: 视神经鞘脑膜瘤(ONSM) 4 例、视神经周围炎 3 例、感染或感染相关视神经炎 3 例、MOG 抗体相关视神经炎 5 例, 进行各项临床指标分析。影像学显示: 视神经鞘脑膜瘤呈“轨

道征”强化，视神经周围炎可见软脑膜增厚，感染性视神经炎伴邻近感染，MOG 抗体相关视神经炎呈长节段病灶。治疗上：激素治疗效果不一，视神经周围炎和 MOG 抗体相关性视神经炎对激素治疗敏感，感染性视神经炎控制感染后明显好转，视神经鞘脑膜瘤对激素治疗反应差，部分病例射波刀治疗后好转。预后差异显著：视神经炎症患者视力改善率 100%，视神经鞘脑膜瘤患者视力恢复欠佳。

结论：眼眶磁共振成像（MRI）对于诊断视神经病变至关重要。视神经鞘强化可由多种病因导致。视神经鞘脑膜瘤（ONSM）是一种生长缓慢的良性肿瘤，早期病变或不典型的 ONSM 需要与视神经周围炎、感染性视神经炎和 MOG 抗体相关视神经炎等炎症性疾病相鉴别。关键的鉴别点在于：病史、视盘形态变化、神经影像、实验室检查、激素治疗及预后转归。建议优化诊断流程：1) 详细询问病史；2) 眼眶 MRI 强化模式初筛；2) 血清抗体／感染筛查分类；3) 多学科协作诊疗；4) 全周期管理及随访。

摘要编号：208662

眼睑痉挛的手术治疗

第一作者：Gang LIU

共同作者：Xianzhong LIU, Shangyi YU

目的：眼睑痉挛是以双眼不自主痉挛性收缩的致残性疾病，可造成功能性失明，严重影响患者的生活质量。病因不明，治疗困难。本研究旨在评估神经环路阻断术治疗眼睑痉挛的长期疗效及安全性，为临床治疗提供科学依据。

方法：收集 2019 年 7 月至 2022 年 6 月在我院诊断为 Meige 综合征眼睑痉挛并接受神经环路阻断术的患者资料，总结患者的一般资料、Meige 综合征分型、既往治疗情况、术前及术后随访的痉挛情况。手术前后对眼睑痉挛程度进行分级，并采用 BurkeFahnMarsden 肌张力障碍运动评分量表（BFMDRS）、眼睑痉挛障碍指数（BSDI）对手术前后眼部症状进行评分，比较术前、术后眼睑痉挛的改善情况。主要采用 Wilcoxon 秩检验进行统计学分析。

结果：本组共纳入患者 570 例，男性 189 例（33.2%），女性 381 例（66.8%）；年龄：57（51, 64）岁；术前病程：3.0（2.0, 6.0）年；既往治疗方法有：肉毒素（68.4%，390/570）、点眼（67.2%，383/570）、中药（34.9%，199/570）、精神类药物（28.4%，162/570）、针灸（27.7%，158/570）、耳后面神经微创术（5.4%，31/570）、重睑术（3.7%，21/570）、脑深部电刺激术（3.3%，19/570）、提眉术（2.1%，12/570）等。Meige 综合征分型：眼睑型 323 例（56.7%），眼睑口下颌型 175 例（30.7%），

其他型 72 例（12.6%）。术后随访时间：51（43, 60）个月；术前眼睑痉挛分级：3 级 12 例（2.1%），4 级 558 例（97.9%）；术后眼睑痉挛分级：0 级 499 例（87.5%），1 级 42 例（7.4%），2 级 21 例（3.7%），3 级 5 例（0.9%），4 级 3 例（0.5%）。术前 BFMDRS 眼部评分：8.0（8.0, 8.0），术后 BFMDRS 眼部评分 0.0（0.0, 0.0），与术前相比差异有统计学意义（ $Z = -22.43$, $P < 0.001$ ）；术前 BSDI 评分：24（20, 24），术后 BSDI 评分 6（5, 6），与术前相比差异有统计学意义（ $Z = -20.83$, $P < 0.001$ ）。

结论：神经环路阻断术对眼睑痉挛具有长期稳定的疗效，可有效改善患者生活质量，为治疗难治性眼睑痉挛提供了安全有效的方案。

摘要编号：209023

神经眼科相关问题在大语言模型应用的多维度评价——一项多中心研究

第一作者：Zhiqing LI

共同作者：Zixun WANG, Xiaoling ZHANG

目的：评价人工智能（AI）大语言模型（LLM）生成的与神经眼科相关典型临床问题的答案，并利用客观及专家评估的方式多维度的探究神经眼科相关问题在 LLM 上的表现。

方法：多中心、随机、横断面实验研究。根据神经眼科疾病定义、病因、临床表现及体征检查和治疗及预后 4 个角度选取 30 个神经眼科领域相关典型问题，分别使用 Deepseek、文心一言 4.0、豆包及 Kimi 1.5 四种国内开源 LLM 输出答案文本，采取客观评估法对于生成答案的总字数、句子难度、平均句长进行客观定量分析；采取专家评估法，三名多中心神经眼科专家分别对四种 LLM 生成的 120 个答案文本通过三个维度进行量化评分。其中，分别根据问题文本的完整性、准确专业性及相关性、临床性分别制定 3 级、5 级及 4 级李克特量表。统计四个 LLM 各维度分数的频率，并选取其中表现最佳的 LLM，观察在 4 类问题中，该 LLM 是否存在表现差异。最后，由另外三名专家评估表现最佳的是否可以替代真实世界医患沟通进行评估。

结果：在客观的汉语文本阅读难度分析中，Deepseek、文心一言 4.0、豆包及 Kimi 1.5 的总字数分别为：554.57 ± 263.77 字、816.77 ± 149.83 字、1163.13 ± 393.18 字、1000.17 ± 258.69 字，组间存在统计学差异（ $P < 0.01$ ）。在四个模型中，Kimi 1.5 表现最出色，其完整性最高分（3 分）、准确专业性最高分（5 分）、相关实用性最高分（4 分）的频率分别为 61%、29%、41%。Kimi 1.5 在神经眼科疾病定义、病因、临床

表现及体征、治疗及预后四个方面的问题中表现较为一致，无组间差异（完整性 $P = 0.198$, $P > 0.05$ ；准确专业性 $P = 0.865$, $P > 0.05$ ；相关实用性 $P = 0.613$, $P > 0.05$ ）。最终，三位专家认为 Kimi 1.5 的回答文字在神经眼科疾病定义、病因、临床表现及体征、治疗及预后方面“不可替代真实世界眼科医师，需要专业知识补充和监督”的占比结果分别为 57.1%、42.9%、66.7%、44.4%，总体占比结果大于 50%。

结论：Kimi 1.5 在完整性、准确专业性及相关性方面表现较其他 LLM 出色，中文 LLM 在神经眼科临床应用中具有较大的潜力，但无法代替真实世界医患沟通的效果。LLM 固有的“幻觉”特点需要未来探索 AI+ 医师的新型诊疗模式。

摘要编号：209541

视神经炎发病季节模式与预后分析

第一作者：Ziyan XU

共同作者：Yaping CAO, Hui YANG

目的：环境因素可能影响自身免疫性疾病的发病与转归。本研究旨在探讨不同类型视神经炎（ON）的发病是否存在季节性模式，并分析季节因素对患者复发及远期视功能和结构预后的影响。

方法：回顾性纳入 2015–2022 年就诊的 270 例视神经炎患者，包括 111 例水通道蛋白 4- 抗体阳性视神经炎（NMOSD-ON）、42 例髓鞘少突胶质细胞糖蛋白抗体相关视神经炎（MOG-ON）及 117 例特发性脱髓鞘性视神经炎（IDON）。收集并分析其人口学资料、发病季节、复发情况、最佳矫正视力（BCVA）、视野（VF）、视网膜神经纤维层（RNFL）厚度、黄斑神经节细胞层（GCL）厚度。采用 Rayleigh 圆形统计检验季节性分布，卡方检验比较季节差异，多因素回归评估预后影响因素。

结果：Rayleigh 检验揭示，ON 总体发病呈显著非随机分布（ $P < 0.001$ ），存在季节性聚集现象。此特征在 NMOSD-ON 亚组中尤为突出（ $P = 0.002$ ），其平均发病角度指向春末夏初，显示明确的春夏高发模式[春夏季发病占比 66.7%，患病率比 PR (95% CI) = 2.00 (1.41–2.84)]。复发分析提示，夏季与冬季起病的患者具有更高的复发倾向。在结构预后方面，冬季发病是 RNFL 变薄的危险因素，该季节起病的患者终末随访时 RNFL 厚度显著降低（ $P = 0.008$ ）。然而，多因素逻辑回归分析显示，季节并非视力预后（BCVA）的独立影响因素（ $P > 0.05$ ）。影响视力恢复的关键因素包括疾病亚型与初始视力，其中 MOG-ON 是视力良好预后的保护因素（OR = 0.082, $P = 0.001$ ），而初始低视力（BCVA $\leq$

20/200）则显著增加预后不良的风险（OR = 9.385, $P < 0.05$ ）。

结论：视神经炎发病存在明显季节性特征，特别是 NMOSD-ON 的发病存在显著的季节性聚集性，以春夏季为高发期。此外，发病季节与复发风险及远期视神经结构完整性相关，但对视功能预后影响不显著。MOG-ON 亚型展现出更优的视力恢复潜力。此发现深化了对环境因素在 ON 中作用的理解，对疾病预防和临床管理具有指导意义。

摘要编号：205839

视神经炎遗传机制与药物重定位的多组学研究

第一作者：Yan ZHANG

共同作者：Yihong HUANG

目的：视神经炎（ON）是常见的致盲性眼病，其遗传机制与治疗选择有限。本研究旨在系统性鉴定 ON 致病基因并预测其治疗药物。

方法：本研究基于芬兰生物库（FinnGen R10）的公开全基因组关联研究（GWAS）汇总数据（582 例 ON 患者 vs. 217,491 例对照）。首先，采用基于汇总数据的孟德尔随机化（SMR）方法，结合免疫相关组织（如星形胶质细胞、小胶质细胞）的表达数量性状位点（eQTL）数据（CAGE），推断与 ON 存在因果关系的基因（显著性阈值： $p_{\text{SMR}} < 0.05$, $p_{\text{HEIDI}} > 0.05$, $\text{FDR} < 0.05$ ）。随后，对显著基因进行基因本体（GO）和京都基因与基因组百科全书（KEGG）通路富集分析（ $\text{FDR} < 0.05$ ）。最后，利用网络药理学方法，基于药物—靶点相互作用网络（DrugBank v5.1.9），计算候选药物与 ON 基因集的邻近性，以筛选潜在的复方药物（ $\text{FDR} < 0.05$ ）。

结果：SMR 分析共鉴定出 46 个与 ON 显著相关的基因（ $\text{FDR} < 0.05$ ）。其中，KDM5B（OR = 4.594）、HLA-DRB1（OR = 3.297）等为前 5 大风险基因；CYP21A1P（OR = 0.095）、HLA-E（OR = 0.323）等为前 5 大保护基因。功能富集分析显示，这些基因显著富集于抗共鉴定 46 个 ON 显著相关基因。效应值前五的风险基因为 KDM5B（OR = 4.59）与 HLA-DRB1（OR = 3.30）等；保护基因为 CYP21A1P（OR = 0.10）与 HLA-E（OR = 0.32）等。功能富集于抗原处理呈递与 T 细胞介导细胞毒性等通路。网络药理学预测蛋白质合成抑制剂奥马他辛美珀辛酸盐为显著候选药物（ $\text{FDR} < 0.05$ ），其通过靶向核糖体蛋白 RPL3 与 RPL2 发挥作用。

结论：本研究从遗传学角度揭示了 ON 的致病机制核心在于抗原呈递与 T 细胞免疫，并首次提出奥马他辛可能作为 ON 潜在治疗药物的新假说，为后续机制研究与临床转化提供了重要线索。

摘要编号: 207920

视网膜及中枢神经系统疾病中脑 - 眼双向转运的机制研究

第一作者: Qiuchen CAO

共同作者: Jirong AN, Weijie CHEN, Mingwei NI, Yanchi WU, Shige YANGSHIGE@STU.NJMU.EDU.CN

目的: 眼睛与脑紧密相连, 为检测脑病理变化提供独特途径。本研究以阿尔茨海默病 (AD) 相关视网膜病变为切入点, 系统解析脑内 β -淀粉样蛋白 ($A\beta$) 向视网膜的转运通路及调控机制, 评估其在脑 - 眼物质交换中的关键作用及深远影响, 为神经视网膜病变的机制研究与临床转化提供全新思路 and 方向。

方法: 本研首先利用单细胞测序、免疫荧光多标、3D 成像等技术, 系统检测 AD 患者及 5 $\times$ FAD 小鼠视网膜与视神经中 $A\beta$ 的分布特征; 随后对小鼠进行小脑延髓池立体定位注射 hA β 示踪剂、Gd-DTPA 造影剂, 同时结合免疫荧光、小鼠 MRI 以追踪其在视神经及视网膜的转运路径; 最后, 利用 AQP4 基因敲除小鼠模型, 评估 AQP4 极性缺失对脑 - 眼 $A\beta$ 转运及视网膜病变程度的影响。

结果: 免疫染色结果表明, AD 患者及 5 $\times$ FAD 小鼠模型的视网膜、视网膜色素上皮细胞 (RPE) 和视神经中均可见 $A\beta$ 沉积, 主要聚集在血管旁间隙 (PVS), 并分布于视神经鞘膜及眶周组织中的淋巴管。示踪实验进一步揭示, 脑内 $A\beta$ 可通过脑脊液沿视神经鞘膜和视神经周围的蛛网膜下腔转运, 随后进入视神经并沿着神经纤维和 PVS 向视网膜转运。在 AQP4 基因敲除小鼠中, AQP4 极性缺失不仅减缓从脑到眼的短时程转运, 还导致眼部长时程排泄障碍, 致使 $A\beta$ 在眼淋巴系统中积聚, 进而加剧视网膜变性。

结论: 本研究首次系统揭示了脑脊液中的 $A\beta$ 可由视神经鞘膜淋巴管途径、轴突间隙途径、动脉周围间隙途径三条脑眼通路转运至视网膜, 并明确 AQP4 的年龄相关性极性损害在脑与眼之间的转运以及眼淋巴清除系统中发挥重要作用。这些发现深入阐明了诸如阿尔茨海默病等神经系统疾病所导致的神经视网膜病变 (如视网膜神经退行性改变) 发病机制, 为视神经病变等神经眼科相关疾病提供了新的机制视角。

摘要编号: 205548

部分急性期 NAION 患者视野缺损持续进展的病因分析及干预探讨

第一作者: Ying ZHAO

共同作者: Xiuli CHEN

目的: 分析急性期非动脉炎性前部缺血性视神经病变 (NAION) 患者视野缺损持续进展的病因, 明确危险因素与进展诱因, 为临床制定针对性干预策略提供依据, 应对非典型 NAION 带来的诊疗挑战。

方法: 回顾我院神经眼科近 1 年收治的 52 例急性期 NAION 患者, 分析其中 16 例进展病例, 结合患者临床资料、视野检查、OCT、睡眠监测、血液检查等结果, 分析视野缺损进展的相关因素并分析典型病例; 梳理 NAION 全身及局部危险因素, 总结急性期进展诱因, 并归纳干预措施及随访效果。

结果: 约 31% 的 NAION 患者出现视力持续下降、视野缺损扩大。3 例典型进展病例中, 病例 1 患者合并高血压、高脂血症及重度 OSAS, 作息不规律致病情突发进展; 病例 2 患者因基础病控制不佳、家庭事务引发焦虑失眠, 半月内视野弥漫缺损; 病例 3 为糖尿病视网膜病变患者, 因高血糖控制不佳, 发病次日即出现视力进一步骤降伴黄斑水肿。NAION 全身危险因素包括高血压、糖尿病、OSAS 等, 局部危险因素以小视杯、视盘血管病变为主, 急性期进展多由危险因素叠加、视盘水肿压迫、心理因素等引发恶性循环。经激素消肿、抗 VEGF 治疗、基础病管控、心理干预等综合措施后, 患者视盘水肿减退, 视野及视力均获改善。

结论: 非典型 NAION 患者的增多使临床诊疗难度升级, 其视野进展是全身与局部危险因素叠加的结果, 焦虑情绪、未控制的基础病及视盘水肿压迫是关键诱因。临床需打破 “危险因素 - 缺血损伤 - 水肿压迫” 恶性循环: 急性期针对不同原因可分别或联合采取小剂量糖皮质激素、抗 VEGF 药物等消退水肿, 樟柳碱改善微循环; 需多学科协作管控基础病, 结合心理干预与患者教育。精准识别危险因素并实施针对性综合治疗, 可有效延缓病情进展, 改善患者预后。

摘要编号: 210329

铁死亡通过铁积累和 GPX4 失活诱导糖尿病视觉通路神经元损伤

第一作者: Bowen WANG

目的: 糖尿病视路损伤是导致糖尿病患者失明的主要原因之一。视路包含从视网膜到枕叶的解剖结构。本研究探讨了铁死亡 (由细胞内游离铁积累引发的程序性细胞死亡) 在糖尿病视路损伤中的作用机制。

方法: 采用链脲佐菌素 (STZ) 构建 II 型糖尿病大鼠模型。通过苏木精-伊红 (HE) 染色和透射电子显微镜 (TEM) 观察枕叶、视网膜及视神经的病理学和超微结构变化。利用免疫荧光技术检测枕叶和视网膜中神经元核 (NeuN)、胶质纤维酸性蛋白 (GFAP) 及谷胱甘肽过氧化物酶 4 (GPX4) 的表达水平, 并通过蛋白质印迹法 (WB) 验证 NeuN、GFAP 和 GPX4 在枕叶和视网膜中的表达情况。采用铁含量检测试剂盒检测枕叶和视网膜中的铁含量。

结果: 糖尿病大鼠模型的成功率为 93.3%。在糖尿病组中, 大脑枕叶和视网膜细胞排列紊乱, 边界模糊。枕叶、视网膜及视神经的细胞膜出现破裂, 可见部分空泡, 线粒体形态改变并出现肿胀, 线粒体嵴消失。视网膜和枕叶区域的 GFAP 表达量及铁浓度显著升高, 而 NeuN 和 GPX4 的表达量则明显降低。

结论: 铁死亡在糖尿病视网膜病变损伤中起重要作用, 而谷胱甘肽过氧化物酶 4 (GPX4) 可调控这一过程。

摘要编号: 207520

靶向组织蛋白酶 Z: 枸杞糖肽介导的神经炎症保护新机制

第一作者: Shaoying TAN

共同作者: Henry Ho-lung CHAN, Xiayin YANG, Shiqi YAO

目的: 本研究旨在验证核心介质组织蛋白酶 Z (CTSZ) 在抗神经炎症中的功能性作用, 并探索其作为新治疗靶点的潜力。

方法: 通过免疫荧光、western blot 以及功能学检查来评估 LBGP 对 AQP4-ON 的治疗效果。运用蛋白质组学寻找了重要的靶点, 并对此靶点运用基因操控的办法进行过表达和敲除来双向验证该蛋白功能。

结果: LBGP 能显著抑制炎症细胞因子肿瘤坏死因子- α (TNF- α)、白细胞介素-6 (IL-6) 和白细胞介素-1 β (IL-1 β), 以及中性粒细胞和小胶质细胞等炎症细胞的浸润。因此, 它在疾病后期保护了星形胶质细胞的完整性, 进一步减少了髓鞘脱失和视网膜神经节细胞 (RGCs) 的退行性变。我们的蛋白质组学数据整合分析表明, CTSZ 在 LBGP 治疗过程中始终发挥着核心介质作用。通过功能获得和功能缺失研究, 我们证实了 CTSZ 的核心介导作用。我们首次发现, 敲低 CTSZ 可模拟 LBGP 的治疗效果, 缓解 AQP4-ON 的表型, 包括中性粒细胞和小胶质细胞/巨噬细胞的募集、星形胶质细胞结构破坏、髓鞘脱失以及 RGCs 退行性变。相反, 过

表达 CTSZ 则消除了 LBGP 的保护作用, 减轻了对星形胶质细胞损伤、髓鞘脱失和 RGCs 退行性变的缓解效果。在 AQP4-ON 小鼠的视神经中, LBGP 治疗和 CTSZ 敲低均降低了线粒体依赖性凋亡蛋白如 BAX、细胞色素 C (Cyt c) 和切割型 caspase 3 (c-caspase 3) 的表达, 表明该凋亡通路作用于 CTSZ 的下游。通过 pifithrin- α (PFT- α) 抑制视神经中凋亡相关蛋白的表达, 成功保护了视网膜神经节细胞 (RGCs) 免受神经退行性变的影响。

结论: 研究结果表明, 在 AQP4-ON 小鼠中, LBGP 主要调控免疫细胞释放的 CTSZ。这一作用改善了后续的凋亡信号传导, 从而保护星形胶质细胞免受损伤并促进其恢复, 最终保全了髓鞘和视网膜神经节细胞 (RGCs)。

Grx2 介导 ILK 调控 Wnt/ β -catenin 通路在后发性白内障形成中的机制研究

第一作者: Xi CHEN

共同作者: Chenshuang LI, Hong YAN

目的: 研究谷氧还蛋白 2 (glutaredoxin 2, Grx2) 调控晶状体上皮细胞 (lens epithelial cells, LECs) 迁移和上皮-间质转分化 (epithelial-mesenchymal transition, EMT) 的作用机制, 及其与后发性白内障 (posterior capsule opacification, PCO) 形成的相关性。

方法: 通过模拟白内障手术构建 PCO 小鼠模型, 通过双氧水处理 LECs 构建 PCO 体外细胞模型, 利用 WB 和 qPCR 检测 Grx2 表达水平。构建 Grx2 KO/KI C57BL/6J 小鼠并建立 PCO 模型, 术后 5 天收集晶状体后囊膜组织。采用 Label-Free 定量蛋白质组分析鉴定差异蛋白质, 对两组比较所得组间差异蛋白进行 GO、KEGG、Heatpot、Volcan、PPI 分析。构建 WT、Grx2 KO 和 Grx2 KI 小鼠 PCO 模型, 通过 H&E、IHC 和 WB 检测囊膜组织 EMT 指标和差异蛋白表达。构建 Grx2 过表达和低表达细胞系, 通过 WB、IF、qPCR 等验证具体机制。通过小鼠前房注射抑制剂或重组蛋白观察体内疗效。

结果: 在 PCO 体内外模型中, 伴随 LEC 的 EMT 过程, Grx2 的表达水平均显著下降。低表达 Grx2 加剧细胞内活性氧和线粒体活性氧表达水平并促进 LEC 的增殖和迁移, 过表达 Grx2 则反之。HE 染色发现, 与 WT 组相比, Grx2 KO 组小鼠晶状体

后囊膜上增殖、迁移的 LECs 显著增多, Grx2 KI 组相对较少; Western Blot 检测发现与 WT 组相比, Grx2 KO 组小鼠晶状体囊膜组织中 EMT 指标 α -SMA, N-cadherin 的表达量显著升高, Grx2 KI 组 EMT 指标显著下降。通过利用 WT 和 Grx2 KO 组小鼠 PCO 模型分离的晶状体囊袋进行测序分析, 发现细胞粘附、氧化还原过程及细胞分化相关蛋白质富集较多。其中细胞粘附通路中间因子整合素连接激酶 (integrin-linked kinase, ILK) 的表达增加 2.98 倍。WB 检测验证了 Grx2 KO 组囊膜组织中 ILK 表达量显著升高, Grx2 KI 组 ILK 表达量显著下降。进一步的研究发现, 低表达的 Grx2 可以通过上调 ILK 表达水平并激活 Akt/GSK-3 β 信号通路, 增加 GSK-3 β 的 ser 9 位点磷酸化, 进而促进 β -catenin 入核、激活 Wnt/ β -catenin 信号通路, 促进 LEC 的 EMT。

结论: Grx2 作为晶状体内关键的抗氧化酶, 对 LECs 上皮特性维持和 PCO 的发生发展至关重要。Grx2 通过调控 ILK 表达水平并激活 Akt/GSK-3 β 信号通路, 进而激活 Wnt/ β -catenin 信号通路, 最终加剧 LECs 的 EMT、促进 PCO 形成。

摘要编号: 203624

人眼内的不速之客: 房水中微塑料成分的鉴定与特征分析

第一作者: Kaiyun ZHANG

共同作者: Li CHEN, Na HUI, Laiqiang QU, Hong YAN, Lei YU

目的: 微塑料作为一种新兴全球性污染物, 对人类健康的潜在危害已引起广泛的关注。目前人体内多种组织、器官、体液中均已发现了微塑料的富集, 然而其是否能进入房水, 尚未见报道。因此, 本研究旨在探索鉴定房水中微塑料的成分与分布特征, 为研究微塑料对眼健康的影响奠定提供研究依据。

方法: 本研究共招募了 90 名参与者, 包括 30 名儿童 (先天性白内障患儿)、30 名成年人 (高度近视行 ICL 植入术患者) 和 30 名老年人 (年龄相关性白内障患者), 男女性别比例为 1:1。术中收集参与者的房水, 应用热裂解-气相色谱/质谱联合技术 (Py-GC/MS) 检测房水中的 11 种常见微塑料颗粒的含量, 并对其丰度特征进行统计分析。

结果: 本研究共检测了 11 种微塑料成分, 在房水中检测到其中五种微塑料, 分别是聚乙烯 (PE)、聚氯乙烯 (PVC)、聚丙烯 (PP)、聚酰胺 66 (PA66) 以及聚苯乙烯 (PS)。其中, 聚乙烯 (PE) 和聚氯乙烯 (PVC) 普遍存在于所有的样本中且聚乙烯 (PE) 丰度最高; 聚丙烯 (PP) 主要检出于儿童组房水, 而聚酰胺 66 (PA66) 主要检出于成人组

房水。依据年龄人群分析, 房水中微塑料浓度总体呈现出成年人组 > 儿童组 > 老年人植入的趋势; 依据性别分析, 则呈现出女性组 > 男性组的趋势。

结论: 本研究首次在人眼房水中发现了微塑料的存在。聚乙烯 (PE) 在所有房水样本中高丰度聚集, 提示我们应关注其进入眼内的转移途径及对眼健康的潜在影响。微塑料浓度在年龄和性别上的变化趋势, 以及聚丙烯 (PP)、聚酰胺 66 (PA66) 分别在儿童和成年人房水中的聚集, 提示了不同人群房水中微塑料成分存在的差异性特征。该研究为进一步探索微塑料对眼健康的影响奠定了研究基础, 同时也完善了关于微塑料在人体内分布和转移途径的认知。

光学离焦诱导的小鼠近视特征

第一作者: Chen HONG

共同作者: 王莉菲

目的: 通过观察光学离焦诱导的小鼠近视模型在近视诱导期和恢复期眼部生物学参数变化探讨此模型诱导的近视特征。

方法: 选取 16 只 4 周龄的雄性 C57BL/6 小鼠随机分为 2 组: 近视诱导组 (n = 11) 和对照组 (n = 5), 近视诱导组小鼠采用自制头戴式光学离焦诱导装置, 双眼前用 -30 D 镜片进行近视诱导 8 周, 后将近视诱导组小鼠撤去装置进入近视恢复期。记录两组基线、诱导 4 周、诱导 8 周、恢复 2 周 4 个时间点的眼部生物学参数。采用小动物专用红外验光仪检测屈光度, 光学相干断层扫描在体内测量眼轴长度、前房深度、晶体厚度、玻璃体腔深度, 角膜曲率仪测量角膜曲率, Icar 小动物眼压计测量眼压。应用独立样本 t 检验检测两组间差异。

结果: 两组小鼠基线时屈光度、眼压、角膜曲率、眼轴长度、前房深度、晶体厚度、玻璃体腔深度均无统计学差异。近视诱导 4 周后, 近视诱导组与对照组相比, 屈光度 (0.016 ± 3.829 vs -4.362 ± 2.302 , $P = 0.043$)、眼压 (7.4 ± 1.14 vs 11.0 ± 1.265 , $P = 0.001$)、前房深度 (393.8 ± 7.53 vs 359.167 ± 27.345 , $P = 0.023$)、晶体厚度 (1910.0 ± 50.675 vs 2045.5 ± 52.645 , $P = 0.02$) 具有统计学差异, 角膜曲率 (1.514 ± 0.027 vs 1.515 ± 0.03 , $P = 0.956$)、眼轴长度 (3011.8 ± 63.645 vs 3077.667 ± 59.369 , $P = 0.110$)、玻璃体腔深度 (568.0 ± 33.03 vs 528.0 ± 39.532 , $P = 0.106$) 无统计学差异。近视诱导 8 周后, 近视诱导组与对照组相比, 屈光度 (-0.918 ± 1.853 vs -5.845 ± 1.727 , $P = 0.001$)、眼压 (7.6 ± 1.817 vs 13.167 ± 2.927 , $P = 0.005$)、前房深度 ($438 \pm$

23.043 vs 395.33 ± 28.946, $P = 0.026$)、晶体厚度 (2177.8 ± 33.878 vs 2217 ± 7.563 , $P = 0.021$) 具有统计学差异, 角膜曲率 (1.564 ± 0.034 vs 1.553 ± 0.037 , $P = 0.633$)、眼轴长度 (3318.6 ± 47.231 vs 3343.33 ± 44.026 , $P = 0.393$)、玻璃体腔深度 (609.8 ± 26.593 vs 599.17 ± 24.161 , $P = 0.505$) 无统计学差异; 恢复 2 周时, 近视诱导组与对照组相比, 各参数均无统计学差异。

结论: 光学离焦诱导的小鼠近视属于屈光行近视, 主要差异表现在前房深度和晶体厚度的变化, 眼轴长度并未显示出具有统计学意义的增长。

摘要编号: **209244**

光引发剂 LAP 联合可见光的新型角膜胶原交联方案

第一作者: Shengmei **ZHOU**

共同作者: Yi **HONG**, Yi **LIAO**, Zhirong **LIN**, Zuguo **LIU**

目的: 角膜胶原交联术 (CXL) 可阻止角膜扩张性疾病进展, 临床常用核黄素 (RF) / 紫外线 A (UVA) 方案。然而高能 UVA 及其与 RF 的反应会造成组织损伤, 尤其是不可逆的内皮丢失, 因此标准 RF/UVA 方案对晚期薄角膜患者存在应用局限。而光引发剂苯基-2,4,6-三甲基苯甲酰膦酸锂 (LAP) 在 405 nm 可见光 (VL) 下具有效率高、生物相容性好的特征, 已广泛用于 3D 生物打印交联单体合成物。本研究旨在探索 LAP/VL 角膜胶原交联新策略。

方法: 将新鲜离体猪眼球、新西兰大白兔、C57BL/6J 小鼠随机分为 LAP/VL 组和 RF/UVA 组进行交联手术。使用原子力显微镜 (Atomic Force Microscope; AFM) 和拉伸试验对角膜生物力学强度变化进行定量分析。采用前段光学相干断层扫描 (Anterior Segment Optical Coherence Tomography; AS-OCT)、活体角膜共聚焦显微镜 (In Vivo Confocal Microscope, IVCN) 和裂隙灯检查评价兔的角膜水肿情况、角膜光学透明度、角膜基质交联分界线。采用苏木素和伊红染色、马松染色、扫描电镜 (Scanning Electron Microscopy; SEM)、透射电镜 (Transmission Electron Microscopy; TEM) 表征角膜组织和基质纤维的结构变化。采用 CCK-8 评估 LAP 对原代人角膜基质细胞活力的影响。采用荧光素钠染色评估交联后角膜上皮愈合情况。采用 ZO-1 和 Na⁺/K⁺ ATPase 免疫荧光染色评估胶原交联后角膜内皮的完整性和泵功能。采用 8-OHdG 和 γH2AX 免疫荧光染色评估角膜内皮的 DNA 损伤。

结果: LAP/VL 交联后角膜颜色与透明度无改变, 猪、兔角膜表面杨氏模量及抗拉强度均显著提升; 电镜示角膜胶原纤维排列致密、直径增大, 交联 6 周

后生物力学强度仍高于空白对照。LAP1/VL 组生物相容性优, 上皮愈合速度与对照一致且快于 RF/UVA 组, 术后角膜水肿轻、消退快, 角膜内皮细胞 DNA 损伤少, 基质细胞恢复迅速。

结论: LAP/VL 方案可显著增加猪及兔角膜硬度, 效果与 RF/UVA 方案相当; 同时减少角膜内皮及基质细胞丢失, 促进上皮愈合与基质再生。综上, LAP/VL 是安全有效的 CXL 替代策略, 对较薄角膜更具优势, 并拓展了 LAP 在原位天然细胞外基质交联中的应用。

摘要编号: **201119**

基于眼动和视觉诱发电位无创评估清醒猴视功能

第一作者: Shu **WANG**

共同作者: Ian **ANDOLINA**, Hong **LIU**

目的: 猕猴是研究人类视觉发育的理想动物模型, 目前缺乏一种客观、非侵入性、可反复多次进行的方法来评估其视功能。本研究旨在开发基于眼动追踪和稳态视觉诱发电位 (sVEP) 的非侵入性方法客观评估清醒幼猴的对比敏感度。

方法: 基于磁共振对头面部轮廓的扫描, 开发设计 3D 打印的头戴式装置来限制幼年食蟹猴的头部活动, 优化眼动仪对幼猴面部的追踪技术, 结合眼动追踪建立清醒幼猴 sVEP 的非侵入性检测系统。对幼猴进行行为学训练后, 在 0.5、1、2、4、8 cpd 这 5 个不同空间频率下进行 sVEP 检测, 垂直光栅刺激的对比度范围为 0.5% ~ 96%。用线性回归估计每个空间频率下的对比敏感度 (CS), 即为客观检测值。继而通过传统心理物理学检测幼猴的主观 CS, 以验证 sVEP 方法的有效性。通过重复测量方差分析比较上述两种方法检测幼猴 CS 的差异, 并将两种 CS 值做相关性分析、分别拟合对比敏感度函数。定义实验总用时比值 (PVR), 通过比较新开发的非侵入性 VEP 与传统心理物理学方法在同一注视条件下的 PVR 来反映这两种方法的实验效率。

结果: 使用两种方法检测得到的幼猴对比敏感度函数图形形状相似。6 例幼猴的 sVEP 平均峰值对比敏感度 (CSp) 为 53.23, 落在空间频率 1.66 cpd; 心理物理学 CSp 为 132.48, 落在 2.46 cpd。在 5 个空间频率上, 平均 sVEP-CS 与心理物理学 CS 均显著相关 ($p < 0.001$), 尽管在每个空间频率上 sVEP-CS 值均低于心理物理 CS 值。在 5 个空间频率的 PVR 均大于 0.67, 表明对于清醒幼猴, sVEP 检测对比敏感度的实验效率比心理物理学方法高。

结论：联合眼动追踪的非侵入性 sVEP 能够有效、客观、无创检测清醒幼猴视功能，且实验效率高于主观的心理物理学方法。

摘要编号：201080

急性低压缺氧环境下色觉分辨力的快速量化评估：基于新型色相鉴别系统的多高度模拟研究

第一作者：Xuemin LI

共同作者：Siru LIU, Yuchen WANG

目的：在模拟高海拔（3500–4500 m）急性低压缺氧条件下，定量追踪人眼对精细色差的动态变化；验证一款比传统 FM-100 Hue 更快捷、便携的软件测试工具。

方法：受试者：14 名色觉正常的健康青年（20–26 岁）。环境：低压舱，5 m/s 上升、3 m/s 下降，每升高 1000 m 休息 2 min，3500/4000/4500 m 各停留 40 min 适应。测试工具：自主研发的“色相差快速识别系统”7 个波段（400–700 nm），1 nm 精度记录最小可识别色差（MHD）；按偏差程度给出 4–1 级评分。观测指标：MHD、评分、测试耗时、色觉识别阈值，共 8 个状态（地面→3500 m→…→返回地面）。

结果：本研究通过新型快速色相鉴别系统，在模拟 3500–4500 m 急性低压缺氧过程中对 14 名正常色觉青年进行连续测试，发现红色光的精细分辨力最差且波动最大（MHD 28.7 → 22.4 nm），40 min 高海拔习服可显著改善青、紫色的辨别能力（MHD 下降 20–35%），却使橙、黄色进一步恶化；其余波段变化轻微。整体 MHD 波长曲线呈 500 nm、600 nm 低谷和 550 nm、620 nm 高峰的经典形态，评分可解释 81% 的 MHD 变异；测试时间由首次 25 s/色 缩短至后续 8–10 s/色，总耗时 ≈ 5 min，验证了新工具的高效与稳定。

结论：急性缺氧优先损害红色精细分辨力；短时习服可改善青、紫色辨别。新软件实现 1 nm 级、5 分钟完成的快速色觉筛查，适用于高原作业、飞行座舱等场景。建议对高海拔工作者、飞行员进行常规色觉阈值检测，并在关键界面设计中为红色信号预留 > 10 nm 安全裕度。

摘要编号：210226

急性视网膜坏死综合征误诊为青光眼睫状体炎综合征及预后不良分析一例

第一作者：Zhongen LI

共同作者：Yungang DING, Jing PANG, Cong REN

目的：探讨一例急性视网膜坏死综合征（ARN）误诊为青光眼睫状体炎综合征的患者临床表现、诊治过程及不良预后的原因。

方法：回顾患者的临床资料、实验室检查及影像学结果，结合文献探讨误诊原因及对预后的影响。

结果：患者男，61 岁。因“左眼红、视力下降 11 天”入院。4 天前因眼压高和前房炎症误诊为青光眼睫状体炎综合征，接受妥布霉素地塞米松和噻吗洛尔眼水治疗。1 天前视力急剧下降至光感，转诊至我院。眼科检查：左眼视力光感，眼压 14 mmHg，轻度睫状充血，羊脂状 KP（+），前房细胞（+），晶状体轻混浊，玻璃体轻度炎性混浊，视网膜脱离累及黄斑，见视网膜坏死灶及血管白线状。行左眼玻璃体切除 + 视网膜复位 + 视网膜激光光凝 + 硅油注入 + 玻璃体腔更昔洛韦注射术。玻璃体液 PCR 检测示水痘带状疱疹病毒（+），确诊左眼 ARN 合并视网膜脱离。术后半年硅油取出，最佳矫正视力为 HM/50 cm，血流 OCT 显示黄斑萎缩及大片视网膜无灌注区。

结论：急性视网膜坏死综合征伴有眼前节反应，尤其在羊脂状 KP 及眼压升高时，应警惕 ARN。眼内液检测可明确病毒感染，辅助 ARN 诊治。黄斑萎缩及视网膜无灌注是预后不良的关键，积极抗炎和抗病毒对改善预后至关重要。

摘要编号：210357

新疆各地州学龄儿童青少年屈光参差患病率及其影响因素

第一作者：Bixia WEI

共同作者：Lin DING, Tao SHEN

目的：评估分析新疆地区 14 个地州 6–18 岁学龄儿童青少年屈光参差的患病率、空间分布特征和影响因素，为制定区域性眼健康干预策略提供科学依据。

方法：采用横断面研究设计，纳入新疆地区 14 个地州的小学、初中及高中学生共 64277 名，收集其人口学特征、屈光状态及地域分布数据。通过等效球镜度（SE）评估屈光状态，采用 Moran's I 分析屈光参差患病率的空间分布，采用单因素及多因素回归分析探讨屈光参差的危险因素。

结果：屈光参差总体患病率为 17.9%（95% CI：17.6%–18.2%），女性屈光参差患病率（18.8%）

高于男性 (16.9%)，汉族 (23.9%) 高于维吾尔族 (11.7%) 和其他民族 (18.4%) ($P < 0.001$)。屈光参差患病率呈空间聚集分布 (Moran's $I = 0.450$, $P = 0.043$, $Z = 2.026$)，并且存在地域差异，昌吉最高 (24.1%)，克州最低 (7.9%)，城市 (19.0%) 高于农村 (15.6%)，北疆 (19.9%) 高于南疆 (13.5%) ($P < 0.001$)。屈光参差患病率与年龄呈正相关，6 岁为 9.8%，18 岁达 22.4%。多因素回归分析显示，女性、北疆地区、近视和较高年龄是屈光参差的独立危险因素。

结论：新疆地区学龄儿童青少年屈光参差患病率较高，在空间上呈聚集分布，且存在显著的人口学及地域差异，女性、北疆地区、近视和较高年龄是屈光参差的独立危险因素，建议加强对高危人群的视力筛查及早期干预。

摘要编号：203211

法瑞西单抗治疗新生血管性年龄相关性黄斑变性、糖尿病性黄斑水肿以及视网膜静脉阻塞的有效性及安全性真实世界研究

第一作者：Danning LIU

共同作者：Ruimin FAN

目的：分析真实世界中玻璃体腔注射法瑞西单抗治疗难治性新生血管性年龄相关性黄斑变性 (nAMD)、糖尿病性黄斑水肿 (DME) 以及视网膜静脉阻塞 (RVO) 的有效性和安全性，并分析治疗疗效与特定生物标志物的关系。

方法：采用回顾性分析方法，纳入患有 nAMD、DME、RVO 并接受玻璃体腔注射法瑞西单抗治疗患者 (所有患者根据说明书原则进行治疗)。对比基线、治疗后 1 周、1 月、2 月、3 月和 4 月评估的最佳矫正视力 LogMar、黄斑中心凹厚度 (CST)、光学相干断层扫描 (OCT) 显示的视网膜生物标志物 (包括：完整外界膜、完整椭圆体带、视网膜内液、视网膜下液、中心凹视网膜内液、视网膜下高反射物质、视网膜内高反射物质、黄斑前膜、色素上皮脱离、地图样萎缩) 以及不良事件。同时对上述患者 1 年内的随访情况进行记录。

结果：研究共纳入 31 名患者，其中 nAMD 组 15 人 21 眼、DME 组 14 人 21 眼和 RVO 组 2 人 2 眼。除 nAMD 组 1 人为初治患者外其余均为经治疗转换法瑞西单抗治疗的患者。转换法瑞西单抗治疗前玻璃体腔注射抗 VEGF/ 傲迪士针数及病程为：nAMD 8.33 次，平均病程 24 个月。DME 9.22 次，平均病程 33.4 个月。RVO 13.5 次，平均病程 36 个月。在法瑞西单抗治疗后第 4 月 nAMD 组、DME 组最佳矫正视力均较基线明显提高，有统计学意义 ($P < 0.05$)。第 4 月平均 CST 均较基线明

显下降，有统计学意义 ($P < 0.05$)。在 nAMD 组中，第 4 月随访时黄斑区外层视网膜损伤、病灶的面积与最终较差的 BCVA 相关。在 DME 组中，第 4 月随访时病灶最厚点的厚度与 BCVA 相关。本研究未发现玻璃体腔注射法瑞西单抗发生眼内炎、青光眼等严重并发症。

结论：难治性 nAMD 和 DME、RVO 组患者在玻璃体腔注射法瑞西单抗负荷剂量治疗后大多数获得了满意的解剖学及视功能的改善学结果及视力的提高，极少数患者第 4 月及其后时间随访未见其解剖学结果明显好转。部分患者，尤其是部分 nAMD 患者视力无明显提升，在 nAMD 眼中，视网膜外层结构的损伤以及病灶面积可能阻碍 BCVA 的改善。根据我院目前玻璃体腔注射法瑞西单抗的观察，法瑞西治疗 nAMD、DME、RVO 安全有效眼底新生血管相关疾病是安全有效的。

摘要编号：204360

玻璃体切割术联合有晶状体眼屈光晶状体植入术治疗中青年患者病理性近视合并近视性牵引性黄斑病变的研究

第一作者：Yue QI

共同作者：Jie SHI

目的：评估 23 G 玻璃体切割术 (PPV) 联合后房型有晶状体眼屈光晶状体 (PC-PRL) 植入术，在治疗病理性近视 (PM) 合并近视性牵引性黄斑病变 (MTM) 患者中的安全性与有效性。

方法：本回顾性研究纳入 11 例患者 (11 只眼)，所有患者眼轴长度均 > 27 mm，球镜度数均 < -10 D，均接受 PPV 联合 PC-PRL 植入术。研究对患者术后 3 个月的解剖学结局、视力 (VA)、屈光不正情况及并发症进行分析。

结果：1. 病变类型分布：11 例患者中，9 例存在黄斑劈裂 (MRS)，5 例存在板层黄斑裂孔性视网膜脱离 (LMHRD)，3 例存在黄斑前膜 (ERM)，2 例存在黄斑裂孔性视网膜脱离 (MHRD)，1 例存在黄斑劈裂性视网膜脱离 (MSRD)。2. 解剖学结局：术后 3 个月随访显示，黄斑裂孔/板层黄斑裂孔 (MH/LMH) 闭合率为 85.7% (7 眼中 6 眼闭合)；8 只眼中有 5 只眼 (62.5%) 仍存在残余视网膜下液。3. 屈光与视力改善：术后球镜度数从 -15.0 D 降至 -0.50 D，差异具有统计学意义 ($P < 0.01$)；矫正远视力 (CDVA) 从 1.3 logMAR 显著提升至 0.52 logMAR，差异具有统计学意义 ($P = 0.026$)。4. 并发症情况：1 例术后出现瞳孔阻滞型青光眼 (虹膜激光后缓解)，2 例 45 岁以上患者术后 1 年左右因白内障加重接受 P+I 手术，无其它并发症发生。

结论: 23 G 玻璃体切割术 (PPV) 联合后房型有晶状体眼屈光晶状体 (PC-PRL) 植入术可在治疗病理性近视患者的近视性牵引性黄斑病变同时, 去除中青年患者高度近视, 能实现良好的解剖学和功能结局, 且并发症发生率低。

磷脂化 ω -3 多不饱和脂肪酸膳食补充对萎缩性病理性近视的影响

第一作者: Ting XIE

共同作者: Dong FANG, Jia LIANG, Shaochong ZHANG

目的: 评估补充磷脂化 ω -3 多不饱和脂肪酸 (PUFAs) 对萎缩性病理性近视 (APM) 患者的治疗效果, 并通过蛋白质组学和脂质组学分析阐明其潜在的分子机制。

方法: 招募 41 例 APM 患者每日口服磷脂化 ω -3 PUFAs, 持续 6 个月。行全面的眼科评估 (多焦视网膜电图 (mERG)、微视野检查、最佳矫正视力 (BCVA)、眼轴长度 (AL) 和等效球镜度数 (SE))。并对血液样本进行蛋白质组学和脂质组学分析。

结果: mERG 分析显示平均 N1 峰潜伏期 (0.028 s 降至 0.026 s, $P = 0.036$) 和 P1 峰潜伏期 (0.06 s 降至 0.050 s, $P = 0.002$) 显著缩短。微视野检查显示平均视网膜敏感度改善 (20.34 dB 升至 21.17 dB, $P < 0.05$)。基线 SE 与 N1 振幅变化 ($r = 0.402$, $P < 0.05$) 和 P1 振幅变化 ($r = 0.45$, $P < 0.001$) 呈正相关。LogMar BCVA、AL 或 SE 未见显著变化 ($P > 0.05$)。蛋白质组学分析鉴定出 2598 个差异表达蛋白, 其中 20 个显示出显著变化, 主要为免疫球蛋白家族蛋白。KEGG 通路分析显示氧化应激、代谢和免疫相关通路富集。脂质组学分析表明, 补充后血浆 ω -3 PUFAs 和 二十二碳六烯酸 (DHA) 水平升高 ($P < 0.05$)。

结论: 在磷脂化 ω -3 PUFAs 治疗后, APM 患者的视锥细胞和双极细胞功能得到改善, APM 患者的视网膜敏感度显著提高, 视网膜反应潜伏期缩短, 提示视网膜光感受器功能增强。此外, 虽然未观察到视觉功能的显著变化, 但补充磷脂化 ω -3 PUFAs 后, 获得 >5 和 >10 ETDRS 字母增益的患者数量较基线增加, ω -3 PUFAs 补充后患者的 BCVA 均有改善的趋势。高通量蛋白质组学和脂质组学分析提示磷脂化 ω -3 PUFAs 调节与抗炎、氧化应激和免疫反应相关的通路有关, 这可能表明 DHA 通过抗炎、抗氧化和免疫调节机制在 APM 的发病机制中发挥关键作用。我们的蛋白质组学分析显示, 几种与免疫反应相关的差异表达蛋白显著上调, 表明参与炎症消退的免疫机制被激活。这些发现表明, ω -3 补充可能通过调节免疫反应和炎症信号通路来增强

APM 患者的光感受器功能和视力, 从而影响近视的发病机制。我们的研究表明, DHA 通过抗炎、抗氧化和免疫调节机制在 APM 的发病机制中发挥关键作用。这是第一项在真实世界临床环境中评估磷脂化 ω -3 PUFAs 在管理 APM 中的疗效的研究。我们的发现对 APM 的发病机制进行了有效的补充, 并提出了一种对 APM 有前途的、非侵入性的治疗干预措施, 有望成为延缓 APM 的进展的潜在治疗手段。

摘要编号: 203870

角膜交感神经调控免疫细胞促进角膜新生血管生长的机制研究

第一作者: Bining ZHANG

共同作者: Shijiu CHEN, Weiyun SHI

目的: 角膜新生血管 (Corneal neovascularization, CNV) 是导致角膜盲及角膜移植术后免疫排斥的主要危险因素, 但现有治疗手段有限。角膜是全身神经末梢最为密集的组织, 其无血管特性对维持透明至关重要。临床上常见角膜神经损伤后伴随 CNV 发生, 提示神经-血管交互作用可能参与调控, 但其机制尚不明确。本研究聚焦角膜交感神经在 CNV 形成中的作用, 旨在阐明其分子通路并探索潜在干预靶点。

方法: 采用 C57BL/6J 小鼠建立碱烧伤、缝线及 bFGF 微囊三种 CNV 模型, 并行角膜转录组测序。建立切断睫状长神经构建角膜去神经模型, 于术后 1、3、7 天裂隙灯观察角膜上皮及 CNV 变化, 使用免疫荧光检测角膜组织中交感神经和 β 2-肾上腺素受体 (β 2-AR) 的分布变化; 检测 β 2-AR 激动剂 NE 和拮抗剂 ICI118,551 (ICI) 对 CNV 的影响, 并建立 β 2-AR 敲除小鼠进一步验证。

结果: 三种 CNV 模型转录组测序结果显示与角膜炎症相关的基因上调最高, 与正常野生小鼠相比较, S100A8 是显著上调的基因。角膜去神经模型中, 术后 1 天可见上皮点状浸润, 3 天出现上皮缺损并伴随 CNV, 7 天形成大量 CNV。多种小鼠角膜新生血管模型的角膜中血管与交感神经伴行, NE 处理显著促进 CNV 的长度、密度及面积扩展, 而 ICI 组受抑制。免疫荧光证实 β 2-AR 在角膜上皮表达强阳性, β 2-AR 敲除小鼠中, CNV 生长显著减少。

结论: 角膜感觉神经受损后, 交感神经可长入角膜并与新生血管伴行, 同时角膜内 NE 水平增加。交感神经释放的 NE 与角膜上皮广泛分布的 β 2-AR 结合, 促进免疫细胞浸润及血管生成, 最终诱导 CNV 形成。阻断 NE- β 2-AR 信号通路可显著抑制 CNV 生长, 提示该通路为 CNV 治疗潜在的新靶点。本研究揭示了交感神经在角膜新生血管形成中的关键

作用，为临床防治角膜新生血管相关疾病提供了新的理论依据与治疗策略。

摘要编号：206445

非病理性高度近视眼生理盲点扩大与 γ 区及 PHOMS 有关

第一作者：Qiuyan WU

共同作者：Changzheng CHEN, Min KE, Hongmei ZHENG

目的：探讨非病理性高度近视眼生理盲点扩大的患病率及危险因素。

方法：多中心前瞻性队列研究。对 172 例高度近视患者的 313 只眼进行视野检查。比较 116 只生理盲点扩大眼与 116 只正常视野眼的临床特征。采用广义估计方程（GEE）回归模型评估生理盲点扩大的有关因素。

结果：非病理性高度近视眼生理盲点扩大的发生率为 37.06%。与正常视野眼相比，生理盲点扩大眼具有更大的 γ 区（ $P = 0.038$ ）、更大的 PHOMS 区（ $P < 0.001$ ）、增加的视盘周围视网膜神经纤维层厚度（ $P = 0.006$ ）和减少的黄斑神经节细胞—内丛状层厚度（ $P = 0.016$ ）。在多变量回归分析中，扩大的 γ 区（ $OR = 2.004$ ； $P = 0.022$ ）和更大的 PHOMS 区（ $OR = 4.414$ ； $P = 0.009$ ）与生理盲点扩大有关。

结论：扩大的 γ 区和更大的 PHOMS 区与生理盲点扩大有关，两者可能提示了非病理性高度近视眼中近视性视神经病变的早期改变。这种损害模式可为高度近视和青光眼的鉴别诊断提供线索。

角膜病、干眼症、外眼病、眼库

0.05% 环孢素滴眼液 II 对于白内障围术期患者应用价值的临床研究

第一作者：Yiren WANG

共同作者：Xiaodan JIANG, Xuemin LI

目的：探究 0.05% 环孢素滴眼液对于白内障围手术期患者眼表以及泪膜稳定性保护作用及应用价值。

方法：本研究纳入了 2022 年 6 月至 2022 年 12 月期间在北京大学第三医院眼科中心就诊的白内障患者，共 63 例（63 只眼）。在开始实验及随访前，均已充分告知患者本研究的实验目的、实验设计以及风险等，取得了所有患者的知情同意书。将所有

患者分为实验组 42 例（42 只眼）、21 例（21 只眼）。对照组患者在白内障术后仅使用抗生素、激素眼药水，而实验组还增加使用 0.05% 环孢素 II 滴眼液。收集手术患者术前及术后 1 周、术后 1 个月、术后 3 个月的视力、角膜荧光素染色评分、OSDI、BUT 并进行分析比较。

结果：实验组使用 0.05% 环孢素滴眼液的白内障术后患者干眼相关指标（OSDI、BUT、角膜荧光素染色评分）显著轻于对照组患者。在术前和术后 1 周时，两组患者的 OSDI、BUT 和角膜荧光素染色评分都没有显著差异；而在术后 1 个月和术后 3 个月时，实验组的 OSDI（1 个月：31.60 ± 6.7；3 个月：12.30 ± 4.1）和角膜荧光素染色评分（1 个月：1.2 ± 0.3；3 个月：0.5 ± 0.1）都显著低于对照组的 OSDI（1 个月：51.20 ± 10.3；3 个月：32.60 ± 4.7）和角膜荧光素染色评分（1 个月：5.2 ± 2.0；3 个月：3.4 ± 1.0），实验组的 BUT（1 个月：5.0 ± 2.3 s；3 个月：6.0 ± 2.6 s）显著高于对照组（1 个月：2.1 ± 0.7 s；3 个月：3.2 ± 0.9 s）。此外，实验组患者与对照组患者在术前、术后 1 周、术后 1 个月的矫正视力均无显著差异，而在术后 3 个月时，实验组患者的矫正视力（0.90 ± 0.14）显著优于对照组（0.80 ± 0.13， $P = 0.008$ ）。

结论：0.05% 环孢素的使用可以显著改善白内障术后患者 OSDI、BUT 和角膜荧光素染色评分。0.05% 环孢素滴眼液对白内障术后患者眼表与泪膜稳定性的保护有良好的应用价值。

摘要编号：210321

180° 小梁切开术治疗原发性开角型青光眼合并白内障的临床疗效与安全性

第一作者：耿琦

目的：比较超声乳化白内障摘除联合房角镜辅助下的 180° 小梁切开术（gonioscopy-assisted trabeculotomy, GT）与联合复合式小梁切除术（glaucoma filtration surgery, GFS）治疗合并白内障的原发性开角型青光眼的疗效和安全性。

方法：纳入 2024 年 6 月–2024 年 11 月陆军特色医学中心合并白内障的原发性开角型青光眼患者 53 例（77 只眼）。按手术方式分为 GT 组和 GFS 组。术后随访 1 年，对比两组眼压（intraocular pressure, IOP）、最佳矫正视力（best corrected visual acuity, BCVA）logMAR、使用抗青光眼药物种类、总有效率及并发症情况。

结果：共纳入 GT 组 27 例（43 只眼），GFS 组 26 例（34 只眼）。两组患者基线情况无统计学差异（ $P > 0.05$ ）。术后 1 年 GT 组 BCVA logMAR 低于 GFS 组，差异有统计学意义（ $P < 0.01$ ）。GT

组较 GFS 组术后 IOP 更低, 差异有统计学意义 ($P = 0.03$)。两组总有效率、使用抗青光眼药物种类和并发症发生率的差异无统计学意义 ($P > 0.05$)。

结论: 超声乳化白内障摘除联合 GT 治疗合并白内障的原发性开角型青光眼安全、有效, 具有良好的降压效果。

摘要编号: 207880

AAV 介导 CRISPR/Cas9 基因编辑 VEGFA 抑制角膜新生血管的研究

第一作者: Jinhai HUANG

共同作者: Xingtao ZHOU

目的: 角膜新生血管 (CNV) 是多种致盲性眼病的共同病理环节, 其核心驱动因子血管内皮生长因子 A (VEGFA), 目前依赖反复抗 VEGF 抗体注射, 存在感染、耐药及经济负担等局限。本研究首次探索利用 CRISPR/Cas9 基因编辑技术一次性“断电” VEGFA 表达, 实现长效、微创、非抗体依赖的抗血管生成治疗。

方法: 设计并筛选 3 条靶向人/小鼠 VEGFA 外显子 1 的 sgRNA, 通过 T7E1 与 NGS 验证切割效率后, 构建双 AAV2/9 载体 (AAVSpCas9 与 AAVsgRNA3)。体外转染 HUVEC, 检测 VEGFA 蛋白水平、PI3K/AKT 信号、增殖、迁移与管腔形成; 体内经结膜下注射双 AAV 至 C57BL/6 小鼠, 建立缝线诱导 CNV 模型, 比较血管面积、CD31/ α SMA 表达、视网膜 ERG 及多器官毒性。

结果: sgRNA3 诱导 indel $> 70\%$, VEGFA 蛋白下降约 72%, pPI3K/pAKT 同步下调, HUVEC 管腔形成与迁移分别减少 65% 和 50%, 无明显细胞毒性。小鼠角膜血管面积下降 72.3%, 优于康柏西普; CD31、 α SMA 及 VEGFA 表达显著降低。ERG 与组织学未见视网膜功能或结构损伤, 多器官无脱靶荧光及病理改变, Th17 免疫监视无激活。

结论: 单次结膜下递送 AAVCRISPR/Cas9VEGFA 系统可在角膜局部实现持久、高效、安全的基因“断电”, 阻断 VEGF/PI3K/AKT 轴, 显著抑制 CNV, 且优于传统蛋白中和策略, 为临床提供一次注射、长期受益的“基因编辑眼药水”新策略。

摘要编号: 203013

GWAS 优先级分析与单细胞转录组学联合鉴定 IL-18 受体介导的免疫网络在过敏性结膜炎中的分子机制

第一作者: Liangpin LI

共同作者: Liyun YUAN, Xiaoyong YUAN

目的: 过敏性结膜炎 (Allergic Conjunctivitis, AC) 是一种常见的眼表免疫性疾病, 传统的 Th2 免疫模型难以解释其临床表现与疗效差异。为了深入解析 AC 的遗传易感因素与分子机制, 本研究采用多组学整合策略, 发掘新的病理通路并为个体化治疗提供依据。

方法: 首先, 利用 FUSION、MAGMA 和 UTMOST 三种方法对大规模人群 GWAS 数据进行基因优先级分析, 筛选 AC 易感基因。随后, 基于 OVA 诱导的 AC 小鼠模型, 应用单细胞 RNA 测序 (scRNA-seq) 数据, 结合 CellChat 细胞通讯与 Monocle3 轨迹推断, 系统评估候选基因在不同免疫细胞中的表达及信号网络变化。最后, 通过 qRT-PCR 和 Western blot 在独立小鼠队列中验证关键基因及信号通路的表达与激活水平。

结果: 三种组学分析共鉴定出 9 个高可信 AC 易感基因 (包括 IL1RL1/2、IL18R1/IL18RAP、TLR6/10 等); 在 AC 小鼠结膜组织中, IL-18 受体亚基 Il18r1 与 Il18rap 在 NK 细胞和 T 细胞中显著上调, 并与 Ifng 表达呈正相关。细胞通讯分析显示, AC 状态下 IFN-II、CD80 与 MHC-II 通路的细胞间信号显著增强。轨迹分析揭示, NK/T 细胞中 NF- κ B 与 JAK-STAT 通路活性在伪时间进程中呈动态变化。体内验证进一步证实了 Il18r1/Il18rap 及 NF- κ B 信号的显著上调。

结论: 本研究首次通过“人群多组学—小鼠单细胞—细胞通讯—动物验证”一体化流程, 揭示了 IL-18 受体/IFN- γ 轴在 AC 发病中的核心作用, 拓展了对 AC 免疫病理的认识, 为靶向 IL-18R 及下游 NF- κ B/JAK-STAT 通路的诊疗策略开发提供了新的分子依据。

摘要编号: 205663

Mafb 通过维持角膜缘干细胞功能促进糖尿病角膜上皮修复

第一作者: Xiaowen ZHANG

共同作者: Shengqian DOU, Yujin LIN, Qingjun ZHOU

目的: 全球糖尿病患病率持续攀升, 已成为重大公共卫生问题。近半数糖尿病患者伴发原发性角膜病变, 可能会引起不可逆性视力损害, 然而其发病机制尚不明确。本研究旨在通过单细胞转录组测序技

术，系统解析糖尿病条件下角膜缘干细胞功能失调的分子机制，识别关键转录调控因子，为糖尿病角膜病变的防治提供理论依据与潜在治疗靶点。

方法：在本研究中，我们构建了正常与糖尿病小鼠模型在角膜稳态及上皮损伤修复过程中的单细胞图谱，系统解析了糖尿病角膜细胞类型特异性的转录改变，并鉴定了糖尿病角膜损伤修复过程中的差异转录因子。此外，我们还分析了糖尿病角膜缘干细胞微环境中异常的细胞间通讯。

结果：本研究揭示了糖尿病角膜中存在的干细胞异常分化与耗竭现象，并伴随显著的免疫细胞浸润及炎症信号增强，共同影响了角膜上皮的伤口愈合。此外，我们分析发现转录因子 *Mafk* 的表达随角膜上皮分化而降低，并在糖尿病角膜缘干细胞及基底细胞中显著下调，其可能是维持干细胞功能特性与修复能力的关键调控因子。通过体外实验，我们证实敲低 *Mafk* 会损害小鼠角膜缘干/祖细胞的增殖和迁移能力。体内实验则进一步证明，敲低 *Mafk* 的表达，影响了小鼠角膜缘干细胞的干性和增殖能力，并延缓了角膜上皮损伤修复，而过表达 *Mafk* 可恢复糖尿病小鼠角膜缘干细胞的功能，逆转其伤口修复延迟现象。

结论：本研究系统地揭示了糖尿病状态下角膜缘干细胞功能异常及眼表稳态失衡的分子机制，并鉴定了调控角膜缘干细胞功能的核心转录因子 *Mafk*，这些发现不仅为深入理解糖尿病角膜病变的发病机制提供了重要的依据，同时为开发新的临床干预靶点奠定了坚实的理论基础。

摘要编号：207517

Mihe 人工角膜植入术后的玻璃体视网膜并发症

第一作者：Liqiang WANG

共同作者：Yifei HUANG

目的：描述接受 Mihe 人工角膜 (MIOK) 患者进行玻璃体视网膜手术的适应证及手术方式。

方法：回顾性分析我中心 2015 年至 2025 年间接受 Mihe 人工角膜植入术的所有患者。手术适应证及操作方法均依据 MIOF 方案中患者人口学资料所述。记录视网膜手术的适应证、手术结局以及术中及术后并发症。手术记录中回顾并总结操作方式，同时记录所有后续手术。

结果：共 35 例患者接受 Mihe 人工角膜植入，其中 13 例 (37.1%) 需要进行视网膜手术。4 眼 (11.4%) 存在残余皮质晶状体物质，需进一步前段玻璃体切除以去除；1 眼 (2.86%) 出现假体后膜形成，需行手术性膜切除；5 眼 (14.3%) 因黄斑水肿接受玻璃体腔内抗 VEGF 药物注射；3 眼

(8.57%) 发生眼内炎并行玻璃体切除。所有病例中，视网膜手术目标均在一次手术中实现。

结论：Mihe 人工角膜是治疗重度眼表疾病恢复视力的最后希望，而玻璃体视网膜科医生在这些患者的评估与管理中发挥关键作用。应用广角观察系统辅助的玻璃体切除术在此类复杂病例中是一项有价值的工具，可改善功能结局，同时不影响 Mihe 人工角膜的成功率。

摘要编号：209026

PEDF 在糖尿病眼表病变中的作用机制及治疗潜力

第一作者：Shaozhen ZHAO

共同作者：Shuangping CHEN, Zhenying SHANG, Yilan YIN

目的：本研究旨在系统探究色素上皮衍生因子 (PEDF) 在糖尿病相关眼表病变中的保护作用及其分子机制，阐明 PEDF 缺失如何通过影响泪腺结构与功能导致糖尿病干眼，揭示 PEDF 通过调控内质网应激、细胞凋亡和神经营养因子表达维持眼表稳态的作用通路，验证 PEDF 类肽 (Ppx) 在改善糖尿病眼表病变中的疗效。

方法：采用 8 周龄雄性 C57BL/6J 小鼠，分为野生型对照组 (WT)，PEDF 基因敲除组 (*Pedf*^{-/-}) 和 *Pedf*^{-/-} 糖尿病模型组 (STZ 诱导，55 mg/kg × 5 天)。糖尿病造模成功后 10 周开始治疗，PEDF 类肽治疗组 (Ppx, 0.5 μg/μl，双眼点眼，每日 2 次)、人工泪液对照组 (羧甲基纤维素钠) 和未治疗对照组。眼表功能评估包括 Cochet-Bonnet 角膜知觉仪测量敏感性、Schirmer 试验检测泪液分泌量、角膜荧光素钠染色评分；组织学分析包括 H&E 染色观察泪腺和角膜结构，免疫荧光检测 α-SMA、calponin、keratin14 等标记物，TUNEL 法检测细胞凋亡，鬼笔环肽染色评估 F-肌动蛋白聚合；分子机制研究包括 RNA-seq 转录组分析差异表达基因，qRT-PCR 和 Western blot 检测关键基因表达，检测内质网应激标志物 (PERK、ATF6α、IRE1α 等)，分析 MAPK 信号通路 (P-38、JNK、ERK) 激活状态；细胞和组织功能学包括催产素刺激泪腺收缩实验、角膜铺片神经长度测量以及内皮细胞计数和形态分析。

结果：糖尿病病程对眼表功能的影响表现为进行性功能损害角膜知觉、泪液分泌量随病程加重而下降，角膜上皮损伤评分增加。泪腺病理改变表现为腺泡扩张、泪腺重量减轻、MECs 数量减少。PEDF 缺失导致凋亡通路激活，抗凋亡蛋白 Bcl-2 表达下降，TUNEL 阳性细胞增加；内质网应激反应异常激活，PERK-eIF2α-ATF4-CHOP 通路显著激活，GRP78

表达上调, XBP1 剪切异常; MAPK 通路 (P-38、JNK) 磷酸化水平升高, ERK 通路抑制泪液分泌; 水通道蛋白异常: AQP4 表达下调。外源性补充 PEDF 能够降低 ROS 水平, 上调 Sirt1 表达和 Akt 磷酸化。Ppx 治疗能够改善眼表功能, 恢复角膜知觉和泪液分泌, 减轻角膜上皮损伤, 减少 MECs 凋亡, 维持腺泡收缩功能, 改善 F-肌动蛋白聚合, 分子机制包括抑制内质网应激、下调炎症因子 (IL-1 β 、TNF- α) 表达和调节神经营养因子平衡。

结论: PEDF 是维持眼表稳态的关键调控因子, PEDF 类肽 (Ppx) 作为潜在治疗药物, 具有多重保护作用。

摘要编号: **210261**

ROS 响应性眼用微针负载新型抗 HSV 纳米酶治疗病毒性角膜炎

第一作者: **Ziqing FENG**

共同作者: **Meiyan LI, Ruoyan WEI, Xingtao ZHOU**

目的: 探究负载新型抗 HSV 纳米酶的 ROS 响应性水凝胶微针在病毒性角膜炎中的治疗作用。

方法: 研究由铁离子、单宁酸 (TA) 和聚乙烯吡咯烷酮 (PVP) 合成了一种具有类过氧化物酶活性的纳米酶 (FeTAP), 可以在 HSV 感染的环境中产生具有氧化性的羟基 ($\cdot$ OH) 来杀死病毒从而治疗病毒性角膜炎。使用兼具生物相容性和 ROS 响应性水凝胶制作可分离的角膜微针贴片, 将纳米酶整合到微针尖端中, 并在炎症环境中可控地递送至角膜内。建立 HSV 感染的小鼠模型, 对比传统滴眼液的方法, 评估微针负载 FeTAP 对病毒性角膜炎的疗效。

结果: 微针机械强度测试及体内角膜插入试验表明, 硬度适宜的微针贴片可在拇指轻压下刺破小鼠角膜上皮, 细胞毒性实验 (CCK-8) 和人角膜上皮细胞 (HCEC) 活/死染色实验证实了 ROS 响应性水凝胶材料和纳米酶材料的生物相容性。定量 PCR (qPCR) 和噬斑实验证实 FeTAP 在体外显著抑制 HSV 复制, 透射电子显微镜和 Western Blot 实验表明 FeTAP 破坏病毒结构。最后在雄性 BALB/c 小鼠 (6 周龄) 中诱导 HSK 构建动物模型, 对比使用微针载 FeTAP 和 FeTAP 滴眼液治疗 2 周后的效果, 通过观察裂隙灯和泪液分泌, 发现微针治疗组具有更好的治疗效果, 并且角膜中的病毒载量更低 ($P < 0.05$)。

结论: 载有新型抗 HSV 纳米酶的 ROS 响应性微针贴片与传统治疗滴眼液方法相比治疗效果更好, 该方法为临床上治疗病毒性角膜炎提供了一种新的具有参考性的方法。

摘要编号: **204002**

Rubinstein-Taybi 综合征家系的分子遗传学诊断研究

第一作者: **Xiaozhen LIU**

共同作者: **Jing HONG, Liping YANG**

目的: 总结两例 Rubinstein-Taybi 综合征 (RSTS) 家系的临床表型特征及分子遗传学诊断结果。

方法: 对家系先证者进行详细眼科检查; 采集先证者及可获取亲属的外周血样本, 提取基因组 DNA。使用遗传性眼病基因诊断芯片 (HEDEP) 进行初筛, 并通过 Sanger 测序对候选致病变异进行验证及家系共分离分析。依据美国医学遗传学与基因组学学会 (ACMG/AMP) 标准与指南对变异进行致病性评估, 确定致病基因及突变位点。

结果: 两家系先证者分别为 7 岁女性、6 月龄男性患儿, 临床表现多样。女性患儿于孕 38 周出生 (体重 2.9 kg, 身高 50 cm), 出生时家属发现其左眼患先天性角膜混浊 (CCO), 7 月龄时接受穿透性角膜移植术; 2 月龄时其被诊断为家族性渗出性玻璃体视网膜病变 (FEVR); 9 月龄时家属发现患儿双眼角膜直径大、眼底照相示右眼视盘发育不良, 4 岁及 5 岁时分别接受左、右眼行小梁切开术和 Schlemm 管成形术以控制进展性青光眼; 7 岁时患儿因右眼眼内炎行玻璃体切割术联合晶状体切除及硅油填充术。男性患儿孕 38 周出生 (体重 3.2 kg, 身高 51 cm), 出生时家属即发现其右眼角膜白斑, 就医时发现其患有右眼 CCO、部分虹膜前粘连, 左眼瞳孔膜闭。除复杂眼疾外, 两患儿存在显著的全身表型: 发育迟缓 (语言及运动能力)、认知障碍、脑电图异常、自闭症倾向, 体格检查发现宽拇指及胎儿指垫残留。基因检测揭示两患儿均携带 CREBBP 基因杂合致病变异 (依据 ACMG 标准), 分别为 c.4244A>C (p.Gln1415Pro)、c.3837-2A>G, 家系分析显示两变异均为新发突变 (de novo), 前者已被文献报道可导致 RSTS, 后者为本研究首次报导。结合患儿复杂的多系统临床表现及基因检测结果, 最终确诊为 RSTS。

结论: 研究报告了两例临床表现复杂、初诊困难的 RSTS 病例, 其诊断得益于分子遗传学检测对 CREBBP 基因致病性新发变异的鉴定。该案例凸显了基因检测在明确具有复杂、多系统表型 (尤其是合并特征性眼部病变及发育异常) 患儿的最终诊断中的核心价值, 不仅为患者提供了确切的病因学解释, 也为家系遗传咨询及未来可能的基因治疗奠定了基础。

摘要编号: 209114

Steven-Johnson 综合征睑缘眼表重建手术思考

第一作者: Jie WU

目的: Stevens-Johnson 综合征慢性期是在几周后开始, 并持续终生(持续性或严重眼表炎症反应)。分阶段进行手术治疗(时机选择): 慎选手术; 需充分评估眼表; 前期抗炎治疗等。评价术后治疗效果。

方法: Steven-Johnson 综合征睑缘手术思考: 1. 分阶段进行: 第一期: 松解粘连(睑球粘连)+ 黏膜移植重建湿润眼表环境; 第二期(6 个月后): 矫正睑内翻/倒睫。2. 材料选择: 直系亲属口唇黏膜, 可联合羊膜移植。3. 手术选择: ① 睑球粘连分离+穹隆成形, 重建湿润眼表环境; ② 松解睑结膜瘢痕挛缩(睑板沟附近), 去除睑缘角化组织(挤压原睑板腺开口能否有睑脂); 切除异位乱生睫毛毛囊+/压垫法矫正睑内翻; 唇黏膜修补睑缘黏膜缺损区, 术毕戴绷带镜。注意: 唇黏膜修补——邮票式孔洞(横向, 纵向), 可减少移植片下方积血、积液, 减轻术后挛缩、瘢痕张力。4. 手术方式: ①, 或 ①+②(全身及眼表炎症控制平稳)注意是否合并继发干燥综合征。

结果: 术后 6 个月, 试验组较对照组显著改善, 睑球粘连术后有效改善, 泪液功能; 泪膜破裂时间延长至 7.2 ± 1.5 秒(对照组 3.8 ± 1.1 秒, $P < 0.001$), Schirmer I 试验值提升至 5.6 ± 2.3 mm(对照组 3.1 ± 1.8 mm, $P = 0.002$); 眼表修复: 结膜印迹细胞分级 I - II 级占比达 82.6%(对照组 35.5%, $P < 0.001$); 视功能: BCVA 提高 ≥ 2 行者占 71.0%(对照组 25.8%, $P = 0.001$), 平均 LogMAR 从 0.8 ± 0.3 降至 0.4 ± 0.2 (对照组 0.7 ± 0.3 至 0.6 ± 0.3 , $P = 0.003$)。

结论: Stevens-Johnson 综合征慢性期持续终生(持续性或严重眼表炎症反应)。其眼部并发症如干眼(重度, 最常见并发症), 眼表炎症, “干眼-瘢痕”恶性循环; 眼睑缘瘢痕化, 睑内翻/倒睫, 睑球粘连, 角膜新生血管形成等常常导致患者失去有用视力, 分阶段进行手术方案设计和治疗有助于提高手术成功率。

摘要编号: 206048

TRPV1⁺ 感觉神经介导角膜上皮损伤修复的作用及机制研究

第一作者: Ning WANG

共同作者: Suxia LI, Ya LI

目的: 目前关于角膜神经退行导致角膜上皮损伤的机制尚未完全阐明。本课题建立 TRPV1⁺ 感觉神经退行模型, 探究角膜 TRPV1⁺ 感觉神经调控角膜上皮细胞谷胱甘肽代谢机制以及 Ferrostatin-1 促进角膜上皮损伤修复机制。为治疗角膜神经损伤类疾病的药物研发提供科学基础。

方法: 利用物理损伤三叉神经的方法建立去神经小鼠模型, 利用辣椒素建立 TRPV1⁺ 感觉神经退行模型; 利用免疫荧光、qPCR 等方法测定角膜上皮细胞谷胱甘肽代谢异常。通过结膜下注射辣椒素并刮除角膜中央 2.5 mm 角膜上皮建立 TRPV1⁺ 感觉神经退行角膜上皮损伤模型, 观察角膜上皮修复速度、角膜神经和角膜敏感度恢复。并利用转录组测序, 取对照组、利用物理损伤三叉神经的方法建立去神经小鼠模型, 利用辣椒素建立 TRPV1⁺ 感觉神经退行模型; 利用免疫荧光、qPCR 以及谷胱甘肽过氧化物酶活性的测定等方法测定角膜上皮细胞谷胱甘肽代谢异常。通过局部施用辣椒素并刮除角膜中央 2.5 mm 角膜上皮建立 TRPV1⁺ 感觉神经退行角膜上皮损伤模型, 观察角膜上皮修复速度、角膜神经和角膜敏感度的恢复。并利用转录组测序, 取对照组、TRPV1⁺ 感觉神经退行组以及 Ferrostatin-1 治疗组小鼠角膜上皮细胞进行转录组测序, 并对神经营养性角膜炎患者的角膜上皮进行免疫荧光染色, 并结合人角膜上皮细胞系研究 Ferrostatin-1 促进角膜上皮损伤修复的分子机制。

结果: 三叉神经损伤模型和 TRPV1⁺ 感觉神经退行模型小鼠角膜上皮损伤, 且角膜上皮细胞 GPX4、GSTM1 等基因表达降低, 谷胱甘肽过氧化物酶活性以及 GSH 表达降低。Ferrostatin-1 的应用能逆转 TRPV1⁺ 感觉神经退行引起的角膜上皮损伤修复延迟并促进神经末梢和角膜感觉恢复, 转录组测序结果显示细胞迁移、细胞增殖以及 p53 信号通路相关基因变化显著。体内、外结果显示 Ferrostatin-1 能够下调 p53 的表达并且激活 AKT/mTOR 信号通路, 而激活 P53 通过抑制角膜上皮细胞增殖和迁移影响角膜上皮修复, 同时抑制 AKT/mTOR 通路。免疫荧光染色结果表明, 在神经营养性角膜炎患者的角膜上皮细胞中 GPX4、GSTM1 表达水平降低、P53 表达上调、同时 AKT/mTOR 信号通路被抑制。

结论: Ferrostatin-1 通过调节 p53/AKT/mTOR 通路逆转 TRPV1⁺ 感觉神经退行引起的角膜上皮损伤修复延迟。

摘要编号: 206835

上海地区 63,196 名在校学生干眼症状流行特征及影响因素分析—基于 OSDI 问卷的横断面研究

第一作者: Xia CHEN

共同作者: Xinyue CHEN, Xiangui HE, Jingjing WANG

目的: 探讨上海地区中小学生干眼症状的流行特征及其相关影响因素, 为区域学生干眼防控策略提供循证依据。

方法: 采用整群抽样法, 于 2024 年对上海市 16 个区的幼儿园、小学、初中和高中学生进行 OSDI 干眼问卷调查, 共回收有效问卷 63,196 份。依据 OSDI 评分将受检者划分为正常 (53,109 例, 84.04%)、轻度 (5,572 例, 8.82%)、中度 (2,630 例, 4.16%) 及重度干眼 (1,885 例, 2.98%)。同时收集性别、学段、父母近视状况、日均屏幕与户外活动时间、戴镜与否、阿托品及红光治疗使用等暴露信息。采用 χ^2 检验、Kruskal-Wallis 检验及多因素 Logistic 回归模型分析干眼发生的关联因素。

结果: 干眼总体患病率为 15.96%, 且随学段升高呈递增趋势 (幼儿园 8.26%、小学 11.24%、初中 18.24%、高中 23.25%, $P < 0.001$)。多因素回归显示, 与初中相比, 小学和幼儿园学生干眼风险降低 ($OR = 0.695$, 95% $CI: 0.652-0.740$; $OR = 0.537$, 95% $CI: 0.483-0.596$), 而高中学生风险升高 ($OR = 1.156$, 95% $CI: 1.090-1.225$); 日均屏幕时间每增加 1 小时, 干眼风险增加 14.2% ($OR = 1.142$, 95% $CI: 1.126-1.157$); 日均户外时间每增加 1 小时, 风险降低 4.1% ($OR = 0.959$, 95% $CI: 0.939-0.978$); 父亲近视阳性 ($OR = 1.100$, 95% $CI: 1.052-1.151$) 及戴镜 ($OR = 1.623$, 95% $CI: 1.544-1.707$) 均与干眼独立相关; 性别、母亲近视等因素差异无统计学意义。模型 AUC 为 0.651, 提示预测能力中等。

结论: 上海地区学生干眼症状普遍, 高中及高屏幕暴露、低户外活动、父亲近视和戴镜人群是重点干预对象。应针对学龄阶段制定分级眼健康策略, 减少电子屏幕使用、增加日间户外活动, 并加强对近视家庭的干眼监测与宣教, 以遏制学生干眼流行趋势。

摘要编号: 210292

中国近亲家系两例胶滴状角膜营养不良合并神经性耳聋的病例分析

第一作者: Weining RONG

目的: 本研究旨在通过全基因组外显子测序 (Whole exome sequencing, WES) 技术, 识别胶滴状角膜营养不良 (Gelatinous Drop-Like Corneal Dystrophy, GDLD) 患者中的潜在致病基因变异, 以提高对这一罕见遗传性眼病的诊断准确性和理解其分子病理机制。

方法: 本研究收集了同一家系中两名胶滴状角膜营养不良 (GDLD) 患者及其家族成员的血液样本, 完善相关检查, 利用 WES 技术对样本进行基因分析, 并通过生物信息学工具筛选可能的致病变异。通过 Sanger 测序验证可疑变异, 并结合临床数据进行综合评估。

结果: 先证者自幼双眼视力下降伴眼痛、眼红和畏光, 在 11 岁和 13 岁时, 分别接受了右眼和左眼的板层角膜移植手术, 右眼在术后 3 年复发。先证者的妹妹自幼双眼视力下降伴眼红、磨痛和畏光, 8 岁和 10 岁时分别接受了左眼和右眼的板层角膜移植手术, 并于 2 岁时因先天性重度感音性耳聋接受了人工耳蜗植入术。通过 WES 和 Sanger 测序验证, 发现先证者及其妹妹携带 TACSTD2 基因一个纯合变异 c.588C > A; p.Tyr196, 导致第 196 位氨基酸由酪氨酸变为终止密码子, 生成截断蛋白, 该变异被分类为致病性变异。此外, 先证者的妹妹携带 MYO15A 基因纯合错义变异 c.6442T > A; p.Trp2148Arg, 听力正常的先证者及其父母都携带了相同的杂合变异, 该变异是导致感音性耳聋发生的原因。

结论: 本研究通过 WES 技术, 揭示了 TACSTD2 基因纯合变异与 GDLD 的关联。这一发现扩展了我们对 GDLD 遗传基础的认识, 并为受影响的患者提供了新的诊断依据。此外, 本研究强调了基因测序技术在罕见病诊断中的重要性, 为未来的遗传咨询和治疗策略的开发奠定了基础。

摘要编号: 201828

中药单体成分 punicalagin 在真菌性角膜炎中的治疗作用

第一作者: 林浩

共同作者: Yun FENG

目的: 本研究旨在探讨 punicalagin (PUN) 在小鼠烟曲霉菌性角膜炎模型中的抗真菌作用及抗炎作用。

方法：体外实验：通过时间杀菌实验和菌丝染色实验，评估 PUN 对烟曲霉菌的直接抗真菌活性。体内实验：建立小鼠烟曲霉菌性角膜炎模型，将模型小鼠随机分为 PBS 对照组和 PUN 治疗组。于感染后第 1、3、5 天对小鼠角膜病变进行临床评分；采用逆转录-聚合酶链反应检测炎症因子的 mRNA 表达水平，蛋白质印迹法检测炎症因子的蛋白表达水平；流式细胞术和免疫荧光染色，分析角膜组织中巨噬细胞的数量及空间分布；同时，采用真菌平板计数法量化角膜组织中的真菌载量，以评估 PUN 的体内抗真菌效果；利用 DCFH-DA 荧光探针检测细胞内活性氧水平。

结果：体外实验结果：PUN 对烟曲霉菌具有显著抑制活性，其抑制 90% 真菌生长的最低抑菌浓度（MIC₉₀）为 250 μg/ml；且 PUN 能显著抑制烟曲霉菌生物膜的形成。体内实验结果：与 PBS 对照组相比，PUN 治疗组小鼠的角膜病变明显减轻，表现为更低的临床评分（ $p < 0.05$ ）、更少的巨噬细胞浸润（ $p < 0.001$ ）以及更低的角膜真菌载量（ $p < 0.001$ ）；同时，PUN 治疗可下调角膜组织中促炎因子的 mRNA 表达及蛋白水平。细胞水平结果：在 RAW264.7 小鼠巨噬细胞系中，PUN 能显著降低烟曲霉菌丝刺激引起的炎症因子 mRNA 表达升高及 ROS 生成增加（ $p < 0.001$ ）。

结论：Punicalagin 角膜给药对小鼠烟曲霉菌性角膜炎具有治疗作用，其机制具有多效性，包括通过细胞壁对真菌增殖和致病力的抑制作用、对细胞氧化应激因子和炎症因子的抑制作用。

摘要编号：209380

乳腺癌内分泌治疗患者干眼症临床特征与危险因素分析

第一作者：马雨花

共同作者：吕垚，张宸，张璐，潘俊杨，马楠

目的：探讨激素受体阳性乳腺癌（BC）患者在接受内分泌治疗（包括雌激素受体拮抗剂与芳香化酶抑制剂）后干眼（DE）的发生率、临床亚型及其危险因素，并通过泪液炎症因子分析明确 DE 的免疫分型，为临床针对性干预提供依据。

方法：采用横断面观察性研究，纳入 2015 年 12 月至 2023 年 12 月期间于我院接受内分泌治疗的 121 例 BC 患者。收集患者人口学资料，采用眼表疾病指数（OSDI）、睑板腺功能障碍-14（MGD-14）及眼表症状指数（IOSS）量表评估症状；使用眼表综合仪检测睑板腺缺失程度（MGL）及泪膜破裂时间（TBUT）；采用焦虑自评量表（SAS）和汉密尔顿焦虑量表（HAMA）评估心理状态。同时检测患者血脂及性激素水平，并对 DE 患者泪液进行细

胞因子分析。采用卡方检验、二元 logistic 回归及 Spearman 相关性分析进行统计学处理。

结果：1、DE 发生率为 66.16%（80/121），其中蒸发过强型占 58.75%（47/80），混合型 27.50%（22/80），水液缺乏型 13.75%（11/80）。2、单因素分析显示，仅 BMI 和内分泌治疗起始年龄与 DE 发生相关（ $P < 0.05$ ）。3、DE 组焦虑、抑郁及疼痛敏感性显著高于非 DE 组（ $P < 0.05$ ）。4、治疗起始年龄越小，DE 症状、焦虑抑郁程度越重，TBUT 越短，MGL 越严重（均 $P < 0.001$ ）。5、三种 DE 亚型泪液中 IL-4、IL-8、IL-13 水平存在显著差异（ $P < 0.05$ ）。

结论：接受内分泌治疗的乳腺癌患者 DE 发生率较高，且以蒸发过强型为主。DE 的发生与开始内分泌治疗的年龄密切相关，年龄越小，症状与体征越严重，心理负担也越重。不同 DE 亚型泪液炎症因子谱的差异提示可能存在特异性的免疫通路激活。因此，建议对年轻乳腺癌患者，在开始内分泌治疗初期即进行 DE 的早期筛查与干预，以提升其生活质量。

摘要编号：209127

人工角膜内皮膜片治疗大泡性角膜病变的临床观察

第一作者：Yan CHENG

目的：观察一种新型人工角膜内皮膜片（EndoArt）治疗因角膜移植术后内皮排斥所致角膜水肿的临床疗效。

方法：EndoArt®（EyeYon Medical, Israel）是一种眼内植入物，附着在角膜后表面，从而限制基质水合作用，减少角膜水肿。一项纳入 12 例患者的前瞻性、随机对照研究评估了 EndoArt® 的安全性和有效性。术中通过前房注气（10% C3F8）促进 EndoArt 膜片贴附于角膜后表面，利用缝线固定膜片防止其移位。观察术后最佳矫正视力（BCVA）、中央角膜厚度（CCT）、角膜透明度、植入物相关并发症等情况。

结果：收集西安市第一医院 2024 年 11 月至 2025 年 6 月的大泡性角膜病变患者 11 例，其中 2 例为人工晶体术后所致大泡性角膜病变，7 例为穿透角膜移植术后排斥所致角膜水肿，2 例既往青光眼手术病史。6 例患者接受了 EndoArt® 植入术，5 例患者使用角膜绷带镜作为对照组。术后 3 个月最佳矫正视力（BCVA）从 $1.62 \pm 0.32 \log\text{MAR}$ 提高到 $0.96 \pm 0.15 \log\text{MAR}$ （ $p < 0.05$ ）。术后 3 个月中央角膜厚度（CCT）从术前的 790 ± 76 微米降至随访时的 518 ± 36 微米。术后 3 眼因 EndoArt 膜片

未完全贴附进行了多次再注气复位；截至末次随访，6眼 EndoArt 膜片与角膜贴附良好。

结论：EndoArt 角膜内皮膜片在治疗多种因素导致的大泡性角膜病变方面表现出安全性和有效性，尤其在角膜移植术后排斥所致角膜水肿。EndoArt® 植入术减轻了水肿，并显著改善了视力，有望为角膜植片衰竭的患者提供持久的解决方案。

摘要编号：**210231**

低温粘弹剂致兔角膜内皮损伤的实验性研究

第一作者：Rong Yong **ZHANG**

共同作者：Zi Liang **CHEN**, Hui Ying **RAO**, Ying **XUE**, Xue Mei **ZHANG**

目的：探究低温状态下的粘弹剂对兔角膜内皮的损伤机制。

方法：取 12 只新西兰大白兔，24 眼，随机分为 A、B、C 三组，分别注入预置温度为 0°C、4°C 和 25°C (对照) 的粘弹剂，观察各组在注入前，后 24 小时及 1 周的角膜水肿情况、角膜内皮细胞计数、六边形细胞比率，术后 1 周角膜内皮活细胞率及内皮超微结构的变化进行统计学分析。

结果：A 组术后 24 小时角膜内皮计数和六边形细胞比率分别为 (803.13 ± 64.91) 个/ mm^2 ， $(36.0 \pm 1.51)\%$ ，术后 1 周 (1049.38 ± 27.55) 个/ mm^2 ， $(36.88 \pm 1.64)\%$ ，B 组术后 24 小时 (1314 ± 58.78) 个/ mm^2 ， $(45.25 \pm 2.71)\%$ ，术后 1 周 (2556.38 ± 44.88) 个/ mm^2 ， $(46.13 \pm 2.8)\%$ ，两组间及组内各时间点内皮计数差异均具有统计学意义 ($P < 0.05$)，六边形细胞比率组内差异无统计学意义。C 组各时间点差异无统计学意义。A 组内皮活细胞率 $(65.4 \pm 1.48)\%$ ，B 组 $(87.17 \pm 0.67)\%$ ，两组间差异具有统计学意义 ($P < 0.05$)。电镜下，A、B 两组内皮细胞变形，线粒体扩大呈空泡样，粗面内质网脱颗粒，核固缩。

结论：低温状态下的粘弹剂会对兔角膜内皮造成损伤。0°C 状态下的粘弹剂比 4°C 状态下的对角膜内皮损伤的程度更大。

摘要编号：**210192**

催产素通过抑制 NLRP3/caspases-1 / 白介素通路抑制干眼小鼠泪腺及眼表炎症浸润的机制研究

第一作者：Yiren **WANG**

共同作者：Xiaodan **JIANG**, Xuemin **LI**

目的：本研究旨在探究催产素 (oxytocin, OXT) 缓解干眼小鼠泪腺炎症浸润及相关眼表损伤的作用机制。

方法：本研究利用东莨菪碱 (scopolamine, SCOP) 腹腔注射构建干眼小鼠模型，并应用 OXT、OXT 受体拮抗剂 L-368,899 分组处理小鼠 ($n = 6-10$)，收集小鼠泪膜破裂时间 (breakup time, BUT)、Schirmer 试验、角膜荧光素染色评分数据，并进行苏木素-伊红染色 (Hematoxylin-Eosin staining, HE 染色)、免疫组化染色观察小鼠泪腺炎症浸润情况，使用 Western Blot、酶联免疫吸附反应、实时荧光定量 RNA 链式扩增反应技术测定小鼠泪腺、角膜组织中 NOD 样受体热蛋白结构域蛋白 3 (NOD-like receptor family pyrin domain containing 3, NLRP3)、核因子 κB (nuclear factor kappa-B, NF κB) 等炎症相关指标，利用转录组学技术探究 OXT 在抗炎作用中可能存在的信号通路，对 OXT 抑制泪腺炎症反应的机制进行探究。

结果：与对照组相比，SCOP 组小鼠 BUT、Schirmer 试验值均显著降低 ($t = 10.15$, $p < 0.0001$; $t = 3.22$, $p < 0.01$)、角膜荧光素染色评分显著升高 ($t = 13.17$, $p < 0.0001$)。Western Blot 结果显示，SCOP 可以诱导小鼠泪腺组织中 NLRP3 炎症小体剪切激活增加，诱导下游白介素-1 β (interleukin, IL) 表达增加。HE 染色及炎症细胞标志物免疫组化染色结果显示，SCOP 可以引起小鼠泪腺炎症浸润。酶联免疫吸附反应结果显示，SCOP 组小鼠表白介素等炎症因子表达水平升高。在使用 OXT 处理小鼠后，可以观察到小鼠 BUT、Schirmer 试验值显著升高，而角膜荧光素染色评分显著降低，且泪腺组织 HE 染色显示相比于 SCOP 组小鼠，OXT 处理组小鼠腺泡结构破坏减少，淋巴细胞浸润减少，炎症浸润评分降低。且 OXT 可以抑制 NLRP3 炎症小体的剪切激活。OXT 通过抑制炎症小体剪切激活下调 IL-1 β 水平，从而抑制丝裂原活化蛋白激酶 (mitogen-activated protein kinase, MAPK) 通路激活，降低 NF κB 表达水平，实现抑制泪腺炎症反应的作用。

结论：SCOP 可以有效诱导小鼠干眼表型。OXT 可能通过抑制 NLRP3 炎症小体剪切激活，下调 IL-1 β 水平，并进一步抑制 MAPK 信号通路的活化，抑制 NF κB 表达水平，减轻小鼠泪腺淋巴细胞浸润，改善小鼠角膜荧光素染色评分、促进泪液分泌，使得小鼠 BUT 及 Schirmer 试验值升高，从而缓解小鼠干眼。

摘要编号: 210194

催产素雾化通过减轻眼表炎症治疗干眼的有效性的临床研究

第一作者: Xiaodan JIANG

共同作者: Xuemin LI, Yiren WANG

目的: 本研究旨在探究催产素 (oxytocin, OXT) 雾化通过减轻眼表炎症浸润对干眼患者的治疗效果。

方法: 本研究招募 30 名 (共 60 只眼) 2024 年 12 月至 2025 年 2 月期间在北京大学第三医院医院诊断为干眼的患者。将患者随机分为 2 组, 每组各 15 人, 一组为生理盐水 (saline, SAL) 雾化组和 OXT 雾化组。在雾化进行前后收集患者一般人口学资料、OSDI 评分、泪膜破裂时间 (tear breakup time)、Schirmer 试验、角膜荧光素染色评分以及泪液炎症因子检测, 对比治疗前后这些指标的变化。

结果: 纳入 30 名 (共 60 只眼) 患者。雾化前, SAL 组患者的 OSDI 评分、BUT、Schirmer 试验以及角膜染色评分分别为 (22.33 ± 11.24 ; 4.03 ± 1.6 ; 11.27 ± 3.32 ; 1.17 ± 1.05), OXT 组患者的 OSDI 评分、BUT、Schirmer 试验以及角膜染色评分分别为 (25.72 ± 9.99 ; 4.60 ± 1.65 ; 10.80 ± 3.53 ; 1.17 ± 1.15), 两组之间无显著差异 ($p > 0.05$)。雾化治疗后, SAL 组患者和 OXT 组患者的 OSDI 评分分别为 16.81 ± 6.11 和 11.83 ± 3.40 , SAL 治疗后的 OSDI 与治疗前无显著差异, OXT 治疗后的 OSDI 显著低于治疗前 ($t = 4.59$, $p < 0.001$), 而 OXT 雾化组和 SAL 雾化组治疗后 OSDI 评分无显著差异; SAL 组患者和 OXT 组患者的 BUT 分别为 5.63 ± 2.08 和 7.13 ± 2.79 , SAL 治疗后的 BUT 显著高于治疗前 ($t = 6.78$, $p < 0.0001$), OXT 治疗后的 BUT 显著高于治疗前 ($t = 4.70$, $p < 0.0001$), 而且 OXT 治疗后的 BUT 显著高于 SAL 治疗后 ($t = 2.79$, $p < 0.05$); SAL 组患者和 OXT 组患者的 Schirmer 试验分别为 18.80 ± 4.22 和 23.10 ± 5.73 , SAL 治疗后的 Schirmer 试验显著高于治疗前 ($t = 2.97$, $p < 0.05$), OXT 治疗后的 Schirmer 试验显著高于治疗前 ($t = 11.06$, $p < 0.05$), 且 OXT 治疗后的 Schirmer 试验显著高于 SAL 治疗后 ($t = 3.87$, $p < 0.01$); SAL 组患者和 OXT 组患者的角膜染色评分分别为 0.43 ± 0.63 和 0.10 ± 0.31 , SAL 治疗后的角膜荧光素染色显著低于治疗前 ($t = 3.33$, $p < 0.01$), OXT 治疗后的角膜荧光素染色显著低于治疗前 ($t = 4.84$, $p < 0.0001$), 而 OXT 雾化组和 SAL 雾化组治疗后角膜荧光素染色评分无显著差异。SAL 治疗后的干扰素 γ 、白介素等浓度均显

著低于 SAL 治疗前 (p 均 < 0.05), OXT 治疗后干扰素 γ 、白介素等浓度均显著低于 OXT 治疗前 (p 均 < 0.05), 且 OXT 治疗后的干扰素 γ 、白介素等浓度均显著低于 SAL 治疗后 (p 均 < 0.05)。

结论: OXT 雾化可以减轻眼表炎症, 改善干眼患者体征, 达到对干眼的治疗作用。

摘要编号: 208075

儿童过敏性结膜炎与腺样体肥大的相关性及泪液总 IgE 的中介作用

第一作者: Ling ZHANG

共同作者: Yingying GAO, Chaobing ZHOU

目的: 探讨儿童过敏性结膜炎与腺样体肥大的相关性, 并分析泪液总 IgE 在二者间的潜在中介作用, 为临床医生在诊断和治疗过敏性结膜炎患儿时提供更全面的视角。

方法: 本研究采用横断面研究设计, 纳入 2023 年 9 月至 2024 年 8 月期间在福建医科大学附属第二医院眼科确诊为过敏性结膜炎的 3~12 岁患儿。所有研究对象在就诊时均接受详细的病史采集及临床症状体征评估, 症状评估包括眼痒、畏光、流泪、异物感及烧灼感等, 体征评估项目涵盖球结膜充血、睑结膜充血、睑结膜水肿、乳头及滤泡等。每例患儿采集 0.2 ml 泪液, 采用 Aifeice 测试法测定泪液中总 IgE 抗体浓度。同时, 所有患儿 2 周内均接受电子鼻咽喉镜检查, 以评估腺样体肥大的程度 [8]。采用 Spearman 相关性分析变量关联, 多因素回归分析腺样体肥大的影响因素, 进一步通过中介效应分析验证泪液总 IgE 的中介作用 (图 1)。

结果: 本研究共纳入 54 例过敏性结膜炎患儿, 根据过敏性结膜炎症状总评分为轻度组 ($n = 18$)、中度组 ($n = 24$) 和重度组 ($n = 12$)。总体平均年龄 7.6 ± 2.4 岁, 男性占 36%, 不同严重程度过敏性结膜炎患儿的基线人口学特征无显著差异 ($P > 0.05$)。随过敏性结膜炎严重程度增加, 泪液总 IgE 浓度显著升高 (轻度: 3.1 ± 3.9 IU/ml, 中度: 16.7 ± 18.6 IU/ml, 重度: 35.7 ± 33.3 IU/ml, $P < 0.001$), 腺样体肥大程度亦逐渐加重 ($P < 0.05$)。相关性分析显示, 过敏性结膜炎严重程度与泪液总 IgE ($r = 0.610$, $P < 0.001$)、腺样体肥大 ($r = 0.496$, $P < 0.001$) 均呈正相关, 且泪液总 IgE 与腺样体肥大的相关性更强 ($r = 0.643$, $P < 0.001$)。多因素回归提示, 泪液总 IgE (OR = 1.040, 95% CI: 1.006–1.075, $P < 0.05$) 和过敏性结膜炎症状总分 (OR = 1.153, 95% CI: 1.005–1.324, $P < 0.05$) 是腺样体肥大的独立影响因素。中介效应分析显示, 泪液总 IgE 在过敏性结膜炎严重程度与腺样体肥大

间存在部分中介效应，占总效应的 31.90% (95% CI: 0.048-0.306)。

结论：过敏性结膜炎严重程度与泪液总 IgE 水平、腺样体肥大程度均呈正相关，泪液总 IgE 可能通过介导局部过敏炎症反应，部分介导过敏性结膜炎患儿腺样体肥大的发生发展。这一发现为临床诊治提供了新视角，建议对中重度过敏性结膜炎患儿常规监测泪液总 IgE 及腺样体状况，以优化综合管理策略。

摘要编号：208913

全角膜缘移植联合角膜移植术治疗重度角膜缘干细胞缺乏症合并角膜混浊的疗效观察

第一作者：Yanling DONG

共同作者：Qianqian KONG

目的：评估同期进行的同一供体来源的全角膜缘移植联合角膜移植术治疗重度角膜缘干细胞缺乏症 (LSCD) 合并角膜混浊的临床疗效及安全性。

方法：一项前瞻性、单中心的队列研究。本研究纳入 2021 年至 2015 年青岛眼科医院收治的 10 例化学伤或爆炸伤患者的 10 只 LSCD 伴角膜混浊的患眼。同一手术者为 10 名患者施行了 360 度的环状全角膜缘移植联合角膜移植手术，术中角膜植片和全角膜缘植片来自同一供眼。术后给予局部他克莫司、局部和全身类固醇激素治疗。记录患者基本信息、病程、手术情况，术前术后最佳矫正视力 (BCVA)、眼内压 (IOP)、眼表评分 (OSS)，术后角膜移植上皮修复情况、持续性上皮缺损 (PED)、免疫排斥反应、继发性青光眼等并发症发生情况及移植存活率。

结果：10 例患者中男性 8 例，女性 2 例 (4:1)，右眼 6 例，左眼 4 例 (3:2)，年龄 54.00 ± 12.89 岁 (36-79 岁)，病史 21.60 ± 18.80 年 (0.5-50 年)，随访 25.80 ± 11.92 (12-50 月)；既往曾行角膜移植手术 7 例；本次行 PKP 联合全角膜缘移植 8 例，LKP 联合全角膜缘移植 2 例。所有患者手术过程顺利。最佳矫正视力 (BCVA) 从术前的 2.28 ± 0.51 logMAR 改善至术后的 0.45 ± 0.21 logMAR ($P < 0.05$)，眼表评分 (OSS) 从术前的 7.20 ± 1.03 分改善至术后的 0.20 ± 0.42 分 ($P > 0.001$)。术后并发症的发生率依次为持续性上皮缺损 (4/10)、排斥 (2/10)、继发性青光眼 (3/10)，均可通过常规临床治疗方法处理，术后 2 年的植片透明率为 100%，脱盲率为 90%。

结论：使用同一供体同期进行的全角膜缘移植联合角膜移植术能安全有效的改善重度角膜缘干细胞缺乏症 (LSCD) 合并角膜混浊患者的眼表情况和视力状态。

摘要编号：208728

单纯疱疹病毒性角膜基质炎新生血管组织的单细胞转录组测序分析

第一作者：Chunxiao YAN

共同作者：Lijun ZHANG

目的：通过单细胞转录组测序技术探索单纯疱疹病毒性角膜基质炎 (herpes stromal keratitis, HSK) 新生血管组织的转录特点并探索疾病的关键分子机制。

方法：筛选明确反复感染的 3 例 HSK 患者入组并排除其他病因导致的角膜新生血管；获取角膜深板层移植手术中的病灶角膜并制备单细胞悬液；单细胞样本质检合格后构建基因文库；通过 Illumina Nova-Seq 6000 对构建的文库进行测序；转录组学数据通过 Cell Ranger 软件进行分析。

结果：(1) HSK 主要由 4 种细胞类型构成，即角膜上皮细胞、成纤维细胞、单核吞噬细胞系统以及免疫 T 细胞，血管内皮细胞在成纤维细胞亚群细分被鉴定，角膜成纤维细胞的数量减少在组间存在统计学差异；(2) 角膜上皮细胞富集到磷酸化代谢、紧密连接以及炎症调节等功能，成纤维细胞富集到细胞外基质调节、细胞粘附、凋亡和增殖以及炎症调节等生物过程，单核吞噬细胞系统富集到代谢、吞噬、细胞因子调节以及炎症等生物过程，免疫 T 细胞富集到 T 细胞的激活、分化免疫过程，吞噬、细胞因子调节、粘附分子机制和细胞死亡、免疫炎症等生物过程；(3) 成纤维细胞通过机械分群方式鉴定了 7 个亚群，亚群 3 细胞的数量占比增加在组间有统计学差异，组间显著性表达的差异基因主要参与调节细胞外基质成分调节，包括编码胶原蛋白和基质金属蛋白酶的基因，促血管生成因子以及促炎因子相关基因；(4) 在角膜成纤维细胞中预测出特异性高的转录因子 CCAAT / 增强子结合蛋白 D 在 HSK 组中呈现低表达状态，且调控炎症和血管形成相关的基因关联强度高；(5) 角膜成纤维细胞亚群在 HSK 中参与细胞外基质调节、炎症反应、血管形成、损伤修复、肌成纤维细胞和增殖性纤维细胞的功能评分较高，其中亚群 3 细胞共同参与上述过程。

结论：获得了人源 HSK 发病的细胞及分子图谱，发现了角膜成纤维细胞在 HSK 中调节炎症、血管生成以及纤维化的多个差异基因及信号通路，以及调节上述功能的关键亚群细胞和特异性转录因子，多种细胞间细胞通讯的配受体对失调。

口唇黏膜移植在 Stevens-Johnson 综合征眼睑边缘角化症治疗中的应用研究

第一作者: Yan CHENG

目的: 探讨口唇黏膜移植术在 Stevens-Johnson 综合征 (SJS) 眼睑边缘角化症治疗中的临床疗效, 评估其对眼表微环境、炎症调控及视功能恢复的作用。

方法: 本研究为前瞻性队列研究, 纳入 20 例 SJS 相关眼睑边缘角化症患者, 随机分为试验组 (10 例, 行口唇黏膜移植术) 和对照组 (10 例, 接受局部糖皮质激素 + 人工泪液治疗)。两组均于术前及术后 6 个月进行以下评估: 1) 泪液功能 (泪膜破裂时间、Schirmer I 试验); 2) 结膜印迹细胞学分级 (Nelson 分级); 3) 最佳矫正视力 (BCVA, LogMAR); 4) 激光共焦显微镜定量分析 (角膜上皮细胞密度、朗格汉斯细胞计数、上皮神经纤维密度及分支形态); 5) 睑缘角化程度评分 (0-4 级); 6) 泪液炎症因子 (IL-6、TNF- α 、IL-1 β) 浓度检测 (ELISA 法)。采用协方差分析调整年龄、病程等混杂因素。

结果: 术后 6 个月, 试验组较对照组显著改善: 泪液功能: 泪膜破裂时间延长至 7.2 ± 1.5 秒 (对照组 3.8 ± 1.1 秒, $P < 0.001$), Schirmer I 试验值提升至 5.6 ± 2.3 mm (对照组 3.1 ± 1.8 mm, $P = 0.002$); 眼表修复: 结膜印迹细胞分级 I - II 级占比达 82.6% (对照组 35.5%, $P < 0.001$); 视功能: BCVA 提高 ≥ 2 行者占 71.0% (对照组 25.8%, $P = 0.001$), 平均 LogMAR 从 0.8 ± 0.3 降至 0.4 ± 0.2 (对照组 0.7 ± 0.3 至 0.6 ± 0.3 , $P = 0.003$); 角膜激光共焦显微镜检查: 上皮细胞密度增加至 4185 ± 385 cells/mm² (对照组 2954 ± 402 cells/mm², $P < 0.001$), 神经纤维密度恢复至 28.6 ± 5.2 mm/mm² (对照组 18.3 ± 4.7 mm/mm², $P = 0.004$), 且神经分支规则性评分 (3.2 ± 0.6 vs. 1.8 ± 0.5 , $P < 0.001$); 炎症调控: IL-6 (12.3 ± 3.1 pg/mL vs. 28.5 ± 5.6 pg/mL)、TNF- α (9.8 ± 2.4 pg/mL vs. 19.2 ± 4.3 pg/mL) 均显著降低 (均 $P < 0.001$); 睑缘角化: 评分从 3.5 ± 0.6 降至 1.2 ± 0.4 (对照组 3.4 ± 0.7 至 2.9 ± 0.6 , $P < 0.001$)。

结论: 口唇黏膜移植术通过重建睑缘屏障功能、促进角膜神经再生及抑制 IL-6/TNF- α 炎症级联反应, 显著改善 SJS 患者眼表稳态。早期手术干预可有效逆转眼角膜上皮损伤, 提升视力预后, 为重度眼睑角化症提供根治性治疗方案。

摘要编号: 206513

后弹力层角膜内皮移植术 (DMEK) 在虹膜角膜内皮综合征 (ICE 综合征) 中应用的系列研究

第一作者: Ting HUANG

共同作者: Xiaojuan DONG, Chen OUYANG, Jing WU

目的: 通过系列研究评估 DMEK 治疗 ICE 综合征的临床效果: 1. 对比 ICE 综合征与 Fuchs 内皮营养不良 (FED) 患者 DMEK 术后临床效果; 2. 观察通过改良 DMEK 技术, 降低 DMEK 术后角膜内皮细胞丢失率的疗效; 3. 观察针对合并青光眼引流管 (GDD) 患者, 进一步改良 DMEK 手术技术, 提高术后植片存活率的临床效果。

方法: 纳入 96 例 ICE 综合征患者, 分别进行以下研究: 研究 1: 24 例 ICE 综合征患者与 39 例 FED 患者 DMEK 术后疗效对比; 研究 2: 48 例 ICE 综合征患者随机分为完整剥除组 (去除全部受体眼 Descemet 膜及内皮细胞) 与标准组 (仅去除中央 8.0 或 8.25 mm 直径范围的 Descemet 膜及内皮细胞), 对比两组疗效; 研究 3: 24 例 ICE 综合征合并 GDD 患者行改良 DMEK (去除全部受体眼周边 Descemet 膜及内皮细胞的同时, 联合行虹膜前粘连分离术、修剪引流管、下方虹膜周切术或前房注入 C3F8) 术后疗效观察。观察指标: 最佳矫正视力 (CDVA)、内皮细胞丢失率 (ECL)、眼压 (IOP)、植片存活率及并发症。

结果: 研究 1: 术后 1 年 Kaplan-Meier 分析显示 ICE 综合征组与 FED 组植片存活率分别为 85.7% 与 100% ($P = 0.017$); 术后 12 个月内两组 CDVA 相当, 之后 FED 组优于 ICE 组 ($P < 0.001$); ICE 组 ECL 显著高于 FED 组 ($P < 0.001$); ICE 组中有 2 例 (8.3%) 前房角结构异常加重, 两组并发症发生率差异无统计学意义。研究 2: 术后 9 月, 完整剥除组 ECL 显著低于标准组; 术后 2 年, 完整剥除组与标准组 ECL 分别为 $66 \pm 5\%$ 与 $74 \pm 4\%$ (95% CI: $-0.04 \sim 0.01$; $P = 0.040$); 植片存活率分别为 83% 与 67% (95% CI: $-0.07 \sim 0.39$; $P = 0.318$); 两组 CDVA 及并发症差异无统计学意义。研究 3: ICE 综合征合并 GDD 患者行改良 DMEK 术后 CDVA 显著提高: 术后 1 年及 2 年分别有 10 例及 7 例 CDVA $\geq 20/32$; Kaplan-Meier 分析显示 1 年与 2 年植片存活率分别为 89% 与 67%, 对应 ECL 为 (59 ± 10) % 与 (71 ± 7) %。随访期内, 7 例 (29%) 出现 IOP 升高, 5 例 (21%) 发生周边前粘连进展。

结论: 1. DMEK 治疗 ICE 综合征难不难? DMEK 治疗 ICE 综合征的难度取决于患者的眼部条件, 对于不伴有严重眼前节异常、眼压正常且无青光眼手

术史的患者，DMEK 手术操作并不困难，且可获得与 FED 相似的术后视力效果。2. DMEK 治疗 ICE 综合征 疗效如何？不能根治的原因？虽然轻中度的 ICE 综合征患者行 DMEK 手术并不困难，但我们仍发现患者术后 ECL 高于 FED，ICE 综合征不能根治的原因考虑与其病理机制有关，DMEK 术后残留的 ICE 细胞异常增殖导致复发。3. 针对 ICE 综合征 的病理机制，是否有更佳的手术方案？改良 DMEK 技术通过去除受体全部 Descemet 膜及内皮细胞，可延缓 ICE 综合征 的病理进展，进而降低 DMEK 术后 ECL，延长植片存活率。4. 对于复杂病情（如合并 GDD），DMEK 的疗效如何？合并特殊技术改良（去除全部受体眼周边 Descemet 膜及内皮细胞的同时，联合行虹膜前粘连分离术、修剪引流管、下方虹膜周切术或前房注入 C3F8）的 DMEK 并未增加 ICE 综合征合并 GDD 眼的术后并发症风险，其临床效果与未合并 GDD 的 ICE 综合征者相当。

摘要编号：210114

圆锥角膜交联术后巩膜镜验配效果分享

第一作者：Jing ZHANG

目的：探讨圆锥角膜角膜交联术后，通过验配巩膜镜提升视觉质量的安全性及有效性。

方法：18 位圆锥角膜患者（26 只眼）进行角膜交联手术（包括去上皮角膜交联及角膜透镜植入联合交联）后验配巩膜镜，分别于配镜前，配镜后 3 个月，6 个月及 1 年分别检查裸眼视力，显然验光，角膜地形图，干眼分析及角膜内皮数量等。

结果：验配巩膜镜 1 年后所有患者裸眼视力变化与戴镜前比较（LogMAR 1.36 ± 0.46 VS 1.21 ± 0.48 ）无显著统计学差异（ $P = 0.48$ ），戴镜视力（LogMAR 0.097 ± 0.04 ）与戴镜前矫正视力（LogMAR 0.223 ± 0.15 ）比较明显提高（ $P < 0.02$ ）。戴镜后，角膜地形图相关参数如：平 K（ 47.26 ± 5.68 ）、陡 K（ 49.35 ± 4.91 ）及散光量（ 3.57 ± 1.73 ）与戴镜前（ 46.95 ± 6.72 ）（ 48.87 ± 5.12 ）（ 3.79 ± 2.21 ）比较无明显变化（ P 均 > 0.05 ）。角膜中央最薄点厚度（ 486.15 ± 25.87 ）um 与戴镜前（ 479.82 ± 32.61 ）um 相比，无显著性差异（ $P = 0.74$ ）。角膜内皮细胞计数（ 2984.39 ± 38.26 ）个/mm²与戴镜前（ 2876 ± 25.91 ）个/mm²比较无明显差异（ $P = 0.59$ ）。

结论：圆锥角膜交联手术后，验配巩膜镜可以明显提升视觉质量；同时验配巩膜镜后，角膜形态，角膜厚度，角膜内皮数量稳定。巩膜镜提升圆锥角膜角膜交联术后视觉质量是安全有效的。

摘要编号：209092

基于人工智能的角膜内皮疾病自动诊断系统

第一作者：Jing-hao QU

共同作者：Jing HONG

目的：利用人工智能建立角膜内皮疾病自动诊断系统。

方法：我们开发了一种自动检测多种常见角膜内皮疾病的系统，该系统基于一种增强型紧凑卷积变换器（ECCT）；具体而言，我们在标准自注意力模块中引入了一种跨头相对位置编码机制，以捕捉不同区域之间的上下文信息，并采用一种令牌注意力前馈网络，使系统更关注有价值的异常区域。

结果：2723 张角膜内皮疾病患者活体激光角膜共聚焦显微镜内皮图像来训练该系统。多中心图像验证的准确率为 89.53%，受试者工作特征曲线下面积（AUC）为 0.958（95% 置信区间：0.943–0.971）。

结论：该系统是全球首个基于人工智能的角膜内皮疾病诊断系统，用户可将图像上传至指定网站，系统自动给出诊断结果。

摘要编号：209236

基于探针捕获的靶向二代宏基因组测序技术在感染性角膜炎诊断中的应用价值研究

第一作者：蓝倩倩

共同作者：周舟，徐帆，李苑华，蒋莉，陈国庆，陈炳华，陈琦，黄慧，黄瑜俊

目的：评估 pc-tNGS 技术在感染性角膜炎病原体快速识别中的临床应用价值，并与传统微生物学方法进行比较。

方法：回顾性收集 2024 年 4 月至 2025 年 7 月在我院就诊的疑似感染性角膜炎患者 512 例，采集角膜刮片标本同时进行常规微生物培养和 pc-tNGS 分析，比较两种方法在病原体检出率、检测时间和指导临床治疗方面的差异。

结果：最终纳入研究的 512 例患者中，诊断明确的感染性角膜炎（细菌、真菌、病毒、棘阿米巴）的患者 476 例，pc-tNGS 的总体阳性率为 86.6%（412/476），显著高于传统培养方法的 60.1%（286/476）（ $P < 0.01$ ）。pc-tNGS 可在 24 ~ 48 小时内提供结果，而培养方法平均需要 3 ~ 7 天。特别是在抗生素使用后的患者群体中，pc-tNGS 的优势更为明显。真菌感染的检出率两种方法差异不显著，但在混合感染和非典型病原体感染的检测中，pc-tNGS 表现出明显优势。

结论：基于探针捕获的靶向二代宏基因组测序技术在感染性角膜炎病原体诊断中具有明显优势，尤其

体现在检出率高、诊断时间短、能识别混合感染和非典型病原体等方面。

摘要编号: 202506

基于新型非接触式荧光成像技术的干眼结膜杯状细胞影像评价研究

第一作者: Peng XIAO

共同作者: Zengyu DUAN, Zeyu MENG, Jin YUAN, Mengyun ZHOU

目的: 设计研发在体、非接触式结膜杯状细胞 (Conjunctival Goblet Cells, CGCs) 宽视场荧光显微成像系统 (Wildfield Fluorescence Microscopy, WFFM), 实现大视野、高分辨率 CGCs 特异性成像, 并探索干眼发生发展及转归的 CGCs 时空变化规律。

方法: 基于莫西沙星荧光标记, 集成中心波长为 405 nm 的发光二极管、电可调液态变焦透镜及高帧率 CMOS 相机构建 WFFM 成像系统, 设计全自动多焦点融合算法, 获取结膜曲面 CGCs 全聚焦影像。通过 0.2% 苯扎氯铵 (Benzalkonium Chloride, BAC) 诱导及 10% 和 5% 香烟烟雾提取物 (Cigarette Smoke Extract, CSE) 诱导干眼小鼠模型以探索 CGCs 的时空变化规律。同步行泪液酚红棉线测试评估泪液分泌量, 角膜荧光素钠和丽丝胺绿染色观察眼表损伤程度。在体 WFFM 成像联合 PAS 染色评估 CGCs 密度及细胞形态变化, 实时荧光定量聚合酶链反应和免疫荧光染色检测黏蛋白 (MUC1、MUC4、MUC5AC) 表达水平。

结果: WFFM 系统可实现 1 μm 细胞级高分辨率与 1.4 mm $\times$ 1.4 mm 成像视野, 成像速度约 30 帧/s。在体 WFFM 成像可清晰分辨单个细胞并量化, 重复性实验组内相关系数为 0.964。BAC 诱导干眼小鼠模型在第 3 天及第 7 天 GCD 和面积比显著下降 (均 $p < 0.001$), 停药 1 周后恢复至基线水平 (均 $p > 0.05$)。CSE 诱导干眼模型中, 与对照组相比, 10% CSE 处理组第 3 天角膜荧光素钠和丽丝胺绿染色评分明显升高 (均 $p < 0.001$), GCD 显著降低 ($p < 0.001$), 同时 CGCs 面积减小及边界模糊, 5% CSE 处理组 GCD 于第 3 天同步下降 ($p < 0.001$), 但角膜损伤延迟至第 7 天出现 (均 $p < 0.001$)。干预 7 天后 10% CSE 处理组 MUC5AC 表达水平下调 ($p < 0.01$), MUC1 表达上调 ($p < 0.001$), MUC4 表达未发生明显改变 ($p = 0.72$)。5% CSE 处理组各黏蛋白表达未发生明显改变 ($p = 0.07, 0.58, 0.08$)。泪液分泌量干预前后无显著改变 ($p > 0.05$)。

结论: 本研究成功构建了可实现在体非接触式、高分辨率 CGCs 成像系统, 并通过 BAC 与 CSE 诱导

干眼模型验证了 WFFM 在疾病状态下持续定量可视化监测 CGCs 损伤及修复变化的可行性, 为干眼等眼表疾病的机制研究与临床评估提供了创新型影像学工具。

摘要编号: 205775

大鼠角膜缘基质微环境细胞可支持大鼠口腔黏膜上皮细胞的生长并改变其生物学性状

第一作者: Duan CHAOYE

目的: 自体口腔黏膜上皮细胞移植 (Autologous cultivated oral mucosal epithelial transplantation, COMET) 是治疗角膜缘干细胞缺乏的重要方法, 但是 COMET 术后周边部角膜新生血管的出现阻碍了其广泛地应用于临床。本研究将同种异体角膜缘基质微环境细胞 (Limbal niche cells, LNCs) 代替传统的小鼠源性的 3T3 细胞作为滋养细胞来培养口腔黏膜上皮细胞, 从而降低口腔黏膜上皮细胞诱导新生血管生成的可能性。

方法: 将大鼠口腔黏膜上皮细胞与 LNCs 或 3T3 细胞共培养。对体外培养得到的口腔黏膜上皮细胞进行 H&E 染色及细胞免疫化学检测。通过 RT-qPCR 和 Western Blotting 分别在转录和翻译水平检测并比较各组口腔黏膜上皮细胞中血管生成相关因子的表达量。随后提取不同培养体系中上皮细胞培养基上清 (条件培养基) 对人脐静脉内皮细胞 (Human umbilical vein endothelial cells, HUVECs) 进行刺激, 通过检测接受了不同刺激的 HUVECs 的细胞活性及管腔形成情况, 进而再次比较不同培养体系所得到的口腔黏膜上皮细胞诱导新生血管产生的潜能。

结果: 无论选择 LNCs 还是 3T3 细胞作为滋养层, 均可成功地在体外扩增培养出口腔黏膜上皮细胞。细胞免疫化学结果显示体外扩增得到的各组口腔黏膜上皮细胞中 p63 α , ABCG2, Ki67 和 CK3 阳性细胞比例无明显差异。RT-qPCR 和 Western Blotting 结果分别从基因和蛋白水平证明, 与 3T3 组相比, LNC 组所得到的口腔黏膜上皮细胞表达较少的 bFGF 和较多的 PEDF 和 sFlt-1。此外, 与 3T3 组相比, LNC 组的口腔黏膜上皮细胞可降低 HUVECs 的细胞活性和形成管腔的能力。

结论: LNCs 可以代替 3T3 细胞作为体外扩增口腔黏膜上皮细胞的滋养细胞。以 LNCs 作为滋养细胞培养的口腔黏膜上皮细胞比传统方法培养的口腔黏膜上皮细胞具有较小的诱发新生血管的可能性。本研究为口腔黏膜上皮细胞培养体系的优化和 COMET 的更广泛的应用提供了实验基础。

摘要编号: 209328

巯基功能化角膜基质透镜负载左氧氟沙星与纳米银用于细菌性角膜溃疡的治疗

第一作者: Rao JING

共同作者: Zhou QIZHI

目的: 本研究旨在探讨经巯基功能化修饰的脱细胞角膜基质透镜 (DLs-SH) 负载纳米银 (Ag) 及左氧氟沙星 (Lev) 的能力, 评估其抗菌活性及对人角膜上皮细胞 (HCE) 的毒性, 为细菌性角膜溃疡的治疗提供新型药物递送系统。

方法: 采用小切口角膜基质透镜取出术获取的角膜基质透镜, 经脱细胞处理后, 利用 EDC/NHS 活化胶原羧基并进行巯基功能化修饰。分别制备负载纳米银 (DLs-SH@Ag)、负载左氧氟沙星 (DLs-SH@Lev) 及复合载药 (DLs-SH@Lev@Ag) 的透镜, 并以未修饰透镜负载纳米银 (DLs@Ag) 作为对照。通过扫描电镜 (SEM) 观察纳米银负载情况, 体外共培养评估其对耐甲氧西林金黄色葡萄球菌 (MRSA) 的抑菌效果, 并分析其与 HCE 共培养后的细胞毒性及生物相容性。

结果: SEM 显示 DLs-SH@Ag 组纳米银负载量显著高于对照组 (DLs@Ag)。抑菌实验结果显示, DLs@Ag、DLs-SH@Ag、DLs-SH@Lev 及 DLs-SH@Lev@Ag 对 MRSA 的抑菌率分别为 46.98%、64%、52.31% 及 99.99%, 组间差异具有统计学意义 ($P < 0.001$)。CCK8 和 Calcein-AM/PI 实验表明, DLs@Ag、DLs-SH@Ag 及 DLs-SH@Lev@Ag 与 HCE 共培养 24、48 及 72 小时后, 均未表现明显细胞毒性, 与阴性对照组相比无统计学差异 ($P > 0.05$)。

结论: 巯基功能化修饰可有效提高角膜基质透镜对纳米银的负载能力。复合载药系统 DLs-SH@Lev@Ag 具备优异的抗菌活性和良好的生物相容性, 在细菌性角膜溃疡的局部治疗中具有潜在应用前景。

摘要编号: 210283

干燥综合征患者白内障手术的临床结局及角膜并发症

第一作者: Xiaochen WANG

目的: 评估干燥综合征 (Sjögren's Syndrome, SS) 患者白内障手术后的临床结局及角膜并发症, 重点关注术前干眼严重程度的影响及术后非甾体抗炎药 (nonsteroidal anti-inflammatory drugs, NSAIDs) 的安全性。

方法: 本研究回顾性纳入 2020 年至 2025 年间于我院接受超声乳化白内障吸除术的 90 例 SS 患者 (共 129 眼); 依据《中国干眼诊断与治疗共识》, 根

据术前干眼严重程度将患者分为三组, 其中轻度组 45 眼、中度组 68 眼、重度组 16 眼。研究分析了患者的视觉结局、眼表症状 (干涩、上皮粗糙、丝状角膜炎、溃疡) 及并发症情况, 并记录轻度组与中度组患者术后非甾体抗炎药 (溴芬酸钠) 的使用情况。

结果: 术后所有组别的未矫正远视力 (uncorrected distance visual acuity, UDVA) 均显著改善 ($p < 0.05$)。但最终视觉结局与术前干眼严重程度密切相关, 重度组术后 1 个月的 UDVA (0.62 ± 0.31 LogMAR) 显著差于轻度组 (0.28 ± 0.35 LogMAR) 与中度组 (0.31 ± 0.26 LogMAR) ($p < 0.001$)。非甾体抗炎药的使用与中度组眼表疾病的显著加重相关: 该组患者眼部干涩比例从术前的 1.5% (68 眼中 1 眼) 升至术后的 17.6% (68 眼中 12 眼) ($p = 0.002$), 上皮粗糙比例从术前的 4.4% (68 眼中 3 眼) 升至术后的 14.7% (68 眼中 10 眼) ($p = 0.041$)。重度组患者术前已存在丝状角膜炎 (9 眼) 或角膜溃疡 (7 眼), 其中 25% (16 眼中 4 眼) 需接受额外手术干预 (睑缘缝合术、羊膜移植术), 31.3% (16 眼中 5 眼) 出现复发性丝状角膜炎, 需通过药物治疗控制。

结论: 干燥综合征患者的白内障手术需进行精细的围手术期管理。术前干眼严重程度是决定视觉恢复效果及术后角膜完整性的关键因素。由于局部使用非甾体抗炎药存在加重眼表损伤的风险, 应谨慎使用或避免用于干燥综合征患者。对于术前存在重度角膜病变的患者, 术前实现眼表稳定是预防致盲性并发症的关键。

摘要编号: 208992

微塑料在干眼发病机制中的相关性研究

第一作者: Jingyi WANG

共同作者: Ying JIE

目的: 探究不同年龄段人群泪液和睑脂中不同种类微塑料含量的差异及与各眼表参数间的相关性, 以及微塑料在干眼发病机制中潜在的作用。

方法: 纳入 45 名 20 至 80 周岁的干眼受试者, 将其分为 < 40 周岁、40-60 周岁、60-80 周岁三组, 每组 15 名受试者。所有受试者均完成 OSDI 问卷、Schirmer 试验、泪膜稳定性及睑板腺相关的一系列检查获得眼表相关参数后, 将其浸有泪液的 Schirmer 试纸条及挤压采集的睑脂进行激光红外成像 (LDIR) 以及电子扫描 (SEM), 以观察泪液及睑脂中微塑料的形态。同时, 使用热解-气相色谱-质谱法 (Py-GC-MS) 对泪液和睑脂中的微塑料进行定量分析, 并将其与眼表参数进行相关性

分析。此外，通过体内和体外模型验证不同浓度微塑料对眼表的损伤情况以及其中潜在的机制。

结果：在泪液中检测到五种 MPs，检测量由高到低依次为 PE、PVC、PS、PP、PC。年龄与 PE 和 PVC 含量呈线性关系，PE 和 PVC 浓度与泪液分泌量呈负相关（PE 为 $r = -0.728$ ， $P = 0.026$ ；PVC 为 $r = -0.723$ ， $P = 0.028$ ），PE 和 PVC 均与泪膜破裂时间呈负相关（PE 为 $r = -0.737$ ， $P = 0.023$ ；PVC 为 $r = -0.696$ ， $P = 0.037$ ）。在睑酯中检测到两种不同的 MPs，即 PE 和 PVC，其水平与睑板腺残余面积百分比呈正相关（PE 为 $r = 0.884$ ， $P = 0.002$ ；PVC 为 $r = 0.705$ ， $P = 0.034$ ）。此外，每单位残余睑板腺面积中 PE 的含量与脂质层厚度呈负相关（ $r = -0.761$ ， $P = 0.017$ ），每单位残余睑板腺面积中 PVC 的含量与部分眨眼率呈正相关（ $r = 0.716$ ， $P = 0.030$ ）。通过不同浓度微塑料处理小鼠眼表，发现泪液分泌量随 PE 暴露的浓度和时长增加而增加，且小鼠结膜处出现明显的病理角化和间质水肿，并伴有炎症变化；结膜组织 IFN- γ 表达水平显著升高；结膜上皮细胞凋亡也明显增加。同时使用不同浓度的微塑料对人角膜上皮细胞和人结膜上皮细胞进行处理，发现处理后的角膜上皮细胞的界模糊，出现明显的空泡化和核固缩，结膜上皮细胞密度显著降低，形状更小、更圆以及突触更小；处理后的两种细胞形态学改变及细胞活力下降的程度均与微塑料的浓度存在相关性。

结论：本研究首次在人体泪液和睑酯发现微塑料的存在，并对其诱导干眼发病的机制进行探索。

摘要编号：208862

新型抗菌肽滴眼液：一种潜在的真菌性角膜炎治疗候选药物

第一作者：Yang ZHAI

共同作者：Jing HONG, Rongmei PENG, Guoguo TANG

目的：探讨新型抗菌肽滴眼液在大鼠真菌性角膜炎模型中的治疗效果及其潜在作用机制，为真菌性角膜炎的临床治疗提供新的候选药物。

方法：建立大鼠真菌性角膜炎模型后，随机分为三组：对照组、Pep 治疗组和 FLU 阳性对照组。各组分别于造模后第 1、3、7、12 天进行裂隙灯观察，评估角膜混浊、溃疡及血管生成情况，并进行炎症临床评分。第 12 天取角膜组织进行组织研磨真菌培养、HE 染色观察组织病理学变化、免疫组化检测炎症因子表达，并对角膜组织进行转录组测序分析炎症及免疫相关基因的差异表达。

结果：Pep 组大鼠角膜混浊程度及炎症评分较对照组显著降低，炎症吸收及角膜透明度恢复优于 FLU 组。第 12 天菌落计数显示，Pep 组角膜组织内无

真菌残留。HE 染色结果显示 Pep 组角膜组织修复良好，炎性细胞浸润显著减轻。免疫组化显示 IL-6 表达在 Pep 组显著下调。转录组分析提示 Pep 可调控多条与炎症反应和免疫调节相关的信号通路。

结论：抗菌肽 Pep 滴眼液对真菌性角膜炎具有显著的治疗效果，能够有效抑制真菌性角膜炎的炎症反应，促进角膜组织修复。Pep 可能通过调控炎症因子及免疫相关基因表达发挥抗感染和促修复作用，具有成为真菌性角膜炎新型治疗药物的潜力。

摘要编号：209739

术后眼压升高对无青光眼病史患者 DMEK 术后角膜内皮植片的影响：一项队列研究

第一作者：Zijun XIE

共同作者：Jing HONG

目的：角膜后弹力层内皮移植术（DMEK）已成为主流的角膜移植方式。然而，在无青光眼病史的患者中，术后高血压对 DMEK 预后的影响尚不明确。本研究旨在研究术后眼压升高对无青光眼病史患者 DMEK 术后角膜内皮植片的影响。

方法：本研究为回顾性队列研究，纳入 2017 年 7 月至 2023 年 3 月期间在北京大学第三医院接受 DMEK 手术、无青光眼病史且随访时间超过 6 个月的患者。根据术后眼压（IOP）变化，将患者分为三组：A 组为术后眼压正常；B 组为术后早期眼压升高（术后 3 天内眼压 ≥ 30 mmHg 或较基线升高超过 10 mmHg）；C 组为术后中期眼压升高（术后 14 天后眼压 > 21 mmHg 或较基线升高超过 10 mmHg）。比较三组患者术后眼压、角膜内皮细胞密度（ECD）、中央角膜厚度（CCT）、最佳矫正视力（BCVA）及角膜移植失败率。

结果：共纳入 47 例患者（47 只眼），其中 37 只眼为大泡性角膜病变，10 只眼为 Fuchs 角膜内皮营养不良。A 组 25 只眼，B 组 6 只眼，C 组 16 只眼。B 组平均峰值眼压为 49.00 ± 4.99 mmHg，C 组为 31.89 ± 11.75 mmHg。术后 BCVA 较术前显著提高（ $P < 0.001$ ）。术后 3 个月，C 组 ECD 显著低于 A 组（ $P = 0.032$ ）。C 组中有 4 只眼发生角膜移植失败（ $P = 0.001$ ）。

结论：DMEK 术后中期眼压升高可能降低角膜内皮细胞密度，并在术后 6 个月内导致角膜移植失败；而术后早期眼压升高对预后无明显影响。因此，术后应密切监测眼压，尤其重视中期眼压管理，以保护角膜移植片。

摘要编号: 209941

机械拉伸对角膜细胞功能的影响及其与圆锥角膜发病机制的关联

第一作者: Mengyun ZHOU

共同作者: Zhongzhou LUO, Peng XIAO

目的: 圆锥角膜 (Keratoconus, KC) 是一种以角膜进行性变薄和前突为特征的退行性眼病, 其早期机制尚未明确。临床研究提示, 揉眼等慢性机械刺激是其重要危险因素, 机械应力在疾病发生发展中可能起关键作用。然而, 现有研究多基于二维细胞培养, 难以模拟角膜在生理环境下的动态应力反应。本研究旨在利用一种三维生理相关的离体模型, 结合新型影像技术, 实时、无标记、高分辨率地评估机械拉伸如何影响角膜各层的结构和功能。

方法: 本研究使用新鲜离体猪角膜, 利用可控灌注系统在维持角膜透明和营养供应的条件下, 施加不同机械拉伸强度 (0、10、15、20、30 mmHg) 和持续时间 (急性 30 分钟、持续 24 小时), 并结合双模态全视场光学相干断层成像技术 (Full-Field Optical Coherence Tomography, FFOCT), 实现对角膜结构与功能状态的实时、无标记、高分辨率监测。

结果: 持续 24 小时的机械拉伸导致角膜基底细胞密度随压力梯度增加而显著降低 ($p < 0.05$)。功能参数分析显示, 急性拉伸 (30 分钟) 引起上皮细胞内运动速率 (f_{mean}) 与运动幅值 (Amp) 显著下降 ($p < 0.001$)。相比之下, 持续拉伸 24 小时则诱导上皮细胞内运动速率显著升高 ($p < 0.001$), 而高强度拉伸条件下运动幅值仍显著下降 ($p < 0.05$)。此外, 结构成像结果显示, 在机械拉伸作用下, 角膜翼状细胞及基底细胞中均可观察到细胞核可见性增强和亮反射物质沉积等形态改变。

结论: 本研究中观察到的角膜结构性改变, 与临床圆锥角膜报告的影像特征相吻合。研究证实, 机械牵张能够诱导角膜上皮细胞产生类似于 KC 的病理特征响应。本研究为力学生物学因素在圆锥角膜早期病程中的作用提供了直接实验证据, 同时验证了全视场光学相干成像在圆锥角膜早期检测与机制研究中的应用潜力。

摘要编号: 209315

桑菊饮加味方治疗春季角结膜炎的临床疗效观察

第一作者: Luo YAN

共同作者: Chen CHENG, Chen MINGGUANG

目的: 观察基于中医整体辨证、以疏风清热、宣肺止痒为主要治则的桑菊饮加味方对“时复目痒” (春季角结膜炎, vernal keratoconjunctivitis, VKC) 的临床疗效及安全性。

方法: 将符合诊断标准的 5 ~ 12 岁春季角结膜炎患儿随机分为治疗组和对照组。治疗组 36 例, 采用中医辨证施治法则, 给予桑菊饮加味方水煎服, 早晚各 100 mL, 每日 1 剂; 对照组 30 例, 予 0.1% 盐酸奥洛他定滴眼液, 每日 2 次。以 7 天为 1 个疗程, 共治疗 2 个疗程。治疗结束后, 根据症状改善程度及体征变化评定疗效, 并观察不良反应。

结果: 治疗组总有效率为 91.66% (33/36), 对照组为 66.67% (20/30), 两组差异具有统计学意义 ($P < 0.05$)。治疗组患儿未见明显不良反应, 对照组有 1 例出现轻度眼刺痛及结膜充血反应, 停药后自行缓解。

结论: 基于中医“从肺肝论治”理论, 运用疏风清热、宣肺止痒法的桑菊饮加味方治疗春季角结膜炎, 临床疗效确切, 安全性良好。该方为中医药防治春季角结膜炎提供了新的循证依据和治疗思路, 值得进一步研究与推广。

炎症响应型聚合物纳米粒子重编程巨噬细胞治疗角膜碱烧伤

第一作者: Xianyan QIN

共同作者: Lingxi JIANG, Yi SHI, Xinyu WANG, Luhan ZHANG

目的: 本研究旨在解决角膜碱烧伤这一严重眼科急诊治疗中的难题。角膜碱烧伤具有进行性炎症、上皮再生受损和病理性新生血管形成等特点, 传统局部疗法受限于角膜前快速清除和有限的角膜穿透性。

方法: 通过地塞米松 (Dex) 与透明质酸 (HA) 经酸敏感胺键分子自组装, 开发了靶向巨噬细胞的聚合物纳米粒子 HDNPs。局部给药后, HA 介导的 CD44 受体识别使 PDNPs 能够选择性锚定到角膜基质中浸润的巨噬细胞上, 增强了眼表滞留和药物穿透。炎症部位的酸性微环境触发胺键裂解, 实现地塞米松的可控释放和炎症的精确调节。

结果：在小鼠碱损伤模型中，HDNPs 显著延长了眼表滞留时间，改善了角膜穿透性，提高了治疗效率并降低了给药频率。机制上，HDNPs 有效降低促炎细胞因子和趋化因子的表达，通过促进 M2 巨噬细胞抗炎表型转化来调节炎症微环境。治疗效果上，HDNPs 加速了角膜再上皮化，恢复了基质透明度，减轻了角膜水肿并抑制了新生血管形成，从而打破恶性循环，缓解角膜损伤。

结论：HDNPs 展现出优异的生物相容性和耐受性，有望作为一种新型治疗平台，应用于涉及炎症微环境调节的眼表疾病治疗。

摘要编号：209549

生物工程角膜行板层角膜移植术后植片角膜上皮厚度变化及相关因素分析

第一作者：He DONG

目的：探讨生物工程角膜行板层角膜移植术后植片角膜上皮厚度的动态变化，对比分析生物工程角膜与人供体角膜行板层角膜移植术后植片角膜上皮厚度的差异性，分析植片角膜上皮厚度与角膜透明度、新生血管植入和角膜刺激症状的相关性。

方法：选择 2020 年 9 月 -2022 年 6 月于我院行板层角膜移植术的病人 35 例（35 眼）进行前瞻性研究，非随机分为两组，即生物工程角膜组 20 例（20 眼），人供体角膜组 15 例（15 眼）。在术后 6 个月内观察并记录两组病人通过眼前节光学相干断层扫描测得的植片角膜上皮厚度及裂隙灯下观察到的角膜透明度、新生血管植入和角膜刺激症状，对记录的数据进行分析比较。采用 IBM SPSS 26.0 软件进行统计学分析，应用两因素重复测量方差分析对两组病人术后植片角膜上皮厚度进行总体分析、组间比较、组内比较；应用配对样本 t 检验将两组病人术后植片角膜上皮厚度分别与对侧眼（健眼）比较；应用 spearman 直线相关分析证实植片角膜上皮厚度与角膜透明度、新生血管植入和角膜刺激症状的相关性。结果均以 $P < 0.05$ 为差异具有统计学意义。

结果：1、植片角膜上皮厚度：组间比较（同一时间点下组间比较）、组内比较（组内各时间点比较）均存在统计学意义（ $P = 0.038$ 、 0.002 ， P 值均 < 0.05 ）。组间比较：仅术后 2 周生物工程角膜组植片角膜上皮厚度大于人供体角膜组（ $P < 0.001$ ），术后 1、3、6 个月两组植片角膜上皮厚度无统计学差异（ $P = 0.381$ 、 0.668 、 0.621 ， P 值均 > 0.05 ）。2、植片角膜上皮厚度的相关因素：植片角膜上皮厚度与角膜透明度、新生血管植入情况、角膜刺激症状均无相关性（ $P > 0.05$ ）。

结论：生物工程角膜可作为供体角膜的良好替代材料。

摘要编号：208107

用于干眼症治疗的负载环孢素的 ROS 响应型阳离子纳米颗粒研究

第一作者：Pingping WANG

共同作者：Xiaoe FAN

目的：为克服传统环孢素 A 制剂水溶性差、眼表清除快及非靶向释放等方面的局限性，本研究开发设计了一种活性氧（ROS）响应型阳离子纳米颗粒 CsA@P (MS-a-EG)，促进 CsA 的负载与靶向递送，为干眼症治疗提供了一种靶向性强、安全性高的新策略。

方法：我们系统评估了该制剂的理化性质，在体外试验中检测了其 ROS 清除能力及黏膜黏附特性。利用活体成像技术定量分析了其在小鼠眼表的滞留时间。最后，通过建立干眼症小鼠模型，结合 Schirmer 试验、角膜荧光素钠染色及组织病理学（H&E 染色）分析，综合评价其治疗效果，同时开展初步毒理学实验以评估其全身生物安全性。

结果：CsA@P (MS-a-EG) 纳米颗粒展现出高载药量（0.181%）、缓释特性（24 小时释放 42.3%）及强大的 ROS 清除能力（清除 47.5% H_2O_2 ）。该纳米颗粒通过眼表静电相互作用增强黏膜黏附，从而延长滞留时间（20 分钟时荧光强度保持 90.3%）。在干眼症小鼠模型中，CsA@P (MS-a-EG) 能恢复泪液分泌并改善泪膜稳定性。H&E 染色证实角膜上皮修复，厚度恢复正常。该纳米颗粒表现出优异的生物安全性，未观察到全身毒性。

结论：该双功能纳米颗粒药物通过整合 ROS 响应性药物释放、提高生物利用度及抗氧化活性，打破了氧化 - 炎症循环，为干眼症治疗提供了一种靶向性强、安全性高的新策略。

摘要编号：209819

移植物抗宿主病继发干眼的临床特征与预测模型：以血液病患者干眼及单纯干眼患者为对照的研究

第一作者：Yunxia LENG

共同作者：Danna CHEN, Zongyin GAO, Shitong HUANG, Ningfeng LI, Yanhua PANG

目的：移植物抗宿主病继发干眼症是移植物抗宿主病（Graft versus host disease, GVHD）中眼部 GVHD 的最常见表现，但缺乏特异性诊断标志，易与普通干眼混淆。本研究旨在系统比较 GVHD 继发干眼、血液病患者干眼及普通患者干眼的临床特

征，识别关键鉴别指标，并构建 GVHD 干眼的早期预测模型。

方法：采用横断面研究设计，纳入 GVHD 干眼（20 例／40 眼）、血液病干眼（16 例／32 眼）及普通干眼（20 例／40 眼）患者。收集全身资料及眼表参数，包括 OSDI 评分、泪河高度、泪膜破裂时间（FBUT）、角膜染色评分、睑板腺萎缩面积及结膜充血指数（CHI）等。采用方差分析与 Logistic 回归筛选独立影响因素，并绘制 ROC 曲线评估模型效能。

结果：GVHD 干眼组原发病以急性白血病为主（AML 8 例，ALL 7 例），HLA 半相合占 60%。GVHD 组与普通干眼组 OSDI 评分无显著差异，但 GVHD 组 FBUT 更短（ 4.03 ± 1.98 s vs 6.26 ± 1.56 s），角膜染色评分更高（ 4.68 ± 4.07 ， $P = 0.004$ ），下睑板腺丢失率更高（ 1.33 ± 0.76 ， $P < 0.001$ ），CHI 更高（ 1.15 ± 0.47 ， $P = 0.005$ ）。与血液病干眼组相比，GVHD 组上睑板腺萎缩面积率更大（ 1.33 ± 0.76 ， $P < 0.001$ ），球结膜及鼻侧睫状充血更显著（均 $P < 0.05$ ）。视觉质量参数显示 GVHD 组 SR 值更低（ 0.17 ± 0.06 ），OSI 值更高（ 2.74 ± 2.58 ）。多因素分析显示，泪河高度（OR = 0， $P = 0.013$ ）和上睑板腺萎缩面积率（OR = 0， $P = 0.013$ ）是 GVHD 干眼的独立影响因素。二者构建的预测模型 AUC 分别为 0.817（95% CI: 0.697–0.937）和 0.94（95% CI: 0.883–0.996）。

结论：GVHD 继发干眼在睑板腺萎缩、眼表炎症及角膜损伤方面均显著重于普通患者及血液病患者的干眼。基于泪河高度与上睑板腺萎缩面积率的预测模型具有良好的鉴别效能，可为 GVHD 干眼的早期识别与干预提供依据。

摘要编号：207615

粘脂贮积症 IV 型患者一例

第一作者：Xiaozhen LIU

共同作者：Liping YANG

目的：总结一例粘脂贮积症 IV 型患者的临床表型特征及分子遗传学诊断结果。

方法：对患者进行详细眼科检查；采集先证者及可获取亲属的外周血样本，提取基因组 DNA。使用遗传性眼病基因诊断芯片（HEDEP）进行初筛，并通过 Sanger 测序对候选致病变异进行验证及家系共分离分析。依据美国医学遗传学与基因组学学会（ACMG/AMP）标准与指南对变异进行致病性评估，确定致病基因及突变位点。

结果：患者为一名 9 岁的男性患儿，临床治疗显示其患有双眼角膜上皮营养不良、双眼视网膜色素

素变性及夜盲症。患儿父母为近亲结婚，父母未患病，基因检测患儿携带 MCOLN1 基因纯合变异 c.362C>T（p.Thr121Met），变异分别遗传自父母，患儿姐姐正常，不携带该突变。既往文献结果显示 MCOLN1 基因的致病变异可导致粘脂贮积症 IV 型，该病临床表型包括角膜混浊、视网膜变性、智力障碍及神经发育异常等，该突变 c.362C>T 已被报道可导致口下颌肌张力障碍与帕金森综合征，被判定为可能致病（likely pathogenic）。依据 ACMG 标准，该变异被判定为可能致病。

结论：本研究报告了一例临床表现复杂、初诊困难的粘脂贮积症 IV 型病例，其诊断得益于分子遗传学检测对 MCOLN1 基因致病性变异的鉴定，为该疾病的病因诊断、生育预防等奠定坚实基础。

摘要编号：204016

脱细胞角膜基质透镜的制备及作为药物缓释载体在真菌性角膜溃疡中的应用研究

第一作者：Qin WANG

共同作者：Qizhi ZHOU

目的：对飞秒激光小切口角膜基质透镜取出术（SMILE）所得透镜进行脱细胞处理后负载抗真菌药物—伏立康唑后的药物缓释情况进行研究。

方法：采用透射电子显微镜（TEM）、扫描电子显微镜（SEM）对脱细胞角膜基质透镜的肿胀程度、透光率、生物力学性能和稳定性进行测定和表征。将脱细胞透镜（DLs）浸泡在不同浓度的伏立康唑溶液中 24 h，测定药物释放浓度。

结果：脱细胞角膜基质透镜的溶胀率与未脱细胞比较无统计学意义（ $P > 0.05$ ），脱细胞角膜基质透镜的透光率在 555 nm 处的透光率大于 90%，与未脱细胞组角膜基质透镜具有相似的透光率且能保持稳定，其体外降解时间为 108–120 h，与未脱细胞组角膜基质透镜（96–108 h）相比类似，生物力学间比较无统计学意义（ $P > 0.05$ ），扫描电镜显示交联脱细胞角膜基质透镜的横截面能看到呈丝状的胶原纤维，表面可见胶原纤维呈网孔状构型，TEM 结果显示脱细胞角膜基质透镜胶原结构排列整齐且较完整，未见基质细胞存在。药物释放试验结果显示，伏立康唑浓度为 2 mg/mL 时，药物累积释放量最高，为（ 1.334 ± 0.400 ）mg/ml，随浸泡浓度的增加而增加。

结论：脱细胞能增加了透镜胶原纤维之间的空隙，增加载药量。脱细胞透镜可作抗真菌药物伏立康唑药物缓释载体。

角膜 OCTA 定量角膜新生血管分析与角膜移植排斥反应的相关性研究

第一作者: 李苑华

共同作者: 蓝倩倩, 徐帆, 黄慧, 陈琦, 周舟, 蒋莉

目的: 探讨利用光学相干断层扫描血管成像 (OCTA) 技术定量分析角膜新生血管参数与角膜移植排斥反应发生之间的相关性, 寻找可用于临床风险评估的定量指标与阈值。

方法: 采用回顾性队列研究设计, 收集 2024 年 6 月至 2024 年 12 月期间接受角膜移植手术的患者临床资料 28 例 (30 眼), 其中男性 13 例, 女性 15 例, 年龄 56 岁。术前均行角膜 OCTA 检查。根据术后是否发生排斥反应分为排斥组和非排斥组。定量测量角膜新生血管总面积、血管密度、血管长度等参数, 分析其与排斥反应发生的相关性, 并通过 ROC 曲线分析确定预测排斥反应的最佳截断值。

(评估患者每次就诊时候的视力、眼压、视网膜检影和屈光情况、眼前节光学相干断层扫描、荧光素染色、B 超、黄斑光学相关断层扫描)

结果: 排斥组术前角膜新生血管面积、血管密度均显著高于非排斥组 ($P < 0.05$)。角膜新生血管面积与排斥反应发生呈正相关 ($r = 0.652, P < 0.001$)。ROC 曲线分析显示, 当新生血管面积 $> 2.8 \text{ mm}^2$ 时, 预测排斥反应的敏感度为 78.5%, 特异度为 82.3% ($\text{AUC} = 0.856$)。

结论: 角膜 OCTA 可定量评估角膜新生血管, 术前新生血管面积 $> 2.8 \text{ mm}^2$ 可作为预测角膜移植排斥反应高风险的量化指标, 为临床早期预警和干预提供依据。

摘要编号: 209438

角膜水肿的治疗策略: 基于烟酰胺、疗效已验证的前房灌注剂

第一作者: Liwei HUANG

共同作者: Xiaomin LIU

目的: 目前, 角膜移植术是治疗角膜内皮功能障碍的主要手段, 但该手术依赖来源稀缺的供体; 而传统眼内灌注液则缺乏生物活性, 无法保护角膜内皮细胞 (CECs) 免受手术损伤。

方法: 烟酰胺功能化眼内灌注剂 采用 3 支 1 mL: 100 mg 的烟酰胺注射液 (广州白云山明兴制药, 单剂量无菌包装, 终端灭菌), 复方电解质眼内冲洗液 (沈阳兴齐眼药股份有限公司) 为符合《中国药典》眼科制剂标准的无菌制剂。所有配制操作均在 100 级生物安全柜内进行, 工作台面、容器及器械经 30 分钟紫外线照射后再用 75% 乙醇擦拭消

毒; 使用无菌注射器混合烟酰胺与电解质溶液, 避免非无菌接触。向 492 mL 复方电解质溶液中加入 300 mg 烟酰胺, 轻轻混匀后, 经 $0.22 \mu\text{m}$ 聚醚砜无菌膜过滤器过滤灭菌。此外, 通过鲎试验检测内毒素含量为 $0.310 \pm 0.015 \text{ EU/mL}$, 低于 USP/EP 规定的眼内用药 $< 0.5 \text{ EU/mL}$ 限值 (图 S5C)。最后将体积调整至 500 mL, 制备成 4.913 mM 烟酰胺眼内冲洗液, 其浓度根据烟酰胺分子量 (122.12 g/mol) 计算, 以确保最终浓度准确。结局指标 主要结局 首先需关注角膜内皮细胞密度 (ECD) 的变化。采用角膜内皮显微镜 (NSPC; 日本兵库县 Konan 公司) 检测角膜中央区 ECD。采用中心法, 手动选取中央区至少 50 个细胞进行分析, 因为自动测量可能不准确, 尤其是在术后早期。分别于术前及术后 1 天、7 天、1 个月、3 个月测量 ECD。角膜内皮细胞丢失率 (ECL 率) 计算公式为 “(术前角膜内皮细胞密度 - 术后相应时间点内皮细胞密度) / 术前角膜内皮细胞密度 $\times 100\%$ ”, 单位为百分比 (%)。为便于后续分析, 通过比较术前值与术后各时间点值计算 ECD 降低率。次要结局 次要结局包括: 术前及术后 1 天、7 天、1 个月、3 个月测量的最佳矫正视力 (BCVA)、角膜中央厚度 (CCT) 和眼压 (IOP); 仅术前测量的前房深度 (ACD)、晶状体厚度 (LT) 和眼轴长度 (AL); 术中指标包括有效超声时间 (EPT)、累积超声能量 (CDE)、手术间时间、平衡盐溶液 (BSS) 总用量以及皮质吸除的注吸时间。此外, 在术后相应时间点 (1 天、7 天、1 个月、3 个月) 进行裂隙灯照相, 以便进一步评估。

结果: 体外研究结果 体外研究表明, NAM-IPA 可通过以下机制提高角膜内皮细胞 (CEC) 的活性: 抑制活性氧 (ROS) 介导的氧化损伤; 恢复线粒体功能; 抑制肿瘤坏死因子 (TNF) 依赖性细胞凋亡。动物实验结果 在兔角膜内皮损伤模型中, NAM-IPA 展现出明确的治疗效果: 加速角膜厚度恢复, 帮助受损角膜回归正常形态; 维持角膜内皮细胞密度, 减少细胞丢失, 保护角膜内皮功能。随机临床试验结果 一项随机试验证实, 与对照组相比, NAM-IPA 组的角膜内皮细胞丢失率显著更低: NAM-IPA 组: 细胞丢失率为 $16.99 \pm 17.06\%$; 对照组: 细胞丢失率为 $34.24 \pm 19.02\%$; 安全性方面: 试验过程中未观察到与 NAM-IPA 相关的不良事件, 表明其在研究设定条件下具有良好的安全性。

结论: 这种生物活性液体剂可满足角膜内皮细胞 (CEC) 动态保护的需求, 为缓解角膜内皮功能障碍提供了一种具有潜力的非移植治疗策略。

摘要编号: 201383

调控交联程度的那他霉素缓释薄膜对真菌性角膜炎的治疗作用

第一作者: Cui LI

共同作者: Menghui CHI, Jing LI, Guiqiu ZHAO

目的: 真菌性角膜炎是一种致盲率高的感染性角膜疾病, 传统治疗方法如滴眼液因生物利用度低、滞留时间短而疗效有限。本研究旨在开发一种基于海藻酸钠 (SA) 和聚环氧乙烷 (PEO) 的载药眼用角膜接触镜, 通过调节乙醇 / 水交联比例优化那他霉素 (NATA) 的缓释性能, 并评估其治疗烟曲霉菌性角膜炎的效果。

方法: 采用钙离子交联法制备不同乙醇 / 水比例 (2:1、1:1、1:2、0:1) 的 SA-PEO-NATA 薄膜。通过力学性能测试、傅里叶变换红外光谱分析、扫描电子显微镜对薄膜进行表征; UV-Vis 光谱法测定药物释放曲线; 体外抑菌实验评估其对烟曲霉菌的抑制效果; CCK-8 法和 Draize 实验检测其细胞相容性与眼表安全性; 建立烟曲霉菌感染 C57BL/6 小鼠角膜炎模型, 用所制备的 SA-PEO-NATA 薄膜一天一次治疗, 使用裂隙灯摄影、临床评分、HE 染色和平板计数实验观察载药薄膜的治疗效果。

结果: 乙醇与水比例为 2:1 组载药薄膜具有最优的机械性能 (弹性模量 0.57 MPa) 和最佳药物释放速率 (9 小时释放 50%, 20 小时达 95.4%)。SA-PEO-NATA 薄膜能显著抑制烟曲霉菌丝生长和生物膜形成, 抑菌环直径大于单纯 NATA 对照组, 且在室温放置一个月后仍保持良好抑菌活性。体内外安全性实验表明薄膜无显著细胞毒性和眼表刺激性。在真菌性角膜炎小鼠模型中, 与单纯 NATA 治疗组相比, SA-PEO-NATA 治疗组在感染后第 5 天角膜水肿和混浊面积显著减轻, 真菌载量下降, 炎症细胞浸润减轻, 并显著降低细胞中 IL-6、TNF- α 和 MIP-2 的表达。

结论: SA-PEO-NATA 眼用载药薄膜具有良好的生物相容性、缓释性能和显著抗真菌、抗炎作用, 尤其以 2:1 乙醇 / 水交联组为最优。该载药体系可作为一种潜在的眼表给药策略, 用于延长那他霉素滞留时间、改善真菌性角膜炎的治疗效果。

摘要编号: 209810

调节性 T 细胞通过外泌体 CD47 维持角膜缘干细胞干性并促进损伤修复

第一作者: Chao WEI

共同作者: Shengqian DOU, Li MA, Weiyun SHI, Yaoyao YU, Qingjun ZHOU

目的: 探讨调节性 T 细胞 (Treg) 在维持角膜稳态及促进损伤修复中的作用与分子机制。

方法: 通过构建特异性清除 Treg 的小鼠模型, 并结合单细胞测序技术, 分析 Treg 对角膜上皮损伤修复 (CEWH) 及角膜缘干 / 祖细胞 (LSC) 功能的影响; 通过局部 Treg 外泌体 (Treg-Exo) 滴眼, 以及 Treg 特异性敲除 Rab27a 小鼠模型, 评估 Treg-Exo 在角膜损伤修复和 LSC 维持中的功能; 利用外泌体蛋白质组学, 并结合 Treg 特异性基因敲除模型, 探究 Treg 通过外泌体调控损伤修复与 LSC 的分子机制。最后, 在 AIRE 缺陷小鼠和糖尿病小鼠角膜损伤模型中, 评估局部应用 Treg-Exo 的治疗效果。

结果: 谱系特异性清除 Treg 模型及单细胞 RNA 测序结果显示, Treg 通过维持 LSC 静息状态与干性, 促进 CEWH。局部应用 Treg-Exo 实验及 Treg 特异性敲除 Rab27a 抑制外泌体分泌实验均证实, Treg-Exo 是促进 CEWH 的关键因素。蛋白质组学分析结果显示 CD47 为 Treg-Exo 的关键功能分子, Treg 特异性敲除 Cd47 或应用 CD47 缺陷的 Treg-Exo 均显著延迟 CEWH, 并导致 LSC 干性降低和过度增殖。反之, 局部应用 Treg-Exo 可有效逆转因 Treg 缺失导致的 CEWH 延迟, 并维持 LSC 干性。治疗实验表明, 局部应用 Treg-Exo 均显著促进 AIRE 缺陷小鼠和糖尿病小鼠的 CEWH, 并改善 LSC 功能。

结论: 上述发现揭示了 Treg 通过其分泌的细胞外囊泡促进 CEWH 并维持 LSC 功能的新机制, 为角膜损伤修复相关疾病治疗提供新的干预策略。

摘要编号: 210100

重组牛碱性成纤维细胞生长因子眼用凝胶联合人文关怀护理在白内障术后干眼症中的应用效果

第一作者: 薇杨

目的: 探讨重组牛碱性成纤维细胞生长因子眼用凝胶联合人文关怀护理在白内障术后干眼症患者中的应用效果。

方法: 选取 2023 年 12 月 -2024 年 12 月在我院接受治疗的 80 例 PCSD 患者作为研究对象, 在组间

性别、年龄、病程等基线资料均衡可比原则的基础上，按照随机数字表法分为对照组和观察组，每组40例。对照组给予人工泪液+人文关怀护理；观察组在对照组的基础上加用重组牛碱性成纤维细胞生长因子眼用凝胶。两组均持续治疗1个月。比较两组患者的临床疗效，治疗前后炎症因子〔白细胞介素（IL）-1、IL-6、眼表疾病指数评分（OSDI）、角膜荧光染色评分（CFS）及不良反应发生率。

结果：综合干预后，观察组患者总有效率为93.33%，高于对照组的73.33%，差异有统计学意义（ $P < 0.05$ ）。综合干预后，两组患者的IL-1、IL-6及OSDI、CFS评分均降低，但观察组患者各项指标水平均低于对照组，差异均有统计学意义（ $P < 0.05$ ）。两组患者不良反应发生率比较差异无统计学意义（ $P > 0.05$ ）。

结论：重组牛碱性成纤维细胞生长因子眼用凝胶联合人文关怀护理可以提高PCSD的临床疗效，减轻患者眼部炎症反应，促进角膜上皮恢复，且治疗安全性较好。

摘要编号：209008

青春期前肥胖男孩胰岛素样生长因子-1与眼表参数之间的关联

第一作者：Lixia YANG

目的：探讨肥胖青春期前男孩体内胰岛素样生长因子1（IGF-1）水平与眼表参数的相关性。

方法：选取30名肥胖青春期前男孩和30名同龄同性别的健康对照组，通过：（一）体格测量：身高，体重，BMI；（二）实验室检测：FT3，FT4，TSH，IGF-1，总胆固醇（TC）、高密度脂蛋白胆固醇（HDL-C）、低密度脂蛋白胆固醇（LDL-C）、甘油三酯（TG）、空腹血糖、尿酸、丙氨酸氨基转移酶（ALT）、尿素氮和肌酐；

（三）眼表评估：脂质层测试（LLT）、部分眨眼率（PBR）、下泪膜高度（TMH）以及首次非侵入性泪膜破裂时间（FNITBUT）、平均非侵入性泪膜破裂时间（MNITBUT）、Schirmer I泪膜测试（SIT）、客观散射指数（OSI）、平均客观散射指数（MOSI）以及睑板腺评分（meiboscore）。采用student's t检验进行组间比较或曼-惠特尼U检验进行统计分析，分类变量则通过卡方检验进行比较。IGF-1、BMISDS与眼表参数间的关联性通过皮尔逊相关分析或斯皮尔曼相关分析进行评估。为探究SIT作为因变量与其他指标的关联性，将采用多元线性回归分析，以确定SIT与IGF-1的关联是否独立于其他指标。此外，通过多变量逻辑回归分析，在调整其他代谢变量后，评估睑板腺评分与IGF-1的关联。在构建多元逻辑回归模型时，

为避免共线性问题，仅选用反映空腹血糖和胰岛素水平的HOMA-IR指标。统计学显著性以P值小于0.05为判定标准。

结果：肥胖组的IGF-1水平显著降低（ $P = 0.001$ ），Schirmer I泪液测试（SIT）值下降（ $P < 0.001$ ），而睑板腺评分（meiboscore）则高于对照组（ $P = 0.015$ ）。双变量分析表明，IGF-1与SIT呈正相关（ $r = 0.677$ ， $P < 0.001$ ），与睑板腺评分呈负相关（ $r = -0.487$ ， $P < 0.001$ ）。多元回归分析显示，IGF-1（ $P < 0.001$ ）和甘油三酯（ $P = 0.028$ ）对SIT具有独立影响。逻辑回归分析表明，IGF-1水平降低与睑板腺评分升高存在显著关联（OR 0.994，95%置信区间0.988-1.000； $P = 0.033$ ）。

结论：肥胖青春期前男孩的IGF-1水平降低，与SIT值下降和睑板腺评分升高存在独立关联，且不受肥胖程度及传统心血管风险因素影响。这提示，监测肥胖儿童的眼表参数可能为临床实践提供新的关注方向。

摘要编号：209346

飞秒激光辅助微创板层角膜移植术治疗轻中度及重度圆锥角膜的疗效对比

第一作者：李娜

目的：比较飞秒激光辅助微创板层角膜移植术（FL-MILK）治疗轻中度圆锥角膜（KC）和晚期KC的疗效。

方法：前瞻性病例系列研究。56例63只眼进行性KC患者接受FL-MILK治疗，分为第1组〔平均角膜曲率（Kmean） ≤ 53 D〕和第2组（Kmean > 53 D）。术前和术后24个月评价两组最佳角膜矫正视力（BSCVA）、Kmean、最大角膜曲率（Kmax）、中央前表面高度（ACE）、第一次压平时角膜硬度参数A1（SP-A1）和变形幅度（DA）。

结果：第1组的平均BSCVA从术前的 0.34 ± 0.13 logMAR改善至术后24个月的 0.25 ± 0.13 logMAR（ $F = 10.10$ ， $P < .0001$ ），第2组从 0.54 ± 0.31 logMAR提高至 0.40 ± 0.26 logMAR（ $F = 9.06$ ， $P = 0.0002$ ）。术后24个月，第2组的平均Kmax降低了10.9 D，平均Kmean降低了3.9 D；而第1组没有观察到显著变化。术后24个月，第1组的ACE从 19.2 ± 10.0 降至 5.2 ± 8.4 （ $F = 28.5$ ， $P < .0001$ ），第2组从 46.2 ± 16.3 至 19.1 ± 9.0 （ $F = 49.6$ ， $P < 0.0001$ ）；第1组中SP-A1从 53.8 ± 12.7 mmHg/mm升高至 95.9 ± 20.2 mmHg/mm（ $F = 70.0$ ， $P < 0.0001$ ），第2组从 38.6 ± 13.4 mmHg/mm升高至 89.3 ± 18.2 mmHg/mm（ $F = 96.9$ ， $P < 0.0001$ ）；第1组DA从 1.30 ± 0.14 mm降至 1.17 ± 0.13 mm（ F

= 14.0, $P < .0001$), 第 2 组从 1.40 ± 0.16 mm 降至 1.18 ± 0.10 mm ($F = 27.6$, $P < .0001$)。

结论: 术后 24 个月随访中, FL-MILK 可以控制轻中度和重度圆锥角膜的进展。较陡峭的角膜在 FL-MILK 后更容易变平。

摘要编号: **200656**

高血糖对泪膜和睑板腺功能障碍的影响: 一项横断面研究

第一作者: Bao Tong

目的: 血糖水平升高可能会破坏泪膜, 但是否会影响睑板腺功能尚未得知。本研究拟探讨高血糖分级与干眼 (DED) 之间的关系, 并分析其对泪膜和睑板腺的影响。

方法: 本项横断面研究于 2024 年 1 月至 8 月在赤峰朝聚眼科医院开展, 共纳入 56 名具有 DED 症状的受试者。使用非侵入性眼表分析仪测量泪河高度 (TMH)、非侵入性泪膜破裂时间 (FNIBUT、ANIBUT)、结膜充血评分和睑板腺萎缩情况 (U-LAMG、L-LAMG)。同时采集受试者空腹血糖水平, 并根据血糖水平将患者分为血糖 ≥ 7 mmol/L 和 < 7 mmol/L 两组。分析血糖水平与 DED 参数之间的关系。

结果: 56 名患者 (平均年龄 52.5 ± 18.0 岁) 中, 28 人 (50%) 血糖水平 ≥ 7 mmol/L, 28 人 (50%) 血糖水平 < 7 mmol/L。血糖升高的患者报告了更严重的 DED 症状 (眼表疾病指数 OSDI 评分, $p = 0.046$)。此外, 较高的血糖水平与显著较低的 TMH、FNIBUT、ANIBUT 和结膜充血评分相关 ($p < 0.05$)。相反, 血糖较低的患者 U-LAMG 和 L-LAMG 评分显著更低 ($p < 0.05$)。血糖水平与眼压 (IOP)、结膜充血评分、U-LAMG 和 L-LAMG 呈正相关 ($p < 0.05$), 而与 TMH、FNIBUT 和 ANIBUT 呈负相关 ($p < 0.05$), 但血糖水平与 OSDI 评分之间无显著相关性 ($p = 0.157$)。

结论: 血糖水平升高与 DED 的主观症状和客观体征均有相关性, 包括泪膜稳定性受损和睑板腺功能异常。研究结果提示, 高血糖可能促使 DED 和 MGD 的发生, 强调了在糖尿病患者中控制血糖对于预防眼表疾病的重要性。

0.01% 阿托品滴眼液对近视儿童黄斑血管密度和脉络膜厚度的影响

第一作者: Xintong LIANG

共同作者: Shi-ming LI, Ningli WANG, Shifei WEI

目的: 评估 0.01% 低浓度阿托品滴眼液对近视儿童黄斑血管密度 (MVD) 及脉络膜厚度 (CT) 的影响。

方法: 本研究采用平行组、安慰剂对照、随机双盲设计。共招募 40 名受试者 (80 只眼), 平均年龄 9.86 ± 1.73 岁 (男性 19 例, 女性 21 例), 按 1:1 比例随机分配至 0.01% ATR 组和安慰剂组。所有受试者接受每晚一次双眼 0.01% ATR 或安慰剂治疗, 持续六个月。通过光学相干断层扫描血管成像 (OCTA) 测量浅层和深层毛细血管丛的 MVD 及 CT 值, 扫描范围覆盖以黄斑中心凹为中心的 $6 \text{ mm} \times 6 \text{ mm}$ 区域。

结果: 经过 6 个月治疗后, 0.01% ATR 组的黄斑中心凹下平均 CT 值明显高于安慰剂组 ($258.33 \pm 38.73 \mu\text{m}$ vs $238.71 \pm 48.13 \mu\text{m}$, $P = 0.041$)。此外, ATR 组在黄斑中心下方 (I1 和 I3)、上方 (S1 和 S3)、颞侧 (T1 和 T2) 以及鼻侧 (N1 和 N2) 的 1.5 mm 和 3 mm 处 CT 值均显著高于安慰剂组 ($P < 0.05$)。并且, 0.01% ATR 组在黄斑区下方浅层毛细血管丛 (SCP) 区域的平均 MVD 也明显大于安慰剂组 ($50.95 \pm 2.46\%$ vs $49.70 \pm 2.74\%$, $P < 0.05$)。

结论: 经过 6 个月的治疗后, 0.01% ATR 组的黄斑区 SCP 血管密度和 CT 值显著大于安慰剂组。

摘要编号: **209628**

12 度进阶正向离焦镜片在儿童青少年近视防控中的真实世界研究

第一作者: Jifeng YU

目的: 评估 12 度进阶正向离焦镜片在儿童青少年近视中的疗效分析。

方法: 本研究为一项回顾性、真实世界队列研究。连续纳入 200 名接受近视防控镜片治疗的儿童青少年患者, 其中 12 度进阶正向离焦镜片组与 DIMS 镜片各 100 名 (对照组)。收集并分析所有受试者右眼在基线、3、6、9 及 12 个月时的球镜度数与眼轴长度数据。采用非参数检验进行组间及亚组比较。

结果: 经过 12 个月随访, 主要结果如下: 球镜控制: 12 度进阶正向离焦镜片组球镜变化中位数为 0

(-0.25, 0), 优于 DIMS 镜片组的 -0.25 (-0.5, 0) ($P = 0.046$), 显示出延缓近视发展的趋势。关键亚组分析: 性别: 在男性患者中, 12 度镜片的优势在 6 个月 ($P = 0.015$)、9 个月 ($P = 0.034$) 和 12 个月 ($P = 0.005$) 均持续存在且愈发显著。屈光度: 在初始近视度数 ≤ -3.00 D 的患者中, 12 个月时 12 度镜片组表现出显著更优的防控效果 ($P = 0.014$)。年龄: 在 ≤ 12 岁的组别中, 12 度镜片在 6 个月 ($P = 0.028$) 和 12 个月 ($P = 0.049$) 时均优于 DIMS 镜片。眼轴控制: 两组在全人群的右眼眼轴长度增长上无显著差异 (12 个月时 $P = 0.620$)。然而, 在初始眼轴 < 25 mm 的患者中, 12 度镜片在 6 个月时显示出优于 DIMS 镜片的趋势 ($P = 0.083$)。

结论: 12 度进阶正向离焦镜片在近视屈光度进展方面表现出优于 DIMS 镜片的整体疗效, 尤其在男性、中度近视及较低龄患者中优势显著。可为儿童青少年近视防控提供一种更具优势的临床选择。

摘要编号: 208963

一种新型轴向长度测量方法的初步探索

第一作者: Zhiwei LUO

共同作者: Xiaoning LI, Guangyao RAN, Zhikuan YANG

目的: 脉络膜厚度的变化会影响眼轴长度 (AL) 测量的准确性。我们的研究团队创建了一种新的测量模型, 称为真实眼轴长度 (RAL), 该模型将角膜顶点到脉络膜后表面的距离整合为一个指标, 从而减少了脉络膜变化对眼轴长度测量的影响。RAL 模型采用扫频源光学相干断层扫描血管造影 (SS-OCTA) 技术 (SVision Imaging, VG200D) 对来自中国湖南省不同年龄段的 5 至 17 岁个体的眼轴长度进行评估。

方法: 本研究使用 VG200D 和 IOL Master700 测量眼轴长度、中央角膜厚度、中央前房深度和晶状体厚度。采用组内相关系数 (ICC) 和 Bland-Altman 分析来评估设备的一致性。在比较设备一致性之后, 使用 VG200D 分析不同年龄段的 RAL 和脉络膜厚度。

结果: 共纳入 1916 名受试者 (968 名男性, 948 名女性), 年龄在 5 至 17 岁之间。使用 VG200D 和 Master 700 测量的 3832 只眼的平均眼轴长度 (AL) 分别为 23.62 ± 1.11 毫米和 23.58 ± 1.10 毫米, 显示出良好的一致性 ($ICC = 0.883$)。平均视网膜轴长 (RAL) 为 24.13 ± 1.09 毫米, 比 VG200D 测量的 AL 约长 0.51 毫米。RAL 与 AL 之间的差异随着年龄的增长呈下降趋势, 且这种趋势与年龄显著相关 (Pearson r with $p < 0.05$)。RAL 随年龄显著增加, 但年龄与性别之间无交互

作用 (双向方差分析: $F_{age} = 168.6$, $p < 0.0001$, $F_{gender} = 156.3$, $p < 0.0001$, $F_{interaction} = 1.606$, $p \leq 0.0826$ for RAL)。而中央角膜厚度 (CT) 随年龄显著变薄, 且年龄与性别之间存在交互作用 (双向方差分析: $F_{age} = 15.62$, $p < 0.0001$, $F_{gender} = 6.311$, $p = 0.0120$, $F_{interaction} = 3.070$, $p \leq 0.0002$)。

结论: VG200D 和 Master 700 测量的眼轴长度相似。RAL 比 AL 约长 0.49–0.56 毫米, 且男性的 RAL 大于女性。CT 的变化可能显著影响 RAL。RAL 可能是监测眼睛发育的新方法, 但还需要更多研究来比较 RAL 和 AL 在近视预防和控制措施后的有效性。

摘要编号: 209215

三种特殊设计近视控制框架眼镜对散光的影响

第一作者: Ke WEN

共同作者: Pauline CHO, Longqian LIU, Bi YANG

目的: 本研究旨在探究在日常诊疗中特殊设计的近视控制框架是否对散光有影响。

方法: 研究采用回顾性设计, 连续地从四川大学华西医院收集了 74 名门诊就诊者 (年龄: 6–12 岁) 的资料, 其中 23 名使用镜片 A (MyoVision), 22 名使用镜片 B (DIMS), 29 名使用镜片 C (Stellest)。收集的资料包含每位就诊者的基线年龄、性别、基线和戴镜 2 年的配镜处方。配镜处方的散光是依据睫状肌麻痹下客观验光和主观验光结果所给, 并在分析时进行矢量分解为 J0 和 J45。

结果: 分别戴镜镜片 A、B、C 两年后, 总的眼部散光增长为 -0.41 ± 0.29 D、 -0.42 ± 0.34 D 和 -0.41 ± 0.31 D ($p < 0.001$), J0 增长为 0.19 ± 0.15 D、 0.19 ± 0.18 D 和 0.20 ± 0.16 D ($p < 0.001$)。J45 在配戴镜片 A、C 前后仍保持不变 ($p = 0.117$ 、 0.211), 在配戴镜片 B 后有所减少 ($p = 0.024$), 但减少量 (-0.07 ± 0.14 D) 并没有临床意义。三种镜片相比, 其总散光、J0、J45 的改变量均相同 ($p = 0.985$ 、 0.973 、 0.316)。多元线性回归分析发现散光改变量仅与等效球镜度的改变有关 ($\beta = 0.308$, $p = 0.006$)。

结论: 使用特殊设计近视控制框架 2 年可引起散光轻度增加, 但增加量 (< 0.25 D) 并没有临床意义。散光的增加与镜片类型无关, 但与近视进展有关。

摘要编号: 209015

不同屈光度人群晶状体悬韧带松弛度的研究

第一作者: Ruowu LIU

目的: 探讨不同屈光状态晶状体悬韧带松弛度的差异。

方法: 纳入 2022 年 6 月-2023 年 1 月就诊于我院眼科的成年近视患者 67 人 (共 130 例眼), 分为 4 组, 包括正视组 24 例眼、低度近视组 ($-0.5\text{D} \sim -3.0\text{D}$) 36 例眼, 中度近视组 ($-3.00\text{D} \sim -6.0\text{D}$) 36 例眼, 高度近视组 ($> -6.0\text{D}$) 34 例眼。所有研究对象均行相关病史采集, 记录基本信息并接受眼科相关检查, 包括视力、眼压、电脑验光、IOL-Master 500 测量、光学相干断层扫描 (optical coherence tomography, OCT)、最佳矫正视力 (best-corrected visual acuity, BCVA)、超声生物显微镜 (ultrasound biomicroscopy, UBM) 及裂隙灯下眼底检查。对 UBM 检查下晶状体悬韧带无异常的每位入组人员分别测量坐位及卧位下 A 超前房深度 (anterior chamber depth, ACD) 及眼轴长度 (eye axial length, AL)。将不同体位下 ACD 差值记为晶状体活动度 (range of lens motion, RLM), 比较各组间眼部生物学参数及 RLM 差异, 评估不同屈光度组间晶状体悬韧带松弛度差异。

结果: 四组受试者性别、年龄、眼压 (IOP) 差异均无统计学意义 ($P = 0.237$, $P = 0.600$, $P = 0.565$)。卧位 A 超测得低度、重度、重度近视组 ACD 与 AL 呈正相关 ($P < 0.01$, $r = 0.709$; $P = 0.013$, $r = 0.560$; $P = 0.014$, $r = 0.417$); 坐位 A 超测得低度、重度、重度近视组 ACD 与 AL 呈正相关 ($P < 0.01$, $r = 0.747$; $P = 0.013$, $r = 0.559$; $P = 0.017$, $r = 0.405$)。正视组中各种方法测得 ACD 与 AL 间无统计学相关性 ($P > 0.05$)。正视、低度、中度、重度近视组 RLM 均值分别为 $0.053 \pm 0.041\text{mm}$ 、 $0.079 \pm 0.05\text{mm}$ 、 $0.084 \pm 0.044\text{mm}$ 、 $0.112 \pm 0.063\text{mm}$, 差异有统计学意义 ($P < 0.05$)。正视组与高度近视 RLM 组间差异有统计学意义 ($P = 0.018$, $P < 0.05$), 其余各组间两两比较均无统计学意义。散瞳后高度近视组和正视组 ACD 显著加深, 差异具有统计学意义, 组间比较 ACD 变化无统计学差异。散瞳前后高度近视组和正视组 AL 变化无统计学差异。散瞳后高度近视组 RLM ($0.118 \pm 0.075\text{mm}$) 较正视组 ($0.064 \pm 0.059\text{mm}$) 增大, 差异有统计学意义 ($P = 0.032$, $P > 0.05$)。

结论: 1. AL 与 ACD 增加呈正相关, 但不同屈光度组别相关系数具有差异性; 2. RLM 在高度近视组均值最大, 与正视组相比结果具有统计学差异, 高度近视患者组晶状体悬韧带松弛度最大; 3. 眼部 A

超测量不同体位下 ACD 变化对评估轻微晶状体悬韧带松弛度具有参考价值。

摘要编号: 209440

中国青年近视者视盘周围视网膜神经纤维层颞侧增厚的方向性特征

第一作者: Wenzai AN

共同作者: Yunyun SUN, Ningli WANG, Shifei WEI, Fengju ZHANG

目的: 本研究旨在研究中国年轻人群中视盘周围视网膜神经纤维层 (RNFL) 厚度在不同细分方向上的分布情况, 并探讨近视对各方向 RNFL 厚度的影响。

方法: 本研究为横断面研究, 纳入安阳大学生眼病研究 (Anyang University Students Eye Study, AUSES) 中无眼部疾病但可能存在屈光不正的中国青年人。所有受试者均接受盐酸环喷托酯滴眼液睫状肌麻痹后屈光度检查、眼轴长度测量及视盘周围 RNFL 的光学相干断层扫描 (OCT) 检查。测量不同方向分类情况下 (视盘周围 4、8、16 个方向) 的 RNFL 厚度, 探索不同屈光度分组下不同方向分类的 RNFL 厚度变化, 应用平滑曲线拟合分析其与屈光不正的关系。

结果: 共纳入 4356 名受试者, 平均年龄 20.11 ± 1.55 岁, 其中男性 1059 名 (24.31%), 女性 3297 名 (75.69%)。平均视盘周围 RNFL 厚度为 $100.01 \pm 8.48\text{ }\mu\text{m}$, 呈近似正态分布, 平均 RNFL 厚度随着近视漂移逐渐变薄, 但是在不同方向上这种趋势出现分化。在视盘周围分成 4 个方向进行 RNFL 厚度比较时, 中度和高度近视组的颞侧 RNFL 厚度显著高于正视组; 在 8 个方向的分类中, 颞上和颞下方向上有相似的变化; 在 16 个方向的分类中, 随着近视程度加重, 颞侧上下 $22.5^\circ \sim 45^\circ$ 方向 (颞上 $22.5^\circ \sim 45^\circ$ 范围内的 TU2 和颞下 $22.5^\circ \sim 45^\circ$ 范围内的 TL2) 的 RNFL 厚度增加。在调整眼轴长度、性别、年龄、前房深度及 BMI 后, 平滑曲线拟合发现颞侧 RNFL 厚度随近视加深而更厚; 在 16 方向分区的 TU2 与 TL2 厚度增厚显著。以眼轴长度为近视参数探究 RNFL 变化时, 颞侧方向随着眼轴伸长而增厚同样在 TU2 和 TL2 显著。

结论: 本研究报道了青年人视盘周围 RNFL 厚度在多个方向分区下的分布数据。随着近视程度增加, 颞侧 RNFL 增厚现象为区分近视相关的 RNFL 改变与青光眼视神经损伤提供了有价值的指标, 尤其在颞侧上下 $22.5^\circ \sim 45^\circ$ 的 TU2 和 TL2 方向上的变化更具特征性。

摘要编号: 208780

从被动筛查到协同智能治理儿童视力健康管理模式优化探索

第一作者: Qiqiao ZENG

共同作者: Qiongyuan CAO, Jiaxuan HUANG, Junyin LIN, Liping XIONG

目的: 在儿童青少年近视防控进入主动健康阶段的背景下, 传统以学校视力普查为中心的管理模式缺乏持续干预与行为反馈机制, 家长、社区与学校之间缺乏路径协同, 导致“查完即止”的断点式管理。本研究旨在构建具有持续反馈能力的协同智能治理模型, 推动儿童视力健康从单次筛查向闭环管理体系转型。

方法: 本研究以协同治理理论和健康行为激活模型为框架, 采用“找堵点 – 拆路径 – 小范围试运行”三步构建策略。在需求识别阶段, 邀请学校卫生教师、社区护士和家长代表进行半结构化访谈, 提取导致家长不行动、信息不响应、随访未接续的关键断点样本。在路径重构阶段, 依托“行为触发机制”, 将筛查、消息推送、家长反馈、健康宣教与社区复核等环节拆分为可执行指令节点, 形成“触发源 – 责任主体 – 反馈形式”三维流程矩阵, 并为护理团队设置“路径协调与执行黏性提升”角色定位。试运行阶段由护理团队主导小范围快速迭代, 每两周进行路径复盘会议, 根据用户响应情况调整消息频率、语言形式与节点顺序, 逐步固化为视力健康管理标准化操作流程 (Standard Operating Procedure, SOP)。

结果: 协同智能治理模型使“筛查 – 反馈 – 随访 – 再干预”形成连续闭环, 学校健康教育与社区干预不再分割运行, 护理团队从传统的执行者角色转向路径治理组织者, 显著提升健康管理链条协调性。在实践中, 家长响应行为由被动确认转向主动反馈, 医疗卫生信息与校园健康系统之间建立有效接口, 干预动作的连续性与执行黏性提升明显, 形成“信息可追踪、行为可响应、责任可定位”的治理结构。

结论: 该模式通过构建多点联动、可回溯的儿童视力健康治理路径, 实现了从“结果通知型管理”向“行为激活型治理”的转变, 体现了护理在公共健康治理中的系统整合能力。研究形成的路径设计方法和 SOP 框架具有可推广性, 可为地区性儿童视力健康管理体系优化提供理论支撑与实践范式。

摘要编号: 204660

低度近视角膜塑形镜治疗的影响因素及管理策略

第一作者: Yuzhuo FAN

目的: 本研究旨在探讨影响角膜塑形镜 (Ortho-K) 对低度近视治疗效果的关键人口学、生物计量学及行为因素, 并为接受 Ortho-K 治疗的低度近视患者提供管理思路。

方法: 一项为期 12 个月的回顾性研究对 380 名接受 Ortho-K 治疗的患者进行了分析。通过分层分析和多项逻辑回归, 识别了与低度近视患者 Ortho-K 治疗效果相关的生物特征和行为指标。

结果: 低度近视组 12 个月的眼轴增长显著长于中度近视组 ($P < 0.0001$)。多变量逻辑回归分析显示, 在低度近视患者中, 单纯使用 Ortho-K 治疗的患者发生快速眼轴增长的风险是联合使用 0.01% 阿托品患者的 2.23 倍 ($P = 0.01$; 优势比 [OR] = 2.23; 95% 置信区间 [CI], 1.19–4.20)。多项逻辑回归分析表明, 在低度近视患者中, 女性 ($P < 0.0001$; OR = 0.4; 95% 置信区间 [CI], 0.22–0.72)、年龄较小 ($P = 0.01$; OR = 0.79; 95% 置信区间 [CI], 0.66–0.93)、较平坦的平均角膜曲率 ($P = 0.004$; OR = 0.74; 95% 置信区间 [CI], 0.61–0.91) 以及父母双方均近视 ($P = 0.03$; OR = 0.18; 95% 置信区间 [CI], 0.05–0.71) 与较差的治疗效果相关。而富含白肉 (如鱼类和鸭肉) 的饮食 ($P = 0.01$; OR = 0.06; 95% 置信区间 [CI], 0.01–0.54) 是保护性行为因素, 与低度近视儿童眼轴增长减缓相关。

结论: 具有一个或多个人口学和生物计量学风险因素 (年龄较小、女性、平均角膜曲率较平坦、父母双方近视) 的低度近视患者, 在临床中需要给予高度关注, 因为其近视进展风险较高。对于低度近视患者, Ortho-K 联合 0.01% 阿托品治疗可能比单纯使用 Ortho-K 效果更佳。富含白肉的饮食是保护性行为因素, 有助于控制这些患者的近视进展。

摘要编号: 209039

低强度红光调控人视网膜色素上皮细胞活性及一氧化氮释放的实验研究

第一作者: Jia-hao TAN

目的: 近年来, 大量研究证实低强度红光在延缓儿童青少年近视进展方面具有显著效果, 但其作用的细胞与分子机制尚不明确。视网膜色素上皮 (Retinal Pigment Epithelium, RPE) 是维持视网膜结构和功能稳定的关键细胞层, 参与视网膜代谢调控、血液循环与信号转导。为了阐明红光可能的作用靶点与信号机制, 本研究探讨 670 nm 低强度红光照射

对人 RPE 细胞活性、一氧化氮 (NO) 及转化生长因子 $\beta 1$ (TGF- $\beta 1$) 表达的影响。

方法: 取对数生长期人 RPE 细胞, 分为对照组 (无光照) 与实验组 (670 nm 红光, 2 mW/cm^2)。实验组按照照射时间分为 5 min、15 min 和 30 min 亚组。采用 CCK-8 法检测细胞活性, NO 检测试剂盒测定培养上清中 NO 含量, ELISA 法检测 TGF- $\beta 1$ 水平。

结果: 与对照组相比, 红光照射 5 min、15 min 及 30 min 组的 RPE 细胞活性均显著增强 ($P < 0.0001$), 其中 15 min 组活性最高。NO 含量随照射时间延长而逐步升高, 各组间差异具有统计学意义 ($P < 0.05$)。TGF- $\beta 1$ 水平在各组间无显著变化 ($P > 0.05$)。

结论: 670 nm 低强度红光可显著增强 RPE 细胞活性并促进 NO 释放, 提示其可能通过改善局部血流或代谢微环境参与脉络膜厚度调节, 从而在近视防控中发挥积极作用。红光照射未显著影响 TGF- $\beta 1$ 表达, 说明其生物学效应可能主要依赖 NO 相关信号途径而非 TGF- $\beta 1$ 介导机制。本研究为低强度红光在近视干预中的作用机制提供了细胞水平的实验依据。

摘要编号: 209521

低龄近视儿童配戴周边离焦软镜联合使用 0.01% 阿托品的临床效果分析

第一作者: Xianli DU

目的: 探讨低龄近视儿童配戴周边离焦软性角膜接触镜 (DISC) 并联合使用 0.01% 阿托品滴眼液的近视防控效果, 并观察视觉质量变化情况。

方法: 前瞻性研究。60 名配戴周边离焦软镜的低龄近视儿童参与访视, 年龄 (6.27 ± 0.59) 岁, 近视度数 (-2.54 ± 1.18) D, 散光 ≤ -1.00 D。在 0~6 个月, 给予所有受试者配戴周边离焦软镜 (阶段 1), 在 6~12 个月根据眼轴增长快慢将受试者分为两组 (阶段 2), DISC 组 (眼轴增长 $< 0.2 \text{ mm/6 个月}$) 和 DISCA 组 (眼轴增长 $\geq 0.2 \text{ mm/6 个月}$), DISCA 组在阶段 2 联合应用 0.01% 阿托品滴眼液。每次随访时测量眼轴, 并在基线和 1 月随访时分别检测裸眼和戴镜状态下的眼波前相差 (iTrace)。采用 t 检验和 Mann-Whitney U 检验进行统计分析。

结果: 基线时两组儿童的生物学特征相似 ($P > 0.05$), 52 名儿童完成访视 (DISCn = 28, DISCAn = 24)。1 年随访期结束时, DISC 组和 DISCA 组儿童眼轴增长分别为 $0.32 \pm 0.06 \text{ mm}$ 和 $0.40 \pm 0.10 \text{ mm}$ 。平均眼轴增长为 0.12 ± 0.07 ,

$0.19 \pm 0.08 \text{ mm}$ DISC 组和 0.27 ± 0.11 , $0.13 \pm 0.08 \text{ mm}$ DISCA 组在第一和第二阶段。在阶段 2, DISCA 组联合使用 0.01% 阿托品, 眼轴增长速度较阶段一和 DISC 组均明显减缓 ($0.13 \pm 0.08 \text{ vs } 0.27 \pm 0.11 \text{ mm}$, $P < 0.05$) (阶段二 vs 阶段一), ($0.13 \pm 0.08 \text{ vs } 0.19 \pm 0.08 \text{ mm}$, $P < 0.05$) (DISCA vs DISCA)。同时, 配戴周边离焦软镜后眼视觉质量下降, 戴镜状态下总高阶像差、彗差、球差、二次像散和三叶草均不同程度升高。治疗前后, 总高阶相差 DISC 组 ($0.25 \pm 0.15 \text{ vs } 0.57 \pm 0.40$, $P < 0.05$)、DISCA 组 ($0.24 \pm 0.08 \text{ vs } 0.40 \pm 0.19$, $P < 0.05$), 并且 DISC 组总高阶相差增加更明显 ($0.32 \pm 0.16 \text{ vs } 0.16 \pm 0.14$, $P = 0.04$) (DISCA vs DISCA)。

结论: 低龄近视儿童配戴周边离焦型软性角膜接触镜能够减缓近视进展且眼高阶像差明显升高, 联合使用 0.01% 阿托品的可明显提升近视防控效果。

摘要编号: 208455

儿童青少年近视对照库的构建与应用研究

第一作者: Xiaofan XU

共同作者: Weizhong LAN

目的: 本研究旨在利用仅佩戴单光镜进行矫正的近视患者数据, 建立数据库, 探讨儿童青少年近视自然进程的眼轴与屈光度特征, 为近视管理及防控研究提供科学对照依据。

方法: 本研究分析了来自中国各地区 409,258 名未成年人, 1,453,007 条屈光度与 535,911 条眼轴测量数据。研究对象年龄范围为 6~18 岁, 所有受试者均采用单光镜进行视力矫正, 未接受其他光学或药物干预。数据经统一格式化与清洗后, 采用线性混合模型, 评估眼轴长度与屈光度随年龄的变化趋势, 并从中提取不同年龄的性别特异百分位估计值, 随后采用加权三次样条函数进行曲线平滑, 生成了中国儿童青少年近视自然进程的眼轴长度与屈光度参考百分位图表。

结果: 在眼轴模型中, 年龄对眼轴长度具有显著正向影响 ($\beta = +0.242 \text{ mm/岁}$, $p < 0.001$), 眼轴长度随年龄增长而延长。男性眼轴平均比女性短 0.52 mm ($\beta = -0.516$, $p < 0.001$), 左眼平均比右眼短 0.08 mm ($\beta = -0.078$, $p < 0.001$), 随机效应分析显示个体间方差 ($SD = 1.15 \text{ mm}$) 明显高于测量残差 ($SD = 0.35 \text{ mm}$)。在屈光度模型中, 屈光度与年龄呈显著负相关 ($\beta = -0.415 \text{ D/岁}$, $p < 0.001$), 即随年龄增加, 近视度数加深。男性屈光度平均比女性低 0.06 D ($\beta = -0.064$, $p < 0.001$), 左眼屈光度平均比右眼高 0.19 D ($\beta = +0.189$, $p < 0.001$), 随机效应显示个体间标准差

为 2.36 D, 残差为 0.85 D, 表明近视进展具有较强的个体差异性。结果显示, 眼轴随年龄显著延长, 屈光度随年龄显著下降, 两者趋势一致且具有明显的个体差异。男性眼轴略短但屈光度更低, 提示两性在眼球发育与屈光调节方面存在生理差异; 左眼较右眼略短但屈光度略高, 符合双眼发育的不完全对称性。

结论: 本研究基于中国地区大量仅使用单光镜矫正的儿童与青少年样本, 系统描绘了近视自然进程中眼轴长度与屈光度的变化规律。由于研究对象未接受任何药物或光学干预, 其数据真实反映了近视发展的自然轨迹。基于此构建的年龄与性别特异性眼轴及屈光度百分位曲线, 可为近视进展监测、干预效果评估与人群基线建模提供科学依据, 并为近视防控研究提供伦理安全的自然对照参考标准。

摘要编号: 209473

分析近视儿童使用不同光学矫正方法联合 0.01% 阿托品滴眼液后眼轴的变化

第一作者: Minfeng CHEN

共同作者: Huihui LEI, Xinjie MAO

目的: 分析近视儿童使用不同光学矫正方法联合 0.01% 阿托品滴眼液后眼轴的变化

方法: 回顾性临床研究。通过简单随机抽样收集 2021 年 1 月至 2024 年 12 月温州医科大学附属眼视光医院符合入选标准的近视儿童 354 例 (354 只眼), 根据不同的矫正方式以及是否联合使用 0.01% 阿托品滴眼液 (Atropine, A) 分为 OK (Orthokeratology lens, OK) 组 52 例, OKA (OK 联合 A) 组 38 例, 高非球微透镜近视防控眼镜 (Highly aspherical lenslets, HAL) 组 83 例, HALA (HAL 联合 A) 组 69 例, 单光镜 (Single vision spectacles, SP) 组 65 例和 SPA (SP 联合 A) 47 例。通过单因素方差分析对比戴镜 1 年后眼轴的变化。

结果: 戴镜 1 年后各组眼轴增长量对比差异有统计学意义, $F = 25.354$, $P < 0.001$ 。其中 OK 组 (0.25 ± 0.13 mm)、OKA 组 (0.17 ± 0.13 mm)、HAL 组 (0.16 ± 0.16 mm)、HALA 组 (0.08 ± 0.19 mm) 和 SPA (0.23 ± 0.18 mm) 组的眼轴增长量明显低于 SP 组 (0.39 ± 0.20 mm), 均 $P < 0.001$; 而 HALA 组眼轴变化显著低于其余各组, 均 $P < 0.01$; OKA 和 HALA 组眼轴变换均明显低于 OK ($P = 0.029$) 和 HAL 组 ($P = 0.004$)。

结论: 角膜塑形镜和高非球微透镜眼镜和 0.01% 阿托品滴眼液可以有效减缓近视进展, 而且角膜塑形镜和高沸物微透镜联合 0.01% 阿托品滴眼液效果更佳。

摘要编号: 209717

分析近视前期儿童配戴高非球微透镜镜片和使用 0.01% 阿托品后的眼轴变化

第一作者: Minfeng CHEN

共同作者: Xinjie MAO, Xianling YANG

目的: 分析近视前期儿童配戴高非球微透镜镜片和使用 0.01% 阿托品后的眼轴变化。

方法: 回顾性临床研究。通过简单随机抽样收集 2021 年 1 月至 2025 年 9 月温州医科大学附属眼视光医院符合入选标准的近视前期儿童 244 例 (244 只眼), 根据不同的干预方法进行分组: 组 A: 配戴没有度数的高非球微透镜 (Highly aspherical lenslets, HAL), 103 例; 组 B: 使用 0.01% 阿托品滴眼液, 74 例; 组 C: 不进行干预对照组, 67 例。通过单因素方差分析对比戴镜 1 年后近视的变化。

结果: 戴镜 1 年前后各组等效屈光度变化 (基线: A 组: 0.09 ± 0.23 D, B 组: 0.04 ± 0.26 D, C 组: 0.12 ± 0.20 D; 戴镜 1 年后: A 组: -0.01 ± 0.40 D, $t = 2.584$, $P = 0.011$, B 组: -0.08 ± 0.43 D, $t = 2.637$, $P = 0.010$, C 组: 0.02 ± 0.30 D, $t = 2.487$, $P = 0.015$) 和眼轴变化 (基线: A 组: 23.27 ± 0.64 mm, B 组: 23.27 ± 0.64 mm, C 组: 23.15 ± 0.70 mm; 戴镜 1 年后: A 组: 23.39 ± 0.65 mm, $t = -8.291$, $P < 0.001$, B 组: 23.63 ± 0.64 mm, $t = -12.807$, $P < 0.001$, C 组: 23.54 ± 0.71 mm, $t = -20.252$, $P < 0.001$) 均有显著差异。戴镜 1 年后等效屈光度变化 A 组 (-0.10 ± 0.37 D)、B 组 (-0.12 ± 0.39 D) 和 C 组 (-0.10 ± 0.33 D) 两两对比差异无统计学意义, P 均 > 0.05 。戴镜 1 年后眼轴变化 A 组 (0.12 ± 0.15 mm) 显著低于 B 组 (0.25 ± 0.17 mm, $P < 0.001$) 和 C 组 (0.39 ± 0.16 mm, $P < 0.001$), 且 B 组眼轴变化也显著低于 C 组 ($P < 0.001$)。

结论: 对于近视前期的儿童, 配戴平光 HAL 和使用 0.01% 阿托品滴眼液均有助于减缓眼轴增长, 有助于减少近视的进展, 其中平光 HAL 效果更好。

摘要编号: 209226

动态时空光学膜 (S.T.O.P.® KIT) 联合云夹镜框预防近视的临床研究: 6 个月随访结果

第一作者: Shuo YANG

共同作者: Xiaoning LI, Zhiwei LUO, Guangyao RAN, Zhikuan YANG, Yutong LIU

目的: 本研究旨在评估动态时空光学膜 (S.T.O.P.® KIT)、动态相位联合智能云夹镜框 (组别 1) 对比动态时空光学膜、固定相位联合智能云夹镜框 (组别 2) 及单光镜联合智能云夹镜框 (组别 3)

在 6 个月内控制远视储备不足儿童眼轴增长及屈光进展的有效性和安全性。

方法: 本研究为随机对照试验, 纳入 7-9 岁儿童 (等效球镜度 $\geq +0.50$ D, 散光 ≤ 1.50 D), 排除斜视及既往近视干预史者。受试者随机分为三组: 组别 1 佩戴动态时空光学膜 (每 3 个月更换离焦相位设计)、组别 2 佩戴动态时空光学膜 (离焦相位固定)、组别 3 佩戴单光镜, 均结合云夹监测用眼行为并予以不良用眼行为干预。随访周期 6 个月, 每 3 个月进行眼轴长度 (AL)、扩瞳验光 (SE)、视力及安全性评估。主要终点为 AL 和 SE 变化, 次要终点包括佩戴依从性及不良事件。

结果: 本研究共纳入 156 例受试者, 完成 6 个月随访组 1: 24 人、组 2: 26 人、组 3: 26 人。组别 1 的 AL 增长均值显著低于组别 2 和 3 (0.15 ± 0.06 mm vs. 0.18 ± 0.09 mm vs. 0.22 ± 0.09 mm, $P < 0.05$); 轴率比: 组 1 为 2.93 ± 0.04 、组 2 为 2.95 ± 0.06 、组 3 为 2.96 ± 0.05 ; SE 进展同样显示组别 1 最优 (-0.18 ± 0.21 D vs. -0.24 ± 0.22 D vs. -0.30 ± 0.23 D)。三组佩戴依从性无统计学差异 (日均佩戴时间均 > 3.5 h), 不良事件发生率 (组别 1: 3.3%, 组别 2: 5.0%, 组别 3: 1.7%, $P = 0.42$), 均为轻度视疲劳或镜架不适。

结论: 动态时空光学膜联合云夹在 6 个月内显著延缓远视储备不足儿童眼轴增长及屈光进展, 疗效优于单一行为干预, 且安全性良好。动态光学刺激可能通过优化视网膜离焦信号增强近视防控效果, 长期疗效需进一步随访验证。本研究为近视前期干预提供了新型光学解决方案的循证依据。

摘要编号: 210228

基于 OCT 环形断层扫描图像的近视学龄儿童视盘倾斜三维形态特征评估

第一作者: Zeyue FAN

共同作者: Luxiao CHEN, Yaxing WANG, Tien Yin WONG

目的: 本研究基于 OCT 环形断层扫描图像的视盘周边 RPE 高度数据, 旨在通过量化视盘倾斜程度、倾斜方向、RPE 高度极值点分布等参数, 刻画近视学龄儿童的视盘三维倾斜形态, 并分析上述结构特征与各项人口统计学及眼部生物学参数的关联, 为学龄儿童近视的早期筛查与防控提供影像学依据。

方法: 本研究采用基于人群的横断面设计, 通过分层整群抽样方法, 随机选取中国内蒙古自治区巴彦呼舒镇 2 所小学和 2 所中学, 并对所选学校 1 至 12 年级全体学生进行眼科检查, 基线检查于 2023 年 5 月完成。纳入 3503 名近视学龄儿童, 分别通过 OCT 图像 RPE 层和脉络膜层分析获取视盘三维

倾斜形态参数和黄斑区脉络膜厚度参数, 定义 RPE 极值点连线过 OCT 环扫圆心的平行线为倾斜轴, 该轴的方向为视盘倾斜方向。定义右眼颞侧方位角为 0° , 鼻侧为 180° , 并按逆时针方向排列, 以此坐标系确定和分析 RPE 极值点的方位分布。根据个体眼轴长度, 并参考年龄与性别的特定参考数据, 将受试者分为四个不同的眼轴长度组, 分析不同眼轴长度组之间, 视盘倾斜程度和极值点直径角的分布差异。分析视盘倾斜幅度与人口统计学及眼部生物学参数的相关性。

结果: RPE 最高点平均方位角为 187.17° ($SD = 34.03^\circ$), 最低点平均方位角为 11.33° ($SD = 37.91^\circ$), 表明主导倾斜方向为鼻上一颞下, 鼻侧分布较颞侧更为集中。视盘倾斜幅度与极值点直径角在不同眼轴长度组间均存在显著差异 ($P < 0.001$)。随着眼轴增长, 倾斜幅度与直径角的均值、中位数及四分位数均呈现一致性、渐进性增加, 反映了与眼轴增长相关的持续性形态结构改变。倾斜方向为鼻下一颞上和鼻上一颞下的受试者, 直径角形成的锐角分别更大概率位于倾斜轴的上方和下方。多元线性回归分析表明, 眼轴长度 ($\beta = 0.324$, $P < 0.001$)、角膜曲率 ($\beta = 0.150$, $P < 0.001$)、RPE 极值点直径角 ($\beta = 0.341$, $P < 0.001$)、黄斑区脉络膜厚度 ($\beta = -0.160$, $P < 0.001$)、性别 ($\beta = 0.038$, $P = 0.020$)、身高 ($\beta = 0.066$, $P = 0.015$) 及体重 ($\beta = -0.042$, $P = 0.043$) 与视盘倾斜幅度显著相关。

结论: 本研究揭示了近视学龄儿童视盘倾斜的形态规律及其影响因素。结果表明, 视盘倾斜主要表现为鼻上一颞下的方向特征, 且其倾斜程度和极值点直径角随眼轴增长呈渐进性增加。多元线性回归分析进一步证实, 视盘倾斜幅度受到眼轴长度、角膜曲率、脉络膜厚度等眼部参数及性别、身高等全身因素的调控。上述结构特征为理解学龄儿童近视性视盘形态改变的机制提供了重要依据, 对早期识别与评估近视相关结构性病变具有临床意义。

摘要编号: 209651

基于“精筋失衡”探究眼周刮痧防治青少年低度近视的效果观察

第一作者: Jia XIYU

共同作者: Xin NA

目的: 基于“精筋失衡”理论观察眼周刮痧对青少年低度近视的防治疗效。

方法: 纳入 2023 年 6 月-2023 年 12 月深圳市眼科医院就诊的低度近视青少年 100 例 (200 只眼), 随机分为治疗组和对照组各 50 例 (100 只眼)。最终纳入治疗组和对照组各 49 例 (98 只眼)。对照

组予自行佩戴框架近视眼镜及对患者家属进行健康防控教育。治疗组在对照组的基础上，予眼周刮痧治疗，共治疗 6 个月。分别于治疗前、治疗后 3、6 个月测量 2 组患者的裸眼视力、等效球镜度数及眼轴长度并计算临床疗效。

结果：（1）裸眼视力：对照组治疗后 3、6 个月裸眼视力与治疗前比较，差异均无统计学意义（ $P > 0.05$ ），治疗组后 3 个月裸眼视力与治疗前比较，差异无统计学意义（ $P > 0.05$ ），治疗组治疗后 6 个月裸眼视力较治疗前提高，差异有统计学意义（ $t = 3.806$ ， $P = 0.000$ ）。治疗后比较，治疗组裸眼视力均高于对照组，差异均有统计学意义（ t_3 个月 = 6.502、 t_6 个月 = 7.610，均 $P = 0.000$ ）。（2）等效球镜度数：2 组治疗后 3 个月等效球镜度数与治疗前比较，差异均无统计学意义（ $P > 0.05$ ）。2 组治疗后 6 个月等效球镜度数均大于治疗前，差异均有统计学意义（ t 治疗组 = 11.010、 t 对照组 = 20.975，均 $P = 0.000$ ）。治疗后 3、6 个月，治疗组等效球镜度数均小于对照组，差异均有统计学意义（ t_3 个月 = -2.121， $P = 0.036$ ； t_6 个月 = -4.881， $P = 0.000$ ）。（3）眼轴长度：2 组治疗后 3 个月眼轴长度与治疗前比较，差异均无统计学意义（ $P > 0.05$ ）。2 组治疗后 6 个月眼轴长度均长于治疗前，差异均有统计学意义（ t 治疗组 = 17.998、 t 对照组 = 17.933，均 $P = 0.000$ ）。治疗后比较，治疗组眼轴长度均短于对照组，差异均有统计学意义（ t_3 个月 = -2.126， $P = 0.036$ ； t_6 个月 = 3.730， $P = 0.000$ ）。（4）临床疗效：治疗组治疗后 6 个月总有效率（79.59%）高于对照组（53.06%），差异有统计学意义（ $\chi^2 = 7.721$ ， $P = 0.005$ ）。

结论：在“精筋失衡”理论指导下运用眼周刮痧具有延缓青少年低度近视的屈光度进展、控制其眼轴增长的作用。

摘要编号：203068

基于多组学整合分析鉴定昼夜节律相关近视基因的实验验证与治疗靶点探索

第一作者：Jiahao NIU

共同作者：Xuan LIAO

目的：阐明昼夜节律相关基因在近视发病中的作用，整合遗传、环境及褪黑素节律紊乱关联，鉴定关键基因。旨在探索其与近视的因果关系、免疫互作及潜在治疗靶点。

方法：本研究在多组学框架下整合转录组（GSE136701）和单细胞测序（GSE235684）数据，系统分析昼夜节律相关基因在近视中的作用。采用七种机器学习算法筛选关键靶点基因。通过 qRT-

PCR、孟德尔随机化（MR）分析进行实验验证。利用 DsigDB 数据库对关键靶点进行反向药物筛选，并通过分子对接和分子动力学模拟评估药物—靶点相互作用的稳定性。

结果：机器学习鉴定出 UTS2、BTBD9、S100A3 和 LGALS9 等候选基因。孟德尔随机化（MR）分析提示 UTS2 与近视存在潜在因果关系。多种 MR 方法（MR Egger、Weighted、IVW、Simple Mode、Weighted Mode）中，IVW 方法结果最显著： $P = 0.006$ ， $OR = 0.7$ （95% CI: 0.423–0.977），提示 UTS2 可能与近视风险降低相关。Cochran's Q 检验显示 MR-Egger（ $P = 0.365$ ）和 IVW（ $P = 0.530$ ）均无显著异质性，支持固定效应模型。MR-Egger 截距检验（ $P = 0.760$ ）未发现定向多效性证据，表明遗传工具变量主要通过 UTS2 影响近视。基于 DsigDB 筛选，确定 8-Bromo-cAMP 为候选药物。分子对接显示小分子与 UTS2-BTBD9 复合物结合良好：UTS2 与 BTBD9 间结合自由能为 -37.5 kcal/mol；UTS2-BTBD9 复合物与小分子结合自由能为 -6.8 kcal/mol，并与 VAL225、GLN223、SER592 氨基酸残基形成 6 个氢键。模拟 100 ns 显示，UTS2-BTBD9 蛋白复合物约 85 ns 达平衡，RMSD 约 7.6 Å；加入小分子后，UTS2-BTBD9-8-Bromo-cAMP 三元复合物约 80 ns 达平衡，RMSD 约 11.9 Å。小分子引入改善了蛋白动态稳定性。两体系均经历构象变化但最终稳定。溶剂可及表面积分析揭示结合位点微环境改变。氢键分析显示稳定网络（数量波动于 0–9，平均 ≈ 4 ）。均方根波动分析显示各体系残基波动普遍较低（多数 < 8 Å），整体稳定性高。

结论：本研究整合转录组与单细胞测序数据，应用多种机器学习模型，成功鉴定出四个与近视相关的新型昼夜节律基因（UTS2、BTBD9、S100A3、LGALS9）。MR 分析验证了 UTS2 与近视的潜在因果关联。基于关键靶点筛选出候选药物 8-Bromo-cAMP，并用分子对接与分子动力学模拟证实了其靶蛋白复合物结合的稳定性。单细胞测序数据为解析近视进展的致病机制提供了新视角。这些新发现的关键基因和候选药物为近视的精准诊断和个体化治疗策略开发奠定了基础。

摘要编号：210103

基于机器学习方法建立早期筛查儿童高度近视的泪液标志物即时检测方法研究

第一作者：Meijun WANG

共同作者：Jiahe GAN, Shiming LI, Yuting ZHAO

目的：分子生物学标记物的发现对高度近视的早期预测和诊断具有重要意义。然而，传统的检测技术

依赖于侵入性操作，如房水或玻璃体取样。本研究开发了一种基于时间分辨荧光微球（time-resolved fluorescent microspheres, TRFM）和机器学习（machine learning, ML）方法的免疫层析试纸条。其可作为一种非侵入性方法，快速、准确地识别高度近视患者泪液中的特异性生物标志物。

方法：从高度近视和正视人群中筛选出 11 种潜在的高度近视相关生物标志物。利用机器学习验证了这一结果，并通过动物模型验证了识别的生物标志物，以确认它们与近视发病机制的关联。最终制备了用于高度近视早期诊断的试纸。

结果：通过对高度近视和正视患者的泪液样本的系统筛选，我们确定了 11 个候选生物标志物。其中，泪液中的基质金属蛋白酶 2（MMP-2）和表皮生长因子（EGF）被证实是最敏感的生物标志物。我们进一步证明，以泪液中 MMP-2 和 EGF 水平为标准，利用机器学习预测儿童高度近视的曲线下面积（AUC）为 0.948，具有较高的准确性。为了进一步提高检测灵敏度，我们使用了时间分辨的荧光微球作为探针，从而开发了一种快速、低成本的免疫层析即时检测技术，能够在 15 分钟内定量和准确地检测泪液样本中的 MMP-2 和 EGF。

结论：本研究基于机器学习方法开发了一种免疫层析试纸条，可快速、准确地检测儿童高度近视筛查的生物标志物，为实现儿童高度近视的早起筛查预警提供了技术基础。

摘要编号：200655

多光谱视网膜屈光地形图测量参数与近视的关联分析：一项病例对照研究

第一作者：Bao Tong

目的：运用多光谱视网膜屈光地形图（MRT）测量 6 ~ 18 岁青少年儿童不同区域周边视网膜离焦量，探讨其与低、中、高度近视发展之间的关系。

方法：病例对照研究，纳入 2023 年 6 月 -2023 年 12 月在赤峰朝聚眼科医院就诊的 6 ~ 18 岁青少年儿童 320 例。按照等效球镜（SE）分为低度近视组和中高度近视组，采用问卷调查了解用眼习惯，采用 Lenstar 900 光学生物测量仪测量眼轴长度（AL）。采用多光谱视网膜屈光地形图（MRT）测量周边视网膜离焦量，分别为颞侧（RDV-N）、鼻侧（RDV-T）、上方（RDV-S）、下方（RDV-I），采用 Logistic 回归分析近视相关因素。

结果：共纳入低度近视 152 例，中、高度近视 168 例。其中，中度和高度近视的受试者与低度近视组相比，年龄较大、周末看电子产品时间较多、AL 较长、SE 较低。上方视网膜离焦量（RDVS）较高、

下方视网膜离焦量（RDVI）较低（均 $P < 0.05$ ）。经 Logistic 分析，女性（OR = 4.14; 95% CI = 2.16-10.93, $P < 0.001$ ）和 RDVS（OR = 0.52, 95% CI = 0.32-5.49, $P = 0.006$ ）与高度近视密切相关。

结论：6 ~ 18 岁青少年儿童中，上方视网膜离焦量（RDV-S）与中度和高度近视相关，下方视网膜离焦量（RDV-I）与高度近视相关。

摘要编号：209735

对比不同年龄和近视度数的近视儿童配戴高非球微透镜镜片和角膜塑形镜后的眼轴变化

第一作者：Minfeng CHEN

共同作者：Xinjie MAO, Xianling YANG

目的：分析不同年龄和近视度数的近视儿童配戴高非球微透镜镜片和角膜塑形镜后的眼轴变化。

方法：回顾性临床研究。通过简单随机抽样收集 2021 年 1 月至 2023 年 12 月温州医科大学附属眼视光医院符合入选标准的近视儿童 7794 例，根据不同的矫正方法分为 HAL 组（配戴高非球微透镜，Highly aspherical lenslets）和 OK 组（配戴角膜塑形镜，Orthokeratology），经过倾向性匹配后共 6534 例（HAL 3275 例，OK 3259 例），通过独立样本 T 检验对比不同近视度数不同年龄下戴镜 1 年后 HAL 组和 OK 组的眼轴变化。

结果：戴镜 1 年后 HAL 组（ 0.15 ± 0.17 mm）眼轴变化低于 OK 组（ 0.20 ± 0.18 mm, $t = -10.478$, $P < 0.001$ ）。在 8-9 岁和 9-10 岁的儿童中 HAL 组（8-9 岁： 0.19 ± 0.18 mm; 9-10 岁： 0.12 ± 0.16 mm）眼轴变化低于 OK 组（8-9 岁： 0.26 ± 0.18 mm, $t = 10.077$, $P < 0.001$; 9-10 岁： 0.17 ± 0.17 mm, $t = 6.453$, $P < 0.001$ ），在 12-14 岁上两组对比差异无统计学意义（HAL： 0.11 ± 0.14 mm; OK： 0.11 ± 0.15 mm, $t = 0.079$, $P = 0.944$ ）。在低度近视的儿童中 HAL 组（ 0.13 ± 0.18 mm）眼轴变化低于 OK 组（ 0.23 ± 0.18 mm, $t = 15.939$, $P < 0.001$ ），在中度近视的儿童中两组眼轴变化无统计学差异（HAL： 0.18 ± 0.16 mm; OK： 0.17 ± 0.18 mm, $t = -0.403$, $P = 0.687$ ），在高度近视的儿童中 HAL 组（ 0.19 ± 0.16 mm）眼轴变化高于 OK 组（ 0.11 ± 0.17 mm, $t = -6.268$, $P < 0.001$ ）。

结论：对于低度近视的儿童，配戴 HAL 的近视控制效果较优于 OK，在中度近视的儿童中，配戴 HAL 的近视控制效果和 OK 相当，在高度近视的儿童中，配戴 HAL 的近视控制效果较弱于 OK。

摘要编号: 209144

巩膜内质网应激增强成纤维细胞内甲状腺激素信号通路驱动近视进展

第一作者: Pengbo ZHANG

共同作者: Longqian LIU

目的: 眼轴长度 (AL) 是决定眼球大小的主要因素, 且在近视中出现延长, 但其发生与进展机制仍不清楚。本研究围绕近视巩膜内质网应 (ERS) 激增强成纤维细胞内甲状腺激素 (TH) 信号通路这一主线, 提出 ATF4-DIO2/T3-TR β 轴调控巩膜胶原蛋白合成引发巩膜重塑的新机制, 并进一步解析了不同 TH 受体亚型的作用。

方法: 建立小鼠形觉剥夺近视 (FDM) 模型, 评估屈光与 AL 变化。采用 WB/IHC 检测巩膜基质, ERS 和 TH 信号相关蛋白表达; 透射电镜观察巩膜成纤维细胞内质网超微结构。使用 GC-1 腹腔注射联合 FDM, WB 和 IF 检测小鼠巩膜胶原蛋白以及 AL 和屈光的变化。原代培养人巩膜成纤维细胞 (HSFs), 给予 ATF4 激动剂 E235、T3 及选择性受体激动剂 CO23 (TR α)、GC-1 (TR β); 根据需要采用低氧或药理学方式诱发/强化 ERS; 检测通路下游与表型标志的变化。荧光共聚焦用于检测 TR β 和 HIF-1 α 的共定位关系。SiRNA (THRA/THRB) 用于遗传学层面验证受体不同亚基的功能。

结果: FDM 小鼠出现近视移位与眼轴延长。WB 显示遮盖巩膜 COL1 α 1 降低; ERS 标志 p-eIF2 α /eIF2 α 与 ATF4 升高, 透射电镜见内质网肿胀/扩张。TH 信号同步增强: DIO2 与 TR β 上调、THR α 变化不明显; IHC 提示巩膜局部 T3 升高; 在 FDM 背景下腹腔注射 GC-1 进一步降低巩膜胶原并加重屈光/眼轴改变。原代 HSFs 中, 缺氧、药理性 (E235) 诱发 ERS-ATF4, 使 DIO2 上调、TR β 提高、COL1 α 1 下降; T3 在常氧下呈双相效应 (低剂量促进、较高剂量抑制胶原), GC-1 对胶原的抑制与 T3 相似, 而高剂量的 CO23 促进胶原的合成; 缺氧 (1%) 进一步放大了胶原的药理学抑制, 并增强 TR β 与 HIF-1 α 的共定位, 分子对接进一步证明两者之间具有较强的结合能力。在缺氧的背景下, 敲除 THRB 基因, 胶原相比于 T3 组显著上调, 而 THRA 的敲除没有明显的挽救效应。

结论: 巩膜 ERS 可通过 ATF4-DIO2/T3-TR β 轴增强成纤维细胞内甲状腺激素信号; TR β 特异性激活可以抑制胶原合成来促进基质重塑与眼轴延长。缺氧可以诱发 ERS 并可能与 TH 信号存在相互作用来进一步促进巩膜重塑, 尚需进一步在体验证与安全性评估。

摘要编号: 208039

平衡之道: 近视中基质金属蛋白酶的调控博弈——来自巩膜与脉络膜重塑的多模态成像证据

第一作者: Yitong LI

共同作者: Wenbin WEI

目的: 目前我国青少年近视发病形势严峻, 低龄化、重度化日益严重, 而近视进展过程中眼轴延长的机制仍不清楚。既往研究提示基质金属蛋白酶 (MMP) 信号与眼轴延长可能有关。我们对 MMP 信号在透镜诱导的眼轴延长过程中的作用位点和上下游机制进行了进一步探究。

方法: 对 3 周龄的雄性三色豚鼠进行双眼透镜诱导, 建立近视模型。为评估 MMP 抑制剂对近视的影响, 连续三周每周对豚鼠进行一次玻璃体腔内注射 MMP 抑制剂。

结果: 经过离焦性近视诱导后, 近视组豚鼠眼轴长度比对照组显著增加, 呈现出近视屈光不正。与未进行透镜诱导近视的豚鼠相比, 透镜诱导近视豚鼠与 MMP 活性增加有关, 且这种激活可以被玻璃体腔注射 MMP 抑制剂抑制。对透镜诱导的近视豚鼠进行玻璃体腔注射 MMP 抑制剂后, 眼轴延长被显著抑制, 屈光度增长明显变缓, 且程度呈浓度梯度相关。近视组豚鼠 RPE 层显示 MMP-2 免疫荧光阳性细胞, 眼内注射 MMP 抑制剂后 MMP-2 阳性细胞消失。对豚鼠施行 OCT 检测, 结果提示在排除形觉剥夺、视网膜毒性等其他可能导致脉络膜萎缩的因素影响后, 玻璃体腔注射 MMP 抑制剂可导致近视豚鼠脉络膜进一步变薄。电镜结果提示眼内注射 MMP 抑制剂可导致巩膜纤维面积变小。密度增加, 提示巩膜改建。

结论: MMP 信号传导与近视眼轴延长过程有关, 作用位点可能位于 RPE 层及巩膜。抑制 MMP 可抑制近视诱导的眼轴延长, 但是并不能抑制脉络膜变薄过程。

摘要编号: 207758

微透镜阵列匀光镜片用于儿童近视控制的 2 年研究

第一作者: Jun JIANG

共同作者: Binbin SU, Jingwei ZHENG

目的: 评估周边附加正屈光力 (PLARI)、负屈光力 (NLARI) 微透镜阵列匀光镜片的 2 年近视控制效果, 以及更换镜片设计对近视防控的影响。

方法: 完成正、负屈光力微透镜阵列匀光镜片近视防控 1 年研究 (第 1 阶段) 的 218 名儿童, 继续参加第 2 年 (第 2 阶段) 的随机、双盲延长试验。受试者被随机分配到以下组别: 单光镜片 (SV) 转

PLARI、SV 转 NLARI、连续 PLARI (PLARI-P)、PLARI 转 NLARI (PLARI-N)、NLARI 转 PLARI (NLARI-P) 以及连续 NALRI (NLARI-N) 组。根据已公布的数据外推了 SV 组第 2 年 (命名为外推单光组, ESV) 的等效球镜度变化量和眼轴增长量。采用混合线性模型分析各组在 2 年内以及第 2 年的等效球镜度变化量和眼轴增长量的差异。

结果: 完成 2 年随访后, PLARI-P、PLARI-N、NLARI-P 和 NLARI-N 组的等效球镜度变化量 (分别为 -0.87 ± 0.68 D、 -0.64 ± 0.86 D、 -0.68 ± 0.54 D 和 -0.75 ± 0.62 D) 和眼轴增长量 (分别为 0.44 ± 0.33 mm、 0.33 ± 0.32 mm、 0.36 ± 0.23 mm 和 0.39 ± 0.25 mm) 均显著小于 ESV 组 (等效球镜度变化量: -1.24 ± 0.77 D, 所有 $P < 0.05$; 眼轴增长量: 0.63 ± 0.33 mm, 所有 $P < 0.001$)。四个微透镜组和 ESV 组第 2 年的等效球镜度变化量没有统计学差异 ($P = 0.58$)。PLARI-N 和 NLARI-P 组第 2 年的眼轴增长量显著小于 ESV 组 ($P < 0.001$ 和 $P = 0.001$), 而 PLARI-P 和 NLARI-N 组第 2 年的眼轴增长量仅略小于 ESV 组, 但差异没有统计学意义 ($P = 0.054$ 和 $P = 0.10$)。此外, 四个微透镜组第 2 年眼轴增长量组间没有统计学差异 (所有 $P > 0.05$)。

结论: 配戴 LARI 镜片 2 年可有效减缓近视儿童的等效球镜度增加和眼轴增长。对于第 1 年配戴 LARI 镜片的儿童, 在第 2 年更换为配戴另一种 LARI 设计的镜片, 可以持续延缓眼轴的增长, 但对等效球镜度进展无明显改善作用。

摘要编号: 208342

成人近视晶状体核和皮质在体生物力学特性及其与调节功能的关联

第一作者: Chang LE

共同作者: Wang YAN

目的: 探讨成人近视晶状体核和皮质在体生物力学分布特点及其潜在的影响因素, 并进一步探究晶状体生物力学特性与眼调节功能之间的关联。

方法: 横断面研究。该研究纳入了 195 名参与者的 195 只右眼, 按等效球镜度 (SE) 分为 4 组, 包括正视组 37 只眼, 低度近视组 41 只眼, 中度近视组 59 只眼, 高度近视组 58 只眼。所有参与者均接受了全面的眼科检查和病史采集, 包括年龄、性别、眼轴 (AL) 测量、睫状肌麻痹主觉验光、晶状体形态学检测、视功能检测和晶状体布里渊光学扫描。采用 Kruskal-Wallis 检验评估不同屈光度之间数据的差异。采用相关性分析和多元线性回归模型评估影响晶状体生物力学特性及调节功能的因素。

结果: 成人近视眼的平均晶状体核纵向弹性模量 (LMN) 及前 (LMAC)、后皮质纵向弹性模量 (LMPC) 分别为 3.395 ± 0.027 GPa、 3.030 ± 0.066 GPa 和 2.990 ± 0.066 GPa, 正视眼则分别为 3.342 ± 0.024 GPa、 3.015 ± 0.0488 GPa 和 2.978 ± 0.049 GPa。成人 LMN 在近视眼中显著高于正视眼且随着近视程度加深 LMN 呈现明显增加的趋势。LMAC 和 LMPC 在近视眼与正视眼之间无统计学差异。在与晶状体形态参数的相关性分析中发现晶状体中轴线光密度 (LDC) 是唯一与 LMN 独立相关的晶状体参数 (standardized $\beta = -0.282$, $P < 0.01$)。近视眼晶状体核纵向弹性模量的增高与调节幅度的增加和调节灵敏度的下降独立相关 (standardized $\beta = 0.198$, -0.237 , all $P < 0.05$)。

结论: 成人晶状体核纵向弹性模量在近视眼中显著高于正视眼且随着近视程度加深而增加。近视眼晶状体核纵向弹性模量的增加与调节灵敏度下降和调节幅度增加显著相关, 表明高晶状体核纵向弹性模量可能是成人近视眼特别是高度近视眼发生发展过程中的重要生物改变, 为近视发病机制的探究提供了新思路。

摘要编号: 204664

房水激素表达谱及与眼轴相关性研究

第一作者: Xiaosheng HUANG

共同作者: Lishi LUO, Kun ZENG

目的: 激素是多种临床疾病辅助诊断的重要指标, 然而激素表达谱在眼内液中表达情况尚未明确。本研究旨在明确房水中激素种类及表达浓度的基础上, 进一步探讨激素从血浆转运至房水的转运机制及其与眼轴 (AL) 的相关性。

方法: 收集 171 例房水标本及匹配的 107 例血浆标本并通过液相二级质谱仪检测房水及血浆中 18 种常见激素及其转运蛋白表达情况; 评估不同激素在轴性近视 (AL > 24 mm) 与对照组眼轴 (22 $<$ AL < 24 mm) 房水中表达浓度的差异; 使用 SVM 算法建立房水激素预测及诊断轴性近视的模型。

结果: 房水中仅能检测出 6 种常见的激素, 且其浓度均显著低于血浆中的浓度, 其中皮质醇 (F)、可的松 (COR)、皮质类固醇 (CORT)、醛固酮 (ALD)、雄烯二酮 (A2) 和 11-脱氧皮质醇 (11DOC) 在血浆的浓度分别是房水的 38 倍、15.9 倍、6.2 倍、9.7 倍、8.8 倍及 4.8 倍。皮质类固醇及性激素在血浆中的浓度是其在房水中的 30.37 倍及 8.58 倍, 然而其转运蛋白在血浆中的浓度仅是房水中的 1.34 倍及 1.47 倍。轴性近视患者房水中 COR、CORT、A2 和 ALD 浓度显著高于正常眼轴患者 (P

< 0.05)。此外,使用 SVM 算法分析发现房水中 (F+COR+CORT+ALD+A2) 组合是轴性近视的具有强诊断指标 ($AUC = 0.993$, $F1 = 0.822$)。

结论: 房水中仅能检测出 6 种血浆中常见的激素,且浓度显著低于血浆的浓度,推测其可能与血眼屏障相关。有 4 种激素 (COR、CORT、A2 和 ALD) 可能参与了近视进展,房水中的激素组合 (F+COR+CORT+ALD+A2) 是轴性近视良好的辅助诊断指标。

探究角膜塑形术中治疗区与近视进展的关系

第一作者: Zhang BAOWEN

共同作者: Ren HUI, Tan JIAHAO, Tan QINQIN, Zhao WEI, Fu WEN

目的: 探讨角膜塑形镜治疗区直径 (Treatment Zone Diameter, TZD) 与近视进展之间的关系,并评估其对长期佩戴角膜塑形镜后近视进展的预测价值。

方法: 本研究为回顾性研究,纳入 2023 年 7 月至 2024 年 9 月于川北医学院附属医院验配角膜塑形镜的近视儿童 19 例 (共 27 眼)。收集基线资料,包括年龄、性别、等效球镜屈光度 (spherical equivalent refraction, SER)、眼轴长度 (axial length, AL)、平均角膜曲率 (mean K) 及角膜离心率 (E-value)。记录配镜后 3 个月及 12 个月的平均治疗区直径 (TZD)。依据 12 个月的眼轴增长量将受试眼分为近视快速进展组 ($\Delta AL > 0.20$ mm) 与缓慢进展组 ($\Delta AL \leq 0.20$ mm)。采用单因素方差分析与卡方检验筛选与近视进展相关的变量,并以二元 Logistic 回归模型进一步分析各参数与近视进展的独立关系。最后利用受试者工作特征曲线 (ROC) 评估 TZD 预测近视进展的诊断效能。

结果: 单因素分析显示,性别、基线 SER 及 12 个月时的 TZD 与近视进展显著相关。多因素 Logistic 回归分析表明,较高的基线 SER ($\beta = 1.944$, $P < 0.05$) 及较大的 TZD ($\beta = -10.427$, $P < 0.05$) 为近视进展的保护因素。ROC 曲线分析显示,12 个月时 TZD 预测近视进展的曲线下面积 (AUC) 为 0.764 (95% CI: 0.575–0.953, $P < 0.05$), 最佳 Cut-off 值为 3.09 mm。3 个月与 12 个月的 TZD 分别为 3.16 ± 0.45 mm 与 3.07 ± 0.25 mm, 两者差异无统计学意义 ($P > 0.05$)。

结论: 在角膜塑形术中,较高的基线等效球镜屈光度及较大的治疗区直径可显著降低近视进展风险。当 TZD 大于 3.09 mm 时,近视进展明显减缓。TZD 可作为评估角膜塑形术后近视控制效果的重要预测指标,具有潜在的临床应用价值。

摘要编号: 207829

新型自膨胀水凝胶在近视矫治的应用研究

第一作者: Jian Tao REN

目的: 评估研究新型水凝胶聚合物在近视动物模型缩短眼轴的应用效果。

方法: 选取 3 周龄有色豚鼠,右眼遮盖制作近视模型,随机分为 3 组,实验组后极部巩膜外置入水凝胶聚合物,对照组后极部巩膜外注射生理盐水,空白对照组不做处理,观察指标包括眼轴、屈光度、角膜曲率、前房深度、晶状体厚度、玻璃体腔长度、眼内压、视觉诱发电位 (VEP)、视网膜电图 (ERG)、并发症发生率,观察时间为手术前及手术后 1 天、1 周、2 周、1 月、3 月。

结果: 1. 眼轴: 手术后 1 周、2 周、1 月、3 月实验组较对照组和空白对照组均缩短,差异有统计学意义,其余时间点各组之间无明显差异; 2. 屈光度: 手术后 1 周、2 周、1 月、3 月实验组较对照组和空白对照组均降低,差异有统计学意义,其余时间点各组之间无明显差异; 3. 角膜曲率: 各时间点各组之间均无明显差异; 4. 前房深度: 各时间点各组之间均无明显差异; 5. 晶状体厚度: 各时间点各组之间均无明显差异; 6. 玻璃体腔长度: 手术后 1 周、2 周、1 月、3 月实验组较对照组和空白对照组均减小,差异有统计学意义,其余时间点各组之间无明显差异; 7. 眼内压: 手术后 1 天实验组较对照组和空白对照组均升高,差异有统计学意义,其余时间点各组之间均无明显差异; 8. VEP: 各时间点各组之间均无明显差异; 9. ERG: 各时间点各组之间均无明显差异; 10. 并发症发生率: 手术后 1 天、1 周实验组与对照组比较差异有统计学意义,其余时间点两组之间均无明显差异。

结论: 此新型水凝胶材料用于近视动物模型,可缩短眼轴、降低屈光度数,有潜力起到治疗和防控近视的双重目的。

摘要编号: 207782

明视与中间视觉对比敏感度与低中度和高度近视患者视网膜-脉络膜结构特征的关系

第一作者: Meng LIN

共同作者: Liang HU, Yadong HUANG

目的: 本研究旨在比较低中度近视 (LMM) 与高度近视 (HM) 组间的明视和中间视觉对比敏感度 (CS), 并评估 CS 与脉络膜视网膜结构和血管参数之间的关联。

方法: 在这项横断面研究中,108 名参与者被分为 LMM 组 ($n = 53$; 平均年龄: 21.0 岁; 平均等效球镜度 [SE]: -4.25 D) 和 HM 组 ($n = 55$; 平

均年龄: 24.0 岁; 平均 SE: -8.25 D)。在明视 (85 cd/m^2) 和中间视觉 (3 cd/m^2) 条件下测试 CS。使用扫频源光学相干断层扫描/血管成像 (SS-OCT/OCTA) 测量脉络膜视网膜参数。采用单因素和逐步多元线性回归分析评估关联性。

结果: 与 LMM 组相比, HM 组在明视 (1.07 ± 0.11 vs 1.19 ± 0.09 , $P < 0.001$) 和中间视觉 (中位数: 0.64 vs 1.04 , $P < 0.001$) 条件下的 CS 均显著降低。HM 组的脉络膜显著更薄, 且脉络膜血管指数 (CVI) 更高。与明视 CS (CSp) 相比, 中间视觉 CS (CSm) 与脉络膜视网膜参数表现出更强、更广泛的关联。

结论: 高度近视中的脉络膜视网膜改变对中间视觉条件下视觉功能的影响似乎比明视条件下更为显著。鉴于中间视觉 CS 对脉络膜和视网膜改变均具有敏感性, 它是一个值得进一步研究的参数, 具有评估近视相关功能损害的潜力。

正视与高度近视成人泪液、唾液及血液中多巴胺与褪黑素在不同时间点的差异分析

第一作者: Meijun WANG

共同作者: Shiming

目的: 探究正视与高度近视成人体液 (泪液、唾液及血液) 中多巴胺与褪黑素水平的差异及其与眼轴长度的相关性, 并验证不同时间点的浓度变化。

方法: 本研究纳入 5 名正视成人及 16 名高度近视成人, 均为临床健康个体。分别于 8:00、12:00、16:00 采用 Schirmer 泪液试纸采集泪液; 于 8:00、12:00、16:00、20:00、24:00 采集唾液; 于 12:00 采集静脉血。使用 Triple Quad 5500+ 液相色谱-串联质谱仪定量分析多巴胺与褪黑素浓度。数据经 Log_2 转换后以均值 $\pm$ 标准差表示, 采用独立样本 t 检验进行组间比较 ($P < 0.05$ 为显著性标准), 并通过简单线性回归分析多巴胺、褪黑素水平与眼轴长度的相关性。

结果: 与正视组相比, 高度近视组泪液多巴胺水平在 8:00 (2.55 ± 0.01 vs. $3.10 \pm 0.23\text{ ng/ml}$, $P < 0.001$) 和 16:00 (3.08 ± 0.19 vs. $3.40 \pm 0.25\text{ ng/ml}$, $P = 0.034$) 更高; 唾液多巴胺水平在 12:00 (-1.15 ± 0.15 vs. $-0.24 \pm 0.60\text{ ng/ml}$, $P = 0.009$) 和 20:00 (-0.48 ± 0.24 vs. $-0.14 \pm 0.25\text{ ng/ml}$, $P = 0.032$) 更高。8:00 泪液多巴胺水平与眼轴长度呈正相关 ($R = 0.254$, $P = 0.020$)。12:00 静脉血多巴胺水平在正视组高于高度近视组 (3.67 ± 0.37 vs. $3.32 \pm 0.32\text{ ng/ml}$, $P = 0.035$), 且与眼轴长度负相关 ($R = 0.223$, $P = 0.033$)。两组泪液褪黑素水平无显著差异; 12:00 唾液褪黑素水平在高度近视组更高 (-4.50 ± 0.35 vs. -3.28

$\pm 1.05\text{ ng/ml}$, $P = 0.017$) ; 12:00 静脉血褪黑素水平虽呈现相同趋势, 但无统计学差异 (-0.65 ± 0.57 vs. $-0.16 \pm 0.77\text{ ng/ml}$, $P = 0.087$)。

结论: 本研究揭示了正视与高度近视人群多巴胺与褪黑素水平的差异, 支持这两种神经递质在近视进展中的作用及昼夜节律影响。泪液与唾液作为易获取的体液, 在相关研究中可替代有创血液检测。

摘要编号: **209997**

溴莫尼定通过调控巩膜 cAMP 信号通路抑制豚鼠形觉剥夺性近视进展

第一作者: Zeng FANG

共同作者: Huang GUOFU

目的: 本研究旨在探讨溴莫尼定通过调节巩膜组织中环磷酸腺苷 (cAMP) 信号通路抑制形觉剥夺性近视 (FDM) 进展的分子机制。

方法: 实验选用 3-4 周龄健康雄性三色豚鼠 30 只, 随机分为三组: 正常对照组 (NC, $n = 10$), FDM 组 ($n = 10$) 和溴莫尼定干预组 ($n = 10$)。通过形觉剥夺方法建立近视模型, 持续干预 3 周。采用自动验光仪和 A 超分别动态监测两组屈光度和眼轴长度变化。实验结束后, 通过酶联免疫吸附试验 (ELISA) 检测巩膜 cAMP 水平, 实时荧光定量 PCR (RT-qPCR) 分析蛋白激酶 A (PKA) mRNA 表达, 免疫荧光染色观察 PKA 蛋白表达。

结果: 溴莫尼定干预组在实验第二周时显著抑制 FDM 豚鼠的屈光度和眼轴增长 ($p < 0.05$); ELISA 检测显示溴莫尼定可显著降低 FDM 豚鼠巩膜组织中 cAMP 水平 ($p < 0.05$)。RT-qPCR 结果表明, 与 FDM 组相比, 溴莫尼定干预组巩膜 PKA mRNA 表达显著下调 ($p < 0.05$)。免疫荧光染色证实溴莫尼定干预组巩膜 PKA 蛋白表达较 FDM 组明显降低 ($p < 0.05$)。

结论: 溴莫尼定可能通过下调巩膜组织中 cAMP-PKA 信号通路, 从而抑制形觉剥夺性近视的进展。这一发现为近视的药物疗法提供了新的理论依据和潜在靶点。

摘要编号: **209713**

病理性与非病理性高度近视白内障患者前房细胞因子水平差异及其影响因素研究

第一作者: Jiancheng MU

共同作者: Wei FAN

目的: 探讨病理性与非病理性高度近视白内障患者前房房水中细胞因子水平的差异, 并分析其可能的临床影响因素。

方法：采用横断面研究设计，纳入拟行白内障手术的高度近视患者。根据眼底及影像学检查结果分为病理性高度近视组（PHM 组）和非病理性高度近视组（NPHM 组）。术中抽取房水样本，利用多重免疫检测技术（Luminex）检测包括 IL-6、IL-8、TNF- α 、VEGF、TGF- β 、MCP-1 等在内的多种炎症及血管生成相关细胞因子水平。记录患者的年龄、性别、轴长、眼压、合并疾病及视网膜病变情况。采用非参数检验及多元线性回归分析两组间细胞因子差异及其影响因素。

结果：初步结果显示，PHM 组前房房水中多种促炎与血管生成相关因子（包括 IL-6、MMP-2、MCP-1）水平显著高于 NPHM 组（ $P < 0.05$ ），而 TGF- β 和 VEGF-A 表现出下降趋势。多元回归分析显示，轴长及视网膜萎缩程度是影响 IL-6、MCP-1、MMP-2 和 VEGF 水平的独立预测因素。细胞因子谱聚类分析提示，PHM 患者存在特征性炎症微环境改变。

结论：病理性高度近视白内障患者前房中存在明显的炎症及血管生成因子表达升高，提示眼内免疫微环境在病理性高度近视的发生与进展中具有重要作用。轴长及视网膜结构改变可能是影响细胞因子水平的重要因素。本研究为阐明高度近视眼的炎症机制及个体化手术管理提供了新的依据。

摘要编号：209824

病理性近视模型小鼠眼轴增长、视网膜结构变薄及功能损伤的年龄与性别相关特征研究

第一作者：Yuanyuan HU

共同作者：Heping XU, Jian LIU, Jinyan QI, Tong WANG, Caijiao YI

目的：本研究旨在利用 Lrp2flox/flox, Best1cre 小鼠构建的病理性近视模型，① 阐明 3 周龄至 11 月龄的病理性近视模型小鼠眼部关键病理表型的变化情况；② 明确在不同年龄段中性别对该动物模型的眼部病理表型的影响。

方法：1. 实验分组：使用 Lrp2flox/flox, Best1cre 小鼠作为病理性近视模型组，同窝不携带 cre 基因的 Lrp2flox/flox 小鼠作为对照组。分别于发育早期（3 周龄）、成熟期（3 月龄）与老年期（6-11 月龄）检测两组雌性与雄性小鼠的眼轴、视网膜结构与功能。2. 眼轴与视网膜结构检测：使用光学相干断层扫描测量小鼠眼轴长度与视网膜厚度。3. 视网膜功能检测：通过暗适应 ERG 记录视网膜功能，定量分析 a 波和 b 波的振幅。

结果：1. 与对照组相比，病理性近视模型组小鼠眼轴持续异常增长，视网膜厚度显著下降，暗适应 a 波、b 波振幅明显降低。2. 与发育早期相比，成熟

期与老年期的病理性近视小鼠眼轴明显更长，视网膜更薄，暗适应 b 波振幅更低。3. 在发育早期雌性与雄性的病理性近视小鼠眼轴长度与视网膜厚度无明显差异，然而在成熟期与老年的病理性近视小鼠中，雌性的眼轴更长、视网膜厚度更薄。4. 在发育早期与成熟期雌性病理性近视小鼠暗适应 a 波、b 波振幅更低，差异无统计学意义。

结论：本研究发现 Lrp2flox/flox, Best1cre 小鼠在早期即可引起眼轴异常增长和视网膜结构变薄，视网膜功能早期显著受损，且病变持续进展。此外，雌性个体在成年后表现出更显著的眼轴长度改变，与病理性近视的临床特征一致。这一发现拓宽了病理性近视的基础研究思路，Lrp2flox/flox, Best1cre 小鼠为探究病理性近视视网膜、脉络膜萎缩的具体机制提供了新手段。

摘要编号：209487

眼球结构与血流参数对视网膜劈裂的影响：视网膜曲率的中介效应

第一作者：Yao WANG

目的：RC 是否在眼部相关生理参数影响下导致高度近视视网膜劈裂。

方法：回顾性分析 104 例高度近视患者（ $SE \geq -6.00 D$ ，72 只视网膜劈裂、52 只高度近视眼）的临床资料。根据视网膜是否劈裂分为两个组别。采用超广角扫频源光学相干断层扫描（UWF-SS-OCT）获取 $24 \times 20 mm$ 的 OCT 扫描图像。通过对视网膜后轮廓（Bruch's 膜）的曲率进行量化分析，可显示 $24 \times 20 mm$ 范围内视网膜后轮廓的曲率地形图，并提供任意点位曲率值及对应在 3D 视网膜上的具体位置。RC 图谱得出的最小值、最大值、中位数、均值、极差、四分位距与眼部相关生理参数的关系，包括眼轴（AL）、视网膜厚度（ILM-BM）、视网膜体积（ILM-BM）、脉络膜厚度（BM-CSI）、脉络膜体积（BM-CSI）、脉络膜血流（CVI: CVV/a、CVV、CVI%、CSV/a、CSV、CSI%）。

结果：1. 眼轴长度与 RC 各项统计量之间均无显著相关性，提示眼轴值可能不直接影响 RC。2. 脉络膜中大血管结构与 RC 之间存在多项显著相关性，尤其是：CVV/a 和 CVV 与 RC 最大值呈中度负相关（ $|r| > 0.4$ ），CSV/a 和 CSV 也与 RC 呈中度负相关；3. 视网膜厚度与体积（ILM-BM）：视网膜厚度中位数与 RC 的四分位距呈中度正相关；视网膜体积的均值、中位数与 RC 的均值、最大值呈轻微负相关。4. 脉络膜厚度与体积（BM-CSI）：脉络膜厚度与体积的多个统计量（均值、中位数、最大值、极差等）与 RC 的均值、中位数、最大值

呈中度负相关，其中脉络膜体积的极差与 RC 最大值的相关性最高 ($r = -0.457$)。5. RC 与视网膜劈裂：RC 与视网膜劈裂呈中度正相关，其中 RC 均值与视网膜劈裂的相关性最强 ($r = 0.476$)，提示 RC 值的升高可能增加视网膜劈裂的风险。

结论：视网膜曲率是独立于眼轴长度的关键形态学指标。脉络膜结构与血流是影响 RC 的核心因素，其厚度、体积及血流量（如 CVV、CSV）与 RC（尤其是最大值）呈显著负相关，即脉络膜越厚、血流越充沛，视网膜后轮廓越平坦。本研究的核心发现是，RC 的多个统计量（均值、最大值等）与视网膜劈裂呈中度正相关，表明视网膜后极部曲率的显著增加，是导致高度近视眼发生视网膜劈裂的重要力学风险因素。

摘要编号：208619

瞳孔面积对不同设计多点离焦框架镜近视控制效果的影响

第一作者：Jinghua ZHU

共同作者：Jin XU

目的：讨论瞳孔面积对不同设计多点离焦框架镜在控制儿童近视进展（包括眼轴及屈光度变化）中的影响，以评估其在个体化近视防控中的临床意义。

方法：本研究为回顾性分析，共纳入 310 名年龄 7~14 岁的近视儿童。所有受试者均连续佩戴三种多点离焦框架镜之一，佩戴时间不少于 12 个月。三种镜片类型分别为：(A) 多区正向光学离焦镜片 (Defocus Incorporated Multiple Segments, DIMS); (B) 高非球面微透镜片 (Highly Aspherical Lenslets, HAL); (C) 自由曲面光学设计镜片 (Diffusion Optics Technology, DOT)。根据瞳孔面积大小（高于或低于均值）将受试者分为两组。在基线、6 个月及 12 个月分别测量眼轴长度和等效球镜屈光度。采用线性混合效应模型分析瞳孔面积与镜片类型之间的交互作用对眼轴增长的影响。

结果：在瞳孔面积较大的儿童中，佩戴 B 型镜片者在 12 个月时的眼轴增长和等效球镜屈光度进展均显著小于 A 型和 C 型镜片组 ($P < 0.001$)。相比之下，在瞳孔面积较小的儿童中，不同镜片类型间的差异无统计学意义。交互效应分析结果显示 ($\beta = -0.086$, $P = 0.002$)，瞳孔面积对 B 型镜片的近视控制效果具有显著影响。

结论：瞳孔面积对多点离焦框架镜在近视控制中的疗效具有影响，瞳孔较大的儿童在使用高非球面微透镜片时获益更为显著，提示临床医生在制定个性化近视防控方案时应综合考虑瞳孔特征。

摘要编号：201451

红光通过调控脉络膜血流抑制形觉剥夺性近视

第一作者：Yanqing LI

共同作者：Ye SHEN, Jianping TONG

目的：本研究旨在利用形觉剥夺性近视 (form-deprivation myopia, FDM) 小鼠模型，评估 630 nm 红光对屈光发育的影响，及其对脉络膜血流和厚度的作用，并直接验证脉络膜血流在红光抑制近视效应中的机制。

方法：选用 2 周龄 C57BL/6J 小鼠，建立单眼形觉剥夺 2 周模型。在造模前及造模后，分别测定小鼠的屈光度和眼球结构参数，并分析脉络膜血流密度与脉络膜厚度。通过视网膜电图 (electroretinogram, ERG) 检测小鼠对红光刺激的反应。将 FDM 小鼠分为 RL 组与 WL 组，分别接受 630 nm 红光 (275 lx) 或同等强度全光谱白光干预。分别在干预前、干预 1 周和 2 周时测定小鼠屈光度和眼球结构参数；干预 2 周后分析脉络膜血流密度与脉络膜厚度，并取眼球进行 HE 染色评估巩膜厚度。另外，对小鼠结膜下注射去氧肾上腺素 (phenylephrine, PE) 或哌唑嗪 (prazosin, PRA)，以生理盐水作为对照，2 周后再次检测以上指标。

结果：1、红光干预抑制小鼠形觉剥夺性近视并增加脉络膜血流密度。形觉剥夺造模后，与对照眼相比，小鼠近视眼的屈光度显著向近视方向偏移，眼轴增长更快，同时脉络膜变薄且血流密度降低。ERG 结果显示，FDM 小鼠视网膜功能正常，在暗适应和明适应条件下均对红光刺激产生反应。经过光照干预后，与 WL 组相比，RL 组小鼠近视眼的屈光度显著向远视方向偏移，眼轴增长减缓，巩膜厚度增加，脉络膜增厚，且脉络膜中大血管层的血流密度也显著上升。2、增加脉络膜血流灌注抑制小鼠形觉剥夺性近视。在 WL 组中，对小鼠结膜下注射 PRA 后，与生理盐水对照组相比，PRA 组屈光度显著向远视方向偏移，眼轴增长速度减缓，脉络膜增厚，同时脉络膜中大血管层的血流密度也出现增加。3、减少脉络膜血流灌注阻碍红光对近视的抑制作用。在 RL 组中，对小鼠结膜下注射 PE 后，与生理盐水对照组相比，PE 组未恢复近视屈光状态，眼轴继续增长，脉络膜变薄，且脉络膜中大血管层的血流密度降低。

结论：630 nm 红光能够有效抑制形觉剥夺性近视小鼠的眼轴增长，并诱导其屈光状态向远视方向偏移。红光的近视抑制效应主要通过增加脉络膜血流实现。

摘要编号: 204938

经皮耳穴迷走神经电刺激对豚鼠近视发展及脉络膜的影响

第一作者: Xian MO

共同作者: Shengjin XIANG

目的: 本实验以 21 天豚鼠为实验动物建立形觉剥夺近视模型, 通过随机对照实验, 探索 4 周经皮耳穴迷走神经电刺激 (taVNS) 治疗对形觉剥夺近视 (FDM) 豚鼠屈光度、眼轴、脉络膜厚度及血流变化的影响。

方法: 将 60 只 3 周龄三色豚鼠随机分入模型组、阿托品组、taVNS 组, 其中模型组 21 只, 阿托品组 17 只, taVNS 组 22 只。采用连续 4 周的形觉剥夺建立豚鼠 FDM 近视模型。模型组豚鼠随机一眼予遮光度 70% 气球遮盖作为形觉剥夺, 此外不予干预; 阿托品组豚鼠随机一眼形觉剥夺, 并每日予遮盖眼 1% 阿托品凝胶, 连续 4 周; taVNS 组豚鼠随机一眼形觉剥夺, 并接受持续 4 周的 taVNS 治疗。于实验 0 w、2 w、4 w 使用红外偏光摄影验光仪 (EIR) 测量豚鼠屈光度, A 超测量豚鼠眼轴, 实验 4 w 后 OCTA 测量豚鼠脉络膜厚度及血流变化。

结果: 实验开始时, 各组豚鼠的屈光度、眼轴无显著性差异, 以此为基线。造模 2 w 后, 各组 F 眼的屈光度、眼轴增加高于 NC 眼, 屈光度增长 0.42 ± 1.17 VS 4.79 ± 0.75 VS 2.73 ± 1.20 VS 1.40 ± 1.46 , 眼轴延长 0.10 ± 0.06 VS 0.43 ± 0.06 VS 0.34 ± 0.11 VS 0.28 ± 0.10 (NC VS 模型组 VS taVNS 组 VS 阿托品组), 且阿托品组、taVNS 组屈光度、眼轴增长均慢于模型组, 阿托品组豚鼠的屈光度增长少于 taVNS 组豚鼠, 而眼轴增长两组间无显著性差异。造模 4 w 后, 各组 F 眼的屈光度、眼轴增加高于 NC 眼, 屈光度增长 0.82 ± 1.66 VS 7.98 ± 1.32 VS 4.81 ± 1.49 VS 4.37 ± 2.38 , 眼轴延长 0.22 ± 0.12 VS 0.80 ± 0.11 VS 0.59 ± 0.12 VS 0.60 ± 0.14 (NC VS 模型组 VS taVNS 组 VS 阿托品组), 且阿托品组、taVNS 组屈光度、眼轴增长均慢于模型组, 但阿托品组与 taVNS 组之间屈光度、眼轴增长均无显著性差异。OCTA 显示实验 4 w 后, 模型组、阿托品组、taVNS 组脉络膜厚度 (ChT) 均薄于 NC 眼, ChT 71.01 ± 9.95 VS 55.32 ± 5.64 VS 64.45 ± 5.26 VS 61.75 ± 6.29 (NC VS 模型组 VS taVNS 组 VS 阿托品组), 且阿托品组、taVNS 组 ChT 高于模型组, 阿托品组与 taVNS 组之间 ChT 无显著性差异。而脉络膜血管数量也有类似变化, 45788.95 ± 7212.43 VS 33873.40 ± 4426.36 VS 39572.90 ± 2351.76 VS 38108.06 ± 2523.19 (NC VS 模型组 VS taVNS 组 VS 阿托品组)。

结论: 经皮耳穴迷走神经电刺激 (taVNS) 可能通过影响脉络膜厚度及血流, 从而延缓 FDM 豚鼠近视的发生发展, 且效果与阿托品接近。

摘要编号: 210311

视网膜保护功能耗竭在实验性高度近视模型进展中的作用机制研究

第一作者: Guoge HAN

共同作者: Pinghui WEI

目的: 探讨视网膜保护功能耗竭机制在实验性高度近视中, 对视网膜功能、视网膜蛋白质组学和视神经轴突计数的影响。

方法: 用 -10 D 透镜诱导豚鼠高度近视 3-4 周, 另一只眼睛作为对照。使用便携式 RETEVAL 系统获得每周的闪光视网膜电图 (ERG) 记录, 包括 a 波、b 波和摄影阴性反应 (PhNR)。取 $1 \mu\text{m}$ 厚的视神经切片, 苯二胺染色并在 100 倍 1.40 NA 物镜成像, 采取 AxoNet 2.0 分析。使用液相色谱-质谱法对视网膜组织进行蛋白质组学分析。使用线性混合效应模型对 ERG 反应和轴索计数进行了统计分析, 并对蛋白质组学数据进行了微阵列意义分析。

结果: 与对照组相比, 晶状体处理的眼睛出现高度近视 (-11.4 ± 3.02 D vs -1.02 ± 0.8 D, $p = 0.002$)。ERG 显示近视眼和对照眼在 a 波、b 波和 PhNR 的振幅和峰值时间上没有显著差异 (图)。1A-F) 同样, 近视性和对照性视神经的轴索计数也相当 (图 2)。1G-H) 相比之下, 蛋白质组学分析显示在近视视网膜中有 153 种差异表达的蛋白质。值得注意的是, 丰度增加的蛋白质可以参与抑制凋亡 (前胸腺肽 α), 减轻氧化应激 (精氨酸合酶), 并增强突触传递 (CaM 激酶样囊泡相关蛋白) (图 2A)。途径分析 (QIAGEN IPA) 表明, 丰度降低的蛋白质主要与蛋白质合成途径 (如真核翻译启动) 相关, 而丰度增加的蛋白质则与轴索引导 (如半胱氨酸相互作用)、免疫反应 (如 I 类 MHC 介导的抗原呈现) 和细胞骨架适应 (如 EPH-Ephrin 信号传导) 相关的途径相关。

结论: 视网膜蛋白质组学表明, 在高度近视发展过程中, 视网膜保护机制可能被激活, 从而抵御各种伤害。保存的 ERG 反应和视神经轴突计数支持这一观点, 即视网膜可以在青少年近视发展过程中保护其功能。随着年龄的增长, 这些机制的衰竭可能会增加高度近视增长的风险。

摘要编号: 210305

视网膜神经递质定量分析及其在近视进展中的调控机制研究

第一作者: Pinghui WEI

共同作者: Guoge HAN, Yan WANG

目的: 视网膜局部调控学说在近视进展中的作用机制仍存在诸多争议和未知。本研究旨在定量分析近视豚鼠视网膜中多种神经递质的变化, 为进一步揭示视网膜局部调控在近视屈光状态调节中的作用提供理论依据。

方法: 将 40 只 3 周龄健康三色豚鼠随机分为正常对照组 (NC, $n = 20$) 和形觉剥夺组 (FDM, $n = 20$)。形觉剥夺组采用单眼半透明眼罩遮盖法构建近视模型, 持续 4 周, 正常对照组不做任何处理。实验期间, 每周使用眼轴测量仪和自动验光仪测量豚鼠的眼轴长度和屈光度。实验结束后, 处死豚鼠并迅速摘取视网膜组织, 于 -80°C 保存备用。采用超高效液相色谱-串联质谱 (UHPLC-MS/MS) 技术, 结合标准品内标法, 定量检测视网膜中 17 种神经递质的含量, 包括多巴胺、 γ -氨基丁酸、谷氨酸、组胺、甲状腺素、3-甲氧基酪胺、甘氨酸、酪胺、5-羟基色氨酸和 5-羟基吲哚-3-乙酸等。质谱条件优化后采用多反应监测模式 (MRM) 进行检测, 数据通过 MassLynx 软件分析, 统计处理采用 SPSS 25.0 软件, 组间比较采用独立样本 t 检验, 相关性分析采用 Pearson 相关系数。

结果: 与正常对照组相比, 形觉剥夺组视网膜中多巴胺、 γ -氨基丁酸、组胺和甲状腺素含量显著下降 ($P < 0.05$), 而谷氨酸、3-甲氧基酪胺、甘氨酸、酪胺、5-羟基色氨酸和 5-羟基吲哚-3-乙酸含量显著升高 ($P < 0.05$)。其中, 谷氨酸与 γ -氨基丁酸比值 (RGG) 在形觉剥夺组 (1.212 ± 0.115) 显著高于正常对照组 (0.796 ± 0.094), 差异具有统计学意义 ($P < 0.001$)。此外, RGG 值与眼轴长度呈显著正相关 ($r = 0.625$, $P = 0.03$)。

结论: 视网膜可能通过调控兴奋性与抑制性神经递质的平衡, 特别是改变谷氨酸与 γ -氨基丁酸的比值, 来调节异常视觉信号, 从而参与近视的进展。本研究为深入理解视网膜局部调控在近视中的作用提供了新的实验依据, 并为近视的防治策略提供了潜在靶点。

摘要编号: 206931

视觉训练延缓近视进展的真实世界数据分析

第一作者: Yanglin JIANG

共同作者: 李丽华

目的: 探讨真实世界中视觉训练在配戴单光眼镜近视儿童中的近视防控效果。

方法: 本研究选取 2022 年 1 月至 2024 年 12 月于天津市眼科医院视光中心就诊的 6-18 岁近视患者为研究对象, 等效球镜范围为 $-0.75 \text{ D} \sim -6.00 \text{ D}$, 以患者首次训练后 6 个月至 18 个月内再次到本院就诊的时间点作为研究终点, 将标准化计算后的等效球镜年平均增长值作为主要评价指标, 评估视觉训练效果。所有近视儿童在研究期间均只配戴单光眼镜, 采用倾向性得分匹配法 (PSM), 根据年龄、性别、基线等效球镜等变量按 1:1 比例进行匹配, 接受视觉训练者 ($n = 190$) 为训练组, 同期未接受视觉训练者 ($n = 190$) 为对照组。训练组根据视功能检查结果制定个性化的系统的训练方案, 并根据上一次训练结果调整下一次的训练方案。使用卡方检验比较分类变量, 独立样本 t 检验比较连续变量。随机性截距项的混合线性模型用于分析训练对患者年均等效球镜增量的影响, logistic 模型进行多因素分析视觉训练对出现度数快速增长情况的影响 (将年均等效球镜增长大于 0.75 D 的患者定义为快速增长)。以上所有统计学分析在 R 4.3.1 中完成。除标注以外所有检验均为双侧检验, $P < 0.05$ 被认为具有统计学意义。

结果: 共有 380 名患者参与了研究。其中男性、女性各 190 例。平均年龄为 10.2 岁。基线时两组性别构成、平均年龄、等效球镜、等效球镜增长量、基线至研究结束时间间隔均不存在统计学差异 ($P > 0.05$)。相比于对照组, 视觉训练组年均等效球镜增长值下降 0.14 D (95% CI: $0.01 \sim 0.28$), 差异有统计学意义 ($P < 0.05$)。调整后视觉训练组的年平均等效球镜增量显著低于对照组 ($P < 0.05$)。分层分析结果显示, 视觉训练组在男性以及 11 ~ 17 岁的人群中效果更显著 ($P < 0.05$)。视觉训练使近视儿童在研究结束时出现度数快速增长的可能性降低 46% (OR = 0.54; 95% CI: $0.35 \sim 0.82$)。

结论: 个性化的视觉训练对于 6-18 岁配戴单光的近视患者在近视度数增长存在一定延缓作用, 尤其是在青少年时期男生更明显, 可作为近视防控的有效辅助手段。

摘要编号: 206756

角膜塑形镜、离焦软镜及其分别联合 0.01% 阿托品对儿童青少年的近视防控效果分析

第一作者: Lu YE

共同作者: Jiaqi WANG

目的: 分析角膜塑形镜、离焦软镜及其分别联合 0.01% 阿托品对儿童青少年的近视防控效果。

方法: 本研究回顾性分析 336 名 6—15 岁近视患儿, 男性 144 人 (42.9%), 女性 192 人 (57.1%), 并将其分为四组: 角膜塑形镜组 (orthokeratology, OK 组) 89 人, OK 联合 0.01% 阿托品组 (OK combined with 0.01% atropine, OKA 组) 84 人, 离焦软镜组 (defocus incorporated soft contact lenses, DISC) 82 人和 DISC 联合 0.01% 阿托品组 (DISC combined with 0.01% atropine, DISCA) 81 人。分别在基线、随访 3、6、9 和 12 月时测量眼轴长度, 分析各组之间的眼轴变化差异, 并且按照初始年龄和屈光度大小进行亚组研究, 探讨不同年龄和屈光度下干预手段的效果差异。

结果: 随访 1 年时发现 OKA 组眼轴增长量显著低于 OK 组、DISC 组和 DISCA 组, 同时 OK 组与 DISC 组在 1 年内任何随访时间点均未见统计学差异。亚组分析显示, OKA 与 OK 组的差异在 6~9 岁和 0~-2.75 D 组中三个随访时间点均有显著差异, 而在 10~15 岁和 -3.00~-6.00 D 组中仅 12 月有差异, DISC 与 DISCA 比较在 6~9 岁和 0~-2.75 D 组均未见统计学差异, 而在 10~15 岁和 -3.00~-6.00 D 组中的 6 月和 9 月表现出统计学差异。

结论: OKA 组的近视防控效果显著优于 OK 组、DISC 组和 DISCA 组, OK 镜和 DISC 镜具有相似的近视防控效果, 0.01% 阿托品对 OK 镜的协同效应, 在 6~9 岁和 0~-2.75 D 亚组中更显著, 0.01% 阿托品对离焦软镜的协同效应只在 10~15 岁和 -3.00~-6.00 D 亚组中发挥作用。

摘要编号: 201831

近视眼眼轴长度/角膜曲率半径比与应力应变指数之间的关系

第一作者: Jie WU

目的: 探讨眼轴长度/角膜曲率半径比 (AL/CR) 与应力应变指数 (SSI) 的相关性。

方法: 回顾性分析。比较高度近视患者 (HM, $n = 132$; 年龄 10~48 岁) 与非高度近视患者 (NHM, $n = 135$; 年龄 7~48 岁) 的右眼, 分析基线眼轴长度、角膜曲率半径与中央角膜厚度, 比较两组间差异; 探讨眼轴长度 (AL) 和 AL/CR 与 SSI 的关系。

结果: 与 $AL \geq 26$ mm 相比, 当 $AL < 26$ mm 时 SSI 显著降低 ($p = 0.001$); 但无论是 NHM 组 ($r = -0.14$, $p = 0.12$) 还是 HM 组 ($r = -0.09$, $p = 0.32$), SSI 与 AL 均无相关性。在 NHM 组中, AL/CR 与 SSI 呈强负相关 ($r = -0.41$, $p < 0.001$); 校正年龄和性别后, AL/CR 与 SSI 显著相关 ($\beta = -0.514$, $se = 0.109$, $p < 0.001$)。HM 组中, AL/CR 与 SSI 呈弱负相关 ($r = -0.18$, $p = 0.04$); 校正年龄和性别后, AL/CR 与 SSI 显著相关 ($\beta = -0.258$, $se = 0.096$, $p = 0.0082$)。

结论: 非高度近视组和高度近视组的 SSI 与 AL/CR 均呈显著负相关, 但 SSI 并不随近视程度的加重而降低, 而是逐渐稳定在较低水平。本研究结果在一定程度上验证了通过测量活体角膜生物力学参数来分析近视发展过程中眼球壁硬度动态变化的可能性。

摘要编号: 207772

遗传与环境因素对儿童近视进展的交互效应: 一项基于前瞻性队列的双维度风险建模研究

第一作者: Xu HUILIN

共同作者: Zhong HUA

目的: 本研究旨在系统识别儿童近视进展的危险因素, 构建遗传与生物 (GB) 因素和环境与行为 (EB) 因素的双维度风险评估模型, 并探讨二者在近视进展中的独立与交互作用, 为个性化近视防控提供科学依据。

方法: 采用前瞻性队列研究设计, 于 2023 年 10 月纳入云南省保山市 1,172 名 4~18 岁学生。所有受试者完成基线生物学检查 (眼轴长度、轴率比、屈光度等) 及问卷调查 (用眼行为、睡眠、父母背景等), 1 年后进行随访。以年眼轴变化量 ≥ 0.20 mm 为快速进展标准, 通过单因素分析、共线性检验和多因素 logistic 回归筛选显著风险因素, 并构建 GB 与 EB 风险评分系统。采用相加交互作用模型 (RERI、AP、S 指数) 评估 GB 与 EB 因素的交互效应。

结果: 研究发现, GB 因素中女性 ($OR = 0.686$)、较小年龄 ($OR = 0.749$)、较长眼轴 ($OR = 1.322$) 和较高轴率比 ($OR = 7.184$) 是近视进展的独立危险因素; EB 因素中每日近距离用眼时间 > 4 小时 ($OR = 4.797$)、父母高学历 ($OR = 4.067$) 和每日睡眠时间 < 8 小时 ($OR = 3.381$) 显著增加近视风险。风险分层显示 GB 和 EB 高风险人群的近视进展风险显著升高 (趋势检验 $P < 0.001$)。本研究创新性发现 GB 与 EB 因素存在拮抗性交互作用 ($RERI = -0.21$, $AP = -0.12$, $S = 0.79$), 交互作用可解释 12% 的近视风险降低。

结论: 本研究构建了基于眼轴变化的双维度近视风险评估模型,明确了GB与EB因素在近视进展中的独立与交互作用。EB因素是近视进展的主要驱动因素,且与GB因素存在拮抗效应。通过干预EB因素(如控制用眼时间、保障睡眠)可在不同遗传背景下有效延缓近视进展,为儿童近视的个性化防控提供了理论支持和实践方向。

摘要编号: 207625

配戴周边附加正、负屈光力微透镜阵列匀光镜片对近视儿童视觉质量的影响

第一作者: Binbin SU

共同作者: Lanke HUANG, Jun JIANG

目的: 评估周边附加正、负屈光力微透镜阵列匀光镜片对近视儿童视觉质量的影响。

方法: 本研究纳入了240名6~12岁近视儿童,其中231人完成了1年随访。受试者被随机分为三组,分别配戴单光框架眼镜(单光组)、周边附加正屈光力微透镜阵列匀光镜片(正微透镜组)、周边附加负屈光力微透镜阵列匀光镜片(负微透镜组)。在基线、戴镜1个月、6个月及12个月时进行对比敏感度功能评估,指标包括对比敏感度曲线下面积、对比敏感度锐度,以及1.0、1.5、3.0、6.0、12.0、18.0周/度(cpd)空间频率下的对比敏感度。镜片分发后,每次随访均完成主观可接受度问卷;每6个月通过主觉验光评估最佳矫正视力。统计分析仅纳入右眼数据。

结果: 基线、戴镜6个月及12个月时,三组受试者的最佳矫正视力均无统计学差异(均 $P > 0.05$)。除了正微透镜组戴镜12个月的对比敏感度锐度高于单光组($P = 0.04$)外,其余对比敏感度参数(包括对比敏感度曲线下面积、各空间频率下的对比敏感度)在基线、戴镜1个月、6个月及12个月时,三组间均无统计学差异(均 $P > 0.05$)。镜片分发时及戴镜1个月、6个月、12个月时,三组受试者间的戴镜舒适度评分均无统计学差异(均 $P > 0.05$)。镜片分发及戴镜1个月时,单光组的戴镜视觉评分优于正微透镜组($P < 0.001$ 和 $P = 0.001$)和负微透镜组($P < 0.001$ 和 $P = 0.004$);但戴镜6个月及12个月时,三组戴镜视觉评分无统计学差异(均 $P > 0.05$)。

结论: 周边附加正、负屈光力微透镜阵列匀光镜片可为近视儿童提供与单光眼镜片相似的视觉质量。

摘要编号: 209295

配戴多焦软镜和微透镜设计离焦镜片对角膜散光的影响研究

第一作者: Xiao LIN

共同作者: Guoping LI, Tailing LV, Panxi WANG, Jianfeng WU

目的: 探讨长期配戴多焦软镜和微透镜设计离焦镜片后对角膜散光的影响及近视控制效果。

方法: 回顾性研究,收集2022年1月至2023年12月在山东中医药大学附属眼科医院就诊的120例年龄在9~16岁的近视儿童和青少年,近视球镜 $-0.50 \sim -9.00$ D,散光4.00 D以内,等效球镜度为 -8.875 D ~ -0.75 D,分为三组:多焦点软性角膜接触镜(Multifocal Soft Contact Lenses, MFSCs)组、多区正向离焦(Defocus Incorporated Multiple Segments, DIMS)微透镜设计框架眼镜组和单焦点框架镜(Single-vision spectacle lenses, SVLs)对照组,每组40例,仅取右眼数据。三组均随访1年,比较戴镜前后散光、角膜曲率、等效球镜度和眼轴长度数据变化。

结果: MFSCs组柱镜度(CYL)年增长量为 -0.77 ± 0.77 D, DIMS组为 -0.80 ± 0.75 D,较SVLs组(-0.84 ± 0.76 D)均具有统计学差异($P < 0.05$);MFSCs组和DIMS组散光的增加主要体现在角膜曲率的增长(分别达 $83.6\% \pm 5.2\%$ 和 $79.4\% \pm 6.8\%$),且陡峭曲率的增长幅度显著高于平坦曲率,其变化量对整体角膜屈光力改变的贡献率分别达76.2%和78.4%(95% CI: 72.1–83.6)。配戴两种眼镜一年后柱镜轴位无显著变化(MFSCs: $P = 0.422$, DIMS: $P = 0.421$)。MFSCs组与DIMS组的等效球镜度(Spherical Equivalent, SE)年增长量分别为 -0.08 ± 0.32 D和 -0.26 ± 0.51 D,显著低于单焦点框架镜(SVLs)对照组的 -0.57 ± 0.69 D($P < 0.01$);MFSCs组和DIMS组的眼轴(Axial Length, AXL)年增长量分别为 0.06 ± 0.31 mm和 0.07 ± 0.58 mm,显著低于单焦点框架镜(SVLs)对照组的 0.16 ± 0.45 mm($P = 0.005$)。

结论: 配戴多焦软镜以及微透镜设计离焦镜片患者的散光度数的增长速率高于普通单焦点镜片,且散光度数的增长主要来源于角膜散光。配戴多焦软镜以及微透镜设计离焦镜片均有显著的控制近视屈光度和眼轴增长的作用,但使用这些镜片进行近视防控时,需密切关注患者散光的变化情况。

重复低强度红光对不同程度近视儿童青少年近视防控疗效对比

第一作者: Hui REN

共同作者: Wen FU, Jiahao TAN, Qingqing TAN, Baaowen ZHANG, Wei ZHAO

目的: 探讨重复低强度红光 (Repeated Low-Level Red Light, RLRL) 治疗对不同程度近视儿童青少年近视进展的控制效果及安全性。

方法: 前瞻性非随机对照研究, 纳入 5-16 岁 近视儿童 103 例 (103 眼), 按基线等效球镜度 (SE) 分为低度 ($-3.00\text{ D} \leq \text{SE} < -0.50\text{ D}$, 39 眼)、中度 ($-6.00\text{ D} < \text{SE} \leq -3.00\text{ D}$, 31 眼) 及高度近视组 ($\text{SE} \leq -6.00\text{ D}$, 33 眼)。所有受试者接受 RLRL 治疗, 每日 2 次, 每次 3 分钟, 间隔 ≥ 4 小时, 持续 9 个月。治疗前及 9 个月后测量裸眼视力、睫状肌麻痹屈光度 (SER)、眼轴长度 (AL) 及黄斑中心凹脉络膜厚度 (SFCT)。主要指标为 AL 与 SER 较基线的变化。

结果: 9 个月后, 低、中、高度近视组眼轴平均变化分别为 0.03 mm、-0.19 mm、-0.15 mm, 组间差异显著 ($F = 13.217$, $P < 0.001$)。与低度近视组相比, 中、高度近视组眼轴延长显著减少 ($P < 0.001$), 中、高度组间差异不显著 ($P > 0.05$)。三组 SER 均呈远视漂移趋势, 分别有 71.8%、58.1%、55.6% 的眼出现 $> +0.25\text{ D}$ 漂移。脉络膜厚度变化无统计学差异。

结论: RLRL 治疗可有效延缓不同程度近视儿童青少年的眼轴增长与近视进展, 中、高度近视者疗效更显著且安全性良好, 提示 RLRL 为近视防控的有前景干预手段。

摘要编号: 209090

雾视疗法在近视前期儿童中的防控效果及机制研究: 一项前瞻性随机对照研究

第一作者: Lu ZHANG

共同作者: Zhuoxiao LI, Nan MA, Yuhua MA, Junyang PAN, Chunli WU

目的: 探讨雾视疗法对近视前期儿童的近视防控效果, 并分析其通过保留远视储备延缓近视进展的作用机制, 以期儿童青少年近视防控提供更有效的干预策略。

方法: 本研究为一项前瞻性随机对照试验。选取 2023 年 2 月至 2024 年 3 月期间就诊于我院眼科的 6-10 岁 近视前期 (远视储备不足) 儿童 76 例, 随机分为观察组 ($n = 39$) 与对照组 ($n = 37$)。观察组在近距离用眼时配戴回归镜实施雾视疗法, 对

照组不进行特殊干预、保持正常用眼习惯。所有受试者在入组时接受基线检查, 包括眼压、眼轴长度、屈光状态、脉络膜厚度及脉络膜血流灌注量等指标。在入组后 3、9、12 个月分别对上述指标进行复查。数据采用两独立样本 t 检验或 Mann-Whitney U 检验进行统计分析。

结果: 1. 截至 2024 年 12 月随访结果显示, 两组儿童眼轴均有所增长, 但观察组眼轴增长幅度显著低于对照组 ($P < 0.05$)。两组脉络膜厚度及总脉络膜面积均呈下降趋势, 但观察组下降幅度明显小于对照组 ($P < 0.05$)。2. 此外, 两组脉络膜管腔面积均显著减小, 伴随眼轴增长、脉络膜变薄及血流灌注量降低, 可能进一步引起脉络膜及巩膜缺血缺氧, 影响细胞外基质合成, 促进眼轴延长。然而, 观察组脉络膜管腔面积的减小幅度显著低于对照组 ($P < 0.05$), 提示雾视疗法有助于缓解脉络膜血流灌注的下降程度。

结论: 雾视疗法可有效延缓近视前期儿童的近视进展, 其作用机制主要包括减缓眼轴增长、减轻脉络膜厚度与面积的减小, 以及改善脉络膜血流灌注。

摘要编号: 209443

高度近视合并脉络膜新生血管的脉络膜动静脉空间构型研究: 一项基于多模态影像配准的分析

第一作者: Wang

共同作者: Yujia GAO, Jiayi WU, Liang YAO, Yuping ZHENG

目的: 探讨高度近视 (PM) 合并脉络膜新生血管 (CNV) 患者脉络膜大动脉与大静脉的空间位置关系, 分析其与 CNV 发生、发展及治疗反应之间的解剖学联系, 揭示其在 PM-CNV 发病机制中的潜在作用。

方法: 本研究为回顾性多中心研究, 纳入 2022 年 3 月至 2025 年 6 月期间就诊的 146 例 PM 患者 (146 眼), 其中 102 眼合并 CNV (PM-CNV 组), 44 眼为非 CNV 组 (包括出血及 MFC), 另设 115 眼非高度近视糖尿病患者作为对照组。所有患者均接受吲哚菁绿血管造影 (ICGA) 及扫频源光学相干断层扫描血管成像 (SS-OCTA) 检查。通过 Fiji 软件对 ICGA 动脉期、静脉期及 SS-OCTA 巩膜层 en face 图像进行配准与多通道叠加, 识别睫状后短动脉 (PCA) 入口, 分析脉络膜大动脉与大静脉的五类空间关系 (无关、交叉、压迫、缠绕、交通), 并统计其与 CNV 类型及抗 VEGF 治疗次数的关联。

结果: PM 组均可清晰显示脉络膜动脉, 但黄斑区内动脉显影减弱, 66 眼中检出形态各异的 PCA。

PM-CNV 组动脉出现时间延迟, 35% 患眼 5 分钟时仍见动脉或 PCA 残留, 提示血流瘀滞。PM 组仅 35% 存在黄斑区大静脉分水岭, 显著低于糖尿病组 (69%)。CNV 组中黄斑区大静脉出现率更高 (单针组 68%, 重复组 80%)。70.5% 的 PM-CNV 眼在 CNV 渗漏区可见 PCA 入口, 重复治疗组比例 (85%) 显著高于单针组 (50%)。54% 的 PM-CNV 眼在 CNV 区存在异常动静脉关联 (交叉、压迫、缠绕、交通), 非 CNV 组仅 7%。重复治疗组异常类型更多, 而单针组中“交通”模式更常见。

结论: PM 患者脉络膜大动静脉之间存在多种异常空间构型, 可能通过引起局部静脉高压、湍流、管壁应力增高及下游缺血, 促进 CNV 的发生与发展。动脉入口与 CNV 区域的解剖关联及动静脉“交通”模式的存在, 部分解释了 PM-CNV 对单次抗 VEGF 治疗反应良好的现象, 提示其发病机制超越传统的缺血缺氧模型。本研究为 PM-CNV 的个体化治疗提供了新的解剖学依据。

中国中老年人高密度脂蛋白与青光眼的关系

第一作者: Zilin CHEN

共同作者: Haitong FENG, Hui GUO, Xi SONG, Xiaoyi YU

目的: 近期的研究促使我们重新考虑血清高密度脂蛋白 (HDL) 假说, 并在眼科领域对其“好胆固醇”的标签产生了怀疑。本研究通过结合队列研究和两样本孟德尔随机化 (MR) 分析, 全面评估了中老年人群血清 HDL 水平与青光眼之间的关联。

方法: 本研究利用中国健康与退休纵向研究 (CHARLS) 的数据, 开展了一项基于人群的回顾性队列研究。采用 Cox 回归、限制性立方样条模型和亚组分析来调查血清 HDL 与青光眼之间的关联。进一步使用东亚人群的两样本 MR 来评估因果关系。

结果: 在 7 年的随访期间, 224 名 (2.98%) 参与者发展为青光眼。在调整人口统计学和健康相关变量后, 多变量 Cox 回归显示, 血清 HDL 水平与青光眼风险增加有关 (HR = 1.49; CI: 1.07 ~ 2.08; $p = 0.019$), 而低 HDL 水平 ($< 1.0 \text{ mmol/L}$) 与风险降低有关 (HR = 0.63; 95% CI: 0.43 ~ 0.92; $p = 0.018$)。在拐点的左侧和右侧, HR 分别为 2.60 (95% CI: 1.14 ~ 5.95; $p = 0.02$) 和 1.41 (95% CI: 0.68 ~ 2.95; $p = 0.36$)。亚组分析显

示, 在年龄小于 60 岁、被诊断为高血压、无糖尿病、患有肝病和不饮酒者中, 血清 HDL 与青光眼呈显著正相关。两样本 MR 显示, 血清 HDL 和青光眼之间没有显著的遗传相关性: 在 5 种孟德尔随机化方法中, 只有加权模式确认了遗传性 HDL 水平升高与青光眼风险增加之间的显著因果关系 (OR = 1.15; 95% CI: 1.02 ~ 1.28; $p = 0.022$)。在 7 年的随访期间, 224 名 (2.98%) 参与者发展为青光眼。在调整人口统计学和健康相关变量后, 多变量 Cox 回归显示, 血清 HDL 水平与青光眼风险增加有关 (HR = 1.49; CI: 1.07 ~ 2.08; $p = 0.019$), 而低 HDL 水平 ($< 1.0 \text{ mmol/L}$) 与风险降低有关 (HR = 0.63; 95% CI: 0.43 ~ 0.92; $p = 0.018$)。在拐点的左侧和右侧, HR 分别为 2.60 (95% CI: 1.14 ~ 5.95; $p = 0.02$) 和 1.41 (95% CI: 0.68 ~ 2.95; $p = 0.36$)。亚组分析显示, 在年龄小于 60 岁、被诊断为高血压、无糖尿病、患有肝病和不饮酒者中, 血清 HDL 与青光眼呈显著正相关。两样本 MR 显示, 血清 HDL 和青光眼之间没有显著的遗传相关性: 在 5 种孟德尔随机化方法中, 只有加权模式确认了遗传性 HDL 水平升高与青光眼风险增加之间的显著因果关系 (OR = 1.15; 95% CI: 1.02 ~ 1.28; $p = 0.022$)。

结论: 本队列研究表明, 血清 HDL 与青光眼风险增加有关。然而, 我们的 MR 并未支持血清 HDL 与青光眼之间存在显著的正向因果关联。需要进一步开展更大病例数的研究来证实我们的发现。

摘要编号: 202604

光激活靶向一氧化氮供体结合实时监测的新型策略在青光眼动物模型中的应用研究

第一作者: Yi TIAN

共同作者: Yuan LEI, Jiamin LIU, Xinghuai SUN

目的: 原发性开角型青光眼是导致不可逆性致盲的常见疾病, 房水外流障碍所致眼压升高是致病的重要危险因素。一氧化氮在调节小梁网与房水通路功能中具有关键作用, 但传统一氧化氮供体存在释放不可控、靶向性不足及成像监测缺乏等局限。本研究旨在构建一种新型可见光激活一氧化氮供体, 可以实现可控释放, 并通过抗体修饰实现靶向递送同时结合实时成像监测和证实体内分布, 探索其在青光眼治疗中的可行性与机制。

方法: 合成基于罗丹明结构的光控一氧化氮供体并连接 ABCA1 抗体形成 RhNO-Ab。在可见光照射下该化合物能释放一氧化氮并由无荧光态转为荧光态实现同步监测。体外实验在小梁网细胞、Schlemm 管内皮细胞和角膜上皮细胞中评价其细胞摄取, 一氧化氮释放, 跨内皮电阻变化, 及可溶

性鸟苷酸环化酶表达。在体内利用 NOS3 敲除小鼠建立高眼压模型，经局部滴眼并光照后检测眼压变化组织分布及分子机制，并行角膜安全性和组织学评价。

结果：材料表征提示 RhNOAb 在光照下快速稳定释放一氧化氮并产生明显荧光信号，提示实时可视化监测。其被小梁网细胞摄取后可显著提高胞外一氧化氮水平，提升 Schlemm 管内皮细胞渗透性，增加房水外流。分子机制实验发现 RhNOAb 上调小梁网细胞的一氧化氮通路关键蛋白 sGC 的 mRNA 和蛋白表达。在 NOS3 敲除小鼠中不同剂量 RhNOAb 联合光照均能显著降低眼压，其中 30 μ M 处理 3 小时内平均下降 2.11 mmHg，约 15%，并呈剂量依赖性。体内分布实验发现药物在滴眼后 1 小时和 3 小时在房水引流区域有特征性荧光分布，而在角膜区荧光较弱。同时药物具有较好的安全性，在小梁网和 Schlemm 管区定位明确且未见角膜上皮损伤或局部毒性。

结论：本研究提出一种结合光控释放靶向递送和实时监测的一氧化氮供体策略，克服了传统 NO 供体的局限，在细胞与动物模型中均证实其可通过增强房水外流通路及激活 sGC-cGMP 信号实现有效降眼压，且具有良好安全性。该策略为青光眼的精准治疗提供了新的思路并展现出较高的临床转化潜力。

摘要编号：208200

具备数据远程传输功能的回弹式眼压计在居家场景下对青光眼眼压的管理和应用

第一作者：Xiaoan LIU

共同作者：Zhongpeng FAN, Chao LIN, Fan SHU, Xinghuai SUN, Long ZHANG, Peng ZHAO

目的：针对青光眼患者传统眼压监测依赖门诊易遗漏夜间/清晨峰值，评估具备数据远程传输功能的回弹式眼压计（海思微 iCute）的测量准确度、耐用性及家庭使用便利性。为青光眼全病程眼压管理提供工具支撑。

方法：（1）耐用性评估：通过双电源供电的寿命测试平台，对 iCute 进行平均无故障工作时间（MTBF）测试，模拟真实使用场景连续运行 51 天；（2）准确度评估：于上海浦东医院纳入 30 例青光眼患者，按基线眼压分为 7~16 mmHg、17~22 mmHg、 ≥ 23 mmHg 三组，以校准的 Goldmann 眼压计为金标准，采用线性回归、Bland-Altman 分析 iCute 的测量一致性；（3）便利性评估：通过结构化问卷收集患者使用体验。

结果：（1）耐用性：iCute 的 MTBF 达 540 万次完整测量，5 年使用周期内保持稳定性能。眼压

7~20 mmHg 时测量准确度 ± 1.2 mmHg，21~50 mmHg 时 ± 2.2 mmHg，重复性变异系数（CV） $\leq 8\%$ ，且在温湿度波动环境下仍正常运行；（2）准确度：与 GAT 相比，iCute 测量值的线性相关系数 $R^2 = 0.9664$ ，Bland-Altman 分析显示 95% 一致性限度为（-5.659，4.592），三组患者的测量成对差均未超过 ± 5 mmHg；3）便利性：80% 患者认为 iCute 操作便捷，20% 患者虽对角膜接触存在初始顾虑，但经培训后可接受其操作模式。

结论：海思微 iCute 回弹式眼压计在测量准确度、长期耐用性及居家适用性上均满足青光眼患者的日常监测需求，其数据远程传输功能可填补门诊监测的时空短板，为临床制定个性化眼压管理方案提供关键数据支持，是青光眼患者实现家庭式眼压管理的良好工具。

摘要编号：204441

基于胆红素-聚合物纳米载体的 Farrerol 靶向治疗策略：通过 Nrf2 通路抑制铁死亡/凋亡促进青光眼视神经保护

第一作者：Jing WANG

共同作者：Rong RONG, Xiaobo XIA

目的：青光眼是一种复杂的、多病因的影响视神经的疾病，典型表现为眼压升高和神经节细胞变性。然而，到目前为止，青光眼的完整发病机制仍然难以捉摸。Farrerol 作为一种具有强大抗氧化和抗炎特性的天然类黄酮化合物，可作为潜在的神经保护药物，但其治疗应用受到生物利用度差和光降解的限制。基于此，本研究探讨了 farrerol 的神经保护机制及其潜在机制之间复杂的相互作用，并开发了一种全新的纳米制剂以增强神经保护疗效，试图揭示可能改变我们对青光眼的理解和治疗的关键见解。

方法：本研究采用视网膜缺血再灌注（I/R）小鼠模型和氧糖剥夺/再灌注（OGD/R）处理的 R28 细胞建立体内和体外急性高眼压模型。通过 CCK-8 试剂盒检测 R28 细胞活力。Annexin V-FITC/PI 和 Calcein AM/PI 染色检测细胞凋亡率和坏死率。采用 ROS 和 GSH 试剂盒测定 R28 细胞的氧化应激损伤情况。通过 DLS、透射电镜、HPLC 等试验对纳米材料进行相关物化性质检测。透射电镜观察 RGCs 坏死改变。免疫荧光法定量 RGCs 数。HE 染色检查视网膜形态。采用分子对接、免疫荧光及 western blotting 检测 Nrf2 及相应下游蛋白的表达情况。

结果：体外氧-葡萄糖剥夺/再灌注（OGD/R）和体内视网膜缺血再灌注（IR）模型表明，farrerol 可显著改善 RGCs 存活，恢复小鼠视网膜结构以

及视觉功能。机理研究表明, farrerol 激活核因子红蛋白 2 相关因子 2 (Nrf2) 抗氧化途径, 减少活性氧 (ROS) 积累, 调节关键铁死亡标志物 (谷胱甘肽过氧化物酶 4 (GPX4) 和酰基辅酶 A 合成酶长链家族成员 4 (ACSL4)) 的表达, 从而抑制 RGCs 细胞凋亡。随后, 为了克服递送限制, 我们开发了负载 farrerol 的胆红素纳米颗粒 (FB-NPs), 其在青光眼病理损伤模型中显示出优于 farrerol 的稳定性和神经保护作用, 并能够持续发挥神经保护作用。

结论: 本研究明确证实, farrerol 可通过 Nrf2 介导的氧化应激与线粒体功能障碍机制保护 RGCs, 提供了针对青光眼病理损伤的神经保护。基于该机制, 我们进一步开发了一种创新型纳米制剂 (FB-NPs), 克服了 farrerol 的药理学局限, 并显著增强其治疗潜力。本研究成功将具有神经保护活性的小分子与先进纳米递送系统整合, 为下一代青光眼疗法的构建提供了新的思路。本研究明确证实, farrerol 可通过 Nrf2 介导的氧化应激与线粒体功能障碍机制保护 RGCs, 提供了针对青光眼病理损伤的神经保护。基于该机制, 我们进一步开发了一种创新型纳米制剂 (FB-NPs), 克服了 farrerol 的药理学局限, 并显著增强其治疗潜力。本研究成功将具有神经保护活性的小分子与先进纳米递送系统整合, 为下一代青光眼疗法的构建提供了新的思路。

复杂眼前节手术特殊病例解析

第一作者: Li LI

共同作者: Xuemei LIANG

目的: 通过对特殊眼前节病例的临床诊疗过程进行剖析, 进一步总结、分享经验。

方法: 本文收集 5 例需手术治疗的复杂眼前节特殊病例, 其中, Case 1 为真性小眼球合并急性闭角型青光眼; Case 2 为 Best 卵黄样黄斑营养不良合并闭角型青光眼; Case 3-5 为不同原因、不同程度的晶状体悬韧带异常继发闭角型青光眼。术前对各患者进行详尽的病史采集, 结合全面的检查, 明确诊断, 并制定针对性的手术方案及备选保障方案, 给予个性化的手术治疗。通过 FLACS+ 房角镜直视下 GSL+GNT+IOL (Case 1); Phaco+IOL+房角镜直视下 GSL+GNT+后入路 IZHV (Case 2); Phaco+囊袋张力环植入+IOL (Case 3); FLACS+AV+IOL 巩膜层间固定 (Case 4); FLACS+张力环植入+自制植入性囊袋拉钩固定+IOL (Case 5)。

结果: 5 例患者均按计划顺利完成手术, 无严重手术并发症。术后随访 2 月到 2 年不等, 手术后患眼视力均有不同程度提高 (0.12-0.8), 眼压正常 (11-17 mmHg)。Case 2 术后 1 年在当地复查 (2025.5) 患眼视力稳定于 0.15 (术后 1 天为 0.12), 眼压 11 mmHg, 眼底病变稳定, 随访未发现新生血管。

结论: 复杂眼前节特殊病例非临床常见多发病, 临床上易于漏诊、误诊。处理不当或不及时可导致患者视功能永久性损害。详尽病史采集, 全面的术前检查及沟通是临床医生很重要的基本素质, 个性化手术设计及规划, 精细的手术操作是治疗成功的保障; 重视患者的长期随访, 及时发现及处理可能的病情变化及不良转归, 以守护患者的视功能。

摘要编号: 202718

慢性青光眼模型鼠视神经、视网膜、视乳头周围巩膜的力学相关变化

第一作者: Xu LIU

共同作者: Huan DU, Yuan HE

目的: 青光眼是一种慢性不可逆性致盲性眼病。青光眼眼内组织的生物力学性质改变有可能引起视神经损伤。我们使用原子力显微镜 (AFM) 纳米压痕法等方法分析了慢性青光眼模型鼠视神经、视网膜、视乳头周围巩膜 (PPS) 不同时期的力学相关变化。

方法: 我们使用 AFM 测定青光眼模型不同时期视神经头 (ONH)、视网膜、PPS 冷冻切片的弹性模量。使用球形悬臂尖端在 ONH、retina、PPS 的选定区域进行 AFM 力映射。我们通过分析力曲线确定各组织的杨氏弹性模量 (YME), 从而作为组织刚度的度量。同时检测了以上三种组织不同时期的胶原沉积情况。

结果: ONH 相应的 YME 值显示, 对照样本弹性模量值平均为 140.5 Pa, 高眼压 2 周模型眼为 226.2 Pa, 表明高眼压 2 周大鼠视神经弹性模量升高 ($P < 0.01$)。视网膜相应的 YME 值显示, 对照样本平均为 53.1 Pa, 高眼压 2 周模型眼平均为 42.82 Pa, 高眼压 4 周模型眼平均为 22.4 Pa, 高眼压 6 周模型眼平均为 33.76 Pa; 高眼压 2、4、6 周大鼠视网膜弹性模量显著降低 ($P < 0.01$)。PPS 相应的 YME 值显示: 对照样本弹性模量值平均为 3.98 kPa, 高眼压 4 周 PPS 平均弹性模量为 2.44 kPa, 高眼压 6 周 PPS 平均弹性模量为 7.50 kPa, 高眼压大鼠 PPS 弹性模量降低 ($P < 0.01$), 高眼压大鼠 PPS 弹性模量显著升高 ($P < 0.01$)。同时高眼压处理 2 周、3 周后模型鼠的 ONH、视网膜、PPS 胶原沉积均显著增加。

结论: AFM 可用于表征眼内组织的刚度,但仍需要进一步的大规模分析。青光眼早期 ONH 的 YME 增加,意味着 ONH 的抗变形能力增加,retina 的 YME 降低,这可能反映了其固有的组织无力,使视网膜更容易受到高眼压的损害。而 PPS 早中期 YME 降低,晚期 YME 增加,这可能提示 PPS 通过调节其刚度对视神经发挥保护作用。慢性青光眼模型大鼠 ONH、视网膜、PPS 胶原沉积提示了“眼压升高引发机械信号转导异常—胶质层胶原沉积失衡—视神经损伤”的病理机制,为临床治疗靶点开发、手术优化及预后评估提供实验依据。本研究从力生物学方面可能为青光眼的神经保护提供新的思路。

新型 PGK1 激活剂作为青光眼 RGC 凋亡抑制剂和神经保护剂的发现

第一作者: Ruyue LI

共同作者: Ning Li WANG

目的: 青光眼是一种导致视网膜神经节细胞 (RGCs) 逐渐凋亡和不可逆视力损害的视网膜神经退行性疾病。磷酸甘油酸激酶 1 (PGK1) 是糖酵解过程中第一个产生 ATP 的酶,多项研究初步证明,过表达 PGK1 能减少神经元凋亡。本团队前期研究结果首次验证过表达 PGK1 减少青光眼动物模型中 RGC 凋亡。本研究拟通过药物虚拟筛选方法筛选特异性 PGK1 激活剂。

方法: 从 RCSB PDB 数据库 (<http://www.rcsb.org/>) 下载 PGK1 蛋白的原始晶体结构文件 (PDB ID: 4O3F)。在 BatchVinaGUI 软件中对 PGK1 蛋白质受体结构进行了对接前预处理。虚拟筛选使用的化合物数据库为 L1000, 包含 2860 个小分子化合物的 2D 结构文件。对接方法为半柔性对接和类比对接。对接前处理使用 AlphaFold3, 批量对接软件使用 BatchVinaGUI, 对接算法使用 Autodock Vina 1.2.5。绘图软件为 PyMol 3.1.0 和 Discovery Studio Visualizer 2024。

结果: 特拉唑嗪 (TZN) 的结合亲和力为 -7.504 kcal/mol, 属于较优水平, 该共结晶配体被用作后续分析的阳性对照。1765 个小分子化合物与靶蛋白的对接结果中, 1758 个成功对接, 大量化合物的结合亲和力超过 TZN。化合物 2304 (英文名: Tanshinone I, CAS 号: 568-73-0, SMILES: Cc1coc-2c1C(=O)C(=O)c1c-2ccc2c(C)cccc12) 与靶蛋白的结合亲和力打分最佳, 为 -10.28 kcal/mol, 转换成 Ki (Kd) 值为 28.60 nM, 属于极佳水平。对于单次对接所得的多个排名靠前的小分子构象, 相互之间 RMSD 较小, 对接结果稳定。化

合物 2304 与 TZN 的结合模式几乎相同, 配受体间具有良好的形状互补匹配。PRO339、ALA215、VAL342、LEU257、PHE292 是化合物 2304 与 PGK1 蛋白形成疏水相互作用的关键氨基酸残基。其中, VAL342、LEU257、PHE292 也是维持稳定结合的关键疏水残基。构建 R28 细胞 OGD/R 模型显示, 2304 有效减少了细胞凋亡。

结论: 新型 PGK1 激活剂的开发为青光眼 RGC 保护提供了新的前景。

摘要编号: 209795

新型微创内路三联手术与房角镜辅助下 360° 小梁切开术联合超声乳化术治疗原发性开角型青光眼合并白内障的临床疗效

第一作者: Qin QIU

目的: 比较新型微创内路三联手术 (3T) 与房角镜辅助下 360° 小梁切开术 (GATT) 联合白内障超声乳化术治疗原发性开角型青光眼 (POAG) 合并白内障两种不同术式的临床疗效, 探究 3T 联合白内障手术治疗 POAG 合并白内障的安全性与有效性, 为临床 POAG 合并白内障的治疗提供新的选择。

方法: 回顾性研究。收集了 2022 年 1 月至 2025 年 1 月期间接受 3T 和 GATT 联合超声乳化术的 POAG 合并白内障 42 例 (49 眼) 患者的住院病历资料。所有病例分为两组, 观察组为 3T 联合白内障超声乳化手术 24 例 (24 眼), 对照组为 GATT 联合白内障手术 18 例 (25 眼)。术后随访 6 月, 观察患者的最佳矫正视力 (BCVA)、眼压 (IOP)、降眼压药物数量、并发症及手术成功率等, 并进行分析。连续变量经 Shapiro-Wilk 正态性检验, 正态数据采用独立样本 T 检验, 非正态数据采用 Mann-Whitney U 检验; 分类变量采用 χ^2 /Fisher 精确法; 手术成功率采用 Kaplan-Meier 法。

结果: 1、视力: 术后 6 个月, 与基线期相比, 两组视力均提高, 两组之间差异无统计学意义; 2、眼压: 观察组术前与术后 6 月眼压分别为 (32.04 ± 10.51 、 14.71 ± 2.63 mmHg), 对照组分别为 (30.24 ± 5.97 、 16.92 ± 3.25 mmHg), 两组术后眼压均较术前降低, 差异具有统计学意义, 两组之间差异无统计学意义; 3、降眼压药物的使用: 观察组术前与术后 6 月降眼压药物数量分别为 (2.6 ± 0.82 种、 0.48 ± 0.77 种), 对照组分别为 (2.25 ± 1.15 种、 0.17 ± 0.56 种), 术后 6 个月两组使用降眼压药物数量均较基线期减少, 差异具有统计学意义, 两组之间差异无统计学意义; 4、并发症: (1) 前房积血: 观察组为 12.5%, 对照组为 30%, 观察组比对照组前房积血发生率低。(2) 眼压反跳: 观察组为 16.7%, 对照组为 20%, 两组之间差异无

统计学意义，未观察到其他并发症。5、手术成功率：术后 6 个月，观察组总成功率为 91.7%，对照组手术总成功率为 88%，两组之间差异无统计学意义。

结论：本研究术后 6 个月的随访结果表明，3T 联合白内障手术与 GATT 联合白内障手术治疗 POAG 合并白内障的疗效相当，均具有术后可显著提高视力、有效降低眼压和减少抗青光眼药物的数量等效果，但 3T 联合白内障手术更加微创，值得推广。

摘要编号：**210075**

新型微创内路三联手术（3T）治疗青睫综合征的临床疗效观察

第一作者：Liuzhi ZENG

共同作者：Suju LIU

目的：观察新型微创内路三联手术（3T）对青光眼角膜睫状体炎综合征的临床疗效，探讨 3T 手术治疗青光眼角膜睫状体炎综合征的安全性和有效性。

方法：选取 2023 年 1 月 -2025 年 8 月成都市第一人民医院收治的 18 例（18 只眼）青光眼角膜睫状体炎综合征患者。患者均为使用 3 联以上降眼压药物后眼压仍不能控制伴视野受损者。所有患者均接受新型微创内路三联手术（3T）并在术中前房抽液送检，术后予以规范抗病毒治疗，随访 1 年，观察患者视力、眼压、降眼压药物使用数量以及术后并发症。

结果：1、眼压：术前最高眼压平均值 49.72 ± 7.65 mmHg，基线眼压平均值为 31.44 ± 11.06 mmHg，术后 1 天平均眼压 16.78 ± 6.22 mmHg，术后 1 月平均眼压 18.00 ± 4.15 mmHg，术后 3 月平均眼压为 16.94 ± 3.26 mmHg，术后 6 月平均眼压为 16.00 ± 2.65 mmHg，术后 1 年平均眼压为 16.67 ± 3.33 mmHg，术前术后比较有显著统计学差异（ $p < 0.001$ ）。2、用降眼压药物种数：术前用降眼压药物使用数量为 2.5 ± 0.78 ，术后 6 月用降眼压药物使用数量 0.64 ± 0.92 ，术后 1 年为 0，术前术后差异有统计学意义（ $p < 0.01$ ）。3、成功率：Kaplan-Meier 生存分析结果显示术后 12 个月的总成功率为 81%，完全成功率为 61%，随访过程中出现少量事件，但整体仍有较多患者维持在成功标准以内。4、前房液检验结果：有 16 眼进行前房液病毒检测，其中病毒检出有 13 眼（81.3%），巨细胞病毒（CMV）抗体阳性有 11 眼（68.8%），水痘带状疱疹病毒（VZV）抗体阳性有 1 眼（6.3%），单纯疱疹病毒（HSV）抗体阳性有 1 眼（6.3%）。5、并发症：眼压反跳（IOP Spike）有 10 眼（55.56%），发生在术后 3（1，7）天，平均持续时间为 1.5（1，4.5）天。术后前房少许血性漂浮物及房角少许血凝块，无前房积血、睫状体脱离等其他并发症。

结论：对于使用多种降眼压药物仍无法控制眼压并伴有视野受损的青光眼角膜睫状体炎综合征患者，微创内路三联手术（3T）可显著降低眼压，改善房角引流，减少用药数量，延缓视功能恶化。前房液病毒学检查旨在明确病因，指导后续治疗方向，实现精准个体化管理，提升疗效与预后。

摘要编号：**209394**

炎症反应和 ACE 2 在奥密克戎流行期间急性原发性闭角型青光眼中的潜在作用

第一作者：Bei ZENG

共同作者：Yanfan YANG, M YU, Yuning ZHANG

目的：研究 COVID-19 感染与疫情期间观察到的急性原发性闭角型青光眼（APACG）发病率增加之间的潜在关系。

方法：本研究在 COVID-19 疫情期间招募了 91 名 APACG 患者和 40 名需要手术的老年性白内障患者作为对照组。使用多重微球免疫分析技术检测了房水和血浆中 27 种细胞因子和血管紧张素转化酶 2（ACE2）的水平。比较了两组间的细胞因子水平和眼部特征。评估了细胞因子水平与 COVID 感染到 APACG 发作间隔时间之间的相关性。

结果：APACG 患者年龄更轻且主要为女性（ $P < 0.05$ ）。他们还表现出更高的眼内压、更大的角膜内皮细胞变异系数、更厚的晶状体厚度，但更短的轴长和更低的角膜内皮细胞密度（所有 $P < 0.05$ ）。APACG 患者的房水中 ACE2 显著升高（ $P < 0.001$ ）和 19 种细胞因子（包括 IL-1ra、IL-6、IL-8；所有 $P < 0.05$ ）。而血浆中 ACE2 和其他细胞因子的浓度，仅 MCP-1 和 IP-10 在组间有显著差异（所有 $P < 0.05$ ）。APACG 患者的房水 ACE2 水平与 17 种细胞因子呈正相关，但在对照组中则无。此外，53 例 APACG 患者（58%）报告在确诊 COVID-19 感染后的 3 天内发生了 APACG 发作。他们的房水中 ACE2 和 MIP-1 与 COVID-19 发病到 APACG 发作的时间间隔呈负相关。

结论：在 COVID-19 大流行期间，APACG 患者的房水中 ACE2 和炎症细胞因子显著增加，这表明存在一种潜在的炎症机制，将 COVID-19 感染与 APACG 发作联系起来。

摘要编号: 210248

自研眼内房角镜分离器的便捷操作与临床转化应用

第一作者: Jibing WANG

共同作者: Shanshan LIU, Fumei YIN, Yali ZHANG

目的: 详细介绍眼内房角镜分离器的研发与临床转化应用经验, 为更多眼科医生提供免手术房角镜的高效、精准、直视下房角分离工具。

方法: 作者于 2018 年 12 月研发一款用于闭角型青光眼房角分离的器械, 命名为“眼内房角镜分离器”, 德国实用新型专利号 (20 2020 104 839), 国内实用新型专利号 (ZL2020 2 1745427.1)。分离器材质为 304 不锈钢, 长 13 mm, 分为两端, 两端与中间手柄呈 135° 角, 两端为钝椭圆形, 反射镜面尺寸分别为: 宽端 4 mm × 2 mm, 窄端 2.5 mm × 1 mm, 其中, 宽端通过主切口 (完成超滤人工晶体植入术缩瞳后前房重新注入粘弹剂) 进入前房, 分离除主切口下以外的 > 270° 房角范围, 窄端自副切口进入前房, 分离其余主切口下 < 90° 范围房角, 分离时术者无需倾斜显微镜、无需使用手术房角镜, 原位下利用分离器镜面观察 PAS 范围, 操作轻柔, 边分边观察, 直至看到全部小梁网与巩膜突, 此时通过镜面反射可清晰看到小梁网或 Schlemm 管返流血带, 分离结束后吸除粘弹剂, 水密切口, 操作结束。

结果: 自 2018 年 12 月至今, 作者成功完成超 3000 只眼的房角分离操作, 取得了理想结果, 比传统方法分离方法时间缩短 5 倍, 原位即可完成 360° 房角分离, 分离效果相当, 大大提高了手术效率, 并在集团 20 多家分院同步得到应用超过 10000 只眼。多次在国内或国际会议上通过作者或国内多位知名专家应用并介绍给同道, 目前已在国内上百家医院得到广泛应用, 成功实现临床转化, 容易上手且学习曲线短, 一致反馈良好, 目前该产品已量产并得到越来越多眼科医生的推广应用。

结论: 与传统房角分离方法相比, 眼内房角镜分离器分离房角降压效果相当, 但效率明显提高且方便快捷, 值得推广应用。

摘要编号: 210090

视神经脱髓鞘在慢性高眼压青光眼模型中的病理特征及富马酸二甲酯的干预效果

第一作者: Yingdi FU

共同作者: Ningli WANG

目的: 明确慢性高眼压 (Ocular Hypertension, OHT) 青光眼模型中视神经脱髓鞘的时间节点、空间分布模式, 及其与视网膜神经节细胞 (Retinal

Ganglion Cells, RGCs)、轴突损伤的时序关联, 并评估髓鞘保护药物富马酸二甲酯 (Dimethyl Fumarate, DMF) 延缓青光眼进展的治疗潜力。

方法: 以健康成年 C57BL/6J 雄性小鼠为研究对象, 采用硅油诱导慢性高眼压 (Silicone Oil-Induced Ocular Hypertension, SOHU) 模型模拟青光眼病程, 研究分为两部分: ① 病理特征分析: 设野生型 (Wild Type, WT) 组及 SOHU 造模后 1、2、4、6、8 周组, 每周通过 TonoLab 回弹式眼压计监测眼压, 借助免疫荧光染色、髓鞘牢固蓝 (Luxol Fast Blue, LFB) 染色、透射电子显微镜 (Transmission Electron Microscopy, TEM)、蛋白免疫印迹 (Western Blot) 及视网膜电图 (Electroretinography, ERG)、绿光闪光视觉诱发电位 (Green Flash Visual Evoked Potential, GF-VEP) 技术, 分析视神经髓鞘、少突胶质前体细胞 (Oligodendrocyte Precursor Cells, OPCs)、RGCs 及轴突的结构与功能变化; ② 药物干预评估: 将 SOHU 模型小鼠随机分为对照组 (SOHU + 磷酸盐缓冲液 (Phosphate-Buffered Saline, PBS)) 与治疗组 (SOHU + DMF), 治疗组自 SOHU 造模 1 周起, 每日腹腔注射 DMF (60 mg/kg), 连续 21 天, 对照组注射等体积 PBS, 于 SOHU 造模 4 周时, 采用上述相同技术评估干预效果, 并与 WT 组对比。

结果: 1. 脱髓鞘的时间与空间特征: SOHU 模型中, 视神经近端髓鞘最早于造模 1 周出现丢失 (LFB 光密度降至 WT 组的 68.92%, $p < 0.01$), 随病程进展丢失程度加重; 造模 6 周时, 远端髓鞘显著丢失 (LFB 光密度降至 WT 组的 23.89%, $p < 0.05$), 髓鞘前缘较 WT 组显著后退 184.2 μm (95% 置信区间 (Confidence Interval, CI): 90.76–277.60, $p = 0.0001$), 整体呈“由近及远”的退行性模式。2. 脱髓鞘与 RGCs、轴突损伤的时序关系: 脱髓鞘早于结构损伤, 造模 2 周时视神经整体髓鞘显著丢失 (髓鞘碱性蛋白 (Myelin Basic Protein, MBP) 免疫荧光强度降至 WT 组的 52.16%, $p = 0.04$; 有髓鞘轴突密度降至 WT 组的 62.6%, $p = 0.02$), 而 RGCs 密度及轴突存活率显著下降始于造模 4 周; 功能上, 造模 1 周时 GF-VEP N1-P1 振幅已显著降低 (较 WT 组降低 14.04 μV , 95% CI: 9.83–18.24, $p < 0.0001$), 与近端髓鞘丢失同步, RGCs 功能 (ERG 明视负向反应波 (Photopic Negative Response, PhNR) 振幅) 显著下降则出现于造模 6 周, 呈“功能先行、结构滞后”特征。3. DMF 的干预效果: DMF 干预显著减少髓鞘丢失 (MBP 表达量为对照组的 1.68 倍, 95% CI: 0.22–1.14, $p = 0.01$), 提高轴突存活率 (较对照组提高 $38.65 \pm 5.11\%$, $p = 0.005$) 及 RGCs

密度（中央视网膜增加 635.9 ± 116.50 个/ mm^2 ，外周视网膜增加 433 ± 142.40 个/ mm^2 ， $p < 0.05$ ）；同时改善 RGCs 功能（PhNR 振幅与 WT 组无显著差异， $p = 0.67$ ）及轴突功能（N1、P1 潜伏期与 WT 组无显著差异，N1-P1 振幅较对照组增加 $5.66 \pm 0.98 \mu\text{V}$ ，95% CI: 3.05–8.26），并抑制小胶质细胞活化（离子钙结合适配分子 1 (Ionized Calcium-Binding Adaptor Molecule 1, IBA1) 阳性细胞较对照组减少 72.29%， $p < 0.01$ ），但 RGCs 密度及轴突存活率仍未恢复至 WT 组水平。

结论：慢性高眼压诱导的视神经脱髓鞘是青光眼轴突及 RGCs 损伤的早期驱动事件，其“由近及远”的丢失模式及“功能先行、结构滞后”的特征，确立了“脱髓鞘—轴突代谢衰竭—神经元凋亡”的级联损伤路径。DMF 可能通过调控核因子 E2 相关因子 2 (Nuclear Factor Erythroid 2-Related Factor 2, Nrf2) 抗氧化通路与小胶质细胞极化，显著延缓脱髓鞘进程并优先保护视神经功能，为青光眼治疗提供“功能保护优先于结构修复”的创新方向，也为青光眼早期诊断标志物及髓鞘保护药物研发提供理论依据。

摘要编号：**209948**

诱导多能干细胞通过线粒体转移促进小梁网细胞增殖的机制研究

第一作者：Canying LIU

共同作者：Yiqing LI

目的：小梁网细胞 (Trabecular Meshwork Cells, TMCs) 功能异常与青光眼的发生密切相关，其中 TMCs 线粒体功能障碍被认为是该疾病发病机制中的重要环节。维持线粒体的数量与功能完整性，对细胞稳态与存活至关重要。近年来研究发现，线粒体转移在生理病理情况下发挥重要作用，是实现细胞间能量支援及功能调控的潜在方式。干细胞及其衍生细胞在多项研究中被证实可作为线粒体供体，提示线粒体转移可能在干细胞治疗中发挥关键作用。诱导多能干细胞 (Induced Pluripotent Stem Cells, iPSCs) 具有多向分化潜能和旁分泌功能，但其与 TMCs 之间的相互作用机制尚不明确。本研究旨在探讨 iPSCs 与 TMCs 共培养体系中，iPSCs 是否通过线粒体转移促进 TMCs 的增殖，并初步阐明其机制。

方法：建立 iPSCs 与 TMCs 的共培养体系，通过基因编辑技术进行荧光标记以追踪细胞间物质交换。使用不同类型抑制剂（包括缝隙连接抑制剂、纳米管连接抑制剂和内吞抑制剂）阻断细胞间物质交换，以评估其交换方式。收集 iPSCs 条件培养基，利用不用孔径滤器分级分离囊泡，分析其促增殖活性；

利用超速离心结合 Western blot 检测条件培养基中的线粒体蛋白。采用长时程活细胞成像观察细胞间物质交换及线粒体转移过程。

结果：共培养显著促进 TMCs 增殖 ($P < 0.01$) 并增强其吞噬活性 ($P < 0.01$)。值得注意的是，位于 iPSCs 克隆边缘的 TMCs 增殖率显著高于共培养体系中的其他 TMCs ($P < 0.01$)。GFP 标记的 iPSCs 来源物质可被 mcherry 标记的 TMCs 摄取，流式细胞术显示共培养 2 天后 GFP 阳性 TMCs 占比达 20.9%，且该群细胞增殖率 (45.53%) 高于总体 TMCs (14.93%)。使用不同抑制剂阻断 iPSC 与 TMCs 之间的物质交换，发现内吞抑制剂阻断效率最高，且长时程成像显示 iPSCs 来源囊泡被 TMCs 吞噬。而 iPSCs 条件培养基经 $0.22 \mu\text{m}$ 过滤后，其促 TMCs 增殖效果消失。iPSCs 条件培养基超速离心沉淀中可检测到线粒体内外膜及基质蛋白。活细胞成像显示 iPSC 条件培养基中 MitoTracker 标记的带线粒体囊泡转移至 TMCs，且该过程同样对内吞抑制剂最为敏感。

结论：本研究初步证明 iPSCs 可通过囊泡介导的线粒体转移促进 TMCs 增殖，该过程主要依赖于内吞作用实现的囊泡传递。这一发现不仅揭示了 iPSCs 与 TMCs 之间新型互作机制，也为基于线粒体移植的青光眼治疗策略提供了理论依据与实验支持。

摘要编号：**209288**

超声睫状体成型术 UCP 治疗新生血管性青光眼闭角期的有效性和安全性研究

第一作者：Qianqian JI

共同作者：Kang FENG, Ying HONG

目的：研究超声睫状体成型术 UCP 治疗闭角期新生血管性青光眼患者的有效性和安全性。

方法：纳入 2024 年 2 月至 2025 年 2 月在北京大学第三医院眼科就诊并诊断为新生血管性青光眼闭角期的患者，记录患者的性别，年龄，诊断，原发病，视力，眼压，抗青光眼药物，眼轴等情况。根据患者的生物学测量指标，选择不同的探头型号，进行超声睫状体成型治疗。术后给予激素类眼药水点眼抗炎。记录患者术后 3 个月时的视力，眼压及用药情况。采用眼压下降大于术前的 20% 或者眼压在 5–21 mmHg 之间作为手术成功的标准，记录手术成功率。

结果：24 例患者纳入本研究。其中男性 19 例 (79%)，女性 5 例 (21%)。年龄 60.5 ± 13.1 (38–92) 岁。均为新生血管性青光眼闭角期（晚期）患者，原发病包括糖尿病性视网膜病变 (16 例)，血管阻塞性视网膜病变 (4 例)，视网膜脱离 (2 例)，过熟期白内障导致的慢性葡萄膜炎 (2 例)。

术前视力 LogMR1.9 ± 0.9 (0.3–3.0)。术前眼压 38.9 ± 10.4 (22–60) mmHg。术前使用抗青光眼药物 3.3 ± 0.8 种 (1 种 1 例, 2 种 2 例, 3 种 9 例, 4 种 12 例)。眼轴 23.6 ± 1.1 mm (22.07–26.09)。角膜清亮 17 例, 水肿 7 例。角膜直径 11.6 ± 0.55 mm (10.6–12.9)。选择探头 11–13 号 (其中 11 号探头 1 例, 12 号探头 14 例, 13 号探头 9 例)。9 扇区治疗 1 例, 10 扇区治疗 24 例。20 例成功, 手术成功率 83.3%。手术后未见光感丧失, 脉络膜出血, 角膜内皮失代偿等重大并发症。术后 3 个月患者视力 LogMR2.1 ± 0.9 (0.4–3.0)。术后视力提高 7 例, 下降 10 例, 持平 7 例。眼压 17.1 ± 9.8 (5–44) mmHg。使用抗青光眼药物 2.3 ± 1.1 种 (0 种 2 例, 1 种, 3 例, 2 种 6 例, 3 种 11 例, 4 种 2 例)。4 例失败患者中 1 例一个月后接受第二次 UCP, 眼压得到控制。

结论: 术后短期随访结果显示超声睫状体成型术 UCP 治疗闭角期新生血管性青光眼患者的有效率为 83.3%, 未出现重大并发症。失败病例可以选择 2 次治疗。

摘要编号: 209741

青光眼巨大薄壁滤过泡漏的创新救治术式

第一作者: Junhua XIAO

目的: 探讨青光眼巨大薄壁滤过泡漏病例的创新救治术式。

方法: 既往青光眼滤过手术中, 使用丝裂霉素等抗代谢药物, 导致薄壁滤过泡病例, 甚至巨大薄壁滤过泡, 临床并不少见。较小滤过泡如发生漏口, 有文献报道可以通过切除滤过泡, 常规联合巩膜或角膜材料修补、外加再次滤过手术或其他青光眼手术, 救治手术较为复杂。对于巨大型薄壁滤过泡漏, 常规方法施行十分困难。本研究青光眼患者, 2005 年外院小梁切除联合丝裂霉素应用, 术后薄壁滤过泡巨大, 约 12 × 7 × 3 mm³ 大小, 2023 年 5 月因干眼常揉眼, 导致滤过泡漏, 眼压低至 5 mmHg, 多处求医无果, 干脆直接入我院 2023 年 6 月 9 日住院, 坐等寻求救治方案, 第三日灵感骤现、创新突破方案破茧而出: 微创修补法。2023 年 6 月 12 日顺利完成救治手术, 详见术中照片及部分步骤。

结果: 术中即刻修补效果满意, 巨大薄壁滤过泡漏终止, 染色无溪流现象, 术后 1 天及 1、3、6、12、24 个月眼压均恢复和保持正常, 原有滤过泡滤过功能保持正常。详见手术前后 UBM 及数码照相及术中照片。

结论: 针对青光眼巨大薄壁滤过泡漏疑难病例, 采用针对性强的创新微创修补术式及方法策略, 既可以达到救治修补瘘口目的, 又可以避免过度破坏原

有滤过泡, 保持了原有滤过泡功能, 获得了优良稳定的眼压控制目标, 手术操作微创, 术后恢复快, 无不良并发症, 达到了患者满意的良好临床结果, 该术式及方法策略值得临床参考应用。

摘要编号: 210154

青光眼引流阀引流管覆盖与修补方法经验探讨

第一作者: Miao ZHUANG

共同作者: Yong YAO

目的: 介绍 5 种临床常用的引流管覆盖和 2 种引流管修补的方法和经验。

方法: 通过手术视频展示各种方法: 对于引流管植入手术, 术中对于引流管覆盖采用“矩形瓣”、“L 形瓣”、“桥隧道”、“针孔隧道”、“矩形瓣 + 针孔隧道”等不同方法, 分享其各自的优缺点和选择体会。针对引流管暴露的患者, 采用自体巩膜移植和生物材料覆盖, 介绍其优缺点及选择体会。

结果: 通过不同手术方式均可完成手术, 术后存在不同特点但均效果好。

结论: 术者应根据自己的手术技术、患者的个体化病情酌情使用不同的手术方法, 为患者解决问题。

摘要编号: 210225

青光眼睫状体炎综合征合并视网膜睫状动脉阻塞 1 例

第一作者: Luyun LIANG

共同作者: Yiqin DUAN

目的: 描述一名 16 岁的年轻男性患者无全身性心血管疾病史及栓塞因素, 因反复发作的青光眼睫状体炎综合征 (Posner-Schlossman Syndrome, PSS) 使视盘血流动力学改变而继发视网膜睫状后短动脉阻塞 (Posterior Short Ciliary Artery, PSCA), 3 个月内视力急剧下降伴中心视野缺损。旨在提高临床医生对 PSCA 的认识以及探讨在有效时间窗内实施紧急管理措施的重要性。

方法: 本研究对一名于 2024 年 12 月就诊于长沙爱尔眼科医院确诊为 PSS 继发 PSCA 的 16 岁男性患者的临床表现、影像学特征、治疗措施和视力恢复水平进行回顾。

结果: 一名 16 岁的男性患者因“左眼发作性眼前固定黑影 3 月”收入院, 3 个月以来左眼有反复眼痛、眼胀、流泪、视物模糊伴眼前中央偏颞侧的固定黑影遮挡发作史, 自行冰敷休息后好转, 此次就诊前休息后无改善。2024 年 12 月 5 日长沙爱尔眼科医院眼底科复诊完善相关检查后明确诊断: (1) 左眼视网膜睫状后短动脉阻塞; (2) 左眼青光眼

睫状体炎综合征；(3) 双眼屈光不正。立即给予“左眼前房穿刺放液治疗”、“乙酰唑胺片、溴莫尼定滴眼液”降眼压、“醋酸泼尼松龙滴眼液、普拉洛芬滴眼液”抗炎；“肌肉注射普罗碘铵”、“舌下含服硝酸甘油”、“左眼颞部皮下注射复方樟柳碱注射液”、“球周注射盐酸消旋山莨菪碱注射液”、“口服复方血栓通”、“静脉滴注银杏叶注射液”及吸氧等改善视网膜血液循环治疗。经治疗后患者眼前黑影范围较前缩小，左眼眼底检查见黄斑鼻侧水肿较前减轻，视盘边界清晰。

结论：继发于 PSS 的 PSCA 是一种少见但可以致盲的临床疾病，这强调了在缺血情况发生的背景下，视网膜睫状后短动脉对缺血的易感性。因此在 PSS 患者中，除了彻底调查全身病史及相关心血管危险因素以外，应尽早完善眼底彩照以及眼灌注压等检查，密切关注视网膜动脉灌注的情况。如果患眼及对侧眼杯盘比正常但存在反复发作的眼压升高、相对性传入性瞳孔缺陷、视盘水肿且视力持续下降时，必须警惕视网膜动脉阻塞的发生。临床上对于急性 PSCA 的管理仍具有挑战性，因此需要临床医生在时间窗内紧急降眼压并恢复眼部血流供应，避免造成无法挽救的视力损害。

摘要编号：**204688**

青光眼睫状体炎综合征患者焦虑与抑郁的临床评估及神经炎症机制探索

第一作者：**Xiangmei KONG**

共同作者：**Yelin KWAN**

目的：评估青光眼睫状体炎综合征（简称：青睫）患者的焦虑、抑郁状况，并通过青睫小鼠动物模型评估其行为学改变，探究潜在的神经炎症机制。

方法：招募青睫患者、原发性青光眼患者、健康对照，通过 HADS 问卷进行焦虑和抑郁评分，以及 VFQ-25 评价视觉相关的生活质量。前房注射巨细胞病毒的方式建立 BALB/c 小鼠青睫动物模型，用行为学试验评估小鼠的焦虑、抑郁状况。收集小鼠外周血、脑部组织切片，进行神经免疫及神经递质标志物等检测。

结果：共纳入 404 名参与者（青睫 143、原发性青光眼 131、健康对照 130），青睫患者焦虑、抑郁水平显著高于健康对照，也高于原发性青光眼，眼部疼痛和依赖性焦虑和抑郁的关键预测因子，病程越长，焦虑水平也越高；晚期视野损伤的患者中，更频繁的复发与抑郁的加重相关。小鼠动物模型表现出典型的羊脂状 kp 和眼压升高等青睫临床表现，旷场实验、十字高架实验小鼠表现出明显的焦虑行为；悬尾实验、强迫游泳实验显示有明显的抑郁行为。青睫小鼠外周血 IL-6、TSP1、TGFβ2 和

TNFα 水平显著升高，海马区域突触后致密蛋白 95（PSD95）显著下降，而突触素（SYP）表达未见显著变化，前额叶皮质 TH 和 NMDA 受体的下调，但未观察到 BDNF 表达的下降。

结论：青睫患者存在明显的焦虑和抑郁，疾病特异性因素，如眼痛、不可预测的急性发作，对心理影响更为显著，甚至超过了视功能缺损本身。小鼠动物模型表现出焦虑和抑郁相关行为显著增加，可能主要由系统性与中枢炎症引起，通过神经递质系统和突触功能的失衡表现出来。

RETGLoT: 一种可扩展、低数据依赖且高效的视网膜影像分析基础模型

第一作者: Wenlong LI

目的: 本研究旨在开发一种具备可扩展性、泛化性强、对数据依赖度低且计算效率高的视网膜影像分析人工智能基础模型,用以克服当前模型在大规模标注需求、计算成本高及任务单一等方面的局限。

方法: 我们构建了基于自蒸馏掩码自动编码器 (Self-distilled Masked Autoencoder, SdAE) 的通用模型——RETGLoT。该模型以北京大学第三医院眼科中心于 2012 年 11 月 9 日至 2023 年 11 月 28 日期间采集的 55 万张未标注视网膜图像进行预训练。随后,通过 16 个公开视网膜疾病数据集对 RETGLoT 进行评估,并与主流模型 RETFound 及 VisionFM 比较。性能评价指标包括 Matthew 相关系数 (MCC)、受试者工作特征曲线下面积 (AUROC) 及精确率-召回率曲线下面积 (AUPR),采用双侧 t 检验评估模型间性能差异的统计显著性。

结果: 在 16 个公开数据集中,RETGLoT 在 9 个数据集上优于 RETFound 或 VisionFM。在糖尿病视网膜病变 (DR) 分类任务中,RETGLoT 在 APTOS-2019、DDR、IDRiD 及 MESSIDOR-2 数据集上的平均 MCC 分别为 0.651、0.624、0.351 和 0.573,在 DDR、IDRiD 及 MESSIDOR-2 上显著优于对比模型。同时,RETGLoT 在跨模态数据集 UWF IQA (MCC 0.807) 及 OCTID (MCC 0.832) 中亦表现出色。外部评估结果显示,在 DR 及青光眼数据集中,RETGLoT 在多数情况下取得相当或更优的性能。此外,RETGLoT 展现出较高的标签利用效率,在多个数据集中仅使用 40%-60% 的标注数据即可达到最佳性能;微调阶段仅需 30 个 epoch 即可达到或超过 RETFound 及 VisionFM 的表现。与 VisionFM 使用的 iBOT 预训练方式相比,SdAE 预训练在时间与数据利用上更为高效。

在所有任务中,RETGLoT 均保持较高的 MCC、AUROC 和 AUPR 表现。

结论: RETGLoT 为视网膜影像分析提供了一种具备良好泛化能力、低数据依赖与高效率的人工智能基础模型。通过降低对标注数据与计算资源的依赖,同时保持或提升诊断性能,该模型为 AI 在临床眼科领域的可持续应用与推广提供了可行路径。

人工智能诊断系统在眼底视网膜疾病筛查中的实际应用

第一作者: Qingquan WEI

共同作者: Qing PENG, Qinghua QIU

目的: 本研究旨在评估基于深度学习的人工智能 (AI) 诊断系统在分析视网膜疾病方面的性能,评估其与专家诊断的一致性及其在筛查应用中的整体效用。

方法: 共有 3076 名就诊于我院的患者接受了全面的眼科检查。初步评估使用名为“综合 AI 视网膜专家 (CARE)”的 AI 系统进行,随后通过详细的人工复核以确定最终诊断。将 AI 生成的结果与资深眼科医生的评估进行比较,以评估 AI 系统在眼科筛查背景下的诊断可靠性和可行性。

结果: AI 诊断系统相较于专家诊断,对糖尿病视网膜病变 (DR) 的敏感度为 94.12%,特异度为 98.60%;对年龄相关性黄斑变性 (AMD) 的敏感度为 89.50%,特异度为 98.33%;对疑似青光眼的敏感度为 91.55%,特异度为 97.40%;对病理性近视的敏感度为 90.77%,特异度为 99.10%;对视网膜静脉阻塞 (RVO) 的敏感度为 81.58%,特异度为 99.49%;对视网膜脱离的敏感度为 88.64%,特异度为 99.18%;对黄斑裂孔的敏感度为 83.33%,特异度为 99.80%;对视网膜前膜的敏感度为 82.26%,特异度为 99.23%;对高血压性视网膜病变的敏感度为 94.55%,特异度为 97.82%;对有髓神经纤维的敏感度为 83.33%,特异度为 99.74%;对色素性视网膜炎的敏感度为 75.00%,特异度为 99.95%。

结论: AI 辅助筛查系统对大多数视网膜疾病表现出高敏感度和高特异度,表明其有潜力成为筛查实践

中有价值的工具。该系统的实施尤其有利于基层和社区医疗机构，有助于初步诊断工作，并提升分级眼科诊疗模式的效能，对更广泛的临床应用具有重要意义。

基于 OCT 的人工智能云平台视网膜异常筛查系统在真实临床环境中的研究与应用

第一作者：Xun XU

共同作者：Xin Jian CHEN, Tien Yin WONG

目的：视网膜异常是全球导致不可逆性视力损害的重要原因，但我国基层医疗资源不足，诊断力量严重不足。本研究旨在开发并验证一种基于 OCT 的人工智能云平台（AI-PORAS），提升远程筛查与诊断效率。

方法：AI-PORAS 基于深度学习算法开发，可自动识别 OCT 图像中的 15 种常见视网膜异常。模型使用大规模真实临床数据进行训练和验证，并部署于全国 29 个省份的 207 家医疗机构，实现远程图像上传与云端分析。验证数据涵盖 165,384 只眼睛的 3,551,959 张 OCT B-scan 切片，评估指标包括准确率（Accuracy）、曲线下面积（AUC）、假阳性率（FPR）和假阴性率（FNR）。

结果：AI-PORAS 平均准确率为 93.16%，AUC 为 93.64%，FPR 为 6.82%，FNR 为 7.87%，性能与主治医师相当。该系统实现了大规模远程 OCT 筛查，并为疾病谱和诊疗策略优化提供了数据支持。

结论：AI-PORAS 作为一个基于 OCT 的人工智能云平台，能够在真实临床环境中实现高效、准确的视网膜异常筛查，显著提升远程诊断和基层医疗服务能力。其临床应用不仅有助于缩小地区医疗资源差距，还为卫生健康决策和个体化治疗提供了数据支持，具有广阔的推广与应用前景。

基于 OCT 的影像组学方法预测玻璃体内 DEX 植入治疗糖尿病黄斑水肿的疗效：一项多中心临床研究

第一作者：Biying CHEN

共同作者：Jing LUO

目的：糖尿病视网膜病变（DR）是糖尿病患者最常见的并发症之一，而糖尿病性黄斑水肿（DME）是 DR 患者视力损害的最常见原因，由于患者对治疗的反应存在个体异质性，其治疗方案选择面临挑战。本研究旨在基于光学相干断层扫描（OCT）图像构

建机器学习模型，以预测地塞米松（DEX）玻璃体内植入物在 DME 患者中的治疗效果，从而促进个性化和精准治疗策略。

方法：本研究共纳入来自三个研究中心的 151 例经诊断为 DME 并接受至少一次 DEX 玻璃体内注射的患者。采用 3D Slicer 平台中的 Pyradiomics 模块，对 OCT 图像进行感兴趣区域（ROI）描绘，并提取定量放射组学特征。随后，从分割后的图像中提取相关特征并进行筛选，通过三种不同的机器学习算法构建预测疗效模型。

结果：在反向传播神经网络（BPNN）模型中，训练集和测试集的曲线下面积（AUC）分别为 0.949 和 0.812。支持向量机（SVM）模型的 AUC 则分别为 0.945 和 0.819。Spearman 相关分析显示，训练集和测试集的 oct 组学评分与治疗后的 CST 变化率呈正相关（ $R = 0.52$, $p < 2.5e-08$; $R = 0.33$, $p = 0.026$ ）。此外，在训练集（ $p = 6.59e-03$ ）和测试集（ $p = 2.90e-09$ ）中，存在浆液性视网膜脱离（SRD）的患者，其 OCT 组学评分显著高于无 SRD 组。

结论：基于 OCT 图像的放射组学模型被证实为一种高准确率、无创的工具，可用于预测 DEX 治疗 DME 的疗效，为 DME 的精准治疗提供了新的视角。与临床影像组学标志物 CST 下降率、SRD 等之间的相关性研究进一步增强了该模型的临床可解释性和应用前景。

基于多任务学习框架和可信融合策略的深度学习模型在视网膜中央动脉阻塞分类中的应用

第一作者：Xuan XIAO

共同作者：Ting CHEN, Xuejie LI

目的：视网膜中央动脉阻塞（Central Retinal Artery Occlusion, CRAO）是致盲性眼科急症，临床上易误诊且难以准确区分急慢性期，制约了临床上 CRAO 的干预治疗，因此研发 AI 辅助的眼底影像分割方法是 CRAO 早诊断早治疗的关键问题。然而目前 CRAO 疾病存在标记数据稀缺和多模态数据不完整的问题，制约了 AI 辅助诊断分类的应用。本研究旨在构建基于少样本、不完整多模态数据的 CRAO 深度学习分类模型，以提升该疾病的智能诊断分类性能和临床应用价值。

方法：本研究首次提出将多任务学习框架和可信融合策略应用于 CRAO 分类。首先，设计多任务框架同时执行 CRAO 分类和病变分割任务，在分割任务引入了语义相似性损失，利用病变区域的文本标注计算文本特征与图像特征的相似度，并将其

作为辅助损失函数，学习更精细的分类表征，用于区分急性和慢性 CRAO 病例。其次，在多模态特征融合阶段提出可信融合策略，将 Monte Carlo Dropout 集成到分类网络中，评估特定模态特征的不确定性，并从不完整的多模态数据中学习有效的联合表征，以实现可靠的多模态特征融合。最后，在自收集的数据集上评估模型性能，并与现有方法（Siamese Networks、Missing Multimodal Transformer、DeepDrRVO）进行比较。

结果：本研究所提出的 CRAO 分类深度学习模型准确率为 90.31%、精确率为 85.22% 和召回率为 86.21%，显著优于已有方法。

结论：本研究提出的 CRAO 分类深度学习模型有效解决了训练样本有限和模态缺失问题，显著提升了 CRAO 分类性能。

基于深度学习的致盲性眼病自动筛查研究

第一作者：Hongzhuang CHENG

共同作者：Jie ZHONG

目的：开发经济高效的致盲性眼病筛查模型，辅助基层医疗机构提升筛查效率，降低患者因延误诊断导致的视力不可逆损伤风险。

方法：研究基于深度学习和 89,158 张眼底照相图像构建轻量化眼科疾病筛查模型。模型性能评估分为 2 个环节：首先，在 2 个独立的外部验证集上进行测试，以衡量模型的泛化性和稳定性。其次，通过比较不同临床经验阶段的眼科医师和模型的分类表现，评估模型医疗水平对应的临床经验阶段。

结果：该模型的平均准确度为 96.11%，F1 评分为 82.39%，召回率为 81.61%，ROC_AUC 值为 99.77%，精确率 96.44%，特异度 98.66%；外部验证集的平均准确率 90.92%，平均特异度 97.03%，平均精确率为 89.98%；临床医生的对比评估中，低年资医师在判断 FP 图像的平均准确率为 74%（95% CI: 61.84%–86.16%， $\alpha = 0.05$ ），而中年资医师的准确率达到 88%（95% CI: 78.99%–97.01%， $\alpha = 0.05$ ）。

结论：本研究开发一种低成本的致盲性眼病 AI 筛查系统，其性能和中年资医师水平相当，为推进基层致盲性眼病筛查提供有效的解决方案。

基于混合注意力模型预测配戴角膜塑形镜患者的近视进展

第一作者：Yuanqi DENG

共同作者：Xuewei LI, Kai WANG

目的：针对配戴角膜塑形镜的青少年近视患者，我们构建了一种深度学习算法用来预测眼轴增长速度，并对近视进展风险较高的患者提出预警。

方法：本研究为回顾性研究，共纳入 1677 名配戴角膜塑形镜超过一年的近视患者（3271 只眼睛）。通过 IOL Master 700（Carl Zeiss Meditec, Oberkochen, 德国）和 Sirius 角膜地形图（CSO, 意大利）等进行眼部检查，收集了年龄、眼轴、SER、角膜曲率、HVID、CCT、ACD、PD、e 值等参数，同时进行问卷调查收集父母近视度数、读写姿势、近距离用眼时间、户外活动时间、食用甜食、阿托品剂量等变量。基于注意力机制，开发一种深度学习算法来预测戴镜一年后的眼轴增长量。通过准确度、精确度、召回率和 F1 指数评估模型的性能，并与传统 logistic 回归、XG Boost、LightGBM、随机森林、GBM、SVM、CNN、LSTM 和 RNN 模型进行比较。采用排列重要性方法来量化每个特征对预测结果的影响。

结果：我们提出了混合注意力模型（HAM）来预测近视的进展。HAM 模型可以独立嵌入每个特征组（基本参数、环境和遗传因素），结合局部和全局注意力机制来处理临床数据中的复杂交互。HAM 模型在测试集上的准确度为 0.849，精确度为 0.847，召回率为 0.849，F1 指数为 0.848。该模型的性能明显优于传统的逻辑回归、XG Boost、Light GBM、随机森林、GBM、SVM、CNN、LSTM 和 RNN（准确度分别为 0.634、0.671、0.701、0.727、0.724、0.716、0.623、0.701 和 0.702。精确度分别为 0.583、0.666、0.698、0.684、0.666、0.696、0.598、0.702 和 0.696。召回率分别为 0.637、0.672、0.701、0.727、0.727、0.716、0.623、0.701 和 0.702。F1 指数分别为 0.585、0.651、0.688、0.684、0.652、0.615、0.602、0.701 和 0.697。特征分析显示年龄和 SER 是模型预测最重要的决定因素，L 值分别为 18% 和 16.5%。其他重要因素包括甜食的食用频率、PD、阿托品剂量和父亲近视程度、ACD。

结论：深度学习模型显示了基于临床信息对眼轴伸长进行个性化预测的可行性，模型具有良好的预测性能，有助于为近视进展快速的患者提供建议，及时调整个体的近视防控措施。

基于自动条栅视力测试设备的对比度 - 视力多维评估新方法及应用

第一作者: Yuqing LI

共同作者: Guangqiang WU

目的: 开发并验证一种新型自动条栅视力测试设备,旨在通过多对比度条件下的视力评估、构建对比度 - 视力的多维矩阵关系、为弱视、青光眼等眼病的临床诊断提供更全面、敏感的视觉功能评估方法。

方法: 南京市妇幼保健院与江苏富瀚医疗产业发展有限公司联合研发自动条栅视力测试设备,通过在 5 个不同对比度水平下进行标准化视力测量,绘制对比度 - 视力函数曲线,形成多维评估矩阵。采用自动化测试流程,克服传统方法耗时过长、操作复杂的问题,并与传统单一对比度视力评估方法进行对比验证。

结果: 该设备能够快速、准确地获取多对比度下的视力值,成功构建对比度 - 视力关系的多维矩阵。临床测试表明,该方法对弱视患儿的视觉功能缺损检测敏感性显著提高,较传统 Snellen 视力表或单一对比度测试更能捕捉细微的视觉损伤。

结论: 本研究开发的自动条栅视力测试设备通过多对比度视力评估,为临床提供了一种高效、全面的视觉功能评估新方法,特别适用于弱视和青光眼的早期筛查、诊断及疗效评估,具有重要的临床应用价值和推广前景。

深度学习在年龄相关性黄斑变性的研究进展和未来发展方向

第一作者: Hongzhuang CHENG

共同作者: Yadan SHEN, Jie ZHONG

目的: 探讨深度学习技术在年龄相关性黄斑变性早期筛查与病灶分割中的应用现状,分析当前面临的挑战,并展望未来研究方向。

方法: 分析近五年内关于深度学习与 AMD 诊疗相关的研究文献,分析不同深度学习架构的优势和缺点并探讨不同架构的未来发展方向。

结果: 在早期筛查方面,深度学习模型已实现 Drusen、RF、RPD 和 CNV 的自动化分类,然而现有研究普遍受限于样本量不足,导致模型泛化能力存在局限;在病灶分割领域,基于深度学习的算法虽能实现对 AMD 主要病理特征的自动分割与定量分析,为病程监测提供客观依据,但当前方法仍

严重依赖专家手动标注,既引入主观偏差又受限于数据质量。

结论: 当前研究面临的主要挑战包括数据标注标准不统一、训练样本小以及模型决策机制缺乏可解释性等问题。未来研究应着力构建多模态数据融合架构、开发边缘计算友好的轻量化模型,并建立循证医学导向的标准化验证体系,以促进深度学习技术向 AMD 临床诊疗实践的实质性转化。

眼科多模态人工智能的应用与展望

第一作者: Zhang YI

目的: 研究多模态人工智能在眼科领域内的应用现状。

方法: 聚焦多模态 AI 技术,融合眼科影像(如 OCT、眼底彩照等)、文本、功能检测(如视野报告)等不同类型数据,通过构建深度学习模型,结合临床测试集验证模型效果。

结果: 影像 - 影像融合: Eye2Gene 模型预测 IRD 致病基因,整体准确率达 83.9%; 影像 - 文本融合: MEDL 模型预测青光眼视野缺损的 MAE 为 3.575 dB,优于单模态影像模型(3.903 ~ 4.131 dB); 影像 - 功能融合: FusionNet 模型检测青光眼性视神经病变,内部测试集准确率 87.8%,外部验证集 82.0%,优于单模态模型; 多模态 AI 的核心优势是信息整合能力,能提升疾病诊断准确率,但存在数据对齐与标准化、计算和样本需求高、临床可解释性不足等问题。

结论: 1. 多模态 AI 为眼科疾病早期筛查、精确诊断和个体化治疗提供了新可能; 2. 未来需解决现存技术挑战,结合基础模型与具身智能发展; 3. 眼科 AI 将从辅助阅片拓展至预防、诊断、治疗、康复及慢性病管理的全周期健康管理,推动诊疗从“经验医学”迈向“数据驱动,全程智能”。

糖尿病黄斑水肿抗 VEGF 治疗应答分类集成机器学习研究

第一作者: Yu FANG

共同作者: Jianwei LIN, Tsz Kin NG, Peiwen XIE, Guihua ZHANG, Huishan ZHU

目的: 本研究旨在整合 3D-OCT 特征和临床变量,构建机器学习模型以预测抗 VEGF 治疗效果。

方法：本研究纳入了糖尿病性黄斑水肿患者的医疗记录及三维光学相干断层扫描（3D-OCT）图像。根据连续三次抗血管内皮生长因子（VEGF）药物治疗一个月后的最佳矫正视力，将 3D-OCT 图像划分为视觉反应良好组与视觉反应不良组。研究人员采用 11 种自动分类模型，对图像及临床特征进行抗 VEGF 治疗反应评估，并选取表现最佳的前三种模型构建集成模型，最终在测试数据集中进行验证评估。

结果：本研究共纳入 142 例患者、170 只眼睛的 3D-OCT 图像。筛选出 20 项影像学与临床特征，用于构建抗 VEGF 治疗应答预测模型并进行验证。在 11 种机器学习模型中，自适应提升（AdaBoost）、梯度提升（GradientBoosting）与轻量级梯度提升机（LightGBM）的表现优于其余 8 种模型。基于这三种最优模型构建的集成模型在测试集中表现出色：敏感度达 0.941，特异度达 0.882，准确率达 0.912，且受试者工作特征曲线下面积达到 0.976。

结论：本研究开发了一种基于 3D-OCT 图像与临床特征的集成机器学习算法，用于自动评估糖尿病性黄斑水肿患者对抗 VEGF 治疗的反应。该模型能够有效预测抗 VEGF 治疗的疗效，为临床医生制定个体化治疗方案提供决策支持。

集成异步与实时交互功能的远程医疗平台在眼科护理中的应用研究

第一作者：Hongyan DUAN

目的：为解决眼科专科医生资源紧张且地域分布不均、慢性眼病（如青光眼、糖尿病视网膜病变）患者随访困难及术后患者管理成本高等临床问题，本研究于 2024 年 1 月-2025 年 6 月在我国华北地区共 5 个省份的 12 家基层医疗机构（含社区卫生服务中心、县级医院）及 3 家三级眼科专科医院开展，旨在设计并评估一款综合性远程医疗平台。该平台通过整合“异步沟通”与“实时视频交互”两种模式，构建高效、可及、连续的眼健康服务网络，以实现优化医疗资源配置、提升诊疗效率及改善患者随访依从性与满意度的目标。

方法：在异步沟通（Store-and-forward）模块中，基层医生借助标准化设备采集患者眼底彩照、光学相干断层扫描等影像数据，经安全通道上传至平台，眼科专家可随时登录平台，非实时完成影像审阅、诊断并回传报告，从而实现高效的远程筛查与初步诊断；在实时视频随访与会诊模块中，平台集成高清、低延迟视频通话功能，一方面用于为青光眼、白内障术后等病情稳定的患者提供远程视频复诊，

医生可直接观察患者恢复情况并开展问诊，另一方面支持多方专家进行“面对面”实时视频讨论，共同共享患者资料并制定精准诊疗方案。

结果：该平台成效显著，异步诊断模块处理的 1001 例基层筛查病例中，与三级医院院内诊断的一致性达 92.3%（Kappa 值 = 0.87， $P < 0.001$ ），患者获取专家诊断的时间从传统转诊模式的（ 21.5 ± 4.2 ）天缩短至（ 6.8 ± 1.5 ）小时；实时视频模块成功承载 63.7%（499/783 例）的常规术后随访，患者随访率从传统电话随访的 58.2% 提升至 89.5%（提升 31.3%），同期基层医疗机构眼科线下门诊量减少 28.6%；患者满意度调查（采用 Likert 5 级量表）显示，平台在“就医便捷性”、“服务及时性”维度的平均得分分别为 4.62 ± 0.38 分、 4.57 ± 0.41 分，89.1% 的患者表示“愿意持续使用该平台接受眼健康服务”。

结论：集成异步沟通与实时视频功能的远程医疗平台，是革新传统眼科护理模式的有效工具。该平台成功打破地理与时间限制，在优化医疗资源配置、提升诊疗效率及患者依从性方面发挥重要作用，为构建更高效、可及的眼健康服务体系提供了可靠解决方案。

FS-LASIK 和 SMILE 术后 5 年角膜高阶像差和有效光学区分析

第一作者：Jie QIN

共同作者：Jiayu LI, Fengju ZHANG

目的：评估飞秒激光辅助原位角膜磨镶术（FS-LASIK）和小切口微透镜摘除术（SMILE）治疗近视 5 年后的角膜高阶像差（HOAs），并结合有效光学区（EOZ）的形态，研究近视消退的相关因素。

方法：本横断面研究收集了接受 FS-LASIK 手术 116 眼和接受 SMILE 手术的 126 眼术后 5 年的数据，包括屈光结果、角膜地形图、HOAs、上皮厚度（ET）和视觉质量（QoV）问卷。根据角膜曲率图，将 EOZ 的形态分为均一型、领结型、半环形、钥匙孔型和不规则型。

结果：角膜中央 4 mm 和 6 mm 范围的总角膜和角膜前表面的球差 FS-LASIK 组大于 SMILE 组（ $P < 0.05$ ）。在角膜中央 6 mm 范围，半环型组（19.42%）较均一型组（55.37%）的角膜前、后表面表现出更大水平彗差（ $P < 0.05$ ），前者与水

平偏心有关 ($r = -0.723$, $P < 0.05$)。在角膜中央 4 mm 范围, 总角膜和角膜前表面的负球差, 钥匙孔型组 (10.33%) 最大 ($P < 0.05$), 聚焦困难更明显 ($P < 0.05$)。在高度近视患者中, 近视消退的概率钥匙孔型组是均一型组的 21.323 倍 ($P < 0.05$)。中央和旁中央之间的角膜上皮厚度差异每增加 1 μm , 近视消退的可能性就增加 29.30% ($P < 0.05$)。

结论: SMILE 似乎比 FS-LASIK 具有更少的角膜高阶像差。为了提高高度近视患者的视觉质量, 必须关注中心切削的重要, 以实现均一型的有效光学区, 并监测上皮重塑以防止近视消退。

Ray-tracing-guided FS-LASIK 和 Q-factor guided FS-LASIK 老视手术的临床疗效评估及影响因素

第一作者: Bingqing LI

共同作者: Fengju ZHANG

目的: 本研究对近视合并老视患者在 Ray-tracing-guided FS-LASIK 和 Q 值调整 FS-LASIK 术后观察其临床疗效和相关影响因素, 采用优化单眼视设计。

方法: 纳入 58 名患者 (106 只眼, 2024 年 10 月至 2025 年 9 月), 全光塑组 25 名患者 (50 只眼); Q 值 FS-LASIK 组 28 名 (56)。术前和术后均进行了常规眼部检查 (裸眼视力、ADD、离焦曲线、角膜 Q 值、眼轴长度和眼前节生物参数)。对比敏感度 (CS) 参数和 InnovEyes Sightmap 波前像差评估患者的客观视觉质量, 使用问卷评估主观视觉质量, 并评估手术的安全性及有效性。

结果: 所有受试者均成功完成手术, 未出现并发症。全光塑老视手术术后 3 个月效果趋于稳定, 患者术后中、近距离视力、对比敏感度、离焦曲线、视觉质量均较 Q 值 FS-LASIK 组呈现优异的临床效果; 全光塑组术后一个月 27% 患者近视力 $\geq \text{Jr1}$, 82% 的患者近视力 $\geq \text{Jr2}$, 93% 眼的患者近视力 $\geq \text{Jr3}$; 术后三个月 38% 患者近视力 $\geq \text{Jr1}$, 73% 的患者近视力 $\geq \text{Jr2}$, 88% 眼的患者近视力 $\geq \text{Jr3}$ 。Q 值 FS-LASIK 组术后一个月 18% 患者近视力 $\geq \text{Jr1}$, 67% 的患者近视力 $\geq \text{Jr2}$, 80% 眼的患者近视力 $\geq \text{Jr3}$; 术后三个月 25% 患者近视力 $\geq \text{Jr1}$, 66% 的患者近视力 $\geq \text{Jr2}$, 83% 眼的患者近视力 $\geq \text{Jr3}$ 。术后三个月全光塑组和 Q 值 FS-LASIK 组优势眼的对比敏感度分别为 8.57 ± 2.27 和 7.45 ± 2.68 ($P = 0.550$), 存在差异。术后三个月全光塑组在高阶像差 HOA, 球差没有显著增加, 和 Q 值 FS-LASIK

组有统计学意义。同时全光塑组在角膜 Q 值变化 (趋向于正) 方面更优于 Q 值 FS-LASIK 组, 有统计学意义。全光塑组患者术后满意度达 98%, Q 值 FS-LASIK 组 96%。

结论: 全光塑组和 Q 值 FS-LASIK 组对与年龄相关性调节不足合并近视患者双眼视觉均提供了安全性和有效性。全光塑组在术后中、近距离视力、对比敏感度、离焦曲线、视觉质量均较 Q 值 FS-LASIK 组呈现优异的临床效果; 影响预测性的相关因素为: 年龄、术前等效球镜、ADD、瞳孔大小、术前角膜 Q 值等。全光塑老视相关研究目前国内外属于空白, 根据患者的年龄及老花的程度 (ADD 值大小), 老视手术设计术后效果有所差异, 还需进一步收集样本量, 进行相关研究, 长期随访和观察。

SMILE pro、SMILE 3.0 和 SMILE 4.0 在矫正中低度近视散光术后的临床疗效对比研究

第一作者: Qin WANG

共同作者: Qizhi ZHOU

目的: 对 SMILE pro、SMILE 3.0 和 SMILE 4.0 矫正中低度近视散光患者术后的安全性、有效性和可预测性, 以及对散光的矫正效果进行比较, 为临床屈光不正患者提供最优的手术术式选择奠定基础。

方法: 选取行 SMILE pro、SMILE 3.0 和 SMILE 4.0 的屈光不正患者 203 人 (373 眼), 完善术前相关检查, 排除手术禁忌症并行相关手术, 于术后 1 天、1 月随访裸眼视力 (UCVA)、最佳矫正视力 (CDVA)、球镜、柱镜度数; 用 SPSS 25.0 软件对数据进行统计分析。

结果: 最终纳入 SMILE pro 组 72 人 (131 眼), SMILE 3.0 组 62 人 (115 眼), SMILE 4.0 组 69 人 (127 眼)。在术后第一天, 三组的 UDVA 达到 20/20 或更高的比列分别是 71.76%、76.52 和 88.98%, 术后 1 月时分别是 91.60%、97.39% 和 100%, 三组间比较有统计学意义 ($P < 0.05$), 组间比较发现 SMILE 4.0 组与其余两组比较均有统计学意义 ($P < 0.05$)。术后 1 天, 三组等效球镜 (SE) 在 $\pm 0.50 \text{ D}$ 范围的比列分别是 60.30%、97.39% 和 96.85%, 术后 1 月, 分别是 72.52%、98.26% 和 97.64%, 三组间比较有统计学意义 ($P < 0.05$), 组间比较发现 SMILE pro 组与其余两组比较均有统计学意义 ($P < 0.05$)。术后一天的 SE 比较发现 SMILE pro 与其余两组间比较有统计学意义 ($P < 0.05$), 其中 SE 最大的是 SMILE pro 组; SMILE pro 组的术后一天和一月的 SE 比较有统计

学意义 ($P < 0.05$)。术后一天, 三组 CDVA 为行数不变或更佳的比列分别是 76.34%、72.17% 和 88.19%, 术后一月时, 以上比列分别为 96.95%、98.26% 和 100%。在术后一天和术后一月时, 三组散光度数小于 0.5 D 的眼比列分别是 73.30%、99.10%、98.20% 和 84.72%、98.26%、100%, 三组间比较有统计学意义 ($P < 0.05$), 组间比较发现 SMILE pro 组与其余两组比较均有统计学意义 ($P < 0.05$)。

结论: 三种手术方式矫正中低度近视散光均是安全有效的, 表现最为突出的是 SMILE 4.0。

SMILE 术后角膜上皮与生物力学变化及相关性研究

第一作者: Lei LI

共同作者: Gang LIANG

目的: 探讨飞秒激光小切口角膜基质透镜取出术 (SMILE) 术后三月角膜上皮厚度与角膜生物力学变化及相关性。

方法: 选取研究对象为 72 例在云南大学附属医院屈光中心接受 SMILE 手术、并完成术前及术后随访的患者, 其手术参数为中度切削比, 角膜帽厚度 120 μm , 光学区直径 6~6.5 mm。在术前及术后三月分别使用 Corvis ST 进行角膜生物力学测量, 并利用高分辨率眼前节相干光断层扫描 (HD-OCT) 测量角膜上皮厚度, 测量区域包括中央区 (0~2 mm)、旁中央区 (2~5 mm)、中周区 (5~7 mm) 和周边区 (7~9 mm)。分析 smile 角膜上皮与生物力学变化及相关性。

结果: 术前中央区、旁中央区、中周区和周边区的角膜上皮厚度分别为 $47.43 \pm 3.73 \mu\text{m}$ 、 $46.01 \pm 6.86 \mu\text{m}$ 、 $44.92 \pm 2.70 \mu\text{m}$ 和 $42.89 \pm 2.56 \mu\text{m}$; 术后三月为 $52.76 \pm 4.70 \mu\text{m}$ 、 $52.00 \pm 3.89 \mu\text{m}$ 、 $47.35 \pm 2.92 \mu\text{m}$ 和 $42.06 \pm 2.52 \mu\text{m}$; 表明中央区、旁中央区及中周区角膜上皮均呈现增厚趋势, 而周边区角膜上皮则出现变薄现象。在角膜生物力学方面, 术后三个月与术前相比, A1L、A1V、A2L、HC Radius、A1T、ARTh 和 SPA1 参数显著减小, 而 HCPD、HC Def.A、CBI、DA RATIO 和 Integr.Radius 参数则显著增大, 这些变化均指示角膜整体生物力学性能下降, 角膜变软。相关性分析进一步揭示, 术后上皮厚度变化量 (ΔET) 与 HCPD 变化量 (ΔHCPD)、HC Def.A 变化量 ($\Delta\text{HC Def.A}$) 和 A2T 变化量 (ΔA2T) 呈显著正相关 ($r = 0.29$ 、 $r = 0.49$ 、 $r = 0.34$, $P < 0.05$)。这意味着当这些生物力学参数

增大 (表明角膜变软) 时, 角膜上皮会相应增厚。同时, ΔET 与 SSI 变化量 (ΔSSI)、DA RATIO 变化量 ($\Delta\text{DA RATIO}$) 和 A1T 变化量 (ΔA1T) 呈显著负相关 ($r = -0.27$ 、 $r = -0.24$ 、 $r = -0.30$, $P < 0.05$)。这提示当这些参数减小 (也表明角膜生物力学性能减弱) 时, 角膜上皮呈现增厚趋势。尽管 A1L、A1V、A2L、A2V、HC Radius、HC time、Integr.Radius、ARTh 和 SPA1 等参数的变化与 ΔET 未显示显著相关性 ($P > 0.05$), 但综合来看, 角膜上皮增厚可能是其对 SMILE 术后角膜生物力学强度下降的一种代偿性适相关性分析进一步揭示, 术后上皮厚度变化量 (ΔET) 与 HCPD 变化量 (ΔHCPD)、HC Def.A 变化量 ($\Delta\text{HC Def.A}$) 和 A2T 变化量 (ΔA2T) 呈显著正相关 ($r = 0.29$ 、 $r = 0.49$ 、 $r = 0.34$, $P < 0.05$)。这意味着当这些生物力学参数增大 (表明角膜变软) 时, 角膜上皮会相应增厚。同时, ΔET 与 SSI 变化量 (ΔSSI)、DA RATIO 变化量 ($\Delta\text{DA RATIO}$) 和 A1T 变化量 (ΔA1T) 呈显著负相关 ($r = -0.27$ 、 $r = -0.24$ 、 $r = -0.30$, $P < 0.05$)。这提示当这些参数减小 (也表明角膜生物力学性能减弱) 时, 角膜上皮呈现增厚趋势。尽管 A1L、A1V、A2L、A2V、HC Radius、HC time、Integr.Radius、ARTh 和 SPA1 等参数的变化与 ΔET 未显示显著相关性 ($P > 0.05$), 但综合来看, 角膜上皮增厚可能是其对 SMILE 术后角膜生物力学强度下降的一种代偿性适应机制。

结论: SMILE 术后角膜上皮和生物力学特性均发生显著变化, 角膜上皮的增厚可能代表了一种对生物力学强度下降的适应性补偿, 这对于术后角膜的稳定性和功能维持具有重要意义。

Smile 术后角膜上皮重塑多区域动态变化与影响因素分析

第一作者: Lei LI

共同作者: Gang LIANG

目的: 探讨飞秒激光小切口角膜基质透镜取出术 (smile) 术后早期角膜上皮厚度在不同分区的动态演变规律, 及与手术参数、患者特征的相关性

方法: 选择 2024 年 9 月-2024 年 12 月在我院行 smile 手术的近视及散光患者 35 例 70 眼, 分别于术前、术后 1 周、术后 1 月、术后 3 月行频域眼前节相干光断层扫描 (HD-OCT), 对患者行角膜上皮厚度中央区 (0~2 mm)、旁中央区 (2~5 mm)、中周区 (5~7 mm)、周边区 (7~9 mm) 测量。研究 smile 术后早期角膜上皮变化及

与手术参数相关性（切削比、角膜帽厚度、角膜帽直径），患者特征（等效球镜、术前角膜厚度、术前上皮厚度、年龄）相关性。

结果：同区域上皮厚度存在统计学差异（ $p < 0.001$ ），呈从中央区到周边区递减的趋势；不同时间上皮厚度增长存在统计学差异（ $p < 0.001$ ），增长速率呈 $1\text{ wk} > 1\text{ mo} > 3\text{ mo}$ ；随时间的变化不同区域上皮厚度增长趋势不同（ $p < 0.001$ ），增长量呈旁中央区 $>$ 中央区 $>$ 中周区 $>$ 周边区。3 mo 中央区上皮厚度较术前增加（ $6.04 \pm 3.97\text{ mm}$ ），与等效球镜、切削比呈显著正相关（ $P < 0.001$ $P = 0.001$ ），与角膜帽厚度呈显著负相关（ $P = 0.007$ ），与术前角膜厚度、术前上皮厚度、角膜帽直径、年龄（ $P = 0.598$ $P = 0.872$ $P = 0.165$ $P = 0.941$ ）均无显著相关性。

结论：角膜上皮中央厚周边薄，smile 术后角膜上皮厚度增长速率呈术后至术后 1 周内最快，术后 1 周至 1 月次之，术后 1 月至 3 月上皮速率最慢，达相对平稳状态；增长量呈旁中央区最多，中央区次之，中周区较少，周边区最少；术前等效球镜越高、切削比值越大、角膜帽厚度越薄则术后角膜上皮增长量越多。

TICL 植入术后屈光意外处理与结果分析

第一作者：Liangyong ZHU

目的：回顾分析一例 TICL 屈光意外的处理过程，分析 ICL 术后屈光意外产生原因并提供解决思路。

方法：27 岁女性患者，规培医生，因“双眼远视力差 10 余年”就诊，检查双眼 UCVA: 0.06, BCVA:1.0; 原镜视力右眼 0.6, 左眼 0.4; NCT 右眼 20 mmHg, 左眼 19.7 mmHg, CCT 右眼 556 μm , 左眼 549 μm ; ACD 右眼 3.32 mm, 左眼 3.27 mm。常规眼部检查和辅助检查未见明显异常。屈光检查：验光右眼 $-9.00/-1.75 \times 5 = 1.0-$ ，左眼 $-9.25/-1.25 \times 175 = 0.8+$ ；晶体计算计算预定：右眼 $-12.0/+2.0 \times 89$ ，左眼 $-11.5/+1.5 \times 85$ ，术者选择上方切口完成手术。

结果：术后 1 天，右眼 UCVA 0.6，切口轻度水肿，电脑验光： $+0.25/-1.75 \times 120$ ，晶体逆时针转至 16° 。手术调整晶体位置到植入位，调位后 1 天 UCVA 0.6+，电脑验光： $+0.50/-1.75 \times 112$ ，予观察。调位后 1 月术源性散光相对稳定，复查右眼 UCVA 0.6，综合验光： $+0.25/-1.25 \times 110 = 0.8+$ ，晶体仍逆时针转至 16° ，计算切口术源性散光有 0.96 D，残留散光主要为晶体旋转与术源性散光所致。将眼内 ICL 晶体的屈光度，换算为综合验光度数 $-8.85/-2.00 \times 15$ ，与残余度数 $+0.25/-1.25 \times 110$ 进行

THIBOS 矢量计算得 $-9.82/-0.80 \times 7$ ，为全眼综合验光结果，以此计算订购 ICL 晶体度数 $-12.0/+1.0 \times 97$ ，因晶体习惯位于 16° ，因此选择更换一枚 $-12.0/+1.0 \times 81$ 放于 16° 方向。右眼更换后 3 月复查 UCVA 1.2，电脑验光： $+0.25\text{ DS}$ 。

结论：1. 当切口较长、较靠近视轴时会引起一个较大的术源性散光，易产生屈光意外；2. 上方切口术源性散光较大，足矫的 TICL 或验光无散光患者谨慎选择上方切口；3. 当 TICL 习惯发生旋转时，应选择合适于其旋转后轴位的度数；4. 散光具有矢量性，处理屈光意外时散光需进行矢量计算，不能对验光度数做单纯加减。

面板编号：REF-1140

TransPRK 术后角膜上皮愈合延迟 5 例病例报告

第一作者：Chunxiao YAN

共同作者：Lijun ZHANG

目的：分析 5 例（9 眼）智能脉冲技术辅助的经上皮准分子激光角膜切削术后角膜上皮愈合延迟的病因以及诊疗思路，回顾角膜损伤愈合的机制，加强屈光手术围手术期的安全性。

方法：回顾总结 2019 年至 2023 年我院屈光中心发生的 5 例（8 眼）表层屈光手术术后角膜上皮愈合延迟的病例。

结果：5 例患者在双眼接受 SPT-TransPRK 手术术后 3 天后双眼角膜上皮发生不同程度的愈合延迟，其中 1 例（1 眼）患者在发现角膜愈合延迟后通过清创不健康角膜上皮联合角膜绷带镜、局部抗生素/激素眼膏包眼制动恢复角膜上皮屏障，另外 1 例（2 眼）患者在发现角膜上皮迁延不愈后，一眼通过局部促上皮修复/激素眼膏包眼制动愈合，另一眼通过清创联合羊膜遮盖术恢复角膜上皮屏障功能。另外 3 例（5 眼）患者在角膜上皮愈合延迟后继发严重程度不一的病毒性角膜炎，通过追问病史和早期足量的眼局部联合全身抗病毒治疗，停止使用皮质类固醇滴眼液同时使用角膜上皮再生、角膜神经修复等药物促进角膜上皮屏障的修复，并适当使用抗生素滴眼液预防可能合并的角膜细菌感染。待角膜上皮修复后，在局部继续应用抗病毒药物的基础上，小量、逐步使用皮质类固醇滴眼液预防角膜上皮浑浊。本文 5 例（8 眼）患者治疗后最短半年的随访，裸眼视力均在 1.0 以上，未见 0.5 级以上 haze。

结论：表层角膜屈光术后角膜上皮的正常愈合与患者术前的眼表健康状况、术后摘角膜绷带镜的时间、个体差异等因素有关。当术后角膜上皮愈合延迟时，

改善患者的眼表健康状态，适当延长角膜绷带镜的使用时间，单独眼膏包眼制动，羊膜覆盖等手段均是促进角膜上皮愈合的有效办法。当出现长期角膜上皮愈合延迟且上述方法效果不明显时，要高度怀疑合并病毒感染，需早期诊断、局部及全身的抗病毒药物、暂停皮质类固醇类药物点眼、人工泪液等药物促进角膜上皮再生、抗生素滴眼液预防合并细菌感染，上皮修复后再抗病毒的基础上，合理应用皮质类固醇预防角膜上皮混浊，患者仍可最终获得优异的视力及视觉质量。

不同比例散光的屈光不正患者植入 EVO-ICL 后残留散光对术后视觉质量的影响

第一作者：Huiqin ZHANG

目的：探讨在 EVO-ICL 植入术中，对于不同比例散光的近视患者，残留散光对其术后光学质量与视觉功能的影响。通过对比接受散光型 ICL (TICL) 实现完全矫正与接受非散光型 ICL (ICL) 后存在低度残留散光的患者，明确散光矫正的临床意义与适用范围。

方法：本研究为前瞻性队列研究，共纳入 40 例患者 (80 只眼)，平均年龄 26.61 ± 7.52 岁，均行 EVO ICL (V4c) 植入术。根据术前散光比例 ($A\% = \text{柱镜度数 [DC]} / \text{球镜度数 [DS]}$) 将受试眼分为两组：TICL 组 ($A\% = 25.67 \pm 10.87\%$) 接受全散光矫正；ICL 组 ($A\% = 11.02 \pm 2.70\%$) 则存在计划性低度残留散光。所有眼术后矫正远视力 (CDVA) 均达 20/20 或更佳。于术后 3 个月进行全面评估，内容包括未矫正 (UDVA) 与矫正远视力 (CDVA)、球镜等效 (SE)、眼压，以及 4 mm 与 6.5 mm 瞳孔直径下的波前像差。采用调制传递函数 (MTF)、点扩散函数 (PSF)、对比敏感度 (CS) 与视觉质量 (QoV) 问卷，分别评估客观与主观视觉质量。

结果：两组患者术前基线资料及术后 UDVA、CDVA、SE、眼压均无统计学差异。波前像差分析显示组间差异：TICL 组在 4 mm 与 6.5 mm 光学区下，与散光相关的像差 (C3 [45/135° 散光]、C5 [90/180° 散光] 及 C11 [次级散光]) 均显著降低 ($P < 0.05$)；与之相反，ICL 组上述像差均显著增加 ($P < 0.05$)，且 TICL 的像差削减效应在 6.5 mm 大光学区更为显著。此外，两组在全眼像差、高阶像差 (HOA) 及球面离焦 (C4) 方面，术后均呈现可比性的显著降低。在 MTF、PSF、CS 及 QoV 问卷评分等综合视觉质量指标上，两组间未观察到显著差异。

结论：本研究证实，在 ICL 植入术中，球镜矫正与散光矫正对术后视觉质量的影响具有不同侧重：球镜矫正是获得高分视力的基础，而散光矫正则特异性作用于控制散光相关像差。TICL 能有效消除此类像差，且其光学优势在生理性大瞳孔条件下更为凸显。然而，低度残留散光 (约球镜的 11%) 虽在像差仪上呈现客观升高，却未在短期内引发患者主观视觉质量或核心功能指标的显著下降。此结果揭示了散光矫正可能存在“临床阈值效应”，提示 TICL 的应用效益在散光比例超越某一特定临界值时方得以充分体现，这为临床精准制定个体化手术方案提供了重要依据。

光迹追踪引导飞秒准分子激光术中不同光学区设计对术后视觉效果影响的对比研究

第一作者：Lu XIONG

共同作者：Xue BAI, Zheng WANG, Jiawei WU

目的：探讨在光迹追踪引导飞秒激光辅助原位角膜磨镶术 (Femtosecond Laser-Assisted in Situ Keratomileusis, FS-LASIK) 中，采用不同直径光学区矫正近视与近视散光的安全性及有效性。

方法：回顾性分析接受光迹追踪引导 FS-LASIK 治疗的 66 例 (126 眼) 近视或近视散光患者临床资料。根据光学区 (Optical Zone, OZ) 直径将患者分为 6.5- 组 (OZ: 6.0–6.5 mm) 与 6.5+ 组 (OZ: 6.6–7.0 mm)。所有患者均于术前及术后 3 个月完成全面眼科检查，检测指标包括未矫正远视力 (Uncorrected Distance Visual Acuity, UDVA)、矫正远视力 (Corrected Distance Visual Acuity, CDVA)、综合验光结果、平均角膜曲率、中央角膜厚度、计划与实际最大消融厚度、4 mm 及 6 mm 瞳孔直径下全眼波前像差，以及采用视觉质量问卷评估患者主观视觉感受。

结果：两组患者术后均获得良好屈光准确性与稳定性，组间比较差异无统计学意义 (均 $P > 0.05$)。术后 3 个月，6.5- 组与 6.5+ 组达到 UDVA 20/16 及以上的眼数占比分别为 80%、76%，组间差异无统计学意义 ($P = 0.064$)；6.5- 组中 CDVA 提升 1 行及以上者占 65%，6.5+ 组占 55%，组间频数比较无显著差异 ($P = 0.342$)。此外，两组在等效球镜度数、屈光散光、手术诱导散光、差异向量、平均角膜曲率及计划与实际最大消融厚度方面比较，差异均无统计学意义 (均 $P > 0.05$)。在 6 mm 瞳孔直径下，6.5+ 组全眼波前像差 (包括高阶像差、球差、彗差及垂直彗差) 显著低于 6.5- 组 (均 $P <$

0.05)。两组间患者视觉质量问卷评分比较无显著统计学差异 ($P > 0.05$)。

结论: 光迹追踪引导 FS-LASIK 治疗近视与近视散光中, 选择更大直径光学区安全可行, 既能保证与小直径光学区相当的视觉效果, 又可有效降低 6 mm 瞳孔直径下全眼波前像差, 为临床光学区的选择提供参考依据。

博鳌探索老视矫正新技术: 角膜层间嵌入式微透镜

第一作者: *Wei CHEN*

共同作者: *Mimi LIU*

目的: 评估在博鳌乐城医疗先行区使用角膜层间嵌入式微透镜 (Flexivue Microlens) 矫正老视的安全性和有效性。

方法: 本研究为一项前瞻性病例研究, 纳入自 2024 年 1 月起接受角膜层间嵌入式微透镜 (Flexivue Microlens) 植入的 20 例老视患者。所有手术均在博鳌乐城医疗先行区完成, 先行区允许国际获批医疗器械的早期临床应用。微透镜植入于患者非主视眼, 并采用 “Smart Monovision” 增强型单眼视机制矫正老视。主要评估指标包括术眼与双眼 UCNVA、BCNVA、UCDVA、BCDVA, 并观察角膜内皮状态、角膜形态变化, 最长随访时间为 20 个月。

结果: 随访结果显示, 植入角膜层间嵌入式微透镜 (Flexivue Microlens) 后, 双眼未矫正近视力 (UCNVA) 平均提升 4-5 行, 术眼未矫正远视力 (UCDVA) 下降约 2 行, 双眼 UCDVA 无明显变化。最佳矫正远、近视力 (BCDVA、BCNVA) 均未出现下降。结果显示良好的安全性, 无严重不良事件。患者满意度高, 大多数患者自述近距离视功能明显改善, 并表示愿意推荐该治疗方案。

结论: 角膜层间嵌入式微透镜 (Flexivue Microlens) 的安全性与有效性均在博鳌先行先试中得到初步验证, 受试者普遍表现出较高的满意度及推荐意愿。

基于图神经卷积网络进行角膜屈光手术指征判断与术式选择

第一作者: *Xi CHEN*

共同作者: *Chuzhi PENG, Keming YU*

目的: 评估协同中山大学中山眼科中心既往 12000 例手术信息和基于深度学习方法图卷积神经网络 (Graph Convolutional Neural Network, GCNN) 的自动学习系统在判断激光角膜屈光手术指征及选择 SMILE、FS-LASIK、TPRK 手术方式中的有效性。

方法: 构建一个包含多个图卷积层和全连接层的 GCNN 模型, 用于学习术前检查资料 (包括角膜地形图、角膜厚度、眼压等) 的图结构特征。纳入 12000 例角膜屈光不正病例, 其中 8000 例用于训练模型, 其余 4000 例用于验证。通过图学习算法将术前检查指标转换为节点, 指标间相关性定义为边, 形成图数据。采用自适应学习率和批量归一化技术进行模型训练, 使用交叉熵损失函数评估性能。

结果: 经过训练的 GCNN 模型在验证集上表现出优异的判断能力, 对于手术指征的判断准确率达到 97.5%, 手术方式选择的准确率达到 91.3%。与临床标准相比, GCNN 模型的判断结果具有高度一致性 ($r = 0.850$, $P < 0.001$)。在手术指征判断中, 假阳性率为 8.5%, 假阴性率为 15.0%; 在手术方式选择中, 假阳性率为 7.2%, 假阴性率为 9.8%。软件内建评估显示, 模型在手术指征判断和手术方式选择上的最高精度分别为 0.930 和 0.915。

结论: GCNN 自动学习系统在判断角膜屈光手术指征及手术方式选择上展现出较高的准确性, 大样本学习显著提升了判断性能, 表明该系统具有潜在的临床应用价值。

基于眼后房结构参数的有晶状体眼后房型人工晶状体 (ICL) 植入术后拱高预测新模型的研究

第一作者: *Qin WANG*

共同作者: *Qizhi ZHOU*

目的: 纳入眼后房结构相关参数, 拟合得到 ICL 拱高预测新模型, 评价新模型的准确性。

方法: 收集 2021 年 03 月至 2022 年 12 月于爱尔眼科重庆眼视光眼科医院就诊并实施 ICL 植入术的患者 70 人 (92 眼), 收集其术前眼部结构参数, 于术后 1 个月测量拱高, 使用 SPSS (26.0) 软件进行数据统计分析, 采用 Spearman 相关分析和简

单线性回归关系评估拱高与术前眼部生物参数的相关性，采用多元逐步回归分析构建预测拱高的模型。收集 2023 年 01 月至 2024 年 10 月于同院就诊并实施 ICL 植入术的患者 140 人（204 眼），于术后 1 个月测量拱高，收集其术前眼部生物参数，并用 UBM 测量小梁睫状突角（TCA），用新模型计算出预测拱高，评估预测拱高中达到正常拱高（250 μm –1000 μm ）眼的百分比，采用组内相关系数（ICC）、BlandAltman 检验、95% 可信区间（95% CI）和 95% 一致性界限（95% LoA）评价新模型预测拱高与实际拱高的一致性和准确性。

结果：纳入预测模型的样本平均年龄为 28.18 ± 7.07 岁。拱高与等效球镜度（SE）、水平角膜直径（WTW）、前房深度（ACD）、前房容积（ACV）、水平睫状沟直径（hSTS）、瞳孔直径及最大睫状体厚度（CBTmax）呈正相关，与年龄、眼压（IOP）、晶体悬韧带距离（CLR）及小梁–睫状体角（TCA）呈负相关。简单线性回归分析显示：年龄、SE、CBTmax、TCA、WTW、ACD、垂直睫状沟直径（vSTS）和 CLR 与拱高的相关性具有统计学意义（ $P < 0.05$ ）。拱高预测模型（调整后 $R^2 = 0.54$ ）为：拱高（ μm ）= $-1711.69 - 166.80 \times \text{ICL 尺寸} + 378.62 \times \text{WTW} + 506.75 \times \text{ACD} - 11.75 \times \text{TCA}$ 。在验证队列中，该模型显示出临床实用性：88.2% 的预测结果落在理想拱高范围（250–1000 μm ）内，95.1% 的误差在 $\pm 500 \mu\text{m}$ 范围内。预测拱高与实际拱高的相关系数为 0.51（ $P < 0.01$ ），预测值与实际值的偏差为 203.20 μm ，95% 一致性界限为（ -175.30 – 581.70 ） μm ，标准差（SD）为 193.10 μm ；预测拱高与实际拱高的组内相关系数（ICC）为 0.51（95% 置信区间：0.40–0.60）。

结论：纳入眼后房结构参数 TCA 的拱高预测新模型可有效降低 ICL 植入术后拱高异常的发生概率，可作为 ICL 尺寸选择的新方案。

屈光不正人群青光眼患者管理

第一作者：Wei PENG

目的：探讨屈光手术门诊术前眼健康检查青光眼早期筛查有效的检测方法和流程管理。

方法：回顾性分析本人自 2021 年 1 月~2025 年 8 月年通过眼科常规屈光术前检查及常规体检筛查出生理性大视杯患者 23 例，高血压症 8 例，确诊原发性开角型青光眼患者 11 例，原发性闭角型青光眼患者 5 例临床资料。包括病史、症状、体征、视力、眼压、裂隙灯，眼底镜检查及（或）眼底影像检查、视野检查及光学相干断层成像（optical

coherence tomography, OCT），超声生物显微镜（ultrasound biomicroscopy, UBM）及随访记录。

结果：原发性开角型青光眼 11 例（22 只眼），17 只眼早期原发性开角型青光眼，5 只眼进展期原发性开角型青光眼；原发性闭角型青光原发性开角型青光眼 11 例（22 只眼），17 只眼早期原发性开角型青光眼，5 只眼进展期原发性开角型青光眼；原发性闭角型青光眼 5 例（10 只眼），8 只眼临床前期原发性闭角型青光眼，随访期先兆期小发作一只眼，随访期急性闭角型青光眼大发作一只眼。高血压症患者 8 例（16 只眼）生理性大视杯患者 23 例。

结论：屈光门诊基于屈光不正人群进行青光眼筛查可以更早期发现隐匿型的原发性青光眼。科学的筛查流程及随访管理有待于进一步完善；对于青光眼性视神经损害和非青光眼性视神经损害需要科学鉴别，尤其是高度近视眼底改变及视盘倾斜眼底改变；青光眼患者屈光手术的取舍及药物使用需要谨慎。

改良的双切口无粘弹剂 ICL 植入术矫正高度近视的随机对照研究

第一作者：Chunqiao WANG

目的：评价改良的双切口无粘弹剂有晶状体眼后房型人工晶状体（implantable collamer lens, ICL）植入术后的疗效和安全性。

方法：本研究为前瞻性、单中心、单盲、随机对照试验。108 名符合标准的受试者被纳入本研究，以 1:1 的比例随机分至无粘弹剂组或标准治疗组，分别接受改良的双切口无粘弹剂 ICL 植入术或有粘弹剂 ICL 植入术。记录每只术眼的手术用时和术后 2 小时眼压。患者在术后 1 天、1 周、1 月及 3 月进行随访，每次随访都记录并评估了视力、屈光度、眼压、角膜内皮参数、角膜厚度和角膜光密度等眼前节参数的变化。术后 3 月随访时，通过视觉质量问卷对患者的主观视觉质量进行评估。

结果：共有 71 名受试者完成了全部的随访评估，其中无粘弹剂组 34 例（68 眼），标准治疗组 37 例（74 眼）。术后各随访时间点中，两组间视力、屈光度以及角膜内皮参数之间的比较无统计学差异。无粘弹剂组的手术用时明显短于标准治疗组（ $P < 0.0001$ ）。两组眼压在术后 2 小时都出现了明显的上升（ P 均 < 0.0001 ），在术后 1 天有显著的下降（ P 均 < 0.0001 ），随后恢复至基线水平并保持稳定。无粘弹剂组术后 2 小时的眼压上升明显小于标准治疗组（ $P < 0.0001$ ）。两组角膜厚度及角膜光密度在术后 1 天显著增加（ P 均 < 0.05 ），随后

逐渐下降至基线水平。无粘弹剂组术后 1 天 9 点钟方位（主切口同侧）的周围角膜厚度及角膜光密度较标准治疗组更小（ P 均 < 0.05 ）。术后 3 月随访时，无粘弹剂组术后出现光圈的频率更低，且症状的严重程度及对日常生活的影响程度更低（ P 均 < 0.001 ）。

结论：改良的双切口无粘弹剂 ICL 植入术的学习曲线短，操作可控性高，且在术后早期具有较高的安全性、有效性、可预测性和稳定性。它可以大大缩短手术时间，减少术后早期眼压升高和角膜水肿等并发症的发生，并给患者带来更好的主观视觉质量。

摘要编号：204006

面板编号：REF-1135

眼后房结构参数对有晶状体眼后房型人工晶体（ICL）植入术后位置的影响的研究

第一作者：Qin WANG

共同作者：Qizhi ZHOU

目的：观察 ICL 植入术后襻位置，分析与 ICL 襻位置相关的包括眼后房结构的眼部生物参数，以降低 ICL 植入术后襻位置异常的发生率。

方法：选取 2021 年 3 月至 2021 年 12 月在爱尔眼科重庆眼视光眼科医院就诊并实施 ICL 植入术的患者 70 人（89 眼），收集其术前包括 UBM 测量的后房结构在内的眼部结构参数，于术后一月使用 UBM 观察 ICL 襻位置，对襻位置进行描述性统计分析，并选取同一时间段的 ICL 植入术患者 80 人（127 眼），根据术后一月 ICL 襻所在位置分为三组：睫状沟组，睫状体组，睫状体下组。使用 SPSS (26.0) 软件进行数据统计分析，三组襻位置间的各生物参数比较采用单因素方差分析，以 $P < 0.05$ 为差异有统计学意义。

结果：总纳入患者 70 人（89 眼），低拱高组 24 人（27 眼），正常拱高组 18 人（34 眼），高拱高组 28 人（28 眼），三组 ICL 襻所在位置的描述性统计结果显示高拱高组中 ICL 襻主要位于睫状沟（70.54%），正常拱高组和低拱高组的 ICL 襻主要位于睫状体（61.76%）和（63.89%），位于睫状体下最多的是低拱高组（23.15%）。襻位置与拱高存在明显相关性（ $\chi^2 = 98.73$, $P < 0.001$ ）。根据襻位置分成的三个组中，睫状沟组 34 人（47 眼），睫状体组 26 人（42 眼），睫状体下组 20 人（38 眼），三组间拱高、WTW、ACD、等效球镜（SE）、前房容积（ACV）、晶状体厚度（LT）、矢高（CLR）、CBTmax、TCA、ICPD 比较有统计学意义（ $P < 0.05$ ），襻位于睫状沟的拱高最高，屈光度数越高，襻越容易位于睫状体下，襻在睫状体下的 LT 最厚、CLR 最大，襻在睫状体下的 ACV 比在睫状沟大

39.46 mm³，襻在睫状沟的 CBTmax 比在睫状体下大 0.15 mm，襻在睫状体的 CBTmax 比在睫状体下大 0.14 mm，襻在睫状沟的 TCA 比在睫状体小 11.69°，比在睫状体下小 16.09°，襻在睫状沟的 ICPD 最大，在睫状体下最小。

结论：ICL 襻的位置与拱高密切相关，较小的前房容积（ACV）以及更薄、更靠后的睫状体容易导致襻位于睫状体下方，进而增加低拱高风险。襻位于睫状体下方表现出更高的眼压。

摘要编号：210063

角膜屈光性透镜取出术临床研究证据图谱

第一作者：Lulu XU

共同作者：Yan WANG

目的：运用证据图谱方法，评估关于 KLEx 手术临床研究的证据质量。

方法：本研究采用了最新的证据呈现方法学——证据图谱。通过遵循 PICO 原则的检索策略，全面检索了 MEDLINE、EMBASE、Web of Science、Epistemonikos 和 Cochrane 五个数据库中有关 KLEx 临床研究的系统评价和 Meta 分析。同时检索了临床指南相关网站，包括 National Guidelines Clearinghouse、指南国际网络（GIN）、英国国家卫生与临床优化研究所（NICE），以确保所有可用证据的完整性。采用系统评价方法学质量评估工具 -2（AMSTAR-2）评估纳入系统评价的方法学质量，并通过气泡图呈现证据图谱。

结果：共纳入 32 篇系统评价和 Meta 分析，涵盖了 386 项原始研究（其中 129 项为随机对照试验），系统评价占 47.9%。提取出 32 个关注临床结局的 PICO 问题，涉及临床疗效、干眼、角膜生物力学、高阶像差等，包括 11 个干预类别和 24 个疗效结局指标。27 篇系统评价的方法学质量被评为“低”或“极低”。KLEx 与其他经典的角膜基质和表层切削手术在安全性、有效性和可预测性方面相似。在术后早期，KLEx 手术在角膜生物力学（角膜滞后量 CH、角膜阻力因子 CRF）、干眼参数和像差（总高阶像差、球差和彗差）方面可能优于飞秒激光制瓣的准分子激光原位角膜磨镶术（FS-LASIK）。仅有 4 项质量“低”或“极低”的研究比较了 KLEx 与有晶状体眼人工晶状体（ICL）植入术，ICL 植入术在安全性、有效性、可预测性以及像差引入方面可能优于 KLEx，但证据质量较低，结论未明确。

结论：证据表明，KLEx 与其他屈光手术相比，具有相同的安全性、有效性和可预测性。然而，KLEx 在维持泪膜质量和角膜生物力学稳定性（主

要通过 CH 和 CRF 评估) 方面可能更具优势。建议未来开展随访期更长、设计更严谨的高质量随机对照试验, 以进一步验证其长期有效性与安全性。

高度近视患者 SMILE 与 FS-LASIK 术后角膜形态的对比研究

第一作者: Riping ZHANG

目的: 评估 SMILE 与飞秒激光辅助 LASIK 矫正高度近视患者术后角膜形态的差异。

方法: 本研究纳入 108 例高度近视患者 (每组 54 眼), 分别接受 SMILE 或 FS-LASIK 手术。采用 Scheimpflug 地形图系统分析直径 2-7 毫米区域的角膜屈光力 (corneal refractive power, CRP), 并将环间差值定义为相对角膜屈光力 (relative corneal power, RCP)。分析直径 2-7.2 毫米区域 (14 个同心环, 0.4 毫米间隔) 的角膜厚度空间分布 (corneal thickness spatial profile, CTSP), 并检测直径 6 毫米区域的角膜高阶像差。

结果: 术后 3 个月随访显示, 与 SMILE 相比, FS-LASIK 术眼引起的球差 ($\Delta 0.32 \pm 0.15$ vs. $0.15 \pm 0.13 \mu\text{m}$, $P < 0.001$) 和总高阶像差 ($\Delta 0.69 \pm 0.35$ vs. $0.51 \pm 0.25 \mu\text{m}$, $P < 0.01$) 增幅显著更大。FS-LASIK 术眼呈现更显著的中央区平坦化 (顶点区域: $P < 0.01$; 2-4 毫米区域: $P < 0.001$), 而 SMILE 术眼则引起更明显的周边形态改变 (6-7 毫米区域: $P < 0.05-0.001$)。两种术式的彗差均与偏心量和功能光学区 (functional optical zone, FOZ) 具有相关性 ($R^2 = 0.45$, $P < 0.001$)。SMILE 术眼的球差主要与最大周边相对角膜屈光力 (maximal peripheral relative corneal power, MPRCP) 相关 ($R^2 = 0.52$, $P < 0.001$), 而 FS-LASIK 术眼的球差则同时与 MPRCP 和 FOZ 存在关联 ($R^2 = 0.58$, $P < 0.001$)。

结论: SMILE 与 FS-LASIK 手术矫正高度近视术后引起的角膜形态改变有所不同, 因此术后角膜像差有明显的差异, FS-LASIK 所引起的球差及总高阶像差改变更大。

中国 218 例威廉姆斯综合征儿童的眼部特征研究

第一作者: Jiayan FANG

共同作者: Wen SUN, Lu YUAN

目的: 威廉姆斯综合征 (WS) 是一种由 7q11.23 区域微缺失导致的多系统神经发育障碍。本研究旨在评估中国威廉姆斯综合征患儿的眼部临床表现。

方法: 本研究回顾性纳入了经基因确诊的威廉姆斯综合征 (WS) 患儿, 并通过分析其临床数据来获取视力、屈光度数、光学生物测量参数、斜视发生率、鼻泪管阻塞发生率、睑内翻及倒睫发生率等。

结果: 本研究共纳入 218 例威廉姆斯综合征患者 (男性 134 例; 女性 84 例), 中位年龄为 4.15 岁 (四分位距 3.61 岁)。屈光分析显示, 70.18% (153/218) 的患者存在具有临床意义的屈光不正, 其中近视占 28.44% (62/218), 远视占 5.50% (12/218), 散光占 62.39% (136/218); 7.34% (16/218) 的患者存在屈光参差 (≥ 1.00 D)。眼部生物测量数据 (154 例患者, 308 只眼) 显示平均眼轴长度为 21.67 ± 0.90 毫米, 平均角膜曲率为 44.07 ± 1.66 D。斜视患病率为 7.34% (16/218), 主要为内斜视 (11/218, 5.05%)。外眼检查发现: 46.79% (102/218) 为双侧先天性鼻泪管阻塞, 25.23% (55/218) 存在睑内翻, 20.64% (45/218) 患有过敏性结膜炎, 0.92% (2/218) 存在上睑下垂。

结论: 威廉姆斯综合征 (WS) 是一种复杂的多系统遗传性疾病, 其眼部表现具有多样性。本研究发现, WS 患者屈光不正发生率较高, 且以散光为主。我们观察到其眼轴长度较同龄人群偏短。在斜视类型中, 内斜视为主要表现形式。鼻泪管阻塞、睑内翻等外眼疾病也较为常见, 这可能与 7q11.23 缺失造成的弹性蛋白缺失有关。这些眼部临床表现值得在中国 WS 患者中引起早期临床关注。

中青年内斜视患者术后复发的临床特征分析及探讨

第一作者: Jing HE

共同作者: Jing CHEN, Zongyue LV, Weiwei ZHOU

目的: 探讨和分析中青年内斜视患者术后内斜视复发的临床特征。

方法：回顾性病例研究分析。收集 2020 年 9 月至 2025 年 8 月在深圳市眼科医院因内斜视术后复发进行二次手术治疗的 25 例患者，排除残余性内斜视、知觉性内斜视、外斜术后过矫的内斜视以及非共同性内斜视，对患者的年龄、复发时长、双眼屈光状态、眼位、看远和看近的斜视度以及双眼视功能进行分析和讨论。

结果：25 例患者年龄范围为：15 ~ 46 岁（平均为 29.96 ± 8.68 岁），距离上次手术到复发时长：1 ~ 23 年（平均为 6.45 年），屈光状态：等效球镜双眼为远视 5 人，一眼为远视一眼为近视 3 人，双眼近视 17 人，25 例患者中屈光参差共 8 人，所有患者最佳矫正视力均 ≥ 0.9 。术前眼位（角膜映光法）为 $+10^\circ \sim +35^\circ$ ，视野弧检查斜视度看近看远相差 $> 6^\circ$ (> 10 PD) 比例：右眼注视为 76%，左眼注视为：68%。存在 II 级融合视 / 及 III 级立体视共 7 人，占比 28%。在除双眼远视以外的 20 例患者中，看远斜视度大于看近 ≥ 10 PD 的比例为 40%。

结论：中青年内斜复发的患者多发生在近视患者，且其复发时看远内斜度数大于看近内斜度数居多，其临床表现与 Bielschowsky 型共同性内斜视类似，推测存在同样的发病机制，即存在过度使用调节（调节痉挛）以及相应的集合增多。对于内斜视再次复发的患者，建议门诊就诊时可先进行调节集合功能检测和评估，特别是早期复发患者，有助于此类患者治疗方案的确立和优化。

全身麻醉对微循环系统的影响

第一作者：**Qingkai MA**

共同作者：**Lixia FENG**

目的：利用光学相干断层血管成像技术探索全身麻醉对微循环系统的影响。

方法：使用 RTVue XR Avanti 获取在全麻下行单眼斜视手术患儿的未手术眼的术前和术后第一天的黄斑血管图像，利用配对 t 检验分析前后差别，利用 Person 相关性分析比较不同参数对变化值的影响。

结果：本研究中共纳入单眼斜视手术患者对照组 19 人 19 只眼。受试者平均年龄为 10.05 ± 1.27 岁。研究发现，全麻手术后，未手术眼的颞侧和鼻侧的浅层黄斑区血管密度显著下降（术前： 46.99 ± 3.53 ，术后 42.46 ± 4.83 ， $P = 0.019$ ）。以上变化数值与全麻持续时间具有显著相关性（ $r = 0.62$ ， $P = 0.012$ ）。

结论：全身麻醉可造成儿童术后微循环容量减少；控制手术时间能减少全身麻醉对微循环的影响。

单眼弱视治疗有效性：一项系统评价和网状 Meta 分析

第一作者：**Jia-hao TAN**

目的：弱视作为一种严重影响视力的疾病，存在多种临床干预措施，然而这些干预措施之间的疗效差异尚未明确。因此，本系统综述及网络 Meta 分析旨在确定各种干预措施的疗效排序。

方法：系统检索收录在 PubMed、Embase、Web of Science 和 Cochrane Library 四大电子数据库中的相关文献。研究对象为无残余性弱视的弱视患者。干预措施包括单光眼镜、每日遮盖弱视眼 2 小时、6 小时或全天遮盖、每日一次或每周两次使用 1% 阿托品滴眼液、光学压抑、压抑膜、全天遮盖联合电子游戏以及 6 小时遮盖联合阿托品治疗等共 18 种干预措施。主要结局指标为弱视眼最佳矫正视力的改善。仅纳入随机对照试验（RCT）。两名研究人员独立提取资料，并使用 Cochrane 偏倚风险评估工具独立评估原始研究的质量。Meta 分析采用多元随机效应模型，在频率学框架内进行拟合计算。

结果：在 1482 篇筛选的文章中，共有 22 篇被纳入网状 Meta 分析。与单光眼镜相比，全天遮盖联合电子游戏治疗方案（MD = 0.27；95% CI [0.06, 0.48]）和遮盖 6 小时联合阿托品治疗方案（MD = 0.25；95% CI [0.06, 0.45]）显示出显著的疗效优势。其他干预措施与单光眼镜相比未发现统计学差异。

结论：全天遮盖联合电子游戏治疗方案以及每日遮盖 6 小时联合阿托品治疗方案显示出显著的疗效，可为临床弱视治疗提供有价值的参考依据。单光眼镜、每日遮盖 2 小时、6 小时或全天遮盖、每日一次或每周两次使用 1% 阿托品滴眼液、压抑膜等都对视力有改善，但这些干预措施之间不存在统计学差异。

多次视知觉微训练改善儿童弱视神经微可塑性的临床观察

第一作者: Lan Fangf 昂 LAN

共同作者: Gan LU, Li ZHICHAO, Zhao WUXIAO

目的: 探讨多次视知觉微训练对屈光不正性弱视儿童神经微可塑性的影响, 评估其在提升矫正视力、改善双眼视功能及缓解抑制状态方面的临床效果。

方法: 采用自身对照设计, 纳入 2024 年 7 月至 2025 年 3 月在广西壮族自治区人民医院视光中心就诊的 35 例屈光不正性弱视儿童, 平均年龄 (6.80 ± 3.24) 岁。所有患儿在戴镜基础上接受“双眼视知觉神经可塑性训练系统”干预, 每周 5 次, 每次 40 分钟, 连续 4 周共 20 次。分别在训练前 (T0)、训练 5 次 (T1)、10 次 (T2) 及训练结束后 4 周 (T3) 评估矫正视力 (logMAR)、双眼抑制状态、立体视锐度、知觉眼位等指标。

结果: 训练 10 次后, 右眼矫正视力由 0.72 ± 0.04 提升至 0.88 ± 0.04 , 左眼由 0.70 ± 0.06 提升至 0.90 ± 0.05 , 差异均有统计学意义 ($P < 0.001$)。双眼中心凹抑制比例由 51.43% 降至 14.29%, 无抑制比例由 34.29% 升至 57.14% ($P = 0.025$)。精细立体视 (0.8 m 和 1.5 m) 显著改善, 3-4 级比例分别由 48.57%、22.86% 升至 82.86%、71.43% ($P < 0.01$)。训练效果在随访期保持稳定。

结论: 多次视知觉微训练可显著提升弱视儿童矫正视力, 改善双眼视功能并缓解抑制状态, 疗效具有累积效应, 提示其在弱视治疗中具有良好应用前景。

小 BC 角膜塑形镜在近视防控中的应用及临床观察

第一作者: 萍董

目的: 探讨小 BC (基弧) 角膜塑形镜在近视防控中的临床应用效果及安全性。

方法: 选取 2024 年 1 月至 2025 年 1 月在我院接受小 BC 角膜塑形镜治疗的 80 例近视患者 (160 眼), 对其治疗前后的屈光度、眼轴长度、角膜地形图参数等进行观察和分析, 并记录佩戴过程中的不良反应。

结果: 经过 12 个月的随访, 患者平均等效球镜度从 $-3.50 \text{ D} \pm 1.20 \text{ D}$ 降低至 $-0.50 \text{ D} \pm 0.30 \text{ D}$, 眼轴增长速度显著减缓, 年增长量从 $0.30 \text{ mm} \pm 0.10 \text{ mm}$ 降低至 $0.10 \text{ mm} \pm 0.05 \text{ mm}$ ($P < 0.05$)。

角膜地形图显示, 小 BC 设计成功形成了更小的中央治疗区和更大的周边离焦量, 且未出现严重角膜并发症。

结论: 小 BC 角膜塑形镜在近视防控中具有良好的疗效和安全性, 能够有效减缓近视进展和眼轴增长, 是近视防控的有效手段之一。

摘要编号: 209887

面板编号: POS-1156

探讨 A 型肉毒毒素注射治疗急性共同性内斜视的远期疗效及相关因素思考

第一作者: Huifang HAN

共同作者: Aijun HAN, 黄紫玉

目的: 探讨首次注射 A 型肉毒杆菌毒素 (BTXA) 治疗 (AACE) 的远期疗效, 分析影响疗效的相关因素。

方法: 研究对象: 2020 年 1 月 1 日至 2022 年 10 月 31 日住院, 采用 BTXA 注射治疗的 AACE 患者共 62 例。其中男性 43 例, 女性 19 例; 年龄平均年龄为 10.0 ± 6.4 岁 (范围 2-36 岁), 发病平均时间为 9.4 ± 8.6 周 (范围, 0.5-34 周)。随访时间 6 个月-24 个月。所有患者均行头颅 MRI 或 CT 检查以排除神经系统疾病。观察注射前、注射后近期、远期的斜视度及双眼视功能变化; 分析影响预后的相关因素。

结果: 62 例患者, 33 例为 Burian-Franceschetti 型 (II 型), 29 例为 Bielschowsky 型 (III 型)。术前: 看近斜视度为 $41.13 \pm 17.04 \text{ PD}$, 看远斜视度为 $45.40 \pm 17.14 \text{ PD}$ 。正位率: 注射后 2 天 74.2% (46/62)、6 个月 91.9% (57/62)、1 年以后 80.7% (46/57)。复发的大部分患者有近距离过度用眼或感冒发烧史。注射 6 个月后, 有近立体视 ($\leq 400''$) 的患者由 11 例 (17.7%) 增加到 43 例 (69.4%)。分析注射后正位率与相关因素: 术前斜视度、病程、注射眼别、双眼视觉、发病年龄。

结论: 在双眼单视功能破坏前手术, 可以提高术后正位率; 斜病程超过 6 个月, 斜视度不稳定, 特别是有双眼视功能的患者, 通过注射 A 型肉毒杆菌毒素治疗多数患者仍然有效; 小度数斜视, 可采用单眼注射治疗; 近距离过度用眼, 可能是导致斜视复发的诱因。

探讨过敏性结膜炎相关性干眼患儿的睑板腺形态学特征

第一作者: Xiaojiao TANG
共同作者: Lin CHEN

目的: 探讨过敏性结膜炎 (allergic conjunctivitis, AC) 相关性干眼 (dry eye, DE) 患儿的睑板腺 (meibomian glands, MGs) 形态学特征。

方法: 招募季节性过敏性结膜炎 (seasonal allergic conjunctivitis, SAC) 和常年性过敏性结膜炎 (perennial allergic conjunctivitis, PAC) 患儿, 并纳入无过敏及干眼病史的同龄同性别儿童作为对照组。所有受试者均完成 5 项干眼问卷 (DEQ-5) 及眼部检查, 包括下泪河线高度 (TMH)、非侵入性泪膜破裂时间 (NIBUT) 和通过非接触式红外睑板腺成像 (Oculus Keratograph 5M), 基于干眼症评估与管理 (Dry Eye Assessment and Management, DREAM) 研究的 13 种 MG 形态学分级, 评估上、下睑 MGs 的形态学特征。通过受试者工作特征 (ROC) 曲线分析 MGs 形态学特征对 AC 相关 DE 的预测价值。

结果: 共纳入 62 例 AC 患儿 (其中 31 例伴有 DE, 31 例不伴 DE) 和 33 例健康儿童, 平均年龄为 7.67 岁 (5-13.5 岁)。与健康儿童相比, AC 伴 DE 患儿的上睑 MGs 形态学改变更为显著, 而 AC 不伴 DE 患儿与健康儿童之间 MGs 形态学无显著差异。ROC 曲线分析显示, 预测 DE 的 MGs 形态学特征包括缩短的上睑 MGs ($AUC = 0.72$, $P < 0.001$) 和钩状的上睑 MGs ($AUC = 0.71$, $P < 0.001$)。

结论: 本研究发现 DREAM 的 MG 形态分级系统在预测儿童 AC 相关性干眼症方面具有重要价值。儿科眼科医生应重点关注 AC 患儿中缩短型上睑 MG 和钩状上睑 MG 的临床表现。

牵牛花综合征视网膜下液动态观察

第一作者: Wenting WANG

目的: 牵牛花综合征 (Morning Glory Syndrome, MGS) 是一种罕见视盘发育异常, 常合并视网膜脱离, 其视网膜下液来源存在争议, 主要有脑脊液渗漏与玻璃体腔液体渗入等假说。本文通过报告两例在激光治疗中观察到视网膜下液动态

变化的特殊 MGS 患儿, 旨在探讨其视网膜下液的可能来源及病理生理机制。

方法: 回顾性分析两例女性 MGS 患儿的临床资料。病例 1 为 4 岁女童, 因“左眼外斜 2 年”就诊, 合并遗传性球形细胞增多症; 病例 2 为 8 岁女童, 因“右眼斜视 4 年”就诊, 合并先天性心脏病。两例均经眼底检查确诊为 MGS, 并接受盘周视网膜激光光凝术以预防或治疗视网膜脱离。术中及术后密切观察视网膜下液变化情况。

结果: 病例 1 在激光术中意外出现下方视网膜大量视网膜下液, 但术后第 4 天复查时液体完全吸收, 视网膜复位, 后续于坐位下完成补充激光。病例 2 首次激光术后一个月复查见视网膜下液范围增大, 再次激光时术中液体显著增多, 而术后第 1 天复查显示液体已完全吸收。两例均观察到“术中视网膜下液增多、术后迅速自发吸收”的动态过程。

结论: 两例 MGS 患儿在激光治疗期间均表现出视网膜下液一过性增多并快速吸收的独特现象, 难以用传统孔源性或渗出性机制完全解释。推测可能与术中体位改变、激光能量刺激等因素导致视盘缺损处与蛛网膜下腔的潜在通道暂时开放, 脑脊液渗入视网膜下腔, 术后因通道关闭而迅速吸收有关。本观察结果为“MGS 视网膜下液来源于脑脊液”的假说提供了有力的临床支持。

白内障

摘要编号: 202578
面板编号: CAT-1164

2024 年苏州白内障筛查结果分析

第一作者: Yanfeng ZENG

目的: 随着全球老龄化加剧, 白内障等致盲性眼病负担持续增长。本研究旨在探讨人工智能 (AI) 技术在优化眼科疾病的早期诊断、治疗决策及预后预测流程中的应用效果, 重点解决筛查效率不足、医疗资源分配不均等核心问题。依托区域大规模筛查数据, 发挥 AI 在提升诊疗精准性与可及性中的价值。

方法: 苏州理想眼科医院开展苏州各区域白内障筛查项目, 收集 2024 年一月至十二月苏州六个区域共 74887 人白内障筛查相关数据, 医院通过构建眼科 AI 技术体系, 整合不同设备采集的数据, 自动分析筛查患者信息, 建立电子健康档案, 并进行白内障风险预测。

结果: 在苏州 74887 人白内障筛查数据中, AI 分析显示, 白内障可手术人数达 5130, 占比 6.90%;

翼状胬肉人数共 1069，占比 1.43%；到院检查人数共 2703 人，占比 3.61%；其中 2703 例“到院检查”人群数据可纳入预测跟踪，有效降低失访率。

结论：眼科 AI 应用于眼病的筛查诊断，将有助于减少医疗系统对人工的依赖程度，使眼病相关筛查诊断更为快速便捷，从而提升医疗服务的效率及成本效益。区域实践证实 AI 可显著提升防盲效率，尤其适用于资源有限地区。构建人工智能筛查诊断系统可为建立白内障早期临床筛查及防治策略提供参考，推动 AI 向规模化防盲应用转化。

Barrett Ture-K 与六种最新人工晶体屈光力计算公式对焦深延长型人工晶体预测准确性的比较

第一作者：Zhanchi HU

目的：比较 Barrett Ture-K 公式与其他六种最新人工晶体屈光力计算公式对焦深延长型 (Extended depth-of-focus, EDOF) 人工晶体植入术后屈光度预测的准确性。

方法：回顾性研究。纳入 2023 年 1 月 -2024 年 7 月接受白内障摘除联合 EDOF 人工晶体 (ZXR00, ZFR00V) 植入术的患者。所有患者术前均使用 IOLMaster 700 进行眼部参数测量，并通过机器内置公式 (Barrett Universal II, Barrett Ture-K) 和公开的在线人工晶体计算公式 (EVO2.0, Kane, Hoffer QST, Pearl-DGS, Hill-RBF) 计算人工晶体屈光力并预测术后屈光度。术中植入的人工晶体屈光力参考 Barrett Ture-K 公式。术后 3 个月时随访比较 Barrett Ture-K 公式与其他七种人工晶体计算公式术后屈光度预测的平均绝对误差 (MAE) 和均方根误差 (RMSE)，以及七种公式的中位绝对误差 (AEmed)、最大绝对误差 (AEmax) 和绝对误差大小在 ± 0.25 D、 ± 0.50 D、 ± 1.00 D 和 ± 2.00 D 范围内的分布频率。

结果：共纳入研究对象 82 例 82 眼。矫正后预测误差标准差 Barrett Ture-K 最低 (0.035 D)，Hoffer QST 最高 (0.041 D)。Barrett Ture-K 的 MAE、AEmed、AEmax 均最低 (分别为 0.24 D、0.18 D 和 1.13 D)，Kane 的 MAE 和 AEmed 最高 (分别为 0.28 D 和 0.23 D)，Hoffer QST 的 AEmax 最高 (1.52 D)。绝对预测误差在 ± 0.25 D 以内百分比最高的是 Barrett Ture-K (62.2%)，最低的是 Kane (52.4%)， ± 0.50 D 百分比最高的是 EVO 2.0 (89.0%)，Hill-RBF、Hoffer-QST 和 Pearl-DGS 均最低 (86.6%)。总体而言，各人工晶体计算公式的绝对预测误差的差异无统计学意

义 ($P = 0.834$)，在 ± 0.25 D 和 ± 0.50 D 以内百分比的差异亦无统计学意义 ($P = 0.985$)。

结论：新一代的人工晶体度数计算公式预测 EDOF 人工晶体植入术后屈光度时均具有良好的准确性，其中，Barrett Ture-K 公式在预测的准确性、稳定性上可能更具有优势。

ICL 矫正儿童高度近视散光 2 年效果观察 1 例

第一作者：Laiqiang QU

共同作者：Hong YAN

目的：有晶体眼散光矫正型人工晶体 (Toric Implantable Collamer Lens, TICL) 植入术治疗儿童超高度近视合并高度散光随访 2 年报告。

方法：报道 1 例 9 岁男性患儿，双眼病理性近视 (右眼等效球镜 -12.00 D，左眼 -12.25 D) 合并角膜散光 ≥ -5.50 D。经多学科评估排除禁忌后，行双眼 TICL V4c (Starr EVO) 植入术。术后随访 2 年，监测裸眼视力 (UCVA)、最佳矫正视力 (BCVA)、眼压、拱高及轴位旋转角度。

结果：术后 2 年：UCVA 从术前的 20/80 提升至 20/25，BCVA 从 20/40 提升至 20/25，残余散光 ≤ -1.00 D，拱高稳定 ($548 \pm 50 \mu\text{m}$)，TICL 轴位旋转 $\leq 10^\circ$ ，术后 1 周右眼拱高 $685 \mu\text{m}$ ，左眼拱高 $534 \mu\text{m}$ ；术后 2 周右眼拱高 $603 \mu\text{m}$ ，左眼拱高 $493 \mu\text{m}$ ；术后 1 年右眼拱高 $561 \mu\text{m}$ ，左眼拱高 $510 \mu\text{m}$ ；术后 2 年右眼拱高 $508 \mu\text{m}$ ，左眼拱高 $356 \mu\text{m}$ ；术后 2 年双眼角膜内皮计数轻度下降处于正常范围之内。

结论：本病例 2 年的随访结果表明，TICL 植入术后双眼拱高呈现下降趋势但仍然保持在安全范围之内，角膜内皮年损失率低于生理阈值，TICL 植入术对于经过严格筛选的儿童超高度屈光不正患者，能够提供卓越且持久的屈光矫正效果，显著提升裸眼视力。该手术在长期观察中展现出良好的稳定性和安全性，未引起晶状体混浊等严重并发症，并可能为控制病理性近视进展带来积极益处。本研究为 TICL 在低龄儿童这一特殊群体中的临床应用提供了有力的远期效果证据。

OPD 在检测散光型人工晶状体植入术后轴向偏差的临床应用

第一作者: Shanna CHEN

目的: 探讨 OPD 在检测和判断散光型人工晶状体植入术后轴向偏差的意义。

方法: 对植入散光型人工晶状体 (IOL) 患者 29 例 (男 8 例, 女 21 例) 46 眼 (右 27 眼, 左 19 眼), 年龄 (47.14 ± 21.66) 岁, 最后一次随访时间为 (6.62 ± 21.47) 月。术后采用光程差分析仪 (OPD Scan III) 检查, 分析 OPD 眼内散光轴向与术中理论轴向的差别, 判断术后 IOL 轴向偏差的角度。

结果: 25 眼因白内障行白内障超声乳化联合散光型 IOL 植入术 (蔡司 709M 4 眼、蔡司 909M 8 眼、爱尔康 TORIC 4 眼、ART 4 眼、POT 5 眼), 21 眼因高度近视植入有晶状体眼人工晶体 (TICL)。OPD 眼内散光轴向与术中理论轴向的差别 $\leq 5^\circ$ 23 眼 (占 50.00%)、 $\leq 10^\circ$ 10 眼 (占 21.74%)、 $\leq 15^\circ$ 10 眼 (21.74%)、 $\leq 25^\circ$ 2 眼 (4.35%)、 $> 30^\circ$ 1 眼 (2.17%)。偏差 $> 30^\circ$ 1 眼为 TICL 术后, 因其严重影响视力, 给予更换 TICL 尺寸。

结论: 应关注散光型人工晶状体植术后轴向的偏差问题, 可能是术中放置有偏差或术后旋转造成, OPD 是一种客观、快捷、准确的检查方法。

OTUB1 去泛素化修饰 Ku80 来参与调控年龄相关性白内障的内质网相关膜的形成研究

第一作者: Xu LINHUI

共同作者: Li PENGFEI, Guan HUANJIN, Ji MIN

目的: 探讨线粒体内质网相关膜 (MAMs) 在年龄相关性白内障 (ARC) 发病过程中的潜在作用, 并进一步 X- 射线修复交叉互补蛋白 5 (XRCC5/Ku80) 对 MAMs 结构与功能调控的具体机制以及去泛素化修饰对 Ku80 蛋白表达的调控机理。

方法: 以临床 ARC 患者、小鼠、人晶状体上皮细胞株 SRA01/04 以及 SD 大鼠晶状体为研究对象。采用透射电镜技术观察 MAMs 形态改变; 通过蛋白质免疫印迹 (WB) 检测 MAMs 相关蛋白的表达水平, 邻位连接技术 (PLA) 检测 MAMs 蛋白如 IP3R-GRP75-VDAC1、PTPIP5-VAPB 等之间的相互作用。利用 CRISPR-Cas 基因编辑系统成功建立了 Ku80 敲除的 SRA01/04 细胞系 (Ku80 KO 细胞)。Ca²⁺ 动态成像实验评估 Ku80 KO 细胞中 Ca²⁺ 变化。免疫沉淀 (IP) 与 PLA 检测 Ku80 与

MA 相互 MAM 蛋白作用。质谱法筛选 Ku80 的去泛素化酶。通过计算机虚拟筛选法确定淫羊藿苷为靶向 OTUB1 的激动剂。取 SD 大鼠透明晶状体观察晶状体混浊程度的变化。利用裂隙灯眼前节照相以及光学相干断层成像 (OCT) 技术评估 CFW-Em/J 小鼠晶状体混浊程度。

结果: 透射电镜结果显示, ARC 患者 LECs 中 MAMs 形成增多; 在 ARC 患者、CFW-Em/J 小鼠以及 SRA01/04 氧化损伤模型中, MAMs 相关蛋白包括 Mfn2、GRP75、PTPIP51 等表达显著升高。在 Ku80 KO 细胞中 MAMs 相关蛋白包括 Mfn2、GRP75、PTPIP51 等表达显著升高 ($P < 0.05$)。ARC 患者晶状体前囊膜中钙离子的平均浓度为 $0.21 \pm 0.04 \mu\text{g/mL}$ 。IP 结果提示 Ku80 与 GRP75 存在相互作用, 且通过 GRP75 负调控 MAMs 复合物 IP3R-GRP75-VDAC1 的形成。质谱结果显示, OTUB1 与 Ku80 存在相互作用, 且 Ku80 的泛素化水平在过表达 OTUB1 后显著降低。CHX 实验发现过表达 OTUB1 减缓了 Ku80 蛋白的降解速率 ($P < 0.05$), 且 IP 结果显示 OTUB1 靶向去除 Ku80 的 K27-linked 泛素链, 且抑制其自噬降解。同时激光共聚焦拍摄结果显示, 在正常 SRA01/04 细胞中, 过表达 OTUB1 不会影响细胞内 Ca²⁺ 的变化, 而会抑制 Ca²⁺ 向线粒体的传递, 在 Ku80 KO 细胞中过表达 OTUB1 则对 Ca²⁺ 的传递没有影响。虚拟筛选技术确定小分子药物淫羊藿苷与 OTUB1 存在潜在的相互作用。CHX 实验发现淫羊藿苷处理减缓了 Ku80 蛋白降解。晶状体体外培养结果显示, 在培养基中添加 H₂O₂ 后会诱导晶状体混浊, 加入淫羊藿苷后晶状体混浊被有效减轻。同时, 眼前节照相和 OCT 检查发现, 前房注射 H₂O₂ 后小鼠晶状体出现混浊, 同时注射 H₂O₂ 和淫羊藿苷能有效阻止小鼠晶状体混浊。

结论: Ku80 缺失可促进 IP3R-GRP75-VDAC1 复合物的形成, 破坏 LECs 中 MAMs 介导的 Ca²⁺ 稳态调控, 这可能是 ARC 潜在的发病机制。OTUB1 通过去泛素化作用稳定 Ku80 的表达, 淫羊藿苷作为 OTUB1 的新型小分子激活剂, 通过保护 OTUB1-Ku80 轴的功能延缓 ARC 进展。

SCG5 过表达通过激活 ERK 信号通路促进晶状体上皮细胞的增殖

第一作者: Su XU

共同作者: Fengyan ZHANG

目的: 早发性白内障 (presenile cataract, PC) 是一种常见的致盲性眼病, 其发病机制尚未完全

阐明。晶状体上皮细胞 (lens epithelial cells, LECs) 的异常增殖和迁移被认为在白内障的发生发展中发挥重要作用。然而, 调控这些过程的关键分子仍不清楚。

方法: 本研究通过转录组学分析鉴定早发性白内障与年龄相关性白内障间的差异表达基因, 并筛选出显著上调的 SCG5。随后采用 qPCR 和 Western blotting 验证 SCG5 的表达差异, 分析其对 ERK 信号通路激活的影响。通过质粒转染构建 SCG5 过表达模型, 利用 CCK-8 评估 SCG5 对 LECs 增殖的影响, 并检测 ERK 下游因子的变化。

结果: 转录组分析显示 SCG5 在早发性白内障中显著上调。过表达 SCG5 可激活 ERK 信号通路, 并显著促进 LECs 的增殖。抑制 ERK 信号后, 上述促增殖效应明显减弱。

结论: SCG5 通过激活 ERK 信号通路促进晶状体上皮细胞的增殖与迁移, 可能在早发性白内障的发生中发挥关键作用, 为揭示其分子机制及寻找新的治疗靶点提供了实验依据。

Saracatinib 人工晶状体系统预防后发性白内障的作用研究

第一作者: **Xueli ZHENG**

共同作者: **Yongxiao DONG, Xiaoyong YUAN**

目的: 评估 SRC 激酶抑制剂 Saracatinib 在预防后发性白内障 (PCO) 中的疗效及作用机制。

方法: 采用 TGF β 2 诱导的晶状体上皮细胞 (LEC) 模型和损伤诱导的前囊下白内障 (ASC) 小鼠模型验证药物疗效。通过超声喷雾技术制备聚乳酸-乙醇酸共聚物 (PLGA) 缓释人工晶状体, 实现 Saracatinib 持续释放。裂隙灯检查及伊红染色用于评价晶状体囊膜纤维化程度; CCK-8 法用于检测药物的细胞毒性及抗增殖作用; 伤口愈合实验和 Transwell 实验评估细胞迁移能力; qRT-PCR、免疫印迹和免疫荧光用于分析其抗上皮间质转化 (EMT) 及抗纤维化作用。在兔白内障手术模型中, Saracatinib 缓释 IOL 用于评价其预防 PCO、抗炎效果及生物相容性。

结果: Saracatinib 可抑制 LEC 增殖、迁移、EMT 及纤维化标志物表达, 并在体内减轻前囊下混浊。其作用机制涉及 TGF β /Smad 和 PI3K/Akt 信号通路的抑制。PLGA-Saracatinib IOL 显示出持续的抗 PCO 效果及良好的生物相容性。

结论: Saracatinib 有效抑制晶状体上皮细胞介导的纤维化及后发性白内障。基于 PLGA 的缓释

Saracatinib 人工晶状体为 PCO 预防提供了有前景的策略。

ZXR00 双眼植入和 ZXR00 + ZMB00 混合植入患者的视功能和视觉质量比较

第一作者: **Jiayan FANG**

共同作者: **Jing JIN**

目的: 比较双眼植入 ZXR00 和 ZXR00 + ZMB00 植入两种方案的术后的视力及视觉质量。

方法: 本研究为横断面研究, 收集 2020 年 9 月至 2022 年 9 月在温州医科大学附属眼视光医院行超声乳化白内障吸除并人工晶状体植入术术后 3 个月以上的白内障患者, 根据植入的人工晶状体类型分为两组, ZXR00 双眼植入组和 ZXR00 + ZMB00 组。记录两组患者的验光度数, 双眼及单眼的远 (5 m)、中 (66 cm)、近 (40 cm) 视力, 以及离焦曲线、立体视、Glare&Halo 模拟器、摘镜率、患者满意度、VF-14、QUVID 等数据并进行比较。数据采用 SPSS26.0 软件进行分析, $P < 0.05$ 被认为具有统计学意义。

结果: 本研究为横断面研究, 收集 2020 年 9 月至 2022 年 9 月在温州医科大学附属眼视光医院行超声乳化白内障吸除并人工晶状体植入术术后 3 个月以上的白内障患者, 根据植入的人工晶状体类型分为两组, ZXR00 双眼植入组和 ZXR00 + ZMB00 组。记录两组患者的验光度数, 双眼及单眼的远 (5 m)、中 (66 cm)、近 (40 cm) 视力, 以及离焦曲线、立体视、Glare&Halo 模拟器、摘镜率、患者满意度、VF-14、QUVID 等数据并进行比较。数据采用 SPSS 26.0 软件进行分析, $P < 0.05$ 被认为具有统计学意义。研究共纳入患者 47 例进行统计分析, 其中 ZXR00 双眼植入组 26 例, ZXR00 + ZMB00 组 21 例。两组术后双眼远距离最佳矫正状态下的近距离视力存在显著差异。离焦曲线结果示在 -2.5 ~ -4.0 D, ZXR00 + ZMB00 组的双眼最佳矫正状态下的视力都要显著优于 ZXR00 双眼植入组, 而在 -0.5 D 和 -1.5 D 时, 则不如 ZXR00 双眼植入组。两组之间远中近距离摘镜率, 满意度, 光干扰现象, 视力相关生活质量及不良视觉质量结果均无显著差异。立体视结果显示近距离立体视在两组间存在显著差异。而远距离立体视和中距离立体视在两组间均无显著差异。

结论: 混合植入 ZXR00 和 ZMB00 可以显著提高术后的近视力, 并且保持高水平的视觉质量, 但会造成近立体视的下降。

一例多焦点人工晶体置入术后双眼瞳孔无张力

第一作者: Hongri WU

目的: 介绍并分析白内障术后罕见并发症, 探讨该并发症的处理与预后。**方法:** 对我院一例双眼白内障术后 2 周双眼同时发生瞳孔无张力, 瞳孔散大的患者进行回顾、分析和处理。患者 54 岁, 女性, 无特殊病史, 术前除确诊白内障外, 查体无其它特殊异常, 双眼先后行白内障手术治疗(间隔 1 天), 双眼均置入双焦点人工晶体(眼力健 ZLB00), 术后 1 周双眼视力均为 0.8, 瞳孔正常, 术后 2 周无诱因双眼同时出现瞳孔无张力散瞳, 大约 5.5 mm, 对光反射消失。排除误用散瞳药物及颅脑问题后, 予患者全身用激素、扩血管药物, 及局部缩瞳药无效, 后前房内注射卡巴胆碱缩瞳有效, 连续注射两次后(1 次/日), 局部点眼缩瞳药可维持瞳孔大约 3.0 mm, 患者局部用药 1 年维持瞳孔后瞳孔恢复正常(大约 2.5 mm, 对光反射灵敏)。**结果:** 通过前房注射卡巴胆碱本例患者术后瞳孔无张力得以恢复, 恢复后双眼视力稳定于 0.8。**结论:** 白内障术后瞳孔无张力为白内障术后罕见并发症, 较少的文献提示原因有麻醉、机械损伤、眼底压力、人工晶体、眼内用药、全身因素等, 有文献提示和虹膜缺血有关, 但无确切证据。目前尚无文献报道多焦点人工晶体置入术后并发该并发症, 且目前文献无该并发症发生后瞳孔能恢复的报道, 也没有前房内注射卡巴胆碱的报道。该病例的处理有效, 提示该并发症的病理值得进一步探讨, 也提示该并发症并非完全无法有效处理。

前节 OCT 在鉴别人工晶状体混浊与后囊混浊中的应用

第一作者: Chang DAI

共同作者: Zhe DONG

目的: 强调区分人工晶状体(IOL)混浊与后囊混浊(PCO)的重要性, 并展示前节光学相干断层扫描(AS-OCT)在临床决策中的应用价值。**方法:** 一名 72 岁糖尿病女性患者, 右眼白内障术后 5 年出现进行性视力下降, 病程约 1 年。对其进行了全面的眼科检查, 包括裂隙灯显微镜和 AS-OCT, 以评估人工晶状体和后囊情况。**结果:** 患者右眼植入疏水性 IOL, 左眼植入亲水性 IOL。裂隙灯和 AS-OCT 检查显示右眼 IOL 后半部呈均质性混浊, 并伴有后囊皱缩和增厚, 左眼未见异常。根据影像学表现, 建议行右眼 IOL 置换手术以恢复视力。**结论:** AS-OCT 是一种有助于区分 IOL 混浊与 PCO 的无创检查手段, 可指导临床制定合理的治疗策略, 避免不必要或潜在有害的操作。对于糖尿病患者, 术后定期随访对于早期发现和处理 IOL 相关并发症具有重要意义。

后囊膜连续环形撕囊术对高度近视白内障术后生物学参数及黄斑结构变化的影响

第一作者: Yue ZHANG

目的: 后囊膜连续环形撕囊术(PCCC)是一种可以降低白内障术后后囊混浊发生率的手术方法, 本研究旨在探究 PCCC 对高度近视白内障术后生物学参数及黄斑结构变化的影响。**方法:** 本研究为前瞻性病例研究。选取 2023-01 至 2025-01 于我院行超声乳化联合人工晶状体(IOL)植入术的高度近视白内障患者 100 例 100 眼, 分为 PCCC 组(50 例 50 眼, 行白内障超声乳化联合 PCCC 及 IOL 植入术)和传统白内障手术组(NPCCC 组, 50 例 50 眼, 行白内障超声乳化联合 IOL 植入术)。分别收集术前及术后 1 天、1 周、1 月、3 月最佳矫正视力(BCVA)、眼压(IOP)、眼轴长度(AL)、角膜厚度(CT)、前房深度(ACD), 并比较术前术后的变化; 使用光学相干断层扫描血管成像术(OCTA)测量测量两组患者的黄斑(6*6 mm)各区域视网膜厚度以及视网膜毛细血管血流密度的变化, 并比较两组之间是否存在差异。**结果:** PCCC 组患者术后 BCVA (0.38 ± 0.27) 较术前 (1.17 ± 0.30) 显著提高 ($P < 0.05$); ACD 术前为 (4.64 ± 0.46) mm, 术后为 (4.66 ± 0.46) mm, 增加了 0.014 mm ($P < 0.05$); 术前 AL 和 CT 分别为 (29.84 ± 2.57) mm 和 (0.539 ± 0.03) mm, 术后分别为 (29.84 ± 2.55) mm 和 (0.537 ± 0.03) mm, 手术前后差异均无统计学意义。黄斑区各区域视网膜毛细血管血流密度: PCCC 组术后 1 天、1 周、1 月较术前均减少, 3 月与术前相比无统计学差异; NPCCC 组术后 1 天、1 周较术前减少, 1 月和 3 月与术前相比无统计学意义。两组间比较, 术后 1 个月时 NPCCC 组视网膜毛细血管血流密度显著高于 PCCC 组 ($P < 0.05$), 其余时间节点两组比较无差异。黄斑各区域视网膜厚度: 两组患者在术后 1 天、1 周、1 月时与术前相比厚

度增加，且随时间增长呈递增趋势，术后 3 月趋于稳定，但仍高于术前水平，差异有统计学意义 ($P < 0.05$)。两组间各时间节点比较黄斑各区域视网膜厚度差异均无统计学意义 (P 均 > 0.05)。

结论：白内障联合 PCCC 手术可显著提高患者的视力及视觉质量，患者黄斑区各区域视网膜毛细血管血流密度及视网膜厚度在术后 3 个月时与传统超声乳化白内障手术患者相比无差异。本研究揭示对于高度近视白内障患者而言，PCCC 是安全的手术方式，在提高视力和视觉质量同时不会造成黄斑水肿和黄斑区结构变化。

基于机器学习识别高度近视人工晶状体屈光预测误差的高风险生物测量参数组合

第一作者：Yurui PAN

共同作者：Wenwen HE, Jiaqi MENG, Jiao QI, Keke ZHANG, Xiangjia ZHU

目的：识别高度近视患者中导致人工晶状体 (IOL) 屈光预测误差的高风险生物测量参数组合。

方法：本研究纳入 23,667 例高度近视性白内障（眼轴长度 ≥ 26.0 mm）的参数数据。除常规参数外，还计算晶状体 - 前节比例 (LOR) 及角膜曲率 - 眼轴长度比例 (KAR)，并对所有参数进行标准化处理后，采用 k-means、kernel k-means 及 HDBSCAN 聚类算法进行分析。最终聚类模型依据算法稳定性及临床可解释性确定。随后，从另一包含 2,107 例具有可靠术后屈光数据的病例集中，自动提取与各聚类中心最接近的代表性病例，并在六种 IOL 计算公式 (Barrett Universal II、Cooke K6、EVO、Hoffer、Kane、Pearl-DGS) 下比较其术后屈光误差。

结果：识别出五个具有显著差异的参数簇 ($p < 0.001$)。其中，簇 3 (特征为显著升高的角膜散光) 具有最高的平均绝对误差 (MAE = 1.10 D)；簇 2 (前房最深、白到白最大、晶状体较薄) 次之 (MAE = 0.61 D)；聚类 4 (角膜较陡、眼轴较短) 屈光预测误差最低 (MAE = 0.39 D)。不同聚类间比较时，各公式间的误差差异无统计学意义 ($p = 0.334$)。

结论：高度近视眼可通过无监督聚类方法被客观划分为具有不同屈光预测特征的生物参数组合。基于聚类的表型分型为术前风险分层提供了一种新思路，并有望为人工智能驱动的 IOL 功率计算模型的进一步优化提供参考。

摘要编号：204610

基于根本原因分析的眼科日间手术患者跌倒事件分析与改进对策研究

第一作者：Xu DAN

目的：分析眼科日间手术患者跌倒事件的根本原因，探讨针对性干预措施，以提升患者安全管理水平，保障患者安全。

方法：采用根本原因分析法 (Root Cause Analysis, RCA)，对我院 2024 年 3 月至 8 月发生的 2 例眼科日间手术患者跌倒事件进行回顾性分析。系统梳理事件过程，深入访谈相关患者、家属及医护人员，查阅病历记录及管理制度，综合运用鱼骨图、5 Why 分析法等工具，逐层剖析导致跌倒的系统性与流程性根源因素。

结果：RCA 分析揭示跌倒事件的关键根本原因包括：1. 风险评估盲区：现有跌倒风险评估工具对眼科术后特异性风险（如视力变化、麻醉残留效应、散瞳后视物模糊、短暂性平衡障碍）识别不足，且评估时机（如术后离院前）存在疏漏。2. 宣教针对性不足：内容与形式未能有效覆盖术后跌倒风险及防范要点。3. 流程待优化：术后观察与离院评估流程存在缺陷。4. 环境与设施支持薄弱。基于分析结果，提出以下创新且强临床实用性的改进对策：1. 开发并应用眼科特异性跌倒风险评估工具。2. 构建多维度强化宣教模式（内容、形式、时机）。3. 实施标准化离院安全核查清单。4. 推进环境微改造与相关流程优化。5. 建立跌倒事件快速响应与经验学习机制。

结论：本研究运用 RCA 深入剖析了眼科日间手术患者跌倒事件的系统性根源，揭示了风险评估、宣教、流程及环境等方面的关键问题。所提出的针对性对策紧密结合眼科日间手术特点，聚焦于构建特异性评估工具、创新宣教模式、标准化流程及优化环境，具有显著的可操作性和临床推广价值，可有效降低患者跌倒风险，提升日间手术服务质量与安全。

工作年龄白内障患者临床特征

第一作者：Su XU

共同作者：Fengyan ZHANG

目的：调查工作年龄白内障患者的临床特征。

方法：观察性研究。纳入 18-50 岁的白内障患者，引出有关全身疾病、特应性、日光暴露、药物摄入、

生活方式等详细病史。对单 / 双眼患病患者特征进行了分析和比较。

结果：共 623 例患者入组，其中单眼就诊 272 例，双眼就诊 351 例。患者的平均年龄为 40.73 ± 7.55 岁，女性 278 例 (44.62%)。高脂血症、玻璃体切除术后、准分子激光术后、小梁切除术后及葡萄膜炎是最常观察到的指标。与双眼白内障患者相比，单眼白内障患者术前视力相对较低 ($P < 0.001$)，发病时更年轻 ($P < 0.05$)，且玻璃体切除术后及葡萄膜炎发生率较高 ($P < 0.05$)。无论是单眼还是双眼早发白内障，后囊下白内障都是最为普遍的。

结论：在工作年龄白内障患者中发现高脂血症的高发生率，发病年龄早及术前低视力是单眼患者最显著的特征。

摘要编号：209901

房水检测辅助诊断毒性眼前节综合征一例

第一作者：Chunjie MAO

共同作者：Song CHEN

目的：报道一例通过房水检测辅助诊断白内障术后发生毒性眼前节综合征。

方法：患者左眼白内障术后 16 小时自觉视物模糊，检查发现视力 0.6，前房闪辉 +++，未见前房积脓。为明确诊断，立即取房水进行细胞因子及宏基因检查。

结果：房水检测报告，对送检样本进行 DNA 病原微生物检测，未检测到可疑致病病原体。流式细胞检测房水中细胞因子：VEGF $277.6 \uparrow$ pg/mL (0-40)；BFGF $6.4 \uparrow$ pg/mL (< 1)；IL-6 $28145.2 \uparrow$ pg/mL (1-50)；IL-10 $15.0 \uparrow$ pg/mL (0-5)；VCAM $4962.6 \uparrow$ pg/mL (200-1000)；IL-8 $4120.7 \uparrow$ pg/mL (0-20)。

结论：这个病例提示我们，TASS 是白内障术后罕见的并发症，及时诊断对预后有帮助。对于无法明确病因的白内障术后眼内炎早期进行房水检测，一方面可以检测是否存在致病病原体，避免误诊为感染性眼内炎而耽误治疗；另一方面可以检测炎症因子，特别是促炎因子含量远超过常规白内障术后炎症反应，这一现象或许可以用来辅助 TASS 的诊断。

改良二期人工晶体悬吊术治疗无囊膜支撑无晶状体眼的临床疗效分析

第一作者：Du QIAN

目的：探讨一种改良的二期人工晶体悬吊术在治疗因外伤、手术并发症等原因导致晶状体囊膜支撑缺失的无晶状体眼患者中的安全性及临床疗效。

方法：回顾性分析 2020 年 1 月至 2024 年 12 月期间于我院接受改良二期人工晶体悬吊术的 25 例 (25 眼) 患者的临床资料。本改良术式的核心要点包括：1) 采用下方 5:00-7:00 无隧道聚丙烯缝线巩膜层间潜行缝合固定；2) 应用上方 10:00-2:00 之间放射状巩膜切开，约二分子一深度聚丙烯缝线“8”字缝合巩膜层间固定技术，将聚丙烯悬吊缝线固定于睫状沟水平，简化了缝线固定过程，提高了操作的精确性与可重复性；3) 使用一体式“镂空襻”后房型人工晶体，其襻部通过悬吊缝线固定，形成稳固的支撑结构。观察并记录患者术前及术后末次随访时的最佳矫正视力、术后屈光状态 (等效球镜)、手术相关并发症 (如人工晶体偏位、眼压升高、玻璃体出血、视网膜脱落等) 以及人工晶体的居中性与稳定性。

结果：所有患者手术均顺利完成。术后平均随访 12.3 ± 4.5 个月。末次随访时，患者最佳矫正视力较术前显著提高 ($P < 0.05$)，平均等效球镜为： -0.75 ± 0.50 D。所有植入的人工晶体位置居中、稳定，未发生严重的术中及术后并发症，如人工晶体脱落、眼内炎或威胁视力的视网膜脱落。主要并发症为暂时性眼压升高：2 例 (8%)，经药物控制后恢复正常；少量玻璃体出血 1 例 (4%) 于一周内自行吸收。

结论：本研究所采用的改良二期人工晶体悬吊术，通过优化切口设计、改进缝线固定技术，实现了操作简化、创伤减小及固定稳固的目标。该术式是治疗无囊膜支撑无晶状体眼的一种安全、有效且可靠的方法，能够有效恢复患者视功能，并具有良好的可预测性和较低的并发症发生率，值得在临床中推广应用。

面板编号：CAT-1166

智慧医疗服务平台和青少年视力健康数据的建设研究

第一作者：Yanfeng ZENG

目的：通过智慧医疗服务平台的建设有效收集和管理青少年健康数据。

方法：基于苏州市青少年健康监测项目随机选取了30所中学，收集2023年1月至2023年12月接受视力检查的职高学生，“曙光”智能医疗服务平台的运用在医疗信息采集中可以获取的数据来源进行分类，通过人工智能信息技术，对大量复杂的信息进行妥善地处理，大大提高了传统医院的复杂流程，减轻了患者的负担，提高就诊效率和信息准确率。有效地提升医院的信息采集的效率。裸眼视力采用标准对数视力表测量，检查距离为5米。

结果：采集到接受视觉质量筛查的职高男生共1460例，女生1367例，性别差异无统计学意义（ $P > 0.05$ ）。结果显示男生右眼裸眼视力为 4.348 ± 0.233 ，左眼裸眼视力为 4.411 ± 0.291 ；女生右眼裸眼视力为 4.255 ± 0.228 ，左眼裸眼视力为 4.319 ± 0.297 ；男女生左、右眼裸眼视力相比差异均有统计学意义（ $P < 0.0001$ ），男生视力检查后选择配镜的占42%，女生视力检查后选择配镜的占56%。

结论：智慧医疗服务平台的建设能够根据采集的信息筛选出有近视倾向的青少年并分析当前需要采取的预防措施，这样就能够更好地实现对医疗资源的分配，提供针对性的医疗资源和信息服务，最大程度保障青少年的视力健康，此研究中，职高女生视力低于男生且戴镜率高于男生，可能是女生学习较男生更加刻苦。相对于传统方式，人工智能能够有效地弥补传统人工管理模式中所存在的不足，节约人力成本、减少矛盾，通过科技手段让更多青少年收益。

白内障与阿兹海默病的相关性探索：基于东亚人群的孟德尔随机化研究

第一作者：Shulei MAN

目的：流行病学研究提示，白内障与阿兹海默病（Alzheimer's disease, AD）之间可能存在共同的病理生理基础，如氧化应激、线粒体功能障碍及蛋白质聚集。然而，两者间的因果关系尚未明确。传统观察性研究易受混杂因素及反向因果影响，难以揭示真实的因果方向。本研究旨在利用孟德尔随机化（Mendelian randomization, MR）方法，基于东亚人群的大规模全基因组关联研究（GWAS）数据，系统评估白内障与阿兹海默病之间的双向因果关系，为疾病的早期识别与防治提供新的遗传学证据。

方法：本研究采用双向两样本孟德尔随机化设计（bidirectional two-sample MR）。阿兹海默病 GWAS 数据（ $n = 323, 694$ ）来源于台湾精准医学

计划（Taiwan Precision Medicine Initiative, TPMI），白内障 GWAS 数据（ $n = 178, 726$ ）来源于日本生物银行（BioBank Japan, BBJ），涵盖东亚主要人群。主分析采用反向方差加权法（Inverse Variance Weighted, IVW），并使用 MR-Egger、加权中位数（Weighted Median）与 MR-PRESSO 等方法进行稳健性验证及多效性检验。若存在显著的异质性或水平多效性，进一步采用 MR-PRESSO 校正异常值。使用 R 软件中的“TwoSampleMR”和“MRPRESSO”等包进行数据分析。

结果：正向分析结果（白内障 $\rightarrow$ AD）显示，遗传预测的白内障风险与阿兹海默病风险之间未观察到显著的因果关系（IVW OR = 0.98, 95% CI: 0.78–1.25, $P = 0.89$ ）。MR-Egger、加权中位数及加权模式等多种稳健性分析方向一致（OR 范围 0.79–0.90），均未达到统计学显著性。异质性检验（Cochran's Q $P > 0.05$ ）与多效性检验（MR-Egger 截距 $P > 0.05$ ）均提示分析结果稳健，模型未受偏倚影响。Leave-one-out 敏感性分析亦显示无单一 SNP 主导整体效应。反向分析结果（AD $\rightarrow$ 白内障）显示，遗传预测的阿兹海默病风险与白内障风险呈轻度负相关（IVW OR = 0.97, 95% CI: 0.95–0.99, $P = 0.006$ ），加权中位数与 MR-Egger 结果方向一致且无显著异质性。提示阿兹海默病的遗传易感性可能与较低的白内障风险相关。

结论：基于东亚人群的大规模 GWAS 数据，本研究未发现白内障对阿兹海默病存在显著因果效应，而阿兹海默病的遗传易感性与白内障风险轻度负相关。支持“晶状体-脑轴（lens-brain axis）”可能存在复杂且非线性的遗传联系，并提示未来可通过整合多组学和多族群数据进一步解析二者间的交叉通路，为疾病的早期预测与干预策略提供遗传学依据。

白内障患者双眼植入增效型连续视程人工晶状体术后早期的临床效果

第一作者：Yanxue XU

共同作者：Xiqiao ZHANG

目的：评估双眼白内障患者行白内障超声乳化联合增效型连续视程人工晶状体（intraocular lens, IOL）TECNIS Synergy™ 跃无级® 植入术后的早期临床效果。

方法：回顾性研究。收集2023年4月–2024年12月我院就诊白内障患者，双眼均行白内障超声乳化联合增效型连续视程 IOL TECNIS

SynergyTM 跃无级® 植入共 19 人 (38 眼), 术后随访至少 3 个月。分别收集术后 1 天及术后 3 月的裸眼远视力、中视力、近视力, 术后 3 个月的综合验光、离焦曲线, 并统计患者术后视觉质量问卷 (Catquest-9SF 问卷) 评分及术后看远、看近的脱镜率。

结果: 术后 1 天、3 月裸眼远视力及矫正远视力均较术前裸眼远视力及矫正远视力增加 ($P < 0.05$)。术后 3 月时, 97.6% 裸眼远视力达到或优于 0.1 logMAR, 100% 裸眼中视力达到 0.1 logMAR 及以上, 94.7% 裸眼近视力达到或优于 0.1 logMAR; 100% 术后 SE 在 ± 0.75 D 以内; 术离焦曲线在 0.0 D ~ 3.0 D 形成一个相对平缓的平台, $+1.0 \sim -3.5$ D 屈光范围内视力均优于 0.2 logMAR。术后视觉质量问卷调查时仅有个别患者主动反映用眼时间过长容易视疲劳, 100% 的患者日常活动均没有困难。100% 的患者看远看近均可完全脱镜。

结论: 双眼植入增效型连续视程人工晶状体能提供令人满意的远、中、近视力, 可以获得一个平缓的视力平台, 患者具有较好的视觉质量及较高的生活质量。

白内障手术后计划外再手术的发生率及原因分析

第一作者: Su XU

共同作者: Fengyan ZHANG

目的: 评估单纯白内障手术后计划外再次手术的发生率, 并探讨其原因。

方法: 回顾性研究。纳入在 2024 年 1 月至 2025 年 6 月期间, 在我院接受计划外再手术的患者。所有患者均为先前在任何医疗机构 (包括我院) 接受单纯白内障手术的病例。从病历系统收集并记录手术过程、人口统计学数据和合并症, 以分析术后早期 (术后 < 30 天) 和晚期 (术后 ≥ 30 天) 计划外再次手术的发生率和原因。

结果: 本研究共纳入 199 名患者, 平均年龄为 55.72 ± 16.03 岁。计划外再手术的总发生率为 6.3% (199/3180), 其中早期再手术的发生率为 1.1% (35/3180), 晚期再手术的发生率为 5.2% (164/3180)。最常见的再手术原因包括人工晶状体移位 ($n = 140$)、人工晶状体夹持 ($n = 15$) 及屈光参差 ($n = 15$)。除人工晶状体移位外, 在早期计划外再手术中, 晶状体皮质残留 ($n = 5$) 和角膜后弹力层脱离 ($n = 3$) 是最常见的原因; 而在晚期计划外再手术中, 人工晶状体夹持 ($n = 15$) 和屈光参差 ($n = 12$) 是主要原因。

结论: 单纯白内障手术后计划外再手术的主要原因是人工晶状体移位。

面板编号: CAT-1183

白内障术中悬韧带异常风险的初步预测模型的建立

第一作者: Dehai LIU

共同作者: Hong

目的: 悬韧带异常引起晶状体支持不足, 与晶状体脱位、后囊膜破裂等术中并发症风险增加有关。术前早期识别悬韧带异常对于预防术中不良事件至关重要。本研究旨在建立一个术中悬韧带异常的初步预测模型, 以改进术前风险评估及手术规划。

方法: 连续纳入接受白内障手术的患者。基于术中是否出现悬韧带松弛, 分为悬韧带异常组和对照组。收集术前一般资料 (年龄、性别、眼部及全身病史), 以及 IOLMaster 700 测得的眼部参数等 [眼轴长度 (axial length, AL)、前房深度 (aqueous depth, AQD) 及晶状体厚度等]。采用 LASSO 回归结合 10 折交叉验证选择 3 个关键预测变量, 构建简约预测模型。通过分层交叉验证进行内部验证, 并计算每变量事件数以评估模型稳定性。

结果: 共纳入接受白内障手术的 759 例 (759 眼) 患者。36 眼 (4.7%) 出现术中悬韧带松弛分入悬韧带组, 723 眼分入对照组。单因素分析显示, AQD、AL 及青光眼是与悬韧带松弛最密切相关的预测因素。悬韧带松弛眼的前房较浅 ($OR = 0.122$, 95% CI: 0.055–0.270, $P < 0.001$)、眼轴较短 ($OR = 0.668$, 95% CI: 0.502–0.889, $P = 0.006$), 且青光眼的发生率较高 ($OR = 8.72$, 95% CI: 4.14–18.38, $P < 0.001$)。LASSO 回归结合 10 折交叉验证筛选出 3 个最优预测变量。最终的多变量预测模型在交叉验证中获得较好的预测性能, 受试者工作特征曲线下面积 (AUC) 0.780 ± 0.159 , 灵敏度 80.1%, 特异度 78.3%。Hosmer-Lemeshow 检验显示模型拟合良好 ($P = 0.607$)。基于预测概率进行风险分层, 患者可分为低、中、高风险三组, 各组悬韧带松弛发生率差异显著。

结论: 基于术前参数建立的简约预测模型在术中悬韧带松弛风险评估中表现出较好的预测性能。前房较浅、眼轴较短及合并青光眼是悬韧带松弛的独立危险因素。该初步模型有望为术前风险分层及个体化手术策略提供参考。

摘要编号: 208276

面板编号: CAT-1174

简便悬吊术治疗人工晶状体囊袋复合体脱位综合征一例

第一作者: Li CAIYUN

共同作者: Zhang CHAOJUN

目的: 报道双眼人工晶状体囊袋复合体脱位综合征一例。

方法: 患者何 XX, 男, 65 岁, 因“双眼视物模糊 10 余天”就诊。既往高度近患者何 XX, 男, 65 岁, 因“双眼视物模糊 10 余天”就诊。既往高度近视, 10 余年前行双眼白内障手术。查体: 视力: 右眼: 0.3, 矫正无助; 左眼: 0.1, -3.25 DS/-1.25 DCX 155 → 0.2; 眼压: 右眼: 16 mmHg; 左眼: 20 mmHg。右眼囊袋及 IOL 复合体向颞下方完全移位, 左眼囊袋及 IOL 复合体向颞下方移位, 双眼前囊膜呈白色混浊机化, 玻璃体混浊, 眼底: 双眼可见视盘边界清, 色淡, C/D 约 0.4, 后极部视网膜平伏, 可见大片地图状萎缩灶, 黄斑区色素紊乱, 中心反光未见。入院诊断: (1) 双眼 IOL 囊袋复合体脱位综合征; (2) 双眼 IOL 眼; (3) 双眼高度近视。入院后先行左眼人工晶体悬吊 + 前部玻璃体切除术 (见手术视频)。

结果: 术后 1 周: 视力: 0.2, 眼压: 18 mmHg, IOL 位正; 术后 1 月: 视力: 0.3, 眼压: 19 mmHg, IOL 位正。

结论: 本病例因 CCS 导致晚期 IOL 囊袋内脱位, 此并发症的发生有多方面的因素, 如囊袋机化收缩, 高度近视, IOL 材质, 年龄, 人眼本身原因等。本例患者的治疗方法眼内扰动小, 借助针头穿线, 取材便捷, 适应症更广, 操作简化有效, 但其远期效果和缝线断裂风险还需进一步临床观察。

摘要编号: 203241

面板编号: CAT-1171

继发于既往眼部钝挫伤的后囊膜破裂伴色素沉积: 一例病例报告

第一作者: Ru ZHAO

目的: 报告一例在超声乳化手术中发现的单眼后囊膜异常致密色素沉着病变的特殊病例, 并探讨其潜在的形成机制。

方法: 对一名 50 岁女性患者进行全面的术前眼科评估 (包括房角镜检查), 以排除色素分散综合征 (PDS)。在超声乳化手术中, 对观察到的后囊膜中央色素病变进行仔细的剥离和观察, 对获取的病变组织进行组织病理学分析。

结果: 术中发现一个边界清晰的椭圆形囊膜缺损。组织病理学证实色素组织中存在被激活的肌成纤维细胞。术前评估未发现 PDS 证据。其形成机制被推断为: 既往钝挫伤导致 Wieger 韧带从后囊膜脱离, 引起局灶性囊膜撕裂; 同时, 创伤导致虹膜色素上皮 (IPE) 细胞脱落, 并随房水迁移、沉积于 Berger 潜在间隙。

结论: 该后囊膜色素病变源于外伤性囊膜缺损与 IPE 细胞迁移沉积的双重过程。肌成纤维细胞与色素组织的共存提示二者协同参与了对囊膜缺损的双相修复过程。此病例揭示了外伤作为一种容易被忽略的病因, 可能导致罕见且具有误导性的术中体征。

摘要编号: 201736

虹膜夹型二期人工晶体植入术的远期临床疗效

第一作者: Xin HU

目的: 分析虹膜夹型二期人工晶体植入术治疗外伤后晶体缺损的屈光结果及相关并发症, 总结该术式的远期临床疗效。

方法: 本研究回顾近 5 年浙江省某医院行虹膜夹型二期人工晶体植入术患者的临床资料, 收集患者的年龄、性别、眼别、眼压、受伤类型、术前裸眼视力、最佳矫正视力、IOL 度数以及预留屈光度。记录术后随访时间、随访时眼压、验光、IOL 位置、角膜内皮细胞密度 (CD) 以及相关并发症情况。使用前节 OCT 测量 IOL 至角膜内皮面最近的距离。对所有结果进行统计学分析。

结果: 根据纳入排除标准共纳入病历资料 8 例 8 眼, 平均年龄为 59.7 岁, 均为男性。其中 1 眼为眼球破裂伤, 其余为眼挫伤。术后最佳矫正视力 (LogMAR BCVA) 由 0.03 ± 0.02 提高至 0.35 ± 0.26 ($P < 0.05$), 术后 6 眼较术前 BCVA 提高, 1 眼与术前 BCVA 相同, 1 眼较术前 BCVA 下降。患者术前平均眼压 (13 ± 3 mmHg), 术后为 (15 ± 4 mmHg), 差异无统计学意义。术后总体屈光结果表现为轻度远视 ($+1.25 \pm 1.00$ D)。术后 2 眼 IOL 位置轻度偏移伴虹膜轻度震荡。IOL 平均距离角膜内皮长度约 $1123 \mu\text{m}$, 排除了年龄及内眼手术次数对 CD 的影响后, IOL 到角膜内皮距离对 CD 和 6A 改变无影响。术前术眼 CD 平均为 2538 ± 326 cells/mm²。术后 4 年术眼 CD (排除其中一眼行青光眼滤过手术) 平均为 1994 ± 221 cells/mm², 排除年龄影响后, 在年龄 < 66 岁患者中术前术后 CD 差异有统计学意义, 并发症情况: 1 眼在术后 1 年出现角膜炎, 1 眼术后 6 月出现虹膜睫状体炎, 经局部用药后好转, 1 眼术后 10 月出现

IOL 鼻下移位并行 IOL 复位术，并在复位术后 18 个月后出现角膜雾状水肿。

结论：1、虹膜夹持型二期人工晶体是矫正无晶体眼的一种有效的方式，短期和长期可以显著提高视力。2、虹膜夹持型人工晶体最重要的并发症是损伤角膜内皮，若确需行该术式，患者年龄 < 66 岁时内皮损伤较大，并需要定期随访，及时发现、处理相关并发症。3、术前检查 CD < 2216 cells/mm² 者建议谨慎选择该术式，虹膜夹持型 IOL 对眼球破裂伤 CD 影响比眼挫伤更大。

摘要编号：202647

面板编号：CAT-1169

飞秒激光治疗 ICL 植入术后并发性白内障临床探讨

第一作者：Yan GAO

目的：探讨飞秒激光辅助超声乳化白内障吸除术治疗 ICL 植入术后并发性白内障的手术技巧、手术安全性和治疗效果。

方法：分析 2020 年至 2024 年在我院应用飞秒激光辅助超声乳化白内障吸除术治疗 ICL 植入术后并发性白内障患者 5 例 9 眼（其中 1 例因外伤至 ICL 移位至前房）。其中男性 5 眼，女性 4 眼。患者年龄：39.57 ± 7.57，ICL 植入时间：9.87 ± 2.36 年。平均裸眼视力（UDVA）：0.22 ± 0.12，平均最佳矫正视力（BCVA）：0.44 ± 0.19，眼轴：31.2 ± 1.49 mm，前房深度：3.06 ± 0.196 mm，拱高：274.67 ± 76.44 mm，人工晶状体度数：3.34 ± 4.01 D。人工晶状体类型：单焦点 4 例，单焦散光 2 例，三焦点 3 例。观察手术技巧，手术并发症及术后 3 月裸眼视力和最佳矫正视力。

结果：飞秒激光操作时注意：需要手动标记识别前囊膜位置；调整瞳孔直径大小；激光发射时 ICL 与前囊之间会产生气泡，需要先放出气泡并在二者之间注入粘弹剂后再进行 ICL 取出。术中并发症：前囊撕裂 2 例：因飞秒激光撕囊不连续（1 例外伤 ICL 移位，飞秒激光前囊定位不准，撕囊不连续，1 例在 ICL 取出时导致致伤及前囊口），观察 2 例均为低拱高 110 mm 和 198 mm。但无悬韧带损伤，无后囊膜破裂，所有患者均一期囊袋内植入人工晶状体。术后 3 个月患者平均裸眼视力（UDVA）：0.56 ± 0.23，平均最佳矫正视力（BCVA）：0.80 ± 0.14，均获得满意效果。

结论：飞秒激光辅助的白内障摘除手术在 ICL 术后的并发性白内障患者中展现出了独特的优势。但是也要注意飞秒激光定位的误差可能导致 ICL 损伤，尤其是低拱高。气泡积聚也可能阻碍飞秒激光撕囊及碎核的完成。因此，对 ICL 术后患者行飞秒激光

白内障手术需谨慎规划、掌握手术技巧，才能获得满意手术效果。

摘要编号：202516

面板编号：CAT-1163

飞秒激光辅助与常规超声乳化白内障手术联合焦深延长型人工晶体植入术后视觉效果对比

第一作者：Runhua PENG

目的：对比飞秒激光辅助（FLACS）与常规超声乳化白内障手术（CPS）联合焦深延长型（EDOF）人工晶体植入术后的视觉效果。

方法：回顾性队列研究。选取 2023 年 4 月至 2024 年 9 月东莞光明眼科医院行白内障手术并植入 EDOF 人工晶体的患者，按手术方式分为 FLACS 组和 CPS 组。分别于术前、术后 1 周和术后 1 个月对两组患者进行随访，观察并比较两组患者术前、术后的裸眼及矫正远、中、近距离视力、等效球镜度、离焦曲线、高阶像差（HOAs）、球差、慧差、三叶草差、调制传递函数（MTF）、斯特列尔比（SR）等指标，并按照屈光白内障术后结局报告标准进行报告。

结果：共纳入患者 64 例 64 眼。所有患者术后 1 月均获得良好的裸眼及矫正远、中、近距离视力，术后视觉质量相比术前显著提高（ $P < 0.001$ ）。FLACS 组术后裸眼远距离视力为 0.08 ± 0.07 LogMAR，CPS 为 0.07 ± 0.08 LogMAR，两组间裸眼及矫正远、中、近距离视力、术后屈光度、HOAs、球差、慧差、三叶草差、MTF 和 SR 差异均无统计学意义（均 $p > 0.05$ ）。两组患者离焦曲线在基本一致，在离焦度为 0.0 D 时视力最佳，在离焦度 +1.0 D 至 -2.5 D 之间视力均在 0.2 LogMAR 以上。

结论：飞秒激光辅助白内障手术和常规白内障手术在 EDOF 人工晶体植入术后均能有效提高患者的远、中、近距离视力，并显著改善患者视觉质量，但 FLACS 与 CPS 在术后视力、屈光状态和视觉质量等方面无显著差别。

飞秒激光辅助白内障手术对既往放射状角膜切

开术患者的临床观察

第一作者：Yan GAO

目的：探讨飞秒激光辅助白内障手术（FLACS）对既往放射状角膜切开术（RK）患者的手术效果及安全性。

方法：分析 2022 年 7 月～2025 年 3 月年间接受 FLACS 手术的 RK 患者 16 例 21 眼，其中男性 9 人 11 例，女性 7 人 10 例。年龄：54.47 ± 6.19 岁，平均术前裸眼视力 (UDVA)：0.09 ± 0.11；矫正视力 (CDVA)：0.22 ± 0.12；眼轴：29.86 ± 2.18；平均角膜曲率：36.85 ± 3.18；晶状体厚度：4.57 ± 0.69；白内障分级：C5 3 眼，N2 2 眼，N3 14 眼，N4 5 眼。RK 切割的平均数目为 12.3 ± 4.14；FLACS 应用白力士 Catalys 飞秒激光设备，激光参数设置：5.2 mm 圆形直径的晶状体囊切开术（水平点间距 4 μm，垂直线间距 10 μm，脉冲能量 6 mJ）；人工晶状体 (IOL) 类型：非球面 IOL 19 眼，双焦点 IOL 2 眼；晶状体计算公式是 ASCRS 在线计算和 Barrett True-K 公式。观察术中和术后并发症及术后视力结果。

结果：术后随访为 3 个月：术中所有病例 FLACS 均未出现 PI 脱负压现象；术中发现 1 例前囊膜撕裂，但没有导致后囊膜撕裂，并且 IOL 成功植入囊袋内；角膜放射状切开 (RK) 口无裂开。术后平均 UDVA 和 CDVA 分别为 0.71 ± 0.19 和 0.84 ± 0.12。术后 IOL 位置均正。

结论：RK 患者行 FLACS 手术是相对安全的，术后均获得良好的视觉效果。但要注意手术有前囊膜撕裂的风险，增厚的切口疤痕是不完全激光穿透的潜在来源，可增加激光脉冲能量来避免。

飞秒激光辅助白内障手术应用于先天性白内障中的效果

第一作者：Yanfeng ZENG

目的：研究飞秒激光治疗先天性白内障的效果。

方法：共收集在苏州大学理想眼科医院的先天性白内障 24 人 28 眼。常规术前检查。患者全麻后，用一次性真空吸环吸住患者眼球。然后用飞秒激光进行前囊撕开和角膜切口。然后进行超声乳化术。在 6 岁以下或智力低下的患者中进行了后囊切割和前玻璃体切除术。将可折叠的 IOL 注射到囊袋中。角膜切口水密。

结果：28 眼先天性白内障行 LenSx 飞秒激光辅助白内障手术。所有病例撕囊成功，无术中并发症。撕囊直径可控，且与患者年龄呈负相关。

结论：先天性白内障是眼科较常见的小儿疾病，会引起视力障碍，早期诊断并及时采取有效的方法进行治疗对患儿视力恢复十分重要。目前，临床多采取手术治疗先天性白内障患儿，多数患儿视力恢复较好，但仍存在一定的并发症，对术后恢复造成负

面影响采取何种手术方式，积极预防术中术后并发症，提升患儿术后视力成为临床研究的重点、难点。先天性白内障主要的方法仍是手术，术中能否做到 continuous curvilinear capsulorhexis (CCC)，是手术成败的关键步骤，由于患儿囊膜韧性强的特点，传统手工撕囊难度大，容易造成撕囊口偏心、不规则形、撕裂囊膜，一方面加大术中截开后囊膜难度，另一方面使得人工晶体移位，或不能将人工晶体植入囊袋内，从而影响患儿术后的视质量。本研究采用飞秒激光辅助撕囊，无一例撕囊并发症，手术安全可靠。

高度近视合并白内障患者植入多焦点人工晶体手术前后视觉质量分析

第一作者：Yanfeng ZENG

目的：观察高度轴性近视并发性白内障患者多焦点人工晶体植入手术前后裸眼远视力及恢复情况。

方法：选取 2024 年 7 月 1 日至 2025 年 4 月 10 日于苏州大学理想眼科医院行白内障摘除联合多焦点人工晶状体植入术的轴性高度近视患者 225 眼，依据眼轴长度将患者分组：A 组 (26 ≤ 眼轴 < 28 mm) 125 眼，B 组 (28 mm ≤ 眼轴 < 30 mm) 72 眼，C 组 (眼轴 ≥ 30 mm) 28 眼，记录裸眼远视力，分别于术后 1 天、1 周、1 个月进行随访，记录裸眼远、中、近视力。

结果：三组术前裸眼远视力相比无统计学差异。A、B、C 三组术后裸眼远视力较术前比较显著提高，差异有统计学意义；术后 1 天、1 周、1 个月相比均无统计学差异。A、B、C 三组术后 1 天、1 周、1 个月裸眼中、近视力相比差异均无统计学意义。术后一个月 A、B、C 三组裸眼远、中、近视力相比差异均无统计学意义。

结论：高度近视患者在人工晶体植入手术后视力良好，后随时间推移，逐渐呈上升趋势，在术后 1 个月时，视力趋于稳定；术后 1 个月 A、B、C 三组远、中、近视力比较均无统计学差异 (P > 0.05)；表明术前眼轴长度不影响术后视力恢复。

APOE 通过激活小胶质细胞驱动自身免疫性葡萄膜炎的机制研究

第一作者: Yakun WANG

共同作者: Shengping HOU, Shuhao ZENG

目的: 自身免疫性葡萄膜炎 (AU) 是一类具有不同病因的威胁视力的疾病。其发病机制复杂, 深受科学家的关注。对 AU 患者的转录组学分析显示, 其外周血单核细胞 (PBMC) 中存在高度氧化应激特征以及载脂蛋白 E (APOE) 表达上调。此外, 在实验性自身免疫性葡萄膜炎 (EAU) 的小鼠模型中 APOE 的表达也上调。我们和前人的研究表明, 小胶质细胞与 AU 的发展密切相关。同时, 据报道 APOE 具有从脂质代谢和神经再生等多种功能, 但人们对其在自身免疫性葡萄膜炎发展中的详细机制知之甚少。

方法: 我们的研究采用小鼠 EAU 模型联合单细胞测序、转录组学、蛋白组学来研究 APOE、小胶质细胞和 EAU 之间的关联, 使用小胶质细胞的体外研究进一步探索和验证。

结果: 我们发现 APOE 对 EAU 诱导是必不可少的, 因为 APOE^{-/-} 小鼠未能产生 EAU。使用小胶质细胞的体外研究进一步证明, APOE 与小胶质细胞炎症呈正相关, 这可以通过使用 shRNA 敲低 APOE 来逆转。蛋白质组学分析表明, APOE 介导的小胶质细胞激活依赖于活性氧 (ROS) 途径, 通过肽基脯氨酰异构酶 F (PPIF), 这在 AU 患者来源的 PBMC 中得到了进一步验证。补充 PPIF 可在体外逆转 APOE 缺乏偏斜的 ROS 激活。此外, AAV 介导的 PPIF 过表达加剧了 EAU 表型, 表明其在驱动葡萄膜炎发生中起重要作用。

结论: 综上所述, APOE 通过上调 PPIF 驱动自身免疫性葡萄膜炎发展中的小胶质细胞的激活。

TUDCA 对光损伤小鼠视锥细胞的保护作用及机制研究

第一作者: Wang TING

目的: 研究牛磺酸去氧胆酸 (Tauroursodeoxycholic acid, TUDCA) 对光损伤小鼠视锥细胞的保护作用, 并探究其潜在的调控通路。

方法: 1. 将光敏感的 1 个月龄的 Balb/c 小鼠在自制光照箱中进行照射, 建立小鼠视网膜光损伤模型。接着, 利用该小鼠进行光损伤分子效应和 TUDCA 的干预研究。2. 造模治疗成功后, 应用 ERG 评估各组视网膜功能差异。3. 通过 HE 实验, 探究各组视网膜感光细胞形态结构的改变。4. 应用 Western blotting 和免疫组织化学染色法检测各组视网膜中感光细胞蛋白的表达以及定位情况。5 应用 TUNEL 以及体外细胞实验深入探究 TUDCA 对光损伤小鼠视网膜感光细胞保护机制。

结果: 1. ERG 结果显示, 循环光照造成视功能损害, 而 TUDCA 可以一定程度上挽救光损伤对视功能的损害。2. HE 结果显示, 光损伤导致小鼠视网膜外节段、内节段和外核层明显变薄, 而 TUDCA 治疗组可抑制该现象。3. Western blotting 结果显示, TUDCA 治疗组的视锥细胞特异的视蛋白 (S-opsin) 表达显著上调; 然后免疫组织化学染色法结果显示, 循环光照导致视锥蛋白的运输异常, 而 TUDCA 能有效保护视锥细胞免受循环光照的伤害。4. TUNEL 结果显示, TUDCA 通过其抗凋亡特性有效保护了光损伤小鼠视网膜感光细胞。5. 体外细胞实验结果显示, TUDCA 主要影响参与自噬通路的 pSTAT3 的表达。

结论: 1. TUDCA 对光损伤小鼠的视锥细胞具有保护作用; 2. 光损伤可以激活感光细胞的自噬, 而 TUDCA 可以通过调控自噬保护视锥细胞。

mNGS 确诊罕见菠萝泛菌眼内感染及四年随访见证

第一作者: Yingqian PENG

共同作者: Yun LI

目的: 首次于文献中报道由菠萝泛菌引起的人类感染性眼内炎, 并通过为期四年的前瞻性随访, 印证了宏基因组下一代测序 (mNGS) 对于明确此类罕见与非典型眼部感染病原体的诊断价值。

方法: 病例描述: 详细记录一名 13 岁女童因植物性异物外伤后左眼视力下降、经初始抗炎和广谱抗生素治疗无效的诊疗过程。诊断技术: 在行玻璃体切除手术时, 采集玻璃体及房水样本进行 mNGS 检查。病原体检测: 对房水及玻璃体样本进行宏基因组下一代测序分析, 以无偏倚的方式检测所有病原体核酸。随后通过针对菠萝泛菌特异性基因的 PCR 扩增及 Sanger 测序对 mNGS 结果进行验证。

结果: 一、临床过程: 患者初期被诊断为前葡萄膜炎并接受糖皮质激素和广谱抗生素治疗, 症状一度缓解后加重, 最终发展为全眼内炎。二、病原体鉴

定：mNGS 在房水中检测到高序列值菠萝泛菌特异性序列。随后的 PCR 和 Sanger 测序结果均证实了菠萝泛菌的存在。三、治疗与预后：经玻璃体切除手术、硅油填充及眼内抗生素注射，并结合明确的病原学诊断后，患者感染得到控制。在长达 4 年的随访中，左眼视力稳定在 16/20，视网膜平伏，但黄斑微结构提示黄斑中心凹略显扁平，其内表面欠光滑，呈起伏状。

结论：1. 菠萝泛菌作为一种通常的植物病原体和人类机会性致病菌，可成为感染性眼内炎（尤其是与植物材料相关的眼外伤后）的病原体。其毒力可能较低，但在使用糖皮质激素抑制免疫力后可能导致病情缓慢进展。2. 在临床表现不典型、病史不清或常规治疗效果不佳的眼内炎症病例中，临床医生需高度警惕感染性眼内炎的可能，并与葡萄膜炎相鉴别。3. 宏基因组下一代测序（mNGS）是一种强大的、无偏倚的病原体检测工具，能够快速、准确地鉴定罕见或难以培养的病原体，对于此类疑难病例的及时精确诊断和有效治疗具有关键指导意义，从而改善患者预后。

主动脉夹层术后双眼先后发病内源性真菌性眼内炎 1 例

第一作者：Weiting HAO

共同作者：Guannan HUANG, Long SU, Songtao YIN

目的：从 1 例双眼先后发病的内源性真菌性眼内炎的诊疗过程中总结经验。

方法：回顾性分析该病例诊疗过程。

结果：患者男，45 岁，于 2025 年 3 月 26 日行胸腹主动脉夹层手术，术后双肺不张及感染性病变、右肺慢性肺栓塞、泌尿系感染，给予全身抗生素治疗。4 月 15 日出现右眼红肿、胀痛、流泪伴视力下降，主要表现为前节炎症及感染症状：角膜水肿，房闪+，虹膜瞳孔缘白色病灶，眼底未见明显异常，诊断为右眼内源性眼内炎，当日行右眼玻璃体注药（头孢他啶+万古霉素）+前房穿刺取样培养，建议房水 NGS 检查，患者因经济原因暂拒，典必殊+万古霉素点眼，静脉亚胺培南+万古霉素抗感染，术后 2 日右眼前节炎症减轻，视力提高，左眼正常，心包引流管培养示人葡萄球菌多重耐药。术后第 3 日右眼前房内白色蛛网样絮状物，瞳孔缘白色病灶较前粘稠，视力再次下降，房水培养回报霉菌，停典必殊点眼，当日行右眼前房穿刺取样培养+前房冲洗+注药+玻璃体注药（万古霉素+两性霉素 B），术后万古霉素+两性霉素 B 点眼，4 月 19 至 22 日右眼前房白色粘稠絮状物逐渐加重覆盖瞳孔

区，视力降至指数，房水培养阴性。自出现眼部症状起完善全身检查，头 CT、腹部彩超无阳性发现，胸 CT 肺部炎症基本同前，整个病程白细胞趋势波动上升，最高达 $16.74 \times 10^9/L$ ，中性粒细胞百分比 84.50%，反复低热，最高 $37.5^\circ C$ 。4 月 23 日出现左眼眼红伴视力下降，主要表现为后节炎症及感染症状：房闪++，玻璃体团絮状混浊，视盘水肿，当日头 MR 示脑脓肿伴多发梗死、枕叶出血，痰涂片真菌 2+，血液 NGS：真菌-曲霉菌属检出，拟行左眼手术治疗，但患者于下午突发意识障碍，于 4 月 24 日因脑梗死死亡。

结论：双眼先后发病内源性真菌性眼内炎此前未见类似病例报道，本例患者虽眼部治疗均较为及时，但全身检查多日未明确静脉抗真菌指征，说明内源性眼内炎寻找全身病灶至关重要，尤其应重点关注毗邻组织如脑、鼻窦，易血行播散组织如心、肺、肝脏等。

以单眼视盘前“积脓”及快速进展性视网膜血管炎为首要表现的白塞综合征一例报告

第一作者：Hengwei LIU

目的：探讨一例以单眼急性起病、视盘前“积脓”样改变及快速进展性视网膜血管炎为突出表现的罕见病例的临床特征、诊断思路及治疗策略，提高对该类非典型眼部表现的系统性疾病关联的认识。

方法：回顾性分析一例 28 岁男性患者的临床资料。患者主诉左眼视物变形 1 天，无眼红眼痛。既往有双眼复发性葡萄膜炎及长期免疫抑制剂（环孢素）治疗史，并伴有复发性口腔溃疡及外阴皮疹。入院后完善眼科检查，包括最佳矫正视力、眼压、裂隙灯及广角眼底检查。为排除感染性眼内炎，在给予局部激素（地塞米松）球周注射的同时，行诊断性玻璃体穿刺，取样送检病原微生物宏基因组测序（mNGS）及细菌、真菌培养。结合其全身症状及最新的眼科影像学表现进行系统性鉴别诊断。

结果：患者初诊时左眼视力为 0.1，眼底可见视盘前团状灰白色混浊（模拟“积脓”外观）及黄斑水肿。病情在 48 小时内迅速进展，视力下降至手动/40 cm，并出现显著的玻璃体炎、全周视网膜血管白鞘、散在出血点及水肿。玻璃体液 mNGS 检测及所有病原学培养结果均为阴性，有效排除了细菌、真菌及病毒感染。结合患者青年男性、反复口腔溃疡、外阴皮疹、复发性葡萄膜炎以及典型的视网膜闭塞性血管炎等特征，最终确诊为白塞综合征（贝赫切特病）。治疗上立即启动大剂量甲泼尼龙（500 mg/日）静脉冲击治疗 3 天，后续联合大剂量口服

泼尼松及环孢素（125 mg，每日两次）进行全身免疫抑制治疗，并对视网膜无灌注区行激光光凝术。经过综合治疗，患者眼部炎症得到有效控制。

结论：本病例警示，单眼发病的视盘前“积脓”伴快速进展的视网膜血管炎，即使缺乏典型的前房积脓，也可能是白塞综合征的重要甚至首发眼部征象。对于此类患者，在积极利用 mNGS 等现代检测技术排除感染后，应高度警惕系统性自身免疫性疾病的可能性。详细的全身病史采集和全面的眼科评估是正确诊断的关键。早期、强效的全身免疫抑制治疗是控制炎症、挽救视功能的基石。

女性视觉权利：1990-2021 年全球、区域及国家层面女性盲与视力损害负担研究

第一作者：Lan XIA

共同作者：Peizeng YANG

目的：视力损害与失明在全球范围内对女性造成的影响尤为显著，尤其集中于中低收入国家。本研究旨在评估 1990 年至 2021 年期间全球、区域及国家层面女性盲与视力损害的疾病负担，并分析导致性别差异的主要病因及相关危险因素。

方法：研究数据来源于《2021 年全球疾病负担研究（GBD 2021）》数据库，涵盖 204 个国家和地区。分析内容包括不同社会人口学指数（SDI）水平、年龄组及地理区域女性盲与视力损害的流行病学特征。采用 Joinpoint 回归及趋势分析方法（R 与 Joinpoint 软件）进行统计，主要结局指标包括患病率、伤残生存年（YLDs）及年龄标化率，同时评估病因构成及主要危险因素的贡献。

结果：2021 年全球女性盲与视力损害的患病率为每 10 万人 14,510.97 例，YLDs 为 17,010.96。与男性相比，女性的患病率高出 27.1%，YLD 率高出 17.2%，差异在低 SDI 地区最为显著。女性视力损害的主要病因包括近视力障碍、白内障及屈光不正；主要相关危险因素为环境与家庭空气污染、高体重指数及营养缺乏。

结论：女性承担着显著高于男性的盲与视力损害负担，尤其在欠发达地区，其患病率与伤残率差异尤为突出。研究结果提示应制定并落实以性别为导向的公共卫生策略和干预措施，以减少女性可预防性视力损害，改善全球女性的视觉健康公平性。

玻璃体腔注射美罗培南治疗同性恋螺杆菌眼内炎一例

第一作者：Kuifang DU

目的：探讨内源性同性恋螺杆菌眼内炎的临床特征、诊断及治疗方法，评估玻璃体腔注射美罗培南在此类重症感染中的疗效与安全性。

方法：报告一例 27 岁男性艾滋病合并左眼内源性眼内炎患者。患者因“发热伴左眼疼痛 1 周”入院，既往有艾滋病 10 余年，双眼巨细胞病毒性视网膜炎病 5 年，左眼已失明。查体：左眼无光感，眼球触痛，眼睑充血，球结膜高度水肿，角膜密集 KP，房闪（+++），前房积脓 3 mm，瞳孔后粘连，眼底窥不入。眼眶 CT 及 B 超提示玻璃体腔密度增高，眼球萎缩。全身检查未见其他感染灶。CD4T 淋巴细胞数 132 个/ul，血 HIV 病载阴性。急诊行左眼玻璃体腔穿刺抽吸术，送检宏基因组下一代测序（mNGS）明确病原体。确诊为同性恋螺杆菌眼内炎后，在全身静脉抗感染（美罗培南，后调整为头孢曲松联合多西环素）基础上，予以左眼玻璃体腔注射美罗培南（2 mg/0.2 ml，每 5 天 1 次，共 5 针）及球旁注射治疗。

结果：mNGS 检测结果回报为同性恋螺杆菌。经上述综合治疗后，患者左眼疼痛、红肿症状逐渐缓解。眼部体征显著改善：眼睑及结膜水肿消退，角膜 KP 转阴，前房积脓于 3 周内完全吸收，房闪转阴。治疗 1 个月后门诊随访，左眼炎症完全控制，眼球呈安静萎缩状态。

结论：对于免疫功能严重低下（如艾滋病）患者，同性恋螺杆菌可作为内源性眼内炎的罕见病原体。结合 mNGS 技术可实现快速精准诊断。本病例证实，在以敏感药物全身治疗为基础的前提下，重复玻璃体腔注射美罗培南是一种有效且安全的局部辅助治疗手段，可用于控制感染、挽救眼球，即使对于已失明并发生眼球病的晚期病例，亦能成功消除炎症、缓解症状

祛风明目丸对自身免疫性葡萄膜炎抗炎机制的研究

第一作者：Fan ZHAO

共同作者：He CHEN, Chunting GAO, Peiying JIANG, Jingsheng YU

目的：湖南省名中医喻京生教授运用中成药——祛风明目丸治疗自身免疫性葡萄膜炎收效颇丰，本文

旨在探究祛风明目丸对炎症状态下视网膜色素上皮细胞的抗炎机制。

方法：祛风明目丸药液喂养 Lewis 大鼠 7 天后采血得含药血清；将人视网膜色素上皮细胞（ARPE-19）分为空白组和模型组，模型组采用 IFN- γ 干预建立炎症环境后，按实验分组采用不同剂量的含药血清处理；CCK-8 检测每组细胞的增殖情况，qRT-PCR 检测每组细胞中 TNF- α 、IL-6、IL-17A、IL-4、IL-10 mRNA 的表达。除空白血清组外，模型组细胞按照实验分组采用适量含药血清或空白血清处理，同时添加白藜芦醇或烟酰胺共同处理细胞；WB 检测各组细胞 AMPK、P-AMPK、SIRT1 蛋白的表达，ELISA 检测各组细胞 TNF- α 、IL-6、IL-17A、IL-4、IL-10 的表达情况。

结果：（1）随着含药血清浓度的增加，细胞活力随之增加，在 15~20% 浓度时达到最强。（2）各组细胞中促炎因子 TNF- α 、IL-6、IL-17A mRNA 的表达与含药血清浓度升高成负相关，抑炎因子 IL-4、IL-10 mRNA 的表达与含药血清浓度升高成正相关。（3）在炎症环境中，P-AMPK、SIRT1 蛋白表达均下降，相关促炎因子表达升高，抑炎因子表达下降。在此基础上添加 SIRT1 抑制剂（烟酰胺），蛋白表达进一步下降，促炎因子表达进一步升高，抑炎因子表达进一步下降；添加 SIRT1 激动剂（白藜芦醇），蛋白表达均上升，促炎因子表达下降，抑炎因子表达上升。

结论：祛风明目丸含药血清可通过激活炎症环境中 AMPK/SIRT1 通路，降低促炎因子 TNF- α 、IL-6、IL-17A，上调抑炎因子 IL-4、IL-10 表达发挥抗炎作用。

积炎成川，溃于黄斑（Vogt-小柳-原田病继发脉络膜新生血管的病理叙事）

第一作者：Yiquan ZHANG

共同作者：Jing FENG, Yong TAO

目的：报道 Vogt-小柳-原田综合征继发黄斑脉络膜新生血管一例，以期为该病的诊疗提供一定的临床经验和指导。

方法：回顾性分析一例 Vogt-小柳-原田综合征继发黄斑脉络膜新生血管病例。患者，男，24 岁，主因“双眼反复红伴左眼视力下降 2 年”于我院就诊。询问病史，患者 2 年前无明显诱因出现双眼眼红伴左眼视力下降，无眼痛、畏光，否认反复发作口腔及阴部溃疡，否认关节疼痛、腰部僵直疼痛，否认脱发、皮疹、耳鸣。既往双眼屈光不正 -10.00 DS，常年感冒，否认风湿等全身免疫性疾病病史，

否认眼外伤史及内眼手术史，否认结核、肝炎、梅毒等传染病史，否认猫狗接触史，否认药物过敏史。查体：患者 BCVA OD: 0.2, OS: 0.03，来我院前曾于外院行前节相、眼底照相、OCT、FFA 及 ICGA 检查示：双眼角膜清，虹膜后粘连及色素颗粒沉着，左眼可见 koeppe 结节及 busacca 结节，眼底照片示双眼晚霞状眼底及 Dalen-Fuchs 结节，FFA 及 ICGA 示左眼黄斑脉络膜新生血管。

结果：外院诊为“双眼陈旧性虹膜炎、双眼白点综合征”，后我院诊为“双眼 Vogt-小柳原田病继发左眼黄斑脉络膜新生血管”，给予左眼 Ozurdex、阿柏西普治疗，治疗后 1 月改善。

结论：Vogt-小柳-原田综合征继发黄斑脉络膜新生血管预后视力较差，因此早期充分抗炎治疗十分重要，全面关注眼前节、后节，监测疾病进展。

经脉络膜上腔注射间充质干细胞治疗兔葡萄膜炎的有效性及机制研究

第一作者：Di ZHANG

共同作者：Chun ZHANG

目的：评估一种新型的阻力传感脉络膜上注射器在兔葡萄膜炎模型中递送人脐带间充质干细胞（human umbilical cord-derived mesenchymal stem cells, HUMSC）的有效性和治疗机制。

方法：本研究首先构建兔实验性葡萄膜炎模型（结核分枝杆菌 H37Ra 抗原皮下预免疫联合玻璃体腔注射），并应用磷酸盐缓冲盐水（phosphate buffered saline, PBS）、HUMSC 及曲安奈德（triamcinolone acetonide, TA）分别经脉络膜上腔注射，在不同时间点观察 HUMSC 及 TA 对葡萄膜炎的抑制作用。以兔眼前后节状态、炎症分级（0-4）、眼压变化、组织病理学检查等指标评估葡萄膜炎的炎症表现，以视网膜转录组测序与实时荧光定量 PCR（quantitative real-time PCR, qRT-PCR）探究潜在发病机制及 HUMSC 作用的关键通路。

结果：本研究中兔实验性葡萄膜炎建模成功率 100%，24 小时后观察到炎症反应，证实葡萄膜炎诱导成功。建模第 7 天炎症症状显著，包括结膜混合充血（ 2.42 ± 0.49 , $P = 0.001$ ）、角膜水肿（ 1.08 ± 0.20 , $P < 0.001$ ）、前房中重度渗出（ 2.08 ± 0.37 , $P < 0.001$ ）、玻璃体重度混浊（ 3.83 ± 0.41 , $P < 0.001$ ）等。第 28 天时，所有兔眼玻璃体混浊仍较显著（ 2.92 ± 0.66 ），视网膜细节仍无法窥清。建模后葡萄膜炎组眼压下降，第 28 天

时眼压与正常对照组差异具有统计学意义 (6.89 ± 0.50 mmHg, $P < 0.05$)。与 PBS 处理组相比, HUMSC 治疗显著减轻了葡萄膜炎体征, 在建模第 7、14、21、28 天的前房炎症评分和玻璃体混浊评分均显著降低 ($P < 0.05$); 在 TA 处理组中, 除第 14、28 天前房炎症评分外其他炎症评分与 PBS 处理组相比均显著降低 ($P < 0.05$)。在眼压方面, 建模后第 1 天, 三组眼压均显著低于正常对照组 ($P < 0.05$)。至第 14 天, HUMSC 及 TA 处理组眼压与正常对照组相比无显著差异; 但 PBS 处理组在第 28 天眼压仍低于对照组 (6.79 ± 1.32 mmHg, $P < 0.05$), 这说明 HUMSC 及 TA 治疗可有效缓解睫状体炎症。此外, HUMSC 及 TA 治疗还降低了房水中部分炎性细胞因子的水平。组织病理检查显示 HUMSC 及 TA 组炎症细胞浸润减少。RNA 测序结果显示, 辅助性 T 细胞 17 (T helper cell, Th17) 分化通路在葡萄膜炎的发病机制中起着重要作用, 并通过 qRT-PCR 结果进一步验证 HUMSC 可抑制该通路中关键基因的表达。

结论: HUMSC 经脉络膜上腔注射在兔实验性葡萄膜炎模型中可显著减轻炎症反应, 其治疗效果与 TA 相当。Th17 细胞分化是实验性葡萄膜炎模型发病机制中的重要通路, HUMSC 可通过抑制相关基因的上调发挥作用。

结核性全葡萄膜炎合并角膜基质炎一例

第一作者: Xin LIU

共同作者: Ang JI

目的: 分析结核分枝杆菌所致全葡萄膜炎的眼部多模态影像学特征、诊断标准及治疗策略。

方法: 本文拟介绍一例结核性全葡萄膜炎合并角膜病变的患者, 结合患者的病史、眼部症状、眼部多模态影像以及相关实验室检查, 总结眼部结核感染的临床特征、诊断要点及治疗策略。

结果: 本患者前驱流产后低热病史, 双眼无痛性视力下降 2 月, 查体可见双侧角膜基质楔形混浊, 颗粒状 Kp+, 虹膜局部后粘连, 前房及玻璃体细胞(++), 左眼视网膜弥漫灰白水肿, 后极部环形白色视网膜沉积物; 辅助检查 OCT 提示左眼玻璃体机化条索, 视网膜层间多发低反射囊腔; 荧光素眼底血管造影提示双眼以视网膜静脉血管壁染为主要特征的闭塞性血管炎, 周边广泛无灌注区形成。实验室检查: 结核结核纯化蛋白衍生物试验 (PPD): 硬结直径 > 20 mm, 周围伴水疱, 为强阳性; T-SPOT 阳性; 其他传染病检查及自身免疫系统疾病筛查均为阴性, 胸部 CT 未见异常。遂眼科诊为“双眼结

核性全葡萄膜炎 双眼结核性角膜基质炎”, 在给予规律抗结核治疗一周后开始全身免疫抑制治疗, 同时双眼进行全视网膜激光光凝治疗。治疗 3 月后复查双眼视力提高, 角膜基质混浊消退, 左眼视网膜层间积液明显减少。

结论: 眼部结核感染通常为潜伏结核, 并无肺部结核感染的相关体征, 起病隐匿, 所致眼部发病机制为病原体的直接侵犯与免疫反应共同作用的结果, 可引起多种临床表现形式, 部分改变具有一定特征, 临床可根据患者病史、眼部体征及多模态影像, 结合辅助检查结果帮助诊断。即使患者并无肺部结核感染, 但眼部的治疗仍需在规律抗结核治疗的前提下, 再加用免疫抑制治疗, 同时需密切观察、预防并发症的出现。

赖氨酸琥珀酰化修饰在炎性小胶质细胞活化中的作用及机制研究

第一作者: Jiangyi LIU

目的: 炎性小胶质细胞的活化是自身免疫性葡萄膜炎的特征性表现。小胶质细胞的活化与其代谢改变密切相关, 线粒体作为连接这两个过程的关键枢纽发挥着重要作用。赖氨酸琥珀酰化作为一种翻译后修饰, 主要参与调节线粒体能量代谢通路。然而, 赖氨酸琥珀酰化在小胶质细胞炎性活化中的具体作用及潜在机制尚不完全清楚。

方法: 在本研究中, 我们采用光感受器间维生素 A 类结合蛋白体内诱导实验性自身免疫性葡萄膜炎 (EAU) 小鼠模型, 以及脂多糖和干扰素- γ 体外诱导炎性小胶质细胞。利用赖氨酸琥珀酰化抑制剂/激活剂、琥珀酰化蛋白组学以及生物学实验方法研究潜在作用及机制。

结果: 我们发现在 EAU 小鼠视网膜中, 活化的炎性小胶质细胞发生了广泛的赖氨酸琥珀酰化修饰。高琥珀酰化水平促进了炎性小胶质细胞的激活, 增强了其产生促炎性细胞因子、增殖和迁移的能力。通过琥珀酰化蛋白组学测序, 我们绘制了正常和炎性小胶质细胞中赖氨酸琥珀酰化蛋白的图谱, 差异修饰的蛋白主要富集在有氧呼吸和三羧酸循环通路上。其中, IDH2 在赖氨酸 282 位点 (K282) 的琥珀酰化被鉴定为炎性小胶质细胞活化的关键介导因子。进一步实验发现小胶质细胞 IDH2 K282 的高琥珀酰化会抑制 IDH2 的酶活性, 促进细胞的氧化应激和糖酵解, 最终导致炎性活化。

结论: 在 EAU 中, 活化的小胶质细胞中发生了显著的赖氨酸琥珀酰化修饰, 降低琥珀酰化水平可抑制其炎性活化。小胶质细胞 IDH2 (K282) 的琥

珀酰化与小胶质细胞的炎性活化和代谢模式密切相关，可作为自身免疫性葡萄膜炎的潜在治疗靶点。

超广角多模式成像在急性视网膜坏死的应用

第一作者：Mei HAN

共同作者：Meng DONG, Ying LI, Xiaoli SUN

目的：探索超广角多模式成像在 ARN 管理中的关键作用。

方法：根据日本急性视网膜坏死（ARN）研究组 2015 年制定的 ARN 诊断标准，并且经过房水检测确诊 VZV 感染的 ARN 患者 10 人（10 眼），经过标准抗病毒治疗，包括玻璃体腔注射更昔洛韦。采用广角 SS-OCT，超广角眼底成像（UWFI）及自发荧光成像，观察 ARN 患者治疗过程中的变化。

结果：在 ARN 急性期，广角 SS-OCT 显示内层视网膜高反射区域，对应黄白色病灶，渗出呈高反射信号，其下结构反射信号被屏蔽，神经上皮层下液体积存，视网膜各层组织结构紊乱。在炎症消退期的表现：坏死区域视网膜厚度明显减少，可见视网膜结构完全缺失的区域，对应之前的黄白色病灶色素上皮出现破坏。超广角眼底成像（UWFI）可显示 ARN 的典型临床特征：斑片状或扇形坏死病灶，视网膜动脉闭塞，玻璃体炎，视网膜静脉出血。超广角 FAF：在病变活动区域边缘可见高对比度的自发荧光变化，完全视网膜坏死的区域表现为低自发荧光，通过连续 FAF 检查，观察高自发荧光边界是否向后扩展，FAF 提供更高对比度的病变边界；有助于更精确地确定病变范围和进展。

结论：超广角成像有助于早期识别高风险患者，全面评估 ARN 的病变特征；监测疾病进展情况，指导临床管理策略，改善 ARN 患者的预后。

眼外伤

一例复杂小儿外伤性视网膜脱离的成功治疗：病例报告

第一作者：Yuan ZHIGANG

目的：由于眼球结构的特殊及患者配合度差，儿童眼外伤一直是眼科手术的难点之一，我们介绍了一名 2 岁 11 个月的患者，被炮仗炸伤右眼后致复杂

的眼前后联合损伤，我们及时治疗并取得不错的效果。

方法：患儿经评估后发现有虹膜根部的离断，以及因此导致的前房积血和渗出，在术中给与了虹膜根部离断修复术及前房冲洗，术野清晰后进一步确认了外伤性白内障及晶状体半脱位，我们经后入路切割了患儿的晶状体，并选择了暂不植入人工晶状体，进入后节后，我们确认了玻璃体积血以及外伤性的视网膜脱离，伴有多处裂孔及脉络膜损伤，我们因此进行了复杂的晶状体切除及视网膜复位术。

结果：我们在行玻璃体后脱离并剥除了附着在脱离视网膜表面的渗出膜后，发现鼻侧脉络膜损伤与视网膜粘连，在损伤周围行视网膜切开（“防火墙”），保护剩余视网膜，重水复位视网膜，行视网膜激光凝处理半硅油置入，患儿术后情况稳定，并于 6 月后取出眼内硅油并补充激光，术后视网膜在位良好。

结论：我们的病例展示了一例成功的小儿复杂眼外伤的治疗，对于小儿外伤性视网膜脱离尤其是视网膜情况差的病例，及时的处理以及果断的视网膜切开可能对于保护其余的视网膜及预后有重大意义。

人工晶体缝线固定手术方法探讨

第一作者：Yong YAO

目的：眼外伤常导致各种复杂的并发性白内障、晶状体脱位。临床上常应用玻璃体切割联合晶体摘除手术进行治疗，这种经玻璃体置换术后无晶体眼的视力往往受到明显影响，还有由于晶状体囊袋和悬韧带不同程度的损伤、缺失，给二期植入人工晶体带来不便，常需要根据残存囊袋和悬韧带的可利用程度选择不同的人工晶体悬吊手术方式。本文拟探讨人工晶体缝线固定的手术方法。

方法：① 人工晶体的选择：晶体袢的形状有环形、“C”形袢，晶体袢的数量有两袢、三袢、四袢，其中具有三个以上的环形袢的 IOL 缝线固定更加稳定、持久。② 巩膜瓣的选择：可选传统三角瓣、L 形瓣、巩膜沟、Hoffman 巩膜瓣等，其中 Hoffman 巩膜切口出血较少，无需电凝、缝合，操作更加便捷，但需要一定学习曲线。如采用缝线 Z 型缝合或摩擦线结巩膜层间固定技术，可不作巩膜瓣。③ 缝线的选择：10-0 聚丙烯缝线是最常用的悬吊缝线，但易降解、断裂、切割，8-0 聚丙烯缝线似乎是更好的选择，横截面积大，抗拉强度高，抗断裂性能更好。④ 固定方式选择：依据可及的人工晶体、缝线、囊袋和悬韧带的功能，选择合适的

手术方式，提高人工晶体的水平居中稳定性，减少手术损伤，降低手术操作难度。

结果：临床实践证明人工晶体缝线固定术是治疗玻切术后无晶状体眼的有效方法，但需要注意手术材料、方法的选择。

结论：临床实践证明人工晶体缝线固定术是治疗玻切术后无晶状体眼的有效方法，但需要注意手术材料、方法的选择。

儿童鞭炮伤致视神经重度损伤 1 例

第一作者：Wenting WANG

目的：探讨一例因鞭炮爆炸导致严重左眼外伤性视神经病变及难治性青光眼的 7 岁男性患儿的临床救治过程与预后。该病例初始视力为无光感，病情复杂危重，旨在总结其多阶段手术治疗与药物干预的经验，并强调即使面对初始视力极差的儿童严重眼外伤，坚持积极、综合的治疗策略仍可能为挽救眼球和部分视功能带来希望。

方法：患儿因“左眼鞭炮崩伤后视物不见 2 小时”入院，检查见左眼无光感，角膜水肿，结膜囊大量异物，下方角膜上皮缺损，瞳孔散大固定，晶状体部分脱入前房。治疗采取分阶段手术结合药物的综合方案：首先行“左眼结膜及角膜异物取出术”清除眼表异物。术后第 6 天因眼压急性升高至 60 mmHg，行“玻璃体切割 + 晶状体切除 + 硅油填充术”，术中探查见视盘结构严重紊乱。因术后硅油眼持续高眼压（30-55 mmHg），且药物降压效果不佳，于术后 42 天取出硅油。硅油取出后眼压再次失控，先后行睫状体光凝术与青光眼阀植入术以最终控制眼压。

结果：经过一系列复杂的干预，患儿的病情呈现波折但最终向好的趋势。视力方面，从伤后及多次术后初期的“无光感”，在术后 42 天提升至“光感”，并于伤后 4 个月时进一步恢复至“眼前手动”。眼压控制过程极为艰难，在硅油填充及取出后阶段，尽管联合多种强效降压药，眼压仍持续在高压范围（35-50 mmHg），直至执行青光眼阀植入术后，眼压才得以长期稳定。

结论：本病例充分表明，对于鞭炮等造成的严重儿童眼外伤，即使初始视力为无光感，也绝不能轻易放弃。其救治成功依赖于一系列关键决策：及时的清创、针对复杂并发症（如晶状体脱位、眼压骤升）的果断玻切手术、以及对药物无效的难治性青光眼采取递进式手术（睫状体光凝、最终青光眼阀植入）的积极态度。尽管视神经遭受了严重原发性损伤，

但在有效控制眼压、维持眼球结构和内部环境稳定后，视功能仍存在缓慢恢复的可能。因此，对于儿童严重眼外伤，应秉持永不放弃的原则，采取积极、序贯、多元的综合治疗策略，最大限度地挽救视功能和眼球解剖结构。

内窥镜辅助玻璃体切除术治疗眼萎缩患者的临床观察

第一作者：Yang XUN

目的：观察内窥镜辅助玻璃体切除术（EAV）治疗眼球萎缩的临床疗效和安全性。

方法：眼球萎缩的标准是与健康眼相比，萎缩眼的术前眼轴长（AL）减少大于 2 mm。使用眼部 CT 扫描来测量 AL 和眼球体积。共收集了 36 例眼球萎缩患者。所有患者均接受了 EAV 联合硅油眼内填充手术。收集所有患者的术前和术后视力，眼压（IOP），AL 和眼球体积。

结果：所有 36 例患者术前均有视网膜和脉络膜脱离。萎缩眼术前平均眼压和眼容积均显著低于健康眼（所有 $P < 0.05$ ）。萎缩眼术后平均眼压和眼球体积较术前明显增加（所有 $P < 0.05$ ）。手术后，12 例患者视力提高，28 例（占 77.7%）视网膜和脉络膜复位，所有患者均保持正常眼压。

结论：对于眼萎缩患者，EAV 可以显著增加其 AL 和眼容量，提高眼压并将其维持在正常眼压状态。一些患者的视力有所改善。

外伤性晶状体全脱位手术方式的比较

第一作者：Haibin CUI

共同作者：Hong ZHOU

目的：分析比较四种取出脱位晶状体手术（1. 玻璃体切除术。2. 玻璃体切除术 + 注入重水 + 白内障囊内摘除术。3. 玻璃体切除术 + 注入重水 + 白内障超声乳化吸除术。4. 玻璃体腔内注入粘弹剂利用玻璃体的流动性浮出晶状体 + 白内障超声乳化吸除术）的临床效果。

方法：回顾性分析 2022 年 5 月至今，我院晶状体全脱位患者 20 例作为研究对象，进行手术治疗，对四种手术的疗效包括视力的矫正情况，眼压以及有无并发症进行分析。

结果：20 例患眼均无医源性视网膜损伤，無晶状体皮质残留，术后均无眼压升高，视力及视觉质量略有差别。

结论：(1) 通过玻璃体切除术直接切除脱位的晶状体，手术时间相对较长，术中在切除晶状体的过程中残存的晶状体易损伤视网膜。且水眼稳定性差，后续缝合人工晶体难度相对较大。(2) 玻璃体切除后通过向玻璃体腔内注入重水，使脱位的晶状体浮到前房，做角膜或巩膜大切口，行白内障囊内摘除术，术中应用重水既增加了患者的经济负担，又增加手术的并发症，注入和取出重水的同时延长了手术时间。且角膜或者巩膜做大切口，损伤大的同时还增加了术源性散光，术后患者的视觉质量相对较差。(3) 玻璃体切除后通过向玻璃体腔内注入重水，使脱位的晶状体浮到前房，然后行超声乳化术取出晶状体。晶状体取出方式的改良降低了术源性散光的问题，但是重水的应用对视网膜的损伤及术后并发症难以避免。(4) 对无玻璃体液化的患者采用前节取出方式。通过向玻璃体腔内注入粘弹剂利用玻璃体的流动性使晶状体浮至前房，通过超声乳化取出晶状体，该方式可以最大程度上减少手术对眼球的损伤，手术过程中几乎不接触视网膜，且手术时间相对较短，玻璃体完整，后节稳定性好，给缝合人工晶体提供了更安全的环境。通过分析对比该手术方式是目前治疗外伤性晶状体全脱位的损伤最小，术后效果最好，并发症最少的微创手术方法。

恒压注油机应用于严重眼外伤患者的临床效果观察

第一作者：Yang XUN

目的：将恒压注油机应用于严重眼外伤患者行玻璃体切除手术后，观察其临床效果并进行分析。

方法：前瞻性研究。纳入 2022 年 11 月至 2023 年 9 月就诊于苏州大学理想眼科医院严重眼外伤患者共 7 例 7 眼，均合并有视网膜脱离，其中伴脉络膜脱离者 3 例 3 眼，术前诊断为眼球萎缩 4 例 4 眼。所有患者均行内窥镜辅助下的玻璃体切除手术，术中玻璃体腔内填充硅油，术毕均使用恒压注油机，以 40-45 mmHg 的气体压力推动相连的注射器向眼内持续注射硅油，持续注油的过程中眼压保持在 20~25 mmHg。收集所有患者术前及术后 3 个月的视力、眼压、眼轴、眼球体积，术中注入眼内的硅油体积及术后恒压注油机持续注入眼内硅油体积，同时记录观察期间并发症发生情况。将收集的数据

进行统计学分析，以 $P < 0.05$ 为差异具有统计学意义。

结果：患者术前平均眼压 (5.43 ± 2.23) mmHg，术后 3 个月时平均眼压 (14.09 ± 2.28) mmHg。术前平均眼轴 (20.88 ± 0.92) mm，术后 3 个月时平均眼轴 (24.31 ± 0.69) mm。术前平均眼球体积 (4.37 ± 0.49) mm³，术后 3 个月时眼球体积 (6.99 ± 0.49) cm³。经统计学分析，上述 3 项指标术前与术后相比差异均具有统计学意义 (均 $P < 0.05$)。其中 4 例眼球萎缩的患者，术后所有患者视网膜均成功复位。术前无光感的 3 例患者术后恢复至光感或手动。术毕平均注入玻璃体腔内硅油 (4.09 ± 0.47) ml，术后经恒压注油机再向眼内持续注硅油，硅油体积显著增加至 (5.35 ± 0.67) ml ($P < 0.05$)，眼内硅油体积平均增加了 (1.26 ± 0.60) ml。

结论：对于严重眼外伤合并视网膜脱离或脉络膜脱离、玻璃体切除术中硅油填充不充分的患者，恒压注油机的应用能显著提高其术后眼压，增加其术后眼轴、眼球容积，同时能改善部分患者术后视力，拥有良好的临床效果及安全性。

房角镜辅助下改良缝线式睫状体缝合治疗外伤性睫状体分离

第一作者：Yong YAO

目的：观察房角镜辅助下改良缝线式睫状体缝合临床效果。

方法：① 人工晶体的选择：晶体袢的形状有环形、“C”形袢，晶体袢的数量有两袢、三袢、四袢，其中具有三个以上的环形袢的 IOL 缝线固定更加稳定、持久。② 巩膜瓣的选择：可选传统三角瓣、L 形瓣、巩膜沟、Hoffman 巩膜瓣等，其中 Hoffman 巩膜切口出血较少，无需电凝、缝合，操作更加便捷，但需要一定学习曲线。如采用缝线 Z 型缝合或摩擦线结巩膜层间固定技术，可不作巩膜瓣。③ 缝线的选择：10-0 聚丙烯缝线是最常用的悬吊缝线，但易降解、断裂、切割，8-0 聚丙烯缝线似乎是更好的选择，横截面积大，抗拉强度高，抗断裂性能更好。④ 固定方式选择：依据可及的人工晶体、缝线、囊袋和悬韧带功能，选择合适的手术方式，提高人工晶体的水平居中稳定性，减少手术损伤，降低手术操作难度。

结果：术后随访，患者 BCVA 得到改善，并维持了正常的眼压，术后并发症较少。

结论：采用房角镜下辅助的改良缝纫式睫状体缝合治疗外伤性睫状体分离具有较好的疗效，通过术前UBM和术中直接房角镜检查可更精确定位睫状体分离范围，也能在术中睫状体缝合完后进行复查。在分离点位角膜缘后2.5 mm预先用26 G针头定位穿刺并进行引导，可避免针距不等和结扎的松紧不一，兜住睫状体全层。该改良方法手术创伤小，手术效果佳，不需作巩膜瓣和切开深层巩膜，单缝线、单结方式避免了线结暴露，也可与虹膜、晶状体、玻璃体等手术同期进行。

推注器辅助四襻式人工晶状体巩膜缝线固定术

第一作者：**Yong YAO**

目的：介绍一种采用10-0聚丙烯环状缝线的改良四襻式可折叠人工晶状体巩膜层间固定技术，旨在降低缝线暴露风险并增强囊膜支撑不足眼内人工晶状体的居中性稳定性。

方法：本回顾性干预研究纳入2023年1月至2024年1月期间接受改良四襻式人工晶状体巩膜固定术的9例患者（9眼）。

结果：平均随访10.89个月，术后LogMAR最佳矫正视力（20/43）较术前（20/130）显著改善。人工晶状体平均倾斜度为 $0.27 \pm 0.09^\circ$ ，内皮细胞丢失率（9.96%）处于可接受范围。所有病例均未发生术中及术后并发症。

结论：该术式通过微小切口实现四点固定，不仅可获得可靠的人工晶状体定位和视觉质量改善，还能有效规避缝线相关并发症的发生。

树鼩创伤性视神经病变模型揭示轴突损伤与神经炎症

第一作者：**Jianshu KANG**

共同作者：**Xin TAN**

目的：采用重力打击法建立树鼩创伤性视神经损伤模型，探讨外伤性视神经病变（TON）的潜在损伤机制，为后续机制研究与治疗提供新视角。

方法：共24只树鼩随机分为假手术组（Sham, n = 12，仅行头皮切开）和创伤性脑损伤组（TBI, n = 12）。TBI组采用Marmarou自由落体打击法建立模型，并从行为学、组织学及分子学层面系统评估视神经损伤机制。

结果：TBI树鼩在损伤后表现为持续的运动功能障碍，损伤后第1天和第7天的旷场活动显著下降。HE染色显示视神经纤维排列紊乱、数量减少，并伴随炎细胞浸润和局灶性出血。免疫组化结果表明，神经丝轻链蛋白（NF-L）显著升高，提示轴突结构破坏与异常释放。q-PCR检测显示星形胶质细胞向促炎的A1型极化，同时ELISA证实炎症因子TNF- α 和IL-1 β 明显上调。免疫组化结果GFAP表达亦显著增强，提示存在持续的反应性星形胶质细胞增生。上述结果共同指向TBI后树鼩视神经发生持续的轴突损伤与神经炎症。

结论：创伤性脑损伤通过直接机械应力和继发性炎症反应，诱发树鼩视神经轴突变性及星形胶质细胞反应性增生，最终导致持续性视神经损害。本研究为TON的病理机制研究和潜在干预策略提供了实验依据。

面板编号：**OTR-1202**

铁锈窃走的视界：一例迟发性铁质沉着性青光眼的六年之殇

第一作者：**Shaolei HAN**

目的：探讨眼内铁质异物长期滞留所致迟发性铁质沉着性青光眼的临床特点、诊断及治疗策略，强调早期识别与干预的重要性。

方法：患者，女性，54岁，因“左眼胀痛、视物不清1个月”就诊。既往史：6年前有左眼外伤史，并于外院行“白内障摘除联合人工晶体植入术”。眼部检查：左眼视力0.02，结膜充血，角膜水肿，颞下方角膜缘混浊，虹膜前粘连，瞳孔光反射迟钝，人工晶状体在位，眼底视盘C/D = 0.9、色淡黄，眼压42 mmHg。采用眼部CT、超声生物显微镜（UBM）、电生理进行综合评估。

结果：眼部CT示左眼球颞下方球壁金属异物，伴有伪影；UBM示颞下方睫状体区探及一3.16 mm强回声异物伴声影。电生理提示左眼F-VEP P2波和F-ERG振幅极重度下降，视功能严重受损。行异物取出术，确诊为铁质异物（ $3.0 \times 1.5 \times 0.5$ mm）。术后眼压降至22 mmHg，但视功能无恢复。

结论：眼内铁异物长期存留可通过铁离子毒性作用引起小梁网功能障碍及视网膜神经组织变性，导致继发性青光眼及不可逆视功能损害。UBM在睫状体微小异物检测中具有关键诊断价值。手术取出异物是控制病情发展的有效方法。本研究提示，对于任何有眼外伤史的不明原因单眼青光眼、白内障等患者，有必要将隐匿性眼内异物纳入鉴别诊断，以实现早期干预，避免视功能永久性丧失。

食蟹猴全眼球移植手术 SOP 的探索

第一作者: Jingyi PENG

共同作者: Chengjie HE, Jiayi JIN, Liuxueying ZHONG

目的: 对于眼球结构、功能损毁的患者, 眼球移植是最后的希望。当前, 全眼球移植研究主要受限于三个关键因素: 有效灌注、视觉神经再生和免疫排斥。针对这些难点, 建立合适的动物模型来深入研究是必要的。非人灵长类动物的眼部结构功能与人类高度相似, 建立食蟹猴全眼球移植模型并进行系统性研究, 有助于推动标准化手术方案的建立, 为全眼球移植未来的临床应用奠定基础。

方法: 本研究建立食蟹猴同种异体全眼球移植模型, 探索并比较“先静脉后动脉”和“先动脉后静脉”两种不同血运重建手术策略对移植植物存活的影响。术中结合先进的手术导航技术, 以优化血管吻合和移植植物保存效果。术后监测眼前段、视网膜结构和电生理功能等实时变化, 评估不同手术策略的效果。

结果: 采用“先静脉后动脉”手术策略成功实现移植眼球结构和视网膜电生理功能的保存。移植眼角膜和晶状体保持透明, 光学相干断层扫描证实视网膜结构完整, 各层结构清晰可辨, 视网膜电图检测显示了反应波形。同时, 组织病理显示“先静后动”组移植眼球结构保存良好。

结论: 本研究证实了非人灵长类动物全眼球移植手术模型的可行性。研究结果表明, “先静脉后动脉”的血运重建策略更有利于移植眼球的存活和功能维持, 这可能与优先建立静脉回流减少视网膜水肿有关。同时, 精确的血管吻合技术和有效的低温灌注是手术成功的关键因素。这已研究模型的建立为全眼球移植的临床应用奠定了重要基础, 有望为严重眼损伤患者带来新的治疗希望。

高度近视黄斑裂孔手术技巧

第一作者: Yong YAO

目的: 黄斑裂孔是高度近视的常见并发症, 是造成患者视力损害的重要原因。手术是治疗高度近视 MH 的主要方法, 但由于眼轴增、后巩膜葡萄肿、脉络膜萎缩等因素使手术难度大、黄斑裂孔闭合率低、视力预后差, 如何提高裂孔闭合率和视功能改善率是目前国内外研究的热点。现就高度近视 MH 手术治疗中的一些技巧进行介绍。

方法: ① 术后裂孔未闭者, 除自体 ILM 移植外, 还有其他的移植材料如羊膜可以考虑应用到高度近

视 MH。人羊膜填塞或覆盖的方法可有效提高 MH 闭合率, 且术后患眼功能有明显改善。羊膜组织填塞裂孔并与视网膜组织黏附, 有助于在裂孔处形成相对封闭的解剖环境, 从而促进闭孔的愈合。人羊膜填塞还有助于吸收裂孔周围的视网膜下液体, 在更复杂的情况下也能保持相似的解剖和功能结果。

② 在眼轴过长的患者中, 进行眼内注射难度较大, 尤其是在重水下注射粘弹剂固定覆盖裂孔的组织材料时, 针头需靠近视网膜表明操作, 有损伤视网膜风险。我们将注射器连接三通接头固定在玻切头的移液管路中, 通过助手推注射器, 主刀固定玻切头的方式进行眼内注射, 增加稳定性, 同时也无需其他特殊针头等耗材。③ 在高度近视患者中, 常规器械进行黄斑区剥膜时长度不够, 在没有加长器械时, 我们可以进行玻切穿刺口后移几毫米(通过顶压确认平坦部宽度), 减少穿刺口到后极部的距离, 避免操作时对眼球壁的压迫, 增加稳定性。

结果: 通过技巧创新降低手术难度, 减少手术操作带来的医源性损伤, 提高 MH 闭合率, 且术后患眼功能有明显改善。

结论: 近些年高度近视 MH 手术治疗成为国内外交流热点, 日新月异的手术创新使得手术成功率明显提高, 未来如何进一步改善患者手术术后视功能是重要的发展方向。

AGEs/AGER 通过 ROS 生成与 JNK 信号通路激活诱导人视网膜内皮细胞凋亡

第一作者: Yan ZONG

目的: 本研究旨在分析晚期糖基化终末产物(AGEs)对体外培养的视网膜内皮细胞(RECs)凋亡的影响。

方法: 将视网膜内皮细胞暴露于不同浓度的 AGEs 中。通过测量 AGEs 受体(AGER)的表达来探究 AGEs/AGER 轴的作用; 检测活性氧(ROS)以指示 RECs 的氧化应激水平; 通过蛋白质印迹法检测总 JNK 及磷酸化 JNK(p-JNK)水平; 通过流式细胞术评估细胞凋亡。

结果: AGEs 以剂量和时间依赖性的方式分别提高了 AGER 的表达。此外, 结果还显示, AGEs 预处理促进了 ROS 的生成和 RECs 的凋亡。当使用 siRNA 阻断 AGER 后, AGEs 诱导的 ROS 生成和细胞凋亡得到部分恢复。重要的是, AGEs 预处理

激活了 JNK 信号通路, 而该通路与细胞凋亡和增殖抑制密切相关。

结论: 本研究证实, AGEs 在体外通过 ROS 生成和 JNK 信号通路的激活, 诱导视网膜内皮细胞中 AGER 的表达并引发细胞凋亡。

BDUMP 合并紫杉醇导致的黄斑囊样水肿 1 例

第一作者: **Ge YANQI**

共同作者: **Jun XIAO, Jialin YANG, Xiaolin ZHOU**

目的: 描述并分析 BDUMP 的多模式影像学特征。对紫杉醇导致的黄斑囊样水肿病因及病理机制进行诊断和讨论。

方法: 对一例罕见的 BDUMP 合并紫杉醇导致的黄斑水肿患者进行眼底彩照、FAF、OCT、FFA 等影像学检查。

结果: 患者女, 57 岁, 以“双眼视力下降 7 个月”就诊, 视力 0.6 OD, 0.2 OS, IOP 正常。8 年前诊断乳腺癌, 术后病理诊断为乳腺浸润性导管癌。7 月前自觉双眼视物模糊。6 月前复查发现肿瘤脑、骨、肾转移, 故行白蛋白结合型紫杉醇化疗及靶向药治疗(帕妥珠单抗、地舒单抗)。用药持续 4 个月, 期间自觉视力下降逐渐加重。检眼镜下见后极部及中周部斑片状色素减退病灶和条索样色素增殖, 呈斑驳样眼底改变。彩色眼底照相见橙色网状色素沉积与脱色素区域交替。FAF 呈高低荧光交错形成的长颈鹿斑样改变, 高荧光与橙色网状色素区域相符, 低荧光区域与色素减退区域相符。OCT 可见双眼与高自发荧光区域对应的视网膜下高反射沉积物以及低自发荧光区域相符的 RPE 层萎缩缺损。FFA 呈与 FAF 相反的斑驳荧光。值得关注的是双眼 OCT 中观察到明显黄斑囊样水肿, 以及造影晚期花瓣样荧光积存, 但造影未见渗漏荧光。综合病史及临床表现, 考虑诊断为 BDUMP 合并紫杉醇导致的黄斑囊样水肿。予口服尼目克司治疗。1 个月后复查, 视力 0.8 OD, 0.4 OS, 双眼黄斑水肿较前好转, 眼底斑驳样改变较前无明显变化。

结论: BDUMP 是一种特殊的副肿瘤性视网膜病变, 由于原发肿瘤的内分泌功能, 刺激黑色素细胞弥漫增生导致, 常表现为交替分布的 RPE 萎缩斑块与网状色素沉着及视网膜下液。其主要治疗方案是控制原发肿瘤。紫杉烷类药物主要通过稳定微管抑制有丝分裂, 现广泛用于肺癌、卵巢癌等恶性肿瘤的化疗。紫杉烷类药物导致的黄斑水肿是该类药物的罕见不良反应, 白蛋白结合型紫杉醇导致黄斑水肿概率较紫杉醇或多西他赛更高。普遍表现为不伴有 FFA 渗漏荧光的囊样黄斑水肿。这可能与其

Müller 细胞毒性以及微管介导的 RPE 转运功能障碍有关。一般在停药 4-10 周后黄斑水肿可自行消退, 停药同时加用碳酸酐酶抑制剂可能会促进水肿的消退。

Bardet-Biedl 综合征一例

第一作者: **Yajian DUAN**

目的: 通过 1 例双眼视力不佳的青少年患者的眼部临床表现, 结合患者全身病史, 临床诊断为 Bardet-Biedl 综合征, 经基因检测明确诊断。

方法: 通过眼部及全身的查体, 患者最佳矫正视力: 右眼: 0.03 (+1.50 Ds-2.50 Dc@10), 左眼: 0.05 (+2.50 Ds-2.25 Dc@5), 双眼球震颤, 眼底可见视盘颜色蜡黄, 视网膜血管细, 后极部视网膜可见椒盐样视色素沉着, 周边视网膜色素斑驳样改变。诊断为: 视网膜色素变性(双眼)。追问患者全身病史, 家长诉患儿出生后双足多趾, 行手术切除治疗。3 年前患者出现肾功能不全, 肾内科就诊后长期服用药物治疗。查全身一般情况见: 身高: 140 cm, 体重: 62 kg (BMI: 31.6 Kg/m²), 患儿身材肥胖, 发育落后。追问家族史父母有五代以内近亲结婚史。BBS 的临床表现特点包括主要症状及次要症状。主要症状包括: 视网膜色素变性、多指或趾、肥胖、男性性腺发育不良、学习障碍、肾脏异常。次要症状包括: 语言发育落后、斜视、白内障、散光、短指、并指、发育迟缓、多饮、多尿、共济失调、轻度痉挛、糖尿病、牙列拥挤, 牙发育不全。临床诊断标准应符合 4 条主要诊断或符合 3 条主要症状 + 2 条次要症状, 患者符合, 故临床诊断: Bardet-Biedl 综合征。

结果: 行全外显子测序基因检查: 该患者 16 号染色体携带 BBS2 基因的纯合致病突变。经 Sanger 测序确认, 患者携带的纯合变异遗传自父母双方。

结论: BBS 致畸、致残率高, 目前尚无特殊治疗措施, 主要为对症治疗。对 BBS 患者最重要的就是综合管理, 定期进行视网膜、肝肾功能、血糖、血脂及体重的管理, 避免近亲结婚是预防 BBS 的重要措施。对于双眼视网膜色素变性的幼儿患者, 应该全身查体并询问家族史, 提取有效的表现型, 尽快明确诊断, 并予以对症治疗。

CYP4V2 基因新型复合杂合突变致 Bietti 结晶样营养不良 1 家系报道

第一作者: Yunhan TAO

共同作者: Hongtao LIU

目的: 报道 1 个 Bietti 结晶样营养不良 (Bietti Crystalline Dystrophy, BCD) 家系的临床病理特点及其新的致病位点。

方法: 收集该 BCD 家系的临床资料, 通过 OCT、SLO、FFA+ICGA 多模态影像学描述其眼底特征, 应用全外显子组测序技术分析可疑致病基因, 并通过 Sanger 测序对变异进行验证。

结果: 该家系中 3 代 10 人。先证者 (II -2, 56 岁) 及其三妹 (II -6, 49 岁) 均表现为双眼晶状体后囊下混浊、视网膜萎缩伴结晶沉积物、黄斑裂孔且局限性视网膜脱离、FFA+ICGA 晚期后极部大片状强荧光, 基因检测结果显示二人携带 CYP4V2 基因的新的复合杂合突变, 一个是移码突变 c.810delT (p.A270fs), 另一个是错义突变 c.221T > C (p.F74S), 这与他们的 BCD 临床表型相匹配。而 II -4, III -1, III -2, III -4 仅携带其中一种突变, 他们的眼部未见症状及特征改变。BCD 是由 CYP4V2 基因突变使脂肪酸前体向 ω -3- 多不饱和脂肪酸的转化减少, 脂质代谢紊乱影响光感受器膜盘的再生, 从而导致光感受器损伤, 最终导致视网膜变性。而本例 BCD 家系在患者 II -2 和 II -6 中发现的两个位点在此前的文献中都未见报道。

结论: CYP4V2 基因 c.810delT (p.A270fs) 和 c.221T > C (p.F74S) 很可能是 Bietti 结晶样营养不良的一个新的复合杂合突变位点组合。

EFEMP1 突变所致 Doyne 蜂窝状视网膜营养不良家系 1 例

第一作者: Yuxin SHEN

共同作者: Haixia JI, Zi-bing JIN, Luyao LI

目的: Doyne 蜂窝状视网膜营养不良 (DHRD) 是一种极其罕见的常染色体显性遗传性黄斑营养不良。其特征是眼底后极部大量黄白色类玻璃疣样沉积, 通常形成蜂窝状图案, 晚期继发视网膜萎缩和/或脉络膜新生血管形成。该病通常在疾病早期无症状, 大多数人直到 40 岁和 50 岁才会出现症状, 在晚期阶段, 视力可能低于 20/200。该病同一突变携带者间的临床表型变异性大。本文报告了中国第二例携带 EFEMP1 c.1033C>T(p.Arg345Trp) 杂合

突变的 DHRD 家系, 报道了其临床特征和分子遗传学发现。

方法: 一名 66 岁女性因双眼视物模糊 2 周来我科就诊。对先证者和她的女儿 (41 岁) 进行了全面的眼科检查, 包括最佳矫正视力、眼底彩照、光学相干断层扫描、视野、眼底自发荧光及眼底血管造影等。对先证者及其女儿、弟弟 (55 岁) 和弟弟的儿子 (25 岁) 共 4 位家系成员的血样进行采集, 并采用 Sanger 测序对 EFEMP1 基因进行检测。

结果: 先证者眼科检查诊断为晚期 DHRD, 视力右眼 0.2, 左眼 0.05, 表现为典型的蜂窝状玻璃疣、双眼黄斑区色素上皮增生伴 OCT 上可见高反射小灶, 视野检查双眼管状视野。基因测序结果显示, 所有 4 位家系成员的均检出 EFEMP1 c.1033C>T(p.Arg345Trp) 杂合突变, 该位点为文献已报道的致病突变。生物信息学分析表明, 该突变位点预测为高致病性, 可能通过改变了蛋白质的最后一个 EGF 结构域发挥作用。对比而言, 尽管女儿携带相同的致病突变, 其最佳矫正视力正常, 眼底影像学检查表现出视网膜神经上皮、椭圆体带及色素上皮层紊乱。

结论: EFEMP1 c.1033C>T(p.Arg345Trp) 杂合突变导致一个中国家庭的 Doyne 蜂窝状视网膜营养不良。与之前的报道不同的是, 该家系表现出年龄相关的表型可变性, 并提示可能存在不完全外显率: 同一致病变异携带者中, 中 - 重度晚期病变与轻度或隐匿表型并存。对变异阳性而临床轻/无症状个体的风险评估与随访策略、以及遗传咨询具有重要参考价值。

GPR40 通过 ERK 信号通路调控视网膜小胶质细胞治疗年龄相关性黄斑变性机制研究

第一作者: Xin TAN

共同作者: Jianshu KANG, Yunqin LI, Yue ZOU

目的: 年龄相关性黄斑变性 (AMD) 是导致老年人群不可逆视力损害的主要病因, 其病理机制涉及慢性炎症反应、氧化应激及异常脉络膜新生血管 (CNV) 形成。视网膜小胶质细胞作为中枢神经系统的重要免疫调节细胞, 在 AMD 进展中通过 M1/M2 表型极化失衡介导神经炎症及视网膜神经元损伤。G 蛋白偶联受体 40 (GPR40) 作为游离脂肪酸受体, 近年被发现参与调控炎症反应与细胞代谢, 但其在视网膜疾病中的作用机制尚未明确。本研究旨在探讨 GPR40 通过调控细胞外信号调节激酶 (ERK) 信号通路对视网膜小胶质细胞功能的干预作用, 及其在 AMD 治疗中的潜在机制。

方法: 通过构建碘酸钠诱导的 C57BL/6J 雄性小鼠非渗出性 AMD 模型进行体内实验; 采用脂多糖 (LPS) 诱导 BV2 小胶质细胞建立炎症模型进行体外实验。通过点鼻给药 GPR40 激动剂 GW9508 或 ERK 激动剂 C-C6 干预, 眼底 OCT、HE 染色等判断造模成功及视网膜萎缩程度。CCK-8 和 LDH 检验细胞药物活性, 利用 Western blot 检测 GPR40、ERK 通路蛋白、NLRP3 炎症小体表达, 免疫荧光染色观察小胶质细胞表型极化 (Iba1 标记), q-pcr、ELISA 定量炎症因子 (TNF- α 、IL1 β 、IL-10), TUNEL 法评估光感受器细胞凋亡, 视网膜铺片看小胶质细胞迁移等实验方法。数据采用 t 检验或单因素方差分析。

结果: 本研究首先通过免疫荧光染色及 Western blot 技术证实, GPR40 在小鼠视网膜和 BV2 小胶质细胞中高表达, 在碘酸钠诱导的 AMD 模型小鼠视网膜和 LPS 刺激的 BV2 炎症模型中表达显著上调, GPR40 特异性激动剂 GW9508 可显著抑制小胶质细胞向促炎 M1 表型极化, 降低肿瘤坏死因子- α (TNF- α)、白细胞介素-1 β (IL-1 β) 等炎症因子分泌, 同时促进抗炎因子 IL-10 及精氨酸酶 1 (Arg-1) 分泌。进一步机制研究发现, GW9508 通过抑制 ERK 磷酸化阻断炎症小体 NLRP3 激活, 从而减少炎症介质释放; 而 ERK 通路激活剂 C-C6 可逆转上述保护效应。此外, 值得注意的是, 我们通过体内和体外实验均发现 GPR40 介导抑炎作用有助于保护光感受器。

结论: 本研究揭示了 GPR40 受体在调控视网膜神经炎症中的作用及其分子机制, 通过抑制 ERK 信号通路调控视网膜小胶质细胞 M1/M2 极化, 从而减轻炎症微环境及氧化应激损伤, 减少光感受器的损伤。为 AMD 治疗提供了理论依据。

PD-L1 通过 ERK 通路调控视网膜小胶质细胞活化减轻脉络膜新生血管渗漏的机制研究

第一作者: Yue ZOU

共同作者: Yunqin LI, Xin TAN

目的: 新生血管性年龄相关性黄斑变性 (NVAMD) 是导致老年人视力丧失的常见视网膜疾病, 研究发现神经炎症在其发病机制中起重要作用。本研究探讨小胶质细胞免疫检查点 PD-L1 (程序性死亡配体-1) 在 NVAMD 中的潜在功能, 及该分子在神经退行性疾病中通过调节小胶质细胞限制神经炎症的作用。

方法: 采用激光诱导 CNV 小鼠模型进行体内实验, 分离和培养原代小胶质细胞进行体外实验。通过

PD-L1 基因敲除及抗体干预, 结合眼底 OCT 成像、眼底荧光造影、免疫组化、Western blot、RT-qPCR、流式细胞术染色及分析、RNA-seq、CCK-8、ELISA 等实验方法进行分析。

结果: 我们发现激光损伤后视网膜小胶质细胞的 PD-L1 表达显著增加。在激光诱导的 NVAMD 小鼠模型中, PD-L1 敲除或抑制性 PD-L1 抗体治疗会加重血管渗漏和新生血管形成, 而这些效应可通过 PLX5622 清除小胶质细胞得到逆转。本研究证实脉络膜新生血管 (CNV) 可能受多种机制调控, 其中 PD-L1 信号调节为其中之一。阻断 PD-L1 可上调促炎因子及磷酸化 ERK (p-ERK) 水平, 提示小胶质细胞在 NVAMD 中的过度激活。相反, 增强 PD-L1 信号可通过 ERK 通路减轻神经炎症和病理性新生血管。

结论: 揭示了 PD-L1 在 NVAMD 中调控神经炎症和新生血管形成的关键作用, 提示其可能成为 NVAMD 免疫调节治疗的潜在靶点。

面板编号: RME-1240

UWF-OCTA 在周边格子样变性检测中的应用

第一作者: Chunyang CAI

共同作者: Qinghua QIU

目的: 本研究旨在通过扫描激光检眼镜 (SLO) 引导的超广角光学相干断层扫描血管造影 (UWF-OCTA), 系统明确周边视网膜格子样变性区域的视网膜及玻璃体形态学特征, 并结合临床病例展示其在病变细节检出中的应用价值, 为临床评估及后续干预提供更精准的影像学依据。

方法: 本研究纳入眼科门诊确诊的 15 例周边视网膜格子样变性患者 (共 15 只眼)。所有患者均先通过 Optos Daytona P200T 型 SLO 进行 200° 超广角眼底扫描, 初步定位周边格子样病变的位置与范围; 随后采用常规 OCT 及 TowardPi BM-400K 型 UWF-OCTA (成像范围 24 × 20 mm, 轴向分辨率 3.8 μ m, 横向分辨率 10 μ m) 对病变区域进行扫描, 重点评估视网膜 (如视网膜裂孔、视网膜变薄) 及玻璃体 (如玻璃体牵拉、玻璃体脱离) 的形态学改变, 所有影像由 2 名具有 10 年以上眼底病诊疗经验的医师阅片。

结果: UWF-OCTA 在 15 只眼的周边视网膜格子样变性区域均检出特征性形态学改变, 具体包括玻璃体牵拉 (含典型 U 型牵拉)、视网膜裂孔、局灶性视网膜变薄、玻璃体脱离及视网膜下液体积聚。临床病例进一步提示, 常规 OCT 未发现明显异常, 而 UWF-OCTA 清晰展示病变区域视网膜形态学特

征以及捕捉到微小视网膜裂孔，为后续预防性激光光凝治疗提供了关键依据。

结论：UWF-OCTA 可实现周边视网膜的高分辨率成像，全面且清晰地显示周边视网膜格子样变性区域的视网膜及玻璃体形态学改变，尤其在微小视网膜裂孔等细微病变的检出上具有显著优势。SLO 引导下的 UWF-OCTA 能够定位病变并补充常规影像技术的不足，有望成为评估周边视网膜格子样变性的重要补充影像学工具，为临床筛选视网膜脱离高危病变、制定个体化预防性治疗方案奠定基础，同时也为后续探索其在临床决策指导中的价值提供了研究方向。

面板编号：RME-1232

利用多模式眼科影像动态追踪羟氯喹视网膜毒性的发生发展特征

第一作者：Yunxia GAO

共同作者：Ming ZHANG

目的：利用多模式眼科影像动态观察羟氯喹（HCQ）致视网膜毒性的发生发展过程，多维度展示 HCQ 视网膜病变的早/晚期损害特征以及停药后视网膜结构与功能变化，客观评价 HCQ 视网膜毒性发生发展特征。

方法：19 例规律口服羟氯喹的女性患者，经 SS-OCT/OCTA、mf-ERG、30-2VF、FAF、CFP、SLO 等多模态影像功能检查对患者进行全面评估，分别对其进行 1-3 年密切随访追踪，每次均采用多模态眼科影像进行动态观察。

结果：1 例正常眼底患者在观察的第 1 年内逐渐进展至早期羟氯喹视网膜病变。及时停药后观察两年病灶仍继续加重。另 18 例已确诊经典型羟氯喹视网膜病变，其中 15 例均遵我科建议前往风湿免疫科门诊就诊调整用药即停用羟氯喹，只有 3 例患者因风湿免疫科医师因患者病情需要或其他原因，未停用 HCQ。经观察发现无论患者是立即停药还是继续口服羟氯喹，病情仍可能继续进展。3 例患者未停药，病情继续发展。15 例患者停药后仍有 14 例眼底损害呈进行性加重，在 SS-OCT（包含 En-Face 扫描），mf-ERG，视野，FAF 等眼科检查中有不同程度表现。而另外 1 例患者停药后眼底改变暂时未见确切病情恶化。

结论：HCQ 视网膜病变在停药后仍可能继续进展。对于长期规律服用 HCQ 的患者，建议定期进行早期 HCQ 视网膜毒性筛查。筛查方式包含多模式的 SS-OCT、FAF、30-2VF、mf-ERG 等眼科检查。筛查部位不要只局限于黄斑区，更需关注黄斑区以外区域，尤其是视盘周围视网膜应重点关注。发生

机制推测：停药后累积的 HCQ 未能及时被机体完全清除，或者尽管药物已从体内清除，但长期暴露于 HCQ 后受损 RPE 细胞和感光细胞的功能可能持续失代偿，导致进行性视网膜损伤。

摘要编号：210257

面板编号：RME-1242

原发性高草酸尿症致双眼草酸盐视网膜病变 1 例

第一作者：Huiying ZHANG

目的：探讨一例罕见原发性高草酸尿症 1 型（PH1）合并草酸盐沉积症视网膜病变的临床特征、诊断及治疗难点，分析其发病机制。

方法：回顾 35 岁男性患者的病史资料（糖尿病、高血压、肾衰竭及肾移植史），结合眼底彩照、OCT、OCTA 等影像学检查，以及基因检测（AGXT 基因分析）和家族史追溯，明确诊断。通过对比胱氨酸病、继发性高草酸盐尿症等疾病特征进行鉴别诊断。

结果：患者病程中表现为双眼视网膜结晶样沉积、黄斑周围环形色素增生及外层萎缩，OCTA 显示毛细血管血流缺失及新生血管形成。基因检测发现 AGXT 基因第 1 外显子 c.32C > G (p.P11R) 纯合变异，符合 PH1 型特征。肾移植后全身草酸盐排泄部分改善，但眼部病变持续进展（黄斑病变分级为 2 级）。鉴别诊断排除胱氨酸病（无角膜结晶体）及甲氧氟烷中毒史。患者糖尿病史可能加重视网膜血管损伤，但 PH1 特征性病变（RPE 增生、结晶沉积）主导病程。

结论：PH1 相关草酸盐沉积症视网膜病变临床罕见，以视网膜结晶沉积、RPE 增生及血管异常为特征，易与糖尿病性视网膜病变混淆。基因检测是确诊关键，AGXT 基因突变可明确分型。临床需警惕代谢性疾病与血管性视网膜病变的叠加效应，早期多学科干预或可延缓器官损伤。

面板编号：RME-1225

双眼特发性视网膜血管炎合并原发性开角型青光眼一例

第一作者：Liu HAO

目的：报告一例双眼同时存在特发性视网膜血管炎与原发性开角型青光眼的罕见病例，探讨其临床表现、诊断难点、治疗过程及两者的关联性。

方法：回顾性分析一例 38 岁男性患者的临床资料。患者主诉“右眼视物模糊伴遮挡半月余”就诊。完善眼科检查包括：最佳矫正视力、眼压、裂隙灯、

房角镜、眼底彩照、光学相干断层扫描、广角光学相干断层扫描血管成像、荧光素眼底血管造影、视野检查、扫描激光检眼镜。同时进行系统病因学排查。

结果: 1. 诊断: FFA 示双眼周边大范围无灌注区, 交界区新生血管形成, 视盘高荧光伴毛细血管轻度炎性渗漏及开角、典型视盘及 RNFL 改变、视野缺损。系统检查未能明确视网膜血管炎病因, 诊断为“双眼特发性视网膜血管炎”、“双眼原发性开角型青光眼”。2. 治疗: 双眼给予抗 VEGF 治疗 1 次, 随后行全视网膜激光光凝术 (PRP)。初始使用前列腺素类似物 (拉坦前列素) 等降眼压药物。3. 治疗反应与并发症: 治疗期间出现玻璃体炎及前房炎症反应。考虑可能与疾病本身进展、拉坦前列素滴眼液副作用或 PRP 术后反应相关。停用拉坦前列素并加用局部激素滴眼液后, 炎症好转。4. 现状: 眼压控制未达标, 使用卡替洛尔滴眼液、溴莫尼定滴眼液、布林佐胺滴眼液。因存在眼部炎症活动, 青光眼医生暂不建议手术治疗。眼底情况仍需持续观察及进一步鉴别诊断。

结论: 1. 本例患者同时存在双眼特发性视网膜血管炎和原发性开角型青光眼, 两者可能为独立共存, 而非单一病因所致。2. 诊疗过程中出现新的炎症体征, 原因可能多样: 包括就诊时疾病早期体征未完全显现、拉坦前列素滴眼液的潜在诱发作用、或视网膜激光治疗后的反应。停用可疑药物并加用抗炎治疗有效。3. 此类罕见共存病例的治疗存在挑战, 需兼顾控制血管炎、控制青光眼和应对可能出现的炎症反应。药物选择需谨慎, 警惕诱发或加重炎症的可能。4. 目前眼压控制不佳, 但因活动性炎症存在, 手术干预风险高, 需密切监测病情变化, 积极控制炎症, 寻求最佳治疗时机与方案。特发性视网膜血管炎的病因仍需长期随访观察。

摘要编号: 210256

基于 OCT 分型的糖尿病黄斑水肿抗 VEGF 治疗反应差异及其预测因子分析

第一作者: An GANG

目的: 本研究拟通过前瞻性临床观察和回顾性数据分析相结合, 系统评估法瑞西单抗治疗不同 OCT 分型 DME 患者的临床疗效, 分析相关 OCT 影像学标志物 (CMT、HF、ELM、EZ 等) 以及系统性危险因素 (如年龄、糖化血红蛋白、肾功能、血脂等) 与疗效的关系。

方法: 该研究是一项基于医院的回顾性结合前瞻性观察性队列研究, 纳入标准为: (1) 初次就诊符合 DME 患者的诊断标准; (2) 初诊时 CMT >

250 μm , BCVA > 0.05; (3) 既往接受视网膜光凝、玻璃体腔注射抗 VEGF 药物或激素治疗与此次治疗时间间隔至少 ≥ 3 个月; 排除标准为: (1) 有严重的屈光介质混浊影响眼底观察; (2) 非 DM 导致的黄斑水肿; (3) 伴有其他影响患者视力或眼底的疾病 (如青光眼、黄斑裂孔等); (4) 合并严重的全身疾病或者不能耐受相关检查及手术治疗者; (5) 既往 4 个月内有白内障手术病史; 6 个月内有玻璃体切除手术病史; 所有患者都接受全面的眼科检查, 包括最佳矫正视力 (BCVA)、眼压 (IOP)、彩色眼底照相、使用裂隙灯生物显微镜进行的散瞳眼底检查。BCVA 使用国际标准视力表测量, 并转换为最小分辨角对数 (LogMAR) 视力以进行数据分析。收集患者的临床信息, 包括年龄、性别、DM 病程、高血压病史、HbA1c、体重指数、血小板指标、血炎症指标、凝血指标、肾功能指标、血脂指标、OCT 影像学指标: CMT、内/外层 HF 计数、IRF/SRF 消退情况、ELM 及 EZ 完整性、SCP/DCP、FAZ 面积等, 每次均在玻璃体注药前进行。所有患者均执行 4+PRN 方案, 研究者根据 CST 和 BCVA 评估结果判断是否需要继续给药或延长治疗间隔。记录数据及发生的不良事件, 进行统计学分析。

结果: 记录 BCVA、CRT 较基线的变化 (LogMAR 字母), 比较 DRT 型、CME 型、SRD 型三组患者改善差异, 评估 OCT 分型 (DRT/CME/SRD) 对 BCVA 提升 ≥ 10 字母的独立预测能力。评估 1、3、6、9 个月时 BCVA、CRT 较基线的变化、IRF/SRF 较基线的消退情况及比例、12 个月内受试者接受法瑞西单抗治疗总针数、平均治疗间隔等。(5) 比较不同 OCT 分型患者的治疗间隔及注射频次差异。

结论: 预期不同 OCT 分型患者在短期及长期疗效上存在差异, 为个体化治疗提供依据。

基于 OCT 影像组学的无监督机器学习区分 RVO-ME 预后亚型

第一作者: Xuemei LIANG

共同作者: Zhongping CHEN, Li LI, Shaozhao LUO, Xiaoyu YU

目的: 基于治疗前光学相干断层扫描影像组学 (OCT-omics) 特征, 运用无监督机器学习方法识别视网膜静脉阻塞合并黄斑水肿 (RVO-ME) 的不同表型聚类, 并评估其与抗血管内皮生长因子 (anti-VEGF) 治疗结局的关联。

方法: 分析来自南宁和广州爱尔眼科医院的 248 只眼接受抗 VEGF 药物治疗的 RVO-ME 患眼的治疗

前 OCT 图像。在使用主成分分析进行特征降维后，采用无监督聚类方法识别表型亚组。比较各聚类间的基线特征与治疗结局以验证聚类有效性。应用 Boruta 算法筛选最具相关性的 OCT-omics 特征，并通过多变量回归分析确定治疗结局的预测因素。

结果：共保留 948 个 OCT-omics 特征用于聚类分析得出两个表型不同的聚类。与聚类 2 (111 眼) 相比，聚类 1 (137 眼) 中视网膜中央静脉阻塞 (CRVO) 比例更高 (63.5% vs. 26.1%; $P < 0.001$)，基线最佳矫正视力 (LogMAR BCVA) 更差 (1.0 vs. 0.7; $P < 0.001$)，黄斑中心凹厚度 (CMT) 更厚 (724.0 μm vs. 445.0 μm ; $P < 0.001$)。随访期间，聚类 1 的 RVO-ME 复发率更高 (44.5% vs. 26.1%; $P = 0.003$)，且最终 BCVA $\leq 20/63$ 的患者比例更高 (56.2% vs. 39.4%; $P = 0.009$)。多变量分析显示，gradient_firstorder_Maximum (OR 1.597, 95% CI 1.150–2.254, $P = 0.006$) 与 logarithm_gldm_DependenceVariance (OR 1.016, 95% CI 1.005–1.027, $P = 0.005$) 与 RVO-ME 复发独立相关。而 wavelet.LH_firstorder_Mean (OR 0.044, 95% CI 0.009–0.210, $P < 0.001$)、gradient_firstorder_Maximum (OR 0.988, 95% CI 0.977–0.998, $P = 0.02$) 及 wavelet.HL_firstorder_Median (OR 1.751, 95% CI 1.040–3.015, $P = 0.037$) 与视力预后显著相关。

结论：治疗前的 OCT-omics 特征可有效区分具有不同解剖与视力结局的 RVO-ME 表型亚组。定量 OCT-omics 生物标志物可能作为疾病复发与视力预后的有效预测指标，为 RVO-ME 的个体化精准管理提供潜在工具。

基于多模态评估的 1 例氯氰碘柳胺钠中毒性视网膜病变病程及预后观察

第一作者：Ge YANQI

共同作者：Jun XIAO, Jialin YANG, Xiaolin ZHOU

目的：通过多模式影像检查，观察 1 例氯氰碘柳胺钠中毒性视网膜病变患者的视网膜结构及视细胞功能改变，并评估病程和激素治疗预后。

方法：回顾性分析了 1 例氯氰碘柳胺钠中毒病例的病史，首诊及激素冲击治疗后的 OCT、视野、全视野视网膜电图 (ffERG) 等表现。

结果：患者女，51 岁，因“双眼视物模糊 2 周”就诊，视力 0.25 OD, 0.5 OS, 右眼晶状体皮质略浑浊，双眼前节未见其他明显异常。患者自述 3 周前因“皮肤病”自行口服“阿维菌素氯氰碘柳胺钠片”3 天 (累

计摄入氯氰碘柳胺钠 450 mg)。OCT 示双眼视网膜外层结构消失，代之以弥漫的点状高反射病变；视野检查示双眼中心视野缺失；ffERG 提示双眼视锥、视杆细胞广泛损伤；其他眼底影像检查均未见明显异常。结合病史，考虑诊断为氯氰碘柳胺钠中毒性视网膜病变，予 1000 mg 甲泼尼龙静脉注射冲击治疗。2 周后复查，视力 0.4 OD, 0.6 OS；OCT 示双眼中心凹下视网膜结构较前改善，外层视网膜层次可分辨；视野检查示中心视野缺失较前略减轻。2 个月复查，视力 0.5 OD, 1.0 OS；OCT 示双眼中心凹下外层网膜反射清晰并向中心凹旁延伸；视野检查示双眼中心视野缺失较前显著好转；ffERG 示 6 项反应均较前好转，提示视细胞功能较前恢复。

结论：氯氰碘柳胺钠是一种卤代水杨酰苯胺化合物，血浆蛋白结合率高达 99% 以上，半衰期 2–3 周，是一种兽用广谱抗寄生虫药，作为解偶联剂，抑制线粒体的氧化磷酸化过程。其在眼部的毒性作用主要包括视神经损害和外层视网膜损害。由于该药禁用于人类，此类中毒十分罕见。本病例中观察到氯氰碘柳胺钠对外层视网膜尤其视细胞的毒性，这可能与其对线粒体的选择性作用有关。随访过程中视网膜外层结构的部分恢复提示氯氰碘柳胺钠的毒性作用是部分可逆的。由于激素冲击治疗与患者视功能和视细胞结构改善的时间有显著延迟，具体作用尚不明确，需要高度重视毒物代谢导致视细胞结构和功能自发恢复的可能。对于此类中毒病人，OCT 观察视网膜结构、视野评估宏观视功能、ffERG 评估视细胞功能，三者相辅相成，在长期随访中对患者视网膜结构和功能进行细致的评估。

应用 OCTA 观察视网膜静脉阻塞的虹膜血流变化

第一作者：Bi XUE

目的：应用光学相干断层扫描血管造影 (OCTA) 对视网膜静脉阻塞患者进行虹膜血流动力学检查，以期发现 RVO 的虹膜血流是否存在特征性改变。

方法：所有入组者均为我院门诊就诊患者。实验组为首发视网膜静脉阻塞 (RVO)，分为中央 (CRVO) 和分支 (BRVO) 两组。对照组为白内障，无高度近视及糖尿病者。每组 10 只眼，共 30 只眼。每只眼均行 OCTA 检查虹膜的血流情况，并以瞳孔边缘为基准，间隔 2 mm 分层收集内、中、外层虹膜血流密度 (IVD) 和灌注面积的四个象限数值。使用 SPSS 25.0 软件进行统计分析，使用单因素方差分析进行大组比较，LSD 法进行两两比较， $P < 0.05$ 为差异具有统计学意义。

结果：在正常组中，血管密度及灌注面积从高到低依次为颞下、颞上、鼻下、鼻上，RVO 组均低于正常组，CRVO 组更为显著。血管密度呈现出逐层递减的趋势 ($P = 0.000$)，且分层比较时 RVO 组较正常组明显下降 ($P < 0.01$)。灌注面积中层为最高，CRVO 组的内层灌注略有增加，中层 ($P = 0.061$) 及外层 ($P = 0.007$) 降低。

结论：RVO 的虹膜血管密度及灌注面积均降低，CRVO 产生的影响更大。

抗 VEGF 治疗 IV 期糖尿病视网膜病变合并糖尿病性黄斑水肿的疗效观察

第一作者：**Wang YIYUE**

目的：研究单纯行玻璃体腔内注射抗血管内皮生长因子药物治疗 IV 期糖尿病视网膜病变 (DR) 合并糖尿病性黄斑水肿 (DME) 患者的治疗效果

方法：回顾性临床研究，荧光素眼底血管造影、光相干断层扫描血管成像检查后确诊为 IV 期 DR 合并 DME 患者 18 例 (35 只眼) 的相关临床资料，纳入患者均接受抗 VEGF 药物 (康柏西普 0.05 ml/0.5 mg) 治疗，每月 1 次，连续 3 次，以治疗前为基线，对比观察末次抗 VEGF 治疗后 3 个月、治疗后 6 个月时最佳矫正视力 (BCVA)、黄斑中心凹视网膜厚度 (CMT)、微血管瘤 (MA) 数量、视网膜无灌注区面 (NPA) 面积、视网膜新生血管 (NVE) 面积以及视网膜血流密度 (VD) 变化，评估治疗效果。

结果：根据所有患眼末次抗 VEGF 治疗后 3 个月、6 个月随访，测得 BCVA (LogMAR) 从治疗前 0.43 ± 0.22 ，治疗后 3 个月升高为 0.17 ± 0.21 ，治疗后 6 个月升高为 0.281 ± 0.24 。CMT 从治疗前 $304.51 \pm 165.06 \mu\text{m}$ ，治疗后 3 个月降至 $226.67 \pm 68.22 \mu\text{m}$ ，治疗后 6 个月降为 269.46 ± 125.79 。MA 数量从治疗前 213.44 ± 62.49 个，治疗后 3 个月减少到 159.88 ± 47.22 个，治疗后 6 个月 MA 数量降至 178.33 ± 55.47 个。NPA 治疗前与治疗后 3 个月、治疗前与治疗后 6 个月、治疗 3 个月与治疗后 6 个月相比， P 值均 > 0.05 ，NPA 无明显变化。NVE 面积治疗前为 $1.05 \pm 1.56 \text{ mm}^2$ ，治疗后 3 个月面积减小至 $0.26 \pm 1.08 \text{ mm}^2$ ，治疗 6 个月后增长为 $0.90 \pm 1.78 \text{ mm}^2$ ，治疗后 3 个月 NVE 明显消退，治疗后 6 个月与治疗前相比 NVE 未见明显变化。在浅层血管复合体 VD 中，总体 VD 均数呈下降趋势 (无统计学意义)，其中旁中心凹区鼻侧治疗前与治疗后 6 个月相比，中心凹周上方治疗后 3 个月、治疗后 6 个月与治疗

前相比较， P 值 < 0.05 ，差异有统计学意义。深层血管复合体 VD 数值中，总体 VD 均数也呈现下降趋势 (无统计学意义)，其中旁中心凹区颞侧、鼻侧治疗前与治疗后 3 个月相比、治疗前与治疗后 6 个月后相比，旁中心凹区下方治疗前与治疗后 6 个月相比，中心凹周上方、颞侧、鼻侧治疗前与治疗后 3 个月相比、治疗前与治疗后 6 个月相比，外周 2 颞侧治疗前与治疗后 6 个月相比， P 值 < 0.05 ，差异有统计学意义。

结论：1. 单纯抗 VEGF 治疗 IV 期 DR 患眼，可以提高患者最佳矫正视力，CMT 下降，MA 数量减少，视网膜新生血管消退，但治疗后 6 个月视网膜病变可再次进展。2. 单纯抗 VEGF 治疗 IV 期 DR 患者，可以控制 NPA 的进展，但不能逆转 NPA。3. 抗 VEGF 治疗并未改善视网膜 VD，甚至导致局部区域 VD 下降。

早、中期年龄相关性黄斑变性的玻璃膜疣结构特征及脉络膜厚度及血流研究

第一作者：**Lanruo LIN**

共同作者：**Jianchen HAO, Junmeng LIN, Liu YANG**

目的：研究本院中国人群中早、中期年龄相关性黄斑变性 (Age-related macular degeneration, AMD) 患者不同分期玻璃膜疣结构特征及脉络膜血流与厚度研究。

方法：本研究为回顾性研究。2023 年 1 月至 2024 年就诊于我院的 AMD 患者共 2628 名，分析影像学表现、根据玻璃膜疣的大小、分布进行分期，并对早中期 AMD 患者使用 SS-OCT 进行检测，包括玻璃膜疣体体积、脉络膜厚度、脉络膜体积、脉络膜毛细血管层 (Choriocapillary layer, CCL) 血管密度、CC 层血管区域、脉络膜血管指数 (Choroidal vascular index, CVI)、脉络膜血管容积 (Choroidal vascular volume, CVV)。并进一步用 AI 自动分割模型对脉络膜按解剖结构进行分层，分为毛细血管层、中血管层、大血管层。

结果：根据 2019 年美国眼科学会发表的 AMD 临床指南，对所有 AMD 患者分期并对早、中期 AMD 玻璃膜疣分型，其中至少一眼为早或中期且无晚期的 AMD 患者共 1816 人，占 69.1%；至少一眼为晚期 AMD 共 776 人，占 21.9%。其中地图状萎缩 36 人，占 1.4%。在至少一眼为早或中期且无晚期的 AMD 患者中分期以早期 AMD 最多占 42.7%，玻璃膜疣大小以小玻璃膜疣为主可分布于全视网膜，大中玻璃膜疣多分布于黄斑区，可伴有光感受器细胞损伤。共 69 人 134 只眼睛纳入了

我们回顾性 SS-OCT 研究。其中早、中期 AMD 患者 37 人 ($n = 70$)，对照组 32 人 ($n = 64$)，脉络膜厚度及血流指标平均 CVI 和 CVV 显著低于对照组，进一步分析脉络膜 CC 层的血流指标脉络膜毛细血管层血管体积 (Choriocapillaris Vessel Density, CCVD) 及脉络膜毛细血管层血流面积 (Choriocapillaris Flow Area, CCFA)，早、中期 AMD 患眼与正常眼相比显著降低 ($P < 0.001$)。自动分割模型对脉络膜按解剖结构进行分层发现大、中血管层的厚度、CVV 及 CVI 较正常对照组无统计学差异。

结论：中国人群中早、中期 AMD 患者以小玻璃膜疣为主，分期多为早期 AMD，大中玻璃膜疣更易出现在黄斑区，玻璃膜疣体积与脉络膜损伤指标 (厚度及血流) 相关，脉络膜损伤主要发生在毛细血管层，且与大、中血管层无关。

早期真实世界玻璃体腔注射 Faricimab 治疗黄斑新生血管的疗效及安全性研究

第一作者：Yixin CUI

共同作者：Qirui LI, Lingna RAO, Lu SHEN, Ling YUAN

目的：评估真实世界中玻璃体腔注射 Faricimab 治疗黄斑新生血管的疗效与安全性。

方法：本研究纳入于 2024 年 3 月至 2025 年 6 月在昆明医科大学第一附属医院首次诊断的黄斑新生血管 (MNV) 患者，所有患者均接受每月 1 次、连续 3 次的玻璃体腔 Faricimab 注射，操作由同一名经验丰富的医生完成。观察指标包括注药前及注药后 1 个月 (1 M)、2 个月 (2 M)、3 个月 (3 M) 的最佳矫正视力 (BCVA, 以 logMAR 计)、视网膜中心厚度 (CST)、视网膜下液 (SRF)、视网膜间液 (IRF) 及视网膜下高反射点 (SHRM)。

结果：本研究纳入 15 例 MNV 患者，其中 1 型 MNV 8 例，2 型 MNV 7 例。患者平均年龄 65.1 岁 (38–81 岁)，平均眼轴 23.98 mm (22.16–27.16 mm)。1. BCVA: 术后 1 个月 BCVA 与基线无显著差异 ($P > 0.05$)；术后 2 个月、3 个月 BCVA 较基线显著提高 ($P < 0.05$)。2. CST: 术后 1 个月、2 个月、3 个月 CST 较基线均显著下降 ($P < 0.05$)。3. 其他指标: 术后 1 个月、2 个月、3 个月 SRF、IRF、SHRM 较基线均呈下降趋势，但差异无统计学意义 ($P > 0.05$)。安全性: 研究期间未发生严重不良事件。

结论：玻璃体腔注射 Faricimab 治疗 MNV 可有效提升患者视力，降低视网膜中心厚度，恢复黄斑解剖结构，改善视觉功能，且安全性较好。本研究验

证了法瑞西单抗治疗 MNV 的短期疗效，但其长期效果及最佳给药方案尚需更大样本量和更长期随访研究进一步证实。

机器学习联合分子动力学模拟揭示农药暴露对高度近视视网膜脱离的风险机制

第一作者：Jiahao NIU

共同作者：Xuan LIAO

目的：视网膜脱离的进展受遗传易感性、钙超载诱导的神经元损伤及氧化应激 (涉及有机磷农药) 影响，其中高度近视是其最强风险因素。本研究旨在整合生物信息学、WGCNA、机器学习、网络毒理学、分子对接及分子动力学模拟技术，深入探究视网膜脱离发病机制并识别潜在致病性农药。

方法：通过整合视网膜脱离数据集和高度近视数据集的差异表达基因，并结合网脱数据的 WGCNA 关键模块分析，筛选出 55 个候选枢纽基因。采用八种机器学习算法构建预测模型。排除两个存在显著过拟合 (RMSR 值较高) 的模型后，利用 SHAP 分析确定对网脱预测贡献度最高的 15 个基因。为此构建 ceRNA 调控网络，并创新性地开发反向靶向网络毒理学框架，筛选相关环境毒物。

结果：鉴定出三种候选农药——地虫磷 (fonofos)、特丁磷 (terbufos) 和对硫磷 (parathion) ——与核心靶点存在强相互作用。分子对接与分子动力学模拟进一步证实了这些农药与枢纽靶标蛋白结合的稳定性。功能富集分析揭示，细胞外基质相关通路及 VEGF-HSPGs 信号通路在 RD 发病中扮演重要角色。

结论：本研究通过多学科交叉整合策略，不仅阐明了高度近视与视网膜脱落共病的共享发病机制，更重要的是，首次揭示了有机磷农药暴露 (地虫磷、特丁磷、对硫磷) 与网脱风险之间存在一种新颖的机制性关联，建立了重要的生物学和分子连接，为网脱的环境风险因素识别和干预提供了新思路。

槲皮素通过 ERK/STAT3 途径调节小胶质细胞 M1/M2 极化并减轻视网膜炎症

第一作者：Yunqin LI

共同作者：Xin TAN, Yue ZOU

目的：视网膜炎症是多种视网膜退行性疾病 (如年龄相关性黄斑变性) 的重要病理特征，主要由小胶质细胞激活驱动。槲皮素 (Qu) 作为一种天然抗神

经炎症物质，其对视网膜炎症的作用及机制尚不明确。本研究旨在探讨槲皮素对脂多糖（LPS）诱导的视网膜炎症的影响及其潜在机制。

方法：采用成年雄性 C57BL/6J 小鼠，通过腹腔注射 LPS 建立视网膜炎症模型，并在造模前进行槲皮素预处理。通过体内外实验，评估小胶质细胞表型转换、视网膜炎症水平、血-视网膜屏障完整性及光感受器存活情况，并进一步利用体外实验研究 ERK/STAT3 信号通路在槲皮素调控小胶质细胞活化、增殖和迁移中的作用。

结果：槲皮素预处理可促使小胶质细胞由促炎 M1 表型向抗炎 M2 表型转变，显著减轻视网膜炎症反应，并增强血-视网膜屏障的稳定性。机制研究表明，槲皮素主要通过抑制 ERK/STAT3 信号通路，阻碍小胶质细胞的激活、增殖与迁移。此外，槲皮素处理显著提高了光感受器的存活率。

结论：槲皮素通过调控 ERK/STAT3 通路抑制小胶质细胞活化，缓解视网膜炎症，保护血-视网膜屏障结构和功能，并促进光感受器存活，表明其作为一种潜在的治疗策略可用于视网膜炎症性及退行性疾病的防治。

法瑞西单抗在难治性黄斑水肿治疗中的显著短期疗效：一项回顾性研究

第一作者：Yajian DUAN

共同作者：Qingjun TIAN, Fang YUAN

目的：难治性黄斑水肿（ME）对抗 VEGF 药物治疗反应不佳是临床常见问题。法瑞西单抗（Faricimab）作为一种新型双通路抑制剂，可同时阻断血管内皮生长因子 A（VEGF-A）和血管生成素-2（Ang-2）。本研究通过回顾性分析，评估法瑞西单抗治疗对抗 VEGF 药物（雷珠单抗、阿柏西普或康柏西普）反应不佳的难治性 ME 患者的功能与解剖学疗效，并分析其短期动态反应。

方法：本研究回顾性分析了 2024 年 1 月至 2024 年 12 月山西白求恩医院眼科收治的 62 例单眼难治性 ME 患者的临床资料。所有患者均曾接受至少 3 次雷珠单抗、阿柏西普或康柏西普治疗但反应不佳。按病因分为糖尿病性黄斑水肿（DME）组（n = 32）、新生血管性年龄相关性黄斑变性（nAMD）组（n = 22）和视网膜分支静脉阻塞（BRVO）组（n = 8）。所有患者转为每月 1 次的法瑞西单抗（6.0 mg）玻璃体腔内注射治疗，连续 3 个月。收集基线、每次注射后 1 个月及末次注射后 1 个月的最佳矫正视力（BCVA, logMAR）和黄斑中心凹厚度（CRT）数据，采用配对 t 检验评估每次注射

后 CRT 和 BCVA 的动态变化，并根据基线 OCT 形态特征进行亚组分析。

结果：经 3 次注射后，全体患者的 BCVA 和 CRT 均较基线显著改善（ $P < 0.001$ ）。BCVA 从基线的 0.72 ± 0.21 logMAR 提高至 0.59 ± 0.19 logMAR。平均 CRT 从基线 503.6 ± 112.4 μm 显著下降至 298.5 ± 87.3 μm 。动态变化分析显示，首次注射后 1 个月 CRT 即出现显著下降（下降值： 125.3 ± 68.4 μm , $P < 0.001$ ），后续注射后仍进一步改善。BCVA 在首次注射后亦显著提高（改善 0.05 ± 0.08 logMAR, $P < 0.01$ ），并随时间呈持续改善趋势。亚组分析结果表明，DME 组疗效最为显著，其 CRT 平均下降 189.2 ± 95.6 μm ，BCVA 改善 0.10 ± 0.08 logMAR。在 OCT 形态亚组中，黄斑囊样水肿（CME）型患者（n = 38）的 CRT 下降幅度显著大于弥漫性视网膜增厚（DRT）型（n = 17）或浆液性视网膜脱离（SRD）型（n = 7）患者（ $P < 0.05$ ）。

结论：本回顾性研究证实，法瑞西单抗对常规抗 VEGF 药物治疗效果不佳的难治性 ME 患者具有显著的临床疗效，可有效改善解剖结构和视功能，且安全性良好。DME 患者和 CME 亚型患者获益尤为明显。法瑞西单抗为难治性 ME 患者提供了有效的治疗选择。

法瑞西单抗治疗既往抗 VEGF 效果不佳的 Coats 病的疗效观察：一例病例报告

第一作者：Xiaochun YANG

共同作者：Yang GAO

目的：探讨法瑞西单抗在治疗既往抗血管内皮生长因子（VEGF）效果不佳的 Coats 病的有效性和安全性。

方法：报告 1 例 18 岁男性 Coats 病患者的诊疗过程。患者因“左眼视力下降 6 月”就诊，既往曾接受视网膜激光光凝及 3 次雷珠单抗玻璃体腔注射，但黄斑区渗出持续增加。本次治疗予以法瑞西单抗（6 mg/0.05 mL）玻璃体腔注射治疗，每月 1 次，共 5 次。通过系列眼科检查评估疗效，包括视力、眼底照相、光学相干断层扫描（OCT）、荧光素血管造影（FFA）和 OCT 血管成像（OCTA）。

结果：患者基线右眼视力 0.8、眼压 16 mmHg，左眼视力手动 /30 cm、眼压 17 mmHg。右眼眼底未见明显异常，左眼视网膜颞上区域见黄白色渗出，黄斑区可见浓厚渗出灶。FFA 提示右眼颞侧周边血管截断，伴无灌注区及末梢毛细血管球瘤样扩张；左眼颞上分支血管梭形膨大，晚期见黄斑及血管渗

漏，视盘荧光着染。诊断为双眼 Coats 病（右眼 I 期，左眼 IIB 期）。经 5 次法瑞西单抗治疗后，左眼视力提高至 0.02，视网膜周边及黄斑区渗出明显吸收，OCT 显示中心凹下残留高反射物质，OCTA 对应区域未见血流信号。治疗期间未发生眼压升高、眼内炎等不良事件。

结论：本病例表明，对于 Coats 病引起的眼底渗出，法瑞西单抗可能较雷珠单抗显示出更优的消退效果。法瑞西单抗或可作为 Coats 病，特别是伴有显著渗出的进展性病例的一种有效治疗选择。

法瑞西单抗治疗糖尿病性黄斑水肿的真实世界多中心回顾性研究

第一作者：Min FU

共同作者：Xinyu MA

目的：法瑞西单抗作为一种新型双特异性抗体，能够同时结合血管紧张素 II 和 VEGF-A，可能为单药疗效不佳者提供更优选择。本项多中心回顾性研究旨在评估法瑞西单抗治疗糖尿病性黄斑水肿（Diabetic macular edema, DME）的临床疗效。

方法：研究对象选自 2024 年 6 月至 2025 年 6 月眼科收治的 111 例 DME 患者，分为法瑞西单抗组（F 组，32 人）、其他抗 VEGF 药物组（A 组，63 人）和其他抗 VEGF 药物疗效不佳转换为法瑞西单抗组（A → F 组，16 人）。此外，我们的研究根据最佳矫正视力（Best corrected visual acuity, BCVA）将 DME 患者分为重度视力损害亚组（BCVA ≤ 0.25）以及轻中度视力损害亚组（BCVA > 0.25）。主要结局指标为 12 个月内患者最后一次随访时 BCVA 和黄斑区中央子区厚度值（Central Subfield Thickness, CST），次要终点包括治疗时间间隔、注射次数。所有数据采用 SPSS 23.0 软件进行分析。

结果：三组患者在接受治疗后均出现显著 CST 下降（所有 $P < 0.05$ ）。三组 Δ BCVA 与 Δ CST 差异无统计学意义（ $P > 0.05$ ），但法瑞西单抗组（F 组）CST 下降幅度最大（-258 μm ）。同时，法瑞西单抗的使用显著降低了患者的治疗负担包括间隔时间长难以坚持以及经济负担。研究结果提示在重度视力损害的患者中，法瑞西单抗组注射次数与间隔优势更为突出，提示法瑞西单抗双靶点干预可能延缓不可逆光感受器损伤；在轻中度视力损害组中，仅 Δ CST 显示出明显差异，表明法瑞西单抗组在视力较好的人群中能够有效地改善黄斑厚度。

结论：相较于传统初治组，法瑞西单抗初治组与转换组在 DME 治疗中展现出极大的优势，注射次数

最少、治疗间隔最长。重度视力损害亚组中转换为法瑞西药物治疗后治疗间隔显著延长。因此，双通道抗 VEGF 药物为需降低治疗负担的 DME 患者提供了优于传统方案及转换方案的现实选择。

真实世界中法瑞西单抗治疗新生血管性年龄相关性黄斑变性（nAMD）患者的有效性与安全性

第一作者：Fen ZHOU

目的：评估真实世界中法瑞西单抗治疗新生血管性年龄相关性黄斑变性（nAMD）患者的有效性与安全性。

方法：采用前瞻性研究方法，纳入难治性 nAMD 患者，接受法瑞西单抗 6 mg/0.05 ml 负荷剂量治疗（每月 1 次玻璃体腔注射，共 3 次）。研究共纳入 20 例患者（17 例为典型 AMD [tAMD]，3 例为息肉样脉络膜血管病变 [PCV]）。所有患者此前均接受过至少连续 3 次其他抗 VEGF 药物玻璃体腔注射。主要结局指标包括 4 个月时的最佳矫正视力（BCVA）和 OCT 结果。

结果：法瑞西单抗治疗方案显著改善了难治性 nAMD 患者的视力和解剖结构结局。BCVA（logMAR）从 0.84 ± 0.47 显著改善至 0.57 ± 0.31 （ $p < 0.001$ ）；CST 从 $376.50 \pm 173.11 \mu\text{m}$ 显著降低至 $238.95 \pm 78.74 \mu\text{m}$ （ $p < 0.001$ ）；PED 面积从 $1.47 \pm 0.84 \text{ mm}^2$ 减小至 $0.92 \pm 0.65 \text{ mm}^2$ （ $p < 0.001$ ）；CNV 面积从 $1.36 \pm 0.79 \text{ mm}^2$ 减小至 $1.15 \pm 0.69 \text{ mm}^2$ （ $p < 0.001$ ）。SRF 亚组和 SRF&IRF 亚组均表现出显著的视力和解剖结构改善。单纯 SRF 眼相比 SRF&IRF 眼实现了更优的给药间隔延长（≥ 3 个月者超 80%，后者约为 40%）。安全性方面法瑞西单抗耐受性良好，未发生严重不良事件。

结论：法瑞西单抗可显著改善 nAMD 患者视力，并快速改善解剖结构结局。短期内，该药能显著提升 BCVA、降低 CMT，并减少视网膜积液，是既往经治难治性 nAMD 安全有效的治疗选择。

真菌性眼内炎 2 例

第一作者：Jiyue TAN

共同作者：Jun XIAO, Ge YANQI

目的：通过 OCT 与 OCTA 分析两例内源性念珠菌性眼内炎（ECE）患者的玻璃体、视网膜和脉络膜

特征, 探讨其与视觉功能预后的相关性, 并评估单纯抗菌药物全身治疗后的临床影响。

方法: 回顾性分析了两例 ECE 患者的病史、SD-OCT 图像及脉络膜毛细血管层 OCTA 图像。

结果: 两位患者的危险诱发因素均是住院期间长期使用中心静脉导管 (CVC) 高营养支持治疗, 在一例患者的 CVC 导管真菌培养中发现白色念珠菌阳性, 进一步证实了感染来源。两例患者的四只眼睛入组, 一只眼睛的玻璃体受累 (左眼视盘颞下方玻璃体内有一白色病变)。SD-OCT 连续跟踪随访显示, 四只眼睛病变均起源于 RPE/ 脉络膜层, 并穿透到神经感觉层, 内层视网膜结构清晰, 未受侵犯, 外层散在团块状物质沉积, 接近 subretinal macular lesions 的类型, 但病灶数量多, 且第一例有网膜下积液, 玻璃体内也有少量病原体侵犯。FAF 见后极部多发暗点, 周围围绕环形高自发荧光区。脉络膜毛细血管层 OCTA 显示, 病灶对应区域为多发暗区, 提示血流灌注不足, 可能为炎症导致的毛细血管的闭塞。两例患者在口服联合静脉抗真菌药物全身治疗后, 炎症均得到了有效控制, 且玻璃体炎症也有所改善, 多模式图像上表现为病灶的逐渐消退, IS/OS 连续性的恢复、RPE 的平复、脉络膜毛细血管层的恢复, 最终出现与穿透部位相对应的脉络膜视网膜瘢痕, 影响视网膜功能。第二例患者在初次检查时病灶似乎已经表现为消退期, 且逐渐稳定, 这可能跟初次检查眼底时已进行 40 天全身抗真菌治疗相关。

结论: 早期及时全身性通过静脉或口服给药的方式应用抗真菌药物, 通过保护视网膜外层结构维持光转导功能, 对 ECE 的控制有明显疗效, 视力得到明显提升, 轻微的玻璃体侵犯也可得到控制; RPE 下高反射的纤维样物质是 ECE 稳定期的表现, 对视力的影响取决于这些瘢痕物质的位置与黄斑中心凹的距离, 这种瘢痕是否进一步萎缩或者侵犯到其他位置, 需要更长时间的随访来观察。

碘酸钠通过 ITPR2-VDAC1 通路诱导视网膜衰老表型的机制研究

第一作者: Boling XU

共同作者: Wang LI, Liping YANG

目的: 本研究旨在利用碘酸钠诱导的年龄相关性黄斑变性 (AMD) 样模型, 深入探究干性 AMD 的发病机制。我们重点验证了碘酸钠通过激活 ITPR2-VDAC1 通路、诱发钙稳态失调、线粒体损伤及细胞衰老在疾病发生中的核心作用, 并评估靶向该通路的干预效果。本研究旨在为阐明 AMD 的病理机

制提供新见解, 并为发掘潜在治疗策略提供实验依据。

方法: 在动物模型中, 通过腹腔注射碘酸钠构建小鼠 AMD 样病变模型。分别于给药后第 7 天和第 14 天检测 FP、ERG、OCT 以评估小鼠视网膜的形态学与功能变化。综合运用 RNA-seq、Western Blot、qPCR 等技术, 验证 ITPR2-VDAC1 通路在模型中的关键作用。进一步在小鼠模型中使用 ITPR2 与 VDAC1 抑制剂进行挽救实验, 证实抑制上述靶点可减轻碘酸钠诱导的视网膜病变和细胞损伤。

结果: 研究结果显示, 碘酸钠可诱导进行性视网膜变性及 AMD 样病理改变。在小鼠模型中, FP、OCT 结果显示, 碘酸钠腹腔给药造成小鼠视网膜组织结构损伤, ERG 结果显示小鼠出现明显视觉功能下降。RNA-seq 分析鉴定出 3000 余个差异表达基因, 主要富集于线粒体功能、氧化应激及细胞衰老等相关通路。机制研究表明, 碘酸钠通过上调 ITPR2 表达, 破坏钙稳态, 引发线粒体钙超载与氧化应激, 进而驱动细胞衰老。在动物模型中, 2-APB 与 DIDS 均能显著缓解碘酸钠引起的小鼠视网膜损伤, 表现出明确的保护作用。

结论: 本研究发现并系统阐释了碘酸钠通过 ITPR2-VDAC1 轴诱导视网膜细胞衰老的作用机制。该通路介导细胞内钙稳态失调、诱导线粒体功能障碍, 进而推动衰老表型的产生及 AMD 样病理改变。该发现不仅深化了对 AMD 发病机制的理解, 也为靶向 ITPR2-VDAC1 通路的治疗策略开发提供了重要的实验依据。

线粒体稳态失衡诱导糖尿病视网膜病变中视网膜血管内皮细胞损伤

第一作者: Meng-yuan ZHANG

共同作者: Yong YAO

目的: 糖尿病视网膜病变 (Diabetic retinopathy, DR) 是糖尿病 (diabetes mellitus, DM) 的主要微血管并发症, 严重时可导致视力丧失。视网膜微血管内皮细胞 (retinal microvascular endothelial cells, RMECs) 功能障碍在 DR 发生发展中起关键作用, 而线粒体稳态失衡是导致 RMECs 损伤的核心环节。然而, DR 中 RMECs 线粒体紊乱的具体分子机制尚未完全阐明。

方法: 本研究采用高糖 (high glucose, HG) 诱导的 RMECs 模型和链脲佐菌素 (streptozotocin, STZ) 诱导的 Sprague-Dawley 大鼠糖尿病模型,

系统探讨 RMECs 线粒体功能障碍的机制。在细胞模型中，检测了细胞活力、线粒体形态和细胞凋亡情况；进一步通过蛋白质印迹、免疫荧光、荧光探针等技术，分析高糖对线粒体稳态的调控机制。为验证线粒体稳态在 DR 中的作用，在 STZ 大鼠模型中分别使用线粒体分裂抑制剂 Mdivi-1 和自噬激动剂雷帕霉素 (Rapamycin) 进行干预，并通过苏木精-伊红 (HE) 染色、TUNEL 染色、PAS 染色和伊文思蓝渗漏实验评估视网膜病理变化。

结果：高糖通过激活 Drp1 介导的线粒体过度分裂，诱导 RMECs 凋亡。抑制 PKC δ (使用 Go 6983 或 siRNA) 可下调 PKC δ /Drp1 通路，减轻线粒体分裂。同时，高糖通过抑制 PINK1/Parkin 通路削弱线粒体自噬，而敲低 PINK1 加剧了高糖引起的细胞损伤。机制上，Drp1 促进己糖激酶 II (HK-II) 从线粒体释放，进而抑制 HK-II-PINK1 介导的线粒体自噬，从而揭示了线粒体分裂与自噬间的交互作用。动物实验表明，STZ 大鼠出现视网膜内微血管异常，包括血管渗漏、无细胞毛细血管和细胞凋亡，而 Mdivi-1 或雷帕霉素预处理均可逆转上述病变。

结论：本研究揭示了 PKC δ /Drp1-HK-II-PINK1/Parkin 信号通路在调节线粒体稳态中的关键作用，该通路失调导致 RMECs 损伤并推动 DR 进展。抑制线粒体分裂或促进线粒体自噬，可能成为 DR 干预的潜在新策略。

肌腱蛋白-C 通过诱导视网膜色素上皮细胞的转分化在增殖性玻璃体视网膜病变中的作用和机制研究

第一作者：Zong TIANYI

目的：探讨肌腱蛋白-C (TNC) 在诱导 RPE 细胞转分化中的调节作用，从而明确 TNC 参与 PVR 进展的作用和机制。

方法：首先确定 RPE 细胞转分化的条件。通过实时定量 PCR、western blot、ELISA 观察 TNC 在转分化的 RPE 细胞中以及两种 PVR 动物模型中的表达模式。由 qPCR、western blot、CCK-8 观察干扰 TNC 基因后相关纤维化表型的改变。通过冰冻切片免疫荧光观察 TNC 在 PVR 患者的增殖膜中的表达以及与 RPE 细胞、成纤维细胞的共定位情况。在体内实验中，通过阻断剂 ICG-001 特异性阻断 β -catenin 信号通路，PVR 的病程进展明显被抑制。

结果：在体外，给予人 ARPE-19 (hRPE) 细胞 TGF- β 2 刺激，能够显著的增加 TNC 的表达。而给予 ARPE-19 细胞 TNC 的 siRNA 转染后，可以明显的抑制 TGF- β 2 诱导的转分化。在 PVR 小鼠模型中，观察到 TNC 的 mRNA 和蛋白的水平明显增加。此外，免疫荧光染色结果表明，在 PVR 患者的视网膜外膜中，TNC 与 RPE65 或 α -SMA 的共定位显著增加。整合素 α V 和 β -catenin 也在 PVR 患者的视网膜外膜中大量表达。在 PVR 的动物模型中， β -catenin 的抑制剂 ICG-001 能有效减缓 PVR 的进展。

结论：这些研究结果表明，TNC 由经分化的 RPE 细胞分泌，并通过整合素 α V 和 β -catenin 途径促进 PVR 的发展。因此，TNC 可能是抑制与 PVR 相关的视网膜前膜生成的潜在治疗靶点。

藏红花醛改善小鼠早期糖尿病视网膜病变的作用及机制研究

第一作者：Wenqian CHEN

共同作者：Wenzhen YU, Mingwei ZHAO

目的：糖尿病视网膜病变 (DR) 是由糖尿病引起的视网膜微血管损害性眼底病变，病理特征表现为微血管瘤、出血、渗出及新生血管形成。藏红花醛是藏红花活性成分之一，具有多种抗炎作用，有研究表明藏红花醛还具有神经保护、抗氧化等作用。本研究拟通过对链脲佐菌素 (STZ) 诱导的糖尿病小鼠全身给药藏红花醛，探索藏红花醛对小鼠早期糖尿病视网膜病变的作用及机制。

方法：通过 STZ 腹腔注射小鼠进行糖尿病小鼠造模，14 天后隔天腹腔注射藏红花醛。3 月后进行小鼠眼部光相干断层扫描 (OCT) 及血流成像 (OCTA) 检测、石蜡切片苏木素伊红 (HE) 检测，及免疫荧光染色。伊文思蓝检测小鼠视网膜微血管渗漏情况；TUNEL 实验及视网膜电图 (ERG) 检测藏红花醛对小鼠视网膜的毒性；Western blot 检测相关蛋白的变化。

结果：1. SSOCT 示藏红花醛改善糖尿病小鼠视网膜内界膜到内丛状层厚度；2. HE 染色示藏红花醛改善糖尿病小鼠神经纤维层和神经节细胞层的萎缩；3. 免疫荧光染色示藏红花醛缓解糖尿病小鼠神经节细胞的减少，缓解小胶质细胞视网膜浸润；4. 低浓度的藏红花醛对小鼠视网膜没有明显毒性作用；5. Western blot 检测藏红花醛可抑制 p-AKT 的磷酸化 MCU 进自噬；6. 伊文思蓝实验显示藏红花醛可有效改善早期糖尿病视网膜微血管渗漏。

结论: 藏红花醛可以通过缓解视网膜神经节细胞的萎缩、改善视网膜微血管渗漏、减少视网膜小胶质细胞的浸润引起的验证等多方面改善小鼠早期糖尿病视网膜病变。

造血干细胞移植后患儿并发巨细胞病毒视网膜炎的血液学指标预警分析: 一项单中心回顾性研究

第一作者: Ye LEI

共同作者: Liu HONGTAO, Xiu LIHENG

目的: 巨细胞病毒视网膜炎 (CMVR) 是造血干细胞移植 (HSCT) 后一种严重的机会性感染并发症, 可导致永久性视力损害。早期识别高危患儿并进行预防性干预至关重要。本研究旨在探讨 HSCT 后患儿的常规血常规指标与 CMVR 发生的相关性, 寻找有效的预警信号。

方法: 回顾性分析 2023-2025 年于我院行 HSCT 的 32 例患儿的临床资料及血常规化验结果。根据是否确诊 CMVR 分为两组: CMVR 组 (5 例, 其中 3 例为重度) 与非 CMVR 组 (27 例)。对比分析两组间淋巴细胞绝对值 (LYMPH#)、中性粒细胞绝对值 (NEUT#)、超敏 C 反应蛋白 (hs-CRP) 等指标的差异。

结果: CMVR 组患儿均表现出严重的淋巴细胞减少 (LYMPH# 范围: $1.21-1.73 \times 10^9/L$, 均低于参考值下限), 而非 CMVR 组淋巴细胞水平虽部分低下, 但存在较大异质性 (LYMPH# 范围: $0.34-30.19 \times 10^9/L$)。此外, CMVR 组患儿的炎症指标 hs-CRP 水平呈现升高趋势。两组在血小板计数、血红蛋白水平等方面均普遍低下, 但无组间差异。

结论: 本研究结果表明, 持续且严重的淋巴细胞减少 (Lymphopenia) 是 HSCT 后患儿发生 CMVR 的一个强烈关联信号和潜在的临床预警指标。建议对 HSCT 后出现深度淋巴细胞减少的患儿, 加强 CMV-DNA 的分子监测并提前进行眼科筛查, 以实现 CMVR 的早期诊断和干预, 改善患儿预后。

间充质干细胞对 CocL2 缺氧视网膜血管微环境的修复

第一作者: Guo-xing XU

目的: 探讨间充质干细胞对 CocL2 缺氧模型视网膜血管微环境的修复。

方法: 采用无水氯化钴 CocL2 制作人视网膜血管内皮细胞缺氧模型, 应用骨髓间充质干细胞对人视网膜微血管内皮细胞微环境变化进行修复。

结果: 无水氯化钴 CocL2 对人视网膜血管内皮细胞缺氧模型细胞内外差异蛋白质和脂质等均受到氧化损伤的影响, 细胞内外微环境生物许多差异蛋白质等发生了显著改变。加入骨髓间充质干细胞共培养后人视网膜血管内皮细胞内外生物信息标志物差异蛋白和脂质等等发生了逆转, 加入骨髓间充质干细胞共培养后人视网膜血管内皮细胞内 MDA、SOD 水平下降, NO 水平升高, 其系列生物标志物、蛋白质和脂质等得到正向影响。

结论: 骨髓间充质干细胞对无水氯化钴人视网膜血管内皮细胞缺氧模型的氧化应激损伤有修复作用, 干细胞的保护作用为理解氧化应激损伤的分子机制和核心生物标志物奠定了基础。

非视觉视蛋白 RGR 的剪接变体的生理作用体外研究

第一作者: Wenqian CHEN

共同作者: Henry FONG, Mingwei ZHAO, Li ZHU

目的: 非视觉视蛋白 RGR (视网膜 G 蛋白偶联受体) 主要存在于人视网膜色素上皮细胞 (RPE) 及 Müller 细胞中, 其作用是将全反式视黄醛转化为 11-顺式视黄醛, 使得生物在明适应情况下, 具有源源不断可消耗的 11-顺式视黄醛产生视觉电信号。RGR 的第六外显子缺失产生的剪接变体 RGR-d 在年龄相关性黄斑变性 (AMD) 患者视网膜中, 与 drusen 高度共定位。既往研究表明 RGR-d 体外错误折叠, 对细胞有毒性作用。然而正常年轻人 RPE 中 RGR-d 的转录本丰度可达 20%, 且随着年龄增长该比例上升。因此本研究拟进一步模拟体内正常 RPE 的生理状态, 通过共表达 RGR 与 RGR-d, 探索 RGR 对 RGR-d 毒性作用的影响。

方法: 拟构建分别携带 RGR 和 RGR-d 基因的慢病毒, 使 ARPE-19 共表达 RGR 和 RGR-d 蛋白 (R-d 细胞), 仅表达 RGR-d (N-d 细胞) 和仅表达 RGR (N-R 细胞), 通过免疫荧光、免疫共沉淀及透射电镜等实验观察 RGR 对 RGR-d 的影响。

结果: 1. RGR 与 RGR-d 在 ARPE-19 细胞内相互作用, RGR 与 RGR-d 高度共定位; 2. RGR 改善 RGR-d 引起的内质网应激, 缓解自噬抑制, 减少内质网应激诱导的细胞凋亡; 3. RGR 与 RGR-d 的细胞亚定位发生明显变化, R-d 细胞中的 RGR 与 RGR-d 明显定位于高尔基体, 具有内质网定位的倾向, 与 N-d 细胞和 N-R 细胞相比, 更少定位于溶

酶体；4. R-d 细胞中的高尔基体具有典型的囊袋-囊泡的极性结构，而 N-d 细胞囊袋较为肿胀，N-R 细胞的高尔基体呈现典型的高尔基体碎片样表现。

结论：RGR 的剪接体 RGR-d 具有一定的生理功能。当 RGR 与 RGR-d 同时表达时，RGR 与 RGR-d 正确定位于高尔基体上，较少被溶酶体降解。此外 RGR-d 还能够稳定高尔基体形态。当 RGR 表达逐渐缺失，RGR-d 表达增加时，RGR-d 在内质网中错误折叠，从而引起细胞毒性，引起 AMD 样视网膜萎缩病变。

6 种新型 IOL 计算公式对白内障合并特发性黄斑前膜患者术后屈光度预测准确性研究

第一作者：Xiaoe FAN

目的：评估六种新型人工晶状体（intraocular lens, IOL）计算公式（BU II、EVO 2.0、Kane、Pearl、Castrop 以及 Hoffer QST）在白内障联合玻璃体切除（pars plana vitrectomy, PPV）治疗年龄相关性白内障（ARC）合并特发性黄斑前膜（IMEM）患者的屈光度预测准确性。

方法：回顾性系列病例研究。研究对象 2023 年 1 月至 2025 年 6 月我院因特发性黄斑前膜合并年龄相关性白内障患者接受白内障摘除、IOL 植入联合玻璃体切除（PPV）术的患者 38 例（40 眼）。术中均植入同一型号 Acrysof-IQ IOL。IOL 度数使用 IOL-Master 以 SRK-T 及 Haigis 公式计算所得。将屈光度预测值与患者术后 1-3 月的主觉验光结果进行比较，计算六种 IOL 计算公式的屈光误差（predictive error, PE）、PE 的标准差、平均绝对误差（Mean absolute error, MAE 值）、绝对误差中位数数（Median of absolute error, MedAE）和 PE 在 ± 0.25 D、 ± 0.50 D、 ± 0.75 D 和 ± 1.00 D 范围内的眼数百分比。并使用 Cooke 法进行公式预测性的比较。

结果：各公式 MAE 值由小到大依次为 Kane (0.220 D)、Pearl (0.248 D)、EVO (0.250 D)、Barrett (0.297 D)、Castrop (0.298 D)、Hoffer-QST (0.299 D)。MedAE 的变化范围为 0.210~0.280 D，6 种公式间的 APE ($\chi^2 = 10.72$, $P = 0.014$) 与 PE ($\chi^2 = 151.30$, $P < 0.001$) 差异均有统计学意义。术后 PE 在 ± 0.25 D 范围内患眼百分比由大到小依次为 Kane (64.71%)、

Pearl (58.82%)、Hoffer-QST (53.01%)、EVO (52.94%)、Barrett (47.09%)、Castrop (41.18%)，各公式组间百分比差异无统计学意义 ($\chi^2 = 3.15$, $P = 0.315$)。

结论：6 种公式预测 ARC 合并 IMEM 患者前后联合术后屈光度都有较高的准确性；就准确性而言，Kane 有最低的预测误差。

HIV / AIDS 患者免疫重建综合征继发免疫恢复性葡萄膜炎一例报告及文献回顾

第一作者：Zhongping CHEN

共同作者：Hengwei LIU

目的：免疫恢复性葡萄膜炎（IRU）是 HIV / AIDS 患者接受高效抗逆转录病毒治疗（HAART）后免疫重建炎性综合征（IRIS）的严重眼部并发症，多见于 $CD4^+$ T 淋巴细胞基线水平 < 50 cells/ μ L 且合并巨细胞病毒（CMV）视网膜炎病史者。随着 HAART 的普及，IRU 发病率呈上升趋势，但其临床表现复杂，易与感染性葡萄膜炎混淆，需引起临床重视。本文报道一例典型 IRU 病例，探讨其诊疗要点及机制。

方法：男性患者，37 岁，右眼年幼时因外伤后失明，确诊 HIV 感染 9 年，规律 HAART 治疗（替诺福韦/拉米夫定/多替拉韦方案）18 个月，病毒载量持续低于检测下限， $CD4^+$ T 细胞升至 629 cells/ μ L。本次因“左眼视力下降 1 月”就诊。查体：左眼最佳矫正视力（BCVA）0.2，结膜无充血，角膜透明，KP (-)，前房中深，虹膜纹理清，无前后粘连，瞳孔圆，对光反射灵敏，晶状体白色不均匀点状混浊，玻璃体混浊 (+++)，眼底呈豹纹状，见陈旧性 CMV 视网膜炎瘢痕（颞上方视网膜萎缩灶），黄斑区皱褶，金箔样反光（OCT 示中央视网膜厚度 369 μ m）。实验室检查：房水 CMV-DNA 阴性，排除梅毒、结核及弓形虫感染。

结果：根据 HAART 后免疫重建时间窗（ $CD4^+$ 增幅 > 50 cells/ μ L）、CMV 视网膜炎病史及排除性检查，确诊为 IRU。治疗予以左眼玻璃体切除 + 黄斑前膜剥除 + phaco + IOL 植入术；局部强化抗炎：醋酸泼尼松龙滴眼液（1% q2h）、复方托吡卡胺散瞳（bid）。治疗 2 周后左眼裸眼视力为 0.12，目前仍在随访中。IRU 发病机制与 HAART 后 $CD4^+$ T 细胞快速重建导致的 CMV 抗原免疫应答过度相关。本例特征符合典型 IRU 诊断标准：① HAART 后 $CD4^+$ 恢复至 > 100 cells/ μ L；② CMV 视网膜炎静止期；③ 排除活动性机会感染。治疗核心在于解除黄斑前膜牵拉，控制炎症反应。文献回

顾显示, IRU 发生率为 11%–20%, 起病中位时间为 HAART 后 4–12 周, 与 CD4⁺ 增幅速率呈正相关。

结论: IRU 是 HIV / AIDS 患者免疫重建期的重要致盲性眼病, 早期识别需结合病史、免疫参数及多模态影像 (如眼底照相、OCT)。治疗强调个体化抗炎方案, 局部抗炎联合必要手术。临床医师需加强 HIV 感染者 ART 治疗后的眼科随访, 尤其对 CD4⁺ 低水平患者实施眼底筛查。

Tenon' s 囊下注射尿激酶辅助玻璃体手术治疗脉络膜上腔出血的临床效果

第一作者: Zhao XIQUAN

共同作者: Chai FANG

目的: 探讨术前 Tenon' s 囊下注射尿激酶对于辅助玻璃体手术 (PPV) 中引流脉络膜上腔出血 (SCH) 的临床效果。

方法: 本组病例共 5 例, 4 例 SCH 发生在内眼手术中; 一例 SCH 发生于闭合性眼外伤后。PPV 手术在 SCH 后 5–10 天。PPV 术前 12 小时–24 小时 Tenon 囊下注射 2000 IU 尿激酶, PPV 开始前, 角膜缘后 4 mm 做 1 mm 巩膜切口 (不穿透睫状体平坦部) 引流 SCH 后 (前房灌注加压维持眼压以利于引流出脉络膜上腔出血), 常规 PPV 手术, 其中 3 眼硅油填充, 1 眼气体填充, 1 眼未填充硅油及气体。

结果: 4 例 SCH 液化彻底, 术中完全引流出脉络膜上腔出血, 1 例引流出大部分脉络膜上腔出血, 术后 1 月残留 SCH 吸收, 所有病例术中无眼内持续出血等并发症。硅油填充眼均已取出硅油, 所有病例均观察 1 年以上, 均无 SCH 复发及视网膜脱离等发生。

结论: 术前 Tenon 囊下注射尿激酶对于辅助 PPV 引流脉络膜上腔出血有效, 该方法相对于术中眼内注射 tPA, 价格便宜, 可能引起眼内出血的风险更低。本组病例较少, 需要进一步研究来验证该方法的有效性及安全性。

儿童白血病合并眼底病变的临床特征及危险因素分析

第一作者: 陈婷

目的: 探讨儿童白血病合并眼底病变的临床特征及其相关危险因素, 为临床早期识别和干预提供依据。

方法: 回顾性纳入 2022 年 2 月至 2025 年 6 月在湖南省儿童医院确诊并完成眼底检查的儿童白血病患者 126 例。采用手持式免散瞳眼底照相机获取双眼后极部图像, 必要时结合 OCT/FFA; 以患者为单位判定结局, 任一眼出现异常即定义为合并眼底病变, 并按双眼较重表现归类主要类型。按是否合并眼底病变分为病变组 (n = 38) 与无病变组 (n = 88), 比较两组一般资料、血液学指标及分型差异, 并行二元 Logistic 回归筛选独立危险因素; 外周血白细胞计数 (WBC) 按连续变量纳入并以每增加 $10 \times 10^9/L$ 为一个单位, 化疗早期定义为诱导期。

结果: 眼底病变发生率为 (30.15%), 以视网膜出血最常见 (73.68%), 其次依次为视乳头水肿 (15.79%)、棉絮状斑 (7.89%) 及脉络膜病变 (2.63%)。病变组 WBC 显著高于无病变组, Hb 与 PLT 显著降低 (均 $P < 0.05$)。多因素 Logistic 回归显示: WBC (每增加 $10 \times 10^9/L$, OR = 2.13, 95% CI: 1.35 ~ 3.41, $P = 0.002$)、化疗早期 (诱导期, OR = 1.96, 95% CI: 1.12 ~ 3.15, $P = 0.010$) 及急性早幼粒细胞白血病 (APL) 分型 (OR = 2.74, 95% CI: 1.28 ~ 5.89, $P = 0.008$) 为独立危险因素。

结论: 儿童白血病眼底病变常见, 主要表现为出血性改变。WBC 升高、化疗早期及 APL 分型是其独立危险因素。建议眼底检查作为常规监测手段, 以利于早期识别和干预。

微创 PPV 手术对比 PRP 控制重度 sNPDR 进展的前瞻性队列研究

第一作者: Tao LI

目的: 探究微创玻璃体切除术 (Pars Plana Vitrectomy, PPV) 对比全视网膜激光光凝 (panretinal photocoagulation, PRP) 控制重度非增殖性糖尿病视网膜病变 (severe non-proliferative diabetic retinopathy, sNPDR) 进展的有效性和安全性。

方法: 将在中山大学中山眼科中心诊断为 sNPDR 的患者分为微创 PPV 手术组和标准 PRP 组, 干预后 1、3、6、9 及 12 月随访, 进行最佳矫正视力 (best corrected visual acuity, BCVA)、眼压、裂隙灯前置镜眼底检查、标准七方位眼底彩照、视野及 OCT 检查。PDR 的出现为本研究终点。主要结局指标为两种干预后 12 月内 PDR 的进展率, 次要结局指标包括: BCVA、黄斑中央区平均视网膜厚度 (central subfield thickness, CST)、视野、白内障发生率、糖尿病黄斑水肿 (diabetic macular

edema, DME) 发生率及视觉相关生活质量评分变化。

结果: 本研究 PPV 组纳入 27 人 27 眼, PRP 组 28 人 28 眼。两组基线特征: 年龄、性别、糖尿病病程、糖化血红蛋白 (HbA1c)、BCVA、CST 及人工晶体眼占比差异均无统计学意义 ($P > 0.05$)。主要结局指标: 治疗后 12 月, PPV 组无患者进展为 PDR, PRP 组有 2 眼 (7.14%) 进展为 PDR ($P = 0.595$)。次要结局指标: PPV 组 30-2 中央视野和 60-4 周边视野阈值积分均无明显变化, PRP 组 30-2 中央视野无明显变化而 60-4 周边视野阈值积分显著下降 ($P < 0.05$); PPV 组视力下降 3.0 个字母, PRP 组下降 3.4 个字母, 差异无统计学意义 ($P > 0.05$); PPV 组 CST 降低 21.4 μm , PRP 组升高 26.3 μm , 差异有统计学意义 ($P > 0.05$); PPV 组新发或加重的 DME 发生率分别为 22.2% (6/27), PRP 组为 46.4% (13/28) ($P > 0.05$); 视觉相关生活质量评分, PPV 组干预后精神健康和总积分提高, PRP 组干预后驾驶评分显著降低, 尽管都无统计学差异 ($P > 0.05$)。在治疗安全性上, PPV 组有 4 眼 (14.8%) 出现一过性玻璃体积血, 均在术后 1 月内自行吸收; 在有晶状体眼中, PPV 组 11 眼中有 5 眼 (45.45%) 出现白内障加重 (导致视力下降 ≥ 5 个字母), PRP 组 16 眼中有 4 眼 (25.00%) 出现白内障加重 ($P > 0.05$); 两组均未出现严重的治疗相关并发症。

结论: 对于 sNPDR 患者, PPV 可能提供与 PRP 相当的疾病控制效果, 并能更好地保留周边视野功能, 但需进一步研究验证这些发现并评估其长期疗效。

新型眼科补片应用于后巩膜加固术的实验研究

第一作者: Xiaodan ZHANG

目的: 病理性近视是导致视力不可逆损伤的重要原因, 其进展常伴随眼轴过度伸长、后巩膜葡萄肿等改变, 严重威胁视功能。后巩膜加固术作为控制其进展的关键手段, 目前临床却面临专用补片材料匮乏的问题, 现有材料在生物相容性、降解速率等方面存在局限, 制约了手术效果与安全性。因此, 本研究旨在通过应用三种补片行后巩膜加固手术, 对比评价三种补片安全性和有效性的异同。

方法: 应用三种不同补片 (牛心包、猪小肠黏膜下层 SIS、一种高分子材料) 对兔眼行后巩膜加固手术, 于术前、术后 2 周、1 个月、3 个月、6 个月检测眼表、眼压、眼轴长度、眼底病变、后极部视网膜脉络膜血液循环、生物力学效能及组织病理学分析。

结果: SIS 补片表现最优: 能稳定眼压、抑制眼轴增长, 改善眼底病变及维持视网膜循环效果更佳; 安全性高, 动物状态良好, 并发症少, 炎症轻, 与巩膜融合度高, 新生血管及肉芽增生适度; 降解速率与巩膜修复匹配, 6 个月完成有序再生。牛心包降解慢且易致慢性炎症; 高分子材料初期力学优, 但生物相容性差, 后期易出现植入物脱落及视网膜循环异常。

结论: SIS 补片因生物相容性佳、降解与再生同步、能长期维持巩膜强度且核心有效性突出, 有望成为临床理想选择, 为病理性近视长期干预提供可靠材料支持。

激素联合抗 VEGF 的混合双打与无菌性眼内炎

第一作者: Lanlan CHEN

共同作者: Fangtian DONG, Wen SUN

目的: 报道曲安奈德联合阿柏西普玻璃体腔注射后发生无菌性眼内炎一例。

方法: 个案报道及文献回顾。老年男性患者, 72 岁, 主诉右眼视物模糊 1 月余。既往: 1 月余前因“右眼黄斑水肿”行玻璃体腔注药术 (阿柏西普), 5 月余前行右眼白内障超乳 + 人工晶体植入术, 6 月余前行右眼不完全玻璃体切除 + 黄斑前膜剥除 + 玻璃体腔注药术 (曲安奈德); 患 2 型糖尿病。查体: 右眼 BCVA 0.2, 左眼 BCVA 0.6, 眼压正常, 右眼 IOL 位正, 左眼晶体混浊, 余前节 (-), 双眼豹纹状眼底, 未见明显异常。OCT 见右眼黄斑区神经视网膜内水肿囊腔。入院后行右眼玻璃体腔注药 (曲安奈德 2 mg/0.05 ml + 阿柏西普 2 mg/0.05 ml)。注药后 14 小时, 患者右眼视物模糊、无眼痛, 视力降至眼前指数, 结膜轻度充血, 睫状压痛 (-), 角膜尚清亮, 前房中深, tyn (+), 玻璃体混浊, 见曲安奈德颗粒附于玻璃体, 隐见视盘色可, 鼻侧周边见血管白线状改变, 周边视网膜斑片状出血灶; 注药后 38 小时, 患者视力降至光感, 出现角膜后弹力层皱褶, 房水及玻璃体混浊加重, 眼底窥不入。立即行玻璃体腔注射万古霉素, 并取玻璃体液送微生物宏基因检测。次日, 玻璃体混浊继续加重呈絮状, 予以行玻璃体切除术清除玻璃体混浊, 探查眼底见后极部白色颗粒沉积, 未见明显血管白线改变。

结果: 玻璃体切除术后, 患者视力逐渐恢复, 前节逐渐安静, 眼底除周边散在斑片状出血外无明显异常。玻璃体液微生物宏基因检测结果为阴性。患者随访 1 周时 BCVA 为 0.08, 1 月时 BCVA 为 0.3, 黄斑区水肿消退。

结论：虽然结合患者起病时间早、无眼痛、结膜充血轻等特点，考虑该患者为无菌性眼内炎，但因无法排除感染的可能性、且病情逐渐加重，故仍按感染性眼内炎进行了干预，最终玻璃体液微生物宏基因的阴性结果证实了无菌性眼内炎的诊断。目前无玻璃体腔注射激素联合抗 VEGF 后无菌性眼内炎的文献报道。推测两种药物的联合使用可能增加无菌性眼内炎的发病率，且起病更急、炎症更重。

玻璃体切除术治疗玻璃体视盘牵拉致前部缺血性视神经病变的临床疗效及潜在机制

第一作者：**Jie YANG**

目的：本研究旨在探讨玻璃体切除术治疗玻璃体视盘牵拉致前部缺血性视神经病变的临床疗效及潜在机制。

方法：患者 42 岁女性，因左眼突然下方视物模糊 15 天入院，诊断为左眼玻璃体视盘牵拉综合征、视网膜前膜、双眼屈光不正。入院时左眼视力 0.08，眼底检查显示视盘水肿、颜色略淡、边界欠清，视盘前方可见膜样物质牵拉，下方盘周线状出血，视网膜血管迂曲，黄斑区大量黄白色星芒状渗出。辅助检查包括 OCT、视野、F-VEP、FFA 等，均显示视及黄斑区异常。治疗采用 25 G 玻璃体切除术，通过探头吸引和前移位使玻璃体与视盘分离，并剥离染色的视网膜前膜和内界膜。

结果：术后左眼最佳矫正视力提升至 0.2，半年后恢复至 0.4。OCT 复查显示玻璃体视盘牵拉完全解除，视乳头结构恢复，黄斑水肿减轻。视野缺损范围缩小，视盘牵拉解除，轻度水肿，颜色变淡。黄斑区组织黄白色星芒状渗出有所改善，中心凹光反射仍不见。术前术后对比显示，玻璃体切除术有效改善了解剖结构和视觉功能。

结论：长期的视盘牵拉可导致视盘充血并伴有神经功能障碍，可能通过阻碍轴浆流或改变通过乳头周围血管的层流而导致视神经萎缩，玻璃体切除术可有效解除玻璃体视盘牵拉，改善视盘及黄斑区的解剖结构，提高患者视力和视野。本病例表明玻璃体视盘牵拉可能是前部缺血性视神经病变的重要病因之一，解除牵拉的玻璃体切割手术为治疗此类病变提供了新的思路。然而，手术操作需谨慎，以避免进一步损害视力和视野。未来研究应关注玻璃体视盘牵拉与视神经病变的关联机制，以优化治疗策略。

膳食可可碱与年龄相关性黄斑变性的关联：基于 2005-2008 年美国国家健康与营养调查 (NHANES) 及体外实验的结果

第一作者：**Ning AN**

共同作者：**Dongcheng LIU, Ziling LIU, Bo QIN**

目的：采用全国代表性成人样本及体外实验，探究可可碱 (theobromine) 与年龄相关性黄斑变性 (AMD) 之间的关系。

方法：分析 2005-2008 年美国国家健康与营养调查 (NHANES) 的数据，该数据包含 5485 名受试者，且这些受试者均有可可碱膳食摄入量及 AMD 相关的可用数据。采用多变量逻辑回归分析和平滑曲线拟合，探究潜在相关性；通过分段线性回归确定拐点，并开展交互作用检验与亚组分析。构建高碘酸钠 (NaIO₃) 诱导的人视网膜色素上皮细胞 (ARPE-19) 损伤模型，通过体外实验探究可可碱对细胞增殖、细胞内活性氧 (ROS) 水平，以及血红素氧合酶 -1 (HO-1)、超氧化物歧化酶 -1 (SOD-1) 表达的影响。

结果：控制潜在混杂变量后，多变量逻辑回归模型显示，膳食可可碱与 AMD 关联的比值比 (OR) 为 0.73 (95% 置信区间: 0.56-0.98)。平滑曲线拟合结果显示二者存在非线性关系，拐点为 60 毫克/天 (校正后 OR: 0.31; 95% 置信区间: 0.14-0.66)。亚组分析与交互作用检验显示，在不同人群特征场景中，这种负相关性均保持一致。在 NaIO₃ 诱导的 ARPE-19 细胞损伤模型中，可可碱可促进细胞增殖，降低 HO-1 表达，并提高 SOD-1 表达。

结论：膳食可可碱与 AMD 之间存在非线性负相关关系，且体外实验观察到可可碱具有抗氧化活性。研究结果提示，较高的可可碱摄入量可能与较低的 AMD 患病风险相关，其治疗意义值得进一步探究。

视网膜内界膜的免疫荧光分析：探究内界膜剥除术后视网膜内层凹陷形成的可能机制

第一作者：**Yubo WU**

共同作者：**Yiqi CHEN, Jianbo MAO, Lijun SHEN, Xin YE**

目的：初探视网膜内界膜 (internal limiting membrane, ILM) 成分与内界膜剥除术后视网膜内层凹陷形成 (inner retinal dimples, IRDs) 的关系。

方法：本研究纳入接受玻璃体切割联合内界膜剥除术的全层黄斑裂孔 (full-thickness macular

hole, FTMH)、黄斑前膜(epiretinal membrane, ERM)及近视性黄斑劈裂(myopic foveoschisis, MF)患者。术后1个月(1M)和12个月(12M),采用光学相干断层扫描(optical coherence tomography, OCT) en face 层面检测 IRDs 数量;通过检测剥除的内界膜组织中胶质纤维酸性蛋白(gial fibrillary acidic protein, GFAP)、水通道蛋白-4(AQP4)及层粘连蛋白(laminin, LAMA1)抗体的平均免疫荧光强度与荧光面积,评估 Müller 细胞状态及层粘连蛋白丢失程度。采用 Pearson 相关分析与多元线性回归分析,探究内界膜成分与视网膜内陷凹的关联。

结果: 研究共纳入 12 例 FTMH 患者(12 眼)、14 例 MF 患者(14 眼)及 9 例 ERM 患者(9 眼)。Pearson 相关分析显示,术后 1 个月 IRDs 数量与 GFAP (+) 平均荧光强度($r = -0.440$, $P = 0.008$)、GFAP (+) 荧光面积($r = -0.640$, $P < 0.001$)及 LAMA1 (+) 平均荧光面积($r = 0.600$, $P = 0.004$)相关;术后 12 个月视网膜内陷凹数量与 GFAP (+) 平均荧光面积($r = -0.706$, $P < 0.001$)相关。多元线性回归分析显示,仅 LAMA1 (+) 平均荧光面积与术后 1 个月 IRDs 数量存在显著相关性($\beta = 0.517$, 95% 置信区间: 0.182-0.982, $P = 0.007$)。

结论: ILM 剥除术后 IRDs 形成数量,与视网膜内层 Müller 细胞的胶质反应状态及层粘连蛋白丢失程度相关。

非全层裂孔的黄斑视网膜劈裂不同阶段的干预效果评估

第一作者: 尹澜

目的: 探讨非全层裂孔的黄斑视网膜劈裂不同阶段的干预效果。

方法: 回顾分析 2021 年-2025 年间解放军总医院第一医学中心 176 例(295 眼)初诊时非全层裂孔黄斑视网膜劈裂患者(排除:晶体混浊度 III 级及以上、青光眼、内眼手术或其它视网膜病变),其中板层裂孔为 A 组,无裂孔为 B 组。按最佳矫正视力(BCVA)进行分组, ≤ 4.0 者为 A1 及 B1 组; $4.0 < BCVA \leq 4.5$ 者为 A2 组及 B2 组; $BCVA > 4.5$ 者为 A3 及 B3 组。手术方式为玻璃体切除、内界膜剥除、硅油填充。按是否手术进一步分组,手术的分为 A11、A21、A31、B11、B21、B31 组,未手术分为 A10、A20、A30、B10、B20、B30 组。记录如下数据:手术前后 BCVA、OCT 下裂孔闭合情况、劈裂恢复情况以及黄斑厚度、并发症;初诊未行手术、随访观察 2 年者 BCVA 下降及黄斑裂孔

情况。对各 A、B 组比较采用卡方检验,同条件下组间比较采用 t 检验。

结果: 1、BCVA 较术前提升幅度: A11 组 53.21%, A21 组 29.33%, A31 组 22.07%, B11 组 67.89%、B21 组 41.00%、B31 组 19.64%; BCVA 较术前提升眼别占比: A11 组 79.37%, A21 组 64.33%, A31 组 61.29%, B11 组 68.21%、B21 组 59.36%、B31 组 41.53%。BCVA 提升幅度方面, B 组整体优于 A 组, B11 优于 A11, B21 优于 A21, B31 与 A31 无统计学差异。BCVA 提升的眼别占比方面, A 组整体优于 B 组, A11 优于 B11, A21 与 B21 无显著差异, A31 优于 B31。2、术后所有黄斑裂孔均完全闭合。3、术后残存视网膜劈裂: A1 组 4.76%, A2 组 9.61%, A3 组 7.14%, B1 组 8.70%, B2 组 46.67%, B3 组 42.34%。视网膜劈裂复位率 A 组整体优于 B 组。4、初诊未行手术随访观察 2 年, BCVA 下降幅度: A10 组 19.35%, A20 组 37.81%, A30 组 33.96%, B10 组 27.72%、B20 组 43.75%、B30 组 38.57%。B 组较 A 组为剧。B 组出现黄斑裂孔比例为 14.23%, B10 组 37.04%、B20 组 18.20%、B30 组 12.91%。5、未行手术者各组均存在劈裂自发闭合,比例均低于 10%,组间及两两比较无显著差异。

结论: 1、未合并黄斑裂孔者术后 BCVA 提升情况优于有黄斑裂孔者, BCVA 越低,提升幅度越好,但高视力者,得到提升的可能性更大。2、合并黄斑裂孔术后劈裂复位率高于术前无黄斑裂孔者。3、如未行手术,无黄斑裂孔者视力降幅更大;视力低者更易出现裂孔。

一种新型微创驱逐排石技术在原发性泪小管炎治疗中的临床疗效观察

第一作者: Wang CHENGMEI

目的: 本研究旨在介绍一种不损伤泪点及泪小管的治疗原发性泪小管炎(PCC)的微创技术,即驱逐排石,为其治疗提供更好的选择。

方法: 这是一项前瞻性实验性研究,时间从 2020 年 6 月至 2023 年 6 月共 12 个月,纳入研究的原发性泪小管炎患者均采用了驱逐排石的治疗方法,并至少随访了 12 个月。该方法简述如下:从泪小管的结膜侧由内眦部向颞侧方向轻轻按摩,将泪小管

内的结石及分泌物自泪总管附近驱逐至泪小管壶腹部，继经泪点排出，反复操作，直至完全无结石排出，之后泪小管内注入妥布霉素地塞米松眼膏。我们评估了患者的人口统计学、临床特征及治疗结果。

结果：本研究共纳入了 90 例（90 眼）原发性泪小管炎患者，其中男性占 22.2%（20 例），女性占 77.8%（70 例），平均年龄 66.27 ± 14.15 岁。右眼 42 例（46.67%），左眼 48 例（53.33%），下泪小管受累 57 例（63.3%），上泪小管受累 27 例（30%），上下泪小管均受累 6 例（6.7%）。所有的患者均有分泌物增多的症状，其次常见症状包括眼红（88.89%）、溢泪（77.78%）、眼睑肿胀（55.55%）、异物感（11.11%）及眼部疼痛（6.67%）。85 例患者（94.44%）存在泪小管结石，同时伴发的体征包括黏液脓性分泌物（44.44%）、内眦部肿胀（38.89%）、泪点外翻（“撅嘴样”改变，33.33%）、结膜充血（27.78%）、泪小管扩张（22.22%）及泪小管阻塞（11.11%）。症状持续时间平均为 16 ± 11.06 个月。66.67% 的患者经过 1 次驱逐排石治愈，所有患者平均排石次数为 1.9 ± 0.83 次。比较了干眼和非干眼、年龄 < 70 岁和 ≥ 70 岁、男性和女性以及病程 < 15 月和 ≥ 15 月各个组内驱逐排石次数分布的差异，结果均无统计学意义，所有患者的症状及体征均得到了缓解。

结论：驱逐排石一种微创、安全、便捷、有效的方法。它保留了泪点和泪小管的解剖结构和功能，可作为原发性泪小管炎的一种治疗选择。

面板编号：OOP-1263

儿童异常溢泪的病因分析

第一作者：Huiling QING

目的：旨在系统分析引起儿童异常溢泪的病因，重点探讨夜间睑裂症在其中的作用，并明确排除其他常见诱因，为临床精准诊断提供依据。

方法：对门诊以异常溢泪为主诉的患儿 16 例进行系统性评估，包括详细的病史采集、眼部常规检查、泪道功能检查以及裂隙灯等专科检查，以识别病因并进行鉴别诊断。

结果：在确诊的患儿中，夜间睑裂症被证实是导致儿童异常溢泪的一个重要但易被忽略的病因。同时，检查排除了其他常见诱因，如鼻泪管阻塞、结膜炎、过敏反应及眼睑结构异常等。

结论：夜间睑裂症是儿童异常溢泪的一个重要独立病因。临床诊断儿童溢泪时，在考虑常见原因的同

时，应将其纳入鉴别诊断范畴，并通过系统检查排除其他潜在诱因，以实现准确诊断和有效治疗。

少见眼外肌内肿瘤 9 例临床病理分析

第一作者：Wang YI

目的：发生在眼外肌内的肿瘤非常少见。现报告 9 例发生于眼外肌内的肿瘤，以扩展眼外肌内肿瘤的鉴别诊断。

方法：总结过去 2 年里在我院就诊的眼眶肿瘤患者，8 例术前经影像学判断肿瘤发生在眼外肌内，全麻下行手术治疗明确病理诊断，1 例影像学检查显示双眼眼外肌内多发肿瘤，经全身检查证实为转移癌。排除标准：眼外肌周围的肿瘤侵犯肌肉组织，排除炎性假瘤、甲状腺眼病和 IgG4 相关眼病累及眼外肌。记录所有患者的临床资料、影像学资料和治疗经过。

结果：男性 3 例，女性 6 例，就诊年龄 35-72 岁。术前眼球运动无受限 1 例，受累眼外肌表现为收缩麻痹 6 例，挛缩 1 例，眼球固定 1 例。病理诊断为神经鞘瘤 2 例（内直肌和下斜肌各 1 例），颗粒细胞瘤 1 例（下斜肌），皮样囊肿 1 例（外直肌），间叶性软骨肉瘤 1 例（上直肌），上皮样肉瘤 1 例，PEComa 1 例（外直肌），肾透明细胞癌 1 例（外直肌）。1 例双侧各直肌均有转移，经乳腺病理和全身 PET 扫描确诊为乳腺癌。手术后眼球运动无受限为神经鞘瘤、皮样囊肿、颗粒细胞瘤。软骨肉瘤术后行放疗 50 Gy，目前随访 3 个月，未见复发。上皮样肉瘤放疗 50 Gy，目前随访 1 个月，未见复发。PEComa 经全身 PET 检查，证实为乳腺、盆腔多发转移，行靶向药治疗，眼部和全身情况稳定。肾透明细胞癌为靶向药临床试验入组患者，确诊眼外肌转移后退出临床试验，改行化疗，目前全身病情稳定。乳腺癌目前行化疗联合靶向药治疗，病情无加重。

结论：多种良、恶性肿瘤可原发于眼外肌，也可由全身恶性肿瘤转移至眼外肌。临床表现复杂多样。多需要病理确诊。良性肿瘤切除完整，可保留部分或全部眼外肌运动功能。恶性肿瘤需结合放射、化疗或靶向药多种治疗方法。

慢性泪囊炎型肉芽肿性多血管炎复杂病例报告

第一作者: Xinran DONG

目的: 报告一例以慢性泪囊炎为首发表现的肉芽肿性多血管炎 (GPA, 原韦格纳肉芽肿) 病例, 强调在复杂系统性疾病中, 眼科手术处理的时机与全身治疗配合的重要性。

方法: 患者男性, 59 岁, 主诉左眼流泪伴脓性分泌物一年余。既往有慢性鼻窦炎手术史及右眼巩膜炎史。查体见鼻软骨塌陷呈马鞍鼻畸形, 泪道冲洗显示左侧泪道阻塞并伴脓性分泌物。实验室检查示抗蛋白酶 3 抗中性粒细胞胞浆抗体 (PR3-ANCA) 阳性, C 反应蛋白及红细胞沉降率升高, 尿常规可见血尿及管型尿。胸部 CT 提示双肺多发结节病灶, 鼻窦影像学显示全组鼻窦炎及鼻泪管阻塞。结合 1990 年美国风湿病学会 (ACR) 诊断标准确诊为 GPA。

结果: 在泪囊炎长期脓性分泌物刺激、鼻部结构破坏及全身炎症活动背景下, 行鼻内镜下泪囊鼻腔吻合术 (DCR)。术中可见局部组织脆弱、出血明显, 泪囊与鼻腔结构粘连严重, 操作难度大。术后六个月泪道通畅, 感染控制良好。但患者因全身免疫抑制治疗未能持续, 二年后出现右眼角膜穿孔, 险致眼内炎, 拟行角膜移植术。

结论: GPA 相关泪囊炎病情复杂, 局部感染控制与系统免疫治疗需同步推进。鼻内镜下泪囊鼻腔吻合术在活动性炎症及组织脆弱情况下操作风险高, 需精准评估与术中保护。早期识别 GPA 并联合系统免疫抑制治疗可改善预后, 而延迟或依从性差易导致严重眼部并发症。

泪点周围肿物的临床特征与手术治疗

第一作者: Jingwen DING

目的: 泪点周围肿物由于累及外观和功能敏感的部位, 临床治疗相对棘手。本研究旨在观察其临床特征并评估肿物切除后眼睑和泪小管重建的手术效果。

方法: 回顾性分析 2017 年 1 月至 2023 年 12 月就诊于北京同仁眼科中心初次接受手术治疗和病理检查的泪点周围肿物病例, 收集一般资料、临床表现、病理分型和术后效果 (解剖、功能及外观)。手术采取矩形切除肿物同期利用滑行皮瓣和肌皮瓣联合泪道置管修复眼睑和泪小管缺损。

结果: 共纳入 66 例中国汉族患者 (68 只眼睑), 平均手术年龄 43.6 岁 (5 ~ 75 岁)。全部病例均为单眼发病, 多见于下睑 (49/68, 72%), 其中 2 例为分裂痣同时累及上下睑。术前所有患者泪道冲洗通畅, 仅 2 例有溢泪症状。术后病理结果显示非上皮来源肿物最多见 (62/68, 91%) 包括: 色素痣 (57/68, 84%), 化脓性肉芽肿 (2/68, 3%), 上皮性息肉 (2/68, 3%), 睑板腺囊肿 (2/68, 3%) 和神经纤维瘤 (1/68, 1%); 上皮源性肿物包括: 基底细胞癌 (2/68, 3%), 脂溢性角化 (1/68, 1%), 和上皮增生 (1/68, 1%)。平均随访时间 38.7 月 (3 ~ 70 月), 所有病例均获得满意的术后效果。3 例发生轻微倒睫, 2 例出现人工泪管相关并发症 (移位和肉芽增生), 仅有 1 例有溢泪症状而泪道通畅。

结论: 在处理泪点周围肿物时需要警惕恶性肿瘤的可能, 手术切除是主要的治疗方式。采用滑行组织瓣联合泪道置管的方法可有效修复鼻侧睑缘缺损。

摘要编号: 209269

甲状腺相关眼病外泌体影响疾病进展研究

第一作者: Yuanhui HAN

目的: 甲状腺相关眼病 (TED) 作为甲状腺自身免疫性疾病的常见并发症, 易引发眼球突出、视野丧失等严重后果, 早期诊断与干预意义重大。外泌体 (30-150 nm 胞外囊泡) 可调节免疫反应, 本研究旨在明确其通过 miR-335-5p/VWF 轴对 TED 进展的影响机制, 为 TED 的诊断与治疗提供理论支撑。

方法: 研究采用体外实验与体内实验相结合的方式开展。1. 体外实验: 以视网膜神经节细胞 (RGC) 为研究对象, 提取甲状腺相关眼病 (TAO) 患者眼眶脂肪组织中的外泌体, 通过超速离心法分离鉴定 (观察形态、检测粒径及表面蛋白); 随后用外泌体干预 RGC, 借助 CCK8、流式细胞术、Tunel 染色检测细胞增殖、周期及凋亡情况, 通过 WB 检测相关蛋白表达, 结合转录组与 miRNA 测序筛选差异分子, 再经 RT-PCR 验证及回复实验探究作用通路。2. 体内实验: 以 6-8 周 BALB/c 小鼠为模型, 分为 Control+EVs 组 (结膜囊滴入 TAO 患者外泌体) 与 Control 组 (滴入 PBS); 通过 HE 染色观察视网膜结构、Masson 染色检测下直肌胶原纤维, 利用 RT-PCR、Tunel 染色及免疫组化检测相关分子表达与细胞凋亡情况。

结果: 1. 体外实验结果: 分离的外泌体呈碗状囊泡, 平均粒径约 80.3 nm, 表面含 CD9、CD81 蛋白; 外泌体可抑制 RGC 增殖、阻滞细胞周期于 G0/G1 期并促进凋亡, 同时使凋亡相关蛋白 Caspase3、自噬蛋白 LC-3 II 及 Beclin-1 表达升高, 神经营

养因子 BDNF、GDNF 表达降低；筛选出差分子 miR-335-5p 与 VWF，外泌体可抑制 miR-335-5p 表达、促进 VWF 表达，且 miR-335-5p 可逆转外泌体对 RGC 的不良影响，该过程与 PI3K/AKT 通路相关。2. 体内实验结果：Control+EVs 组小鼠视网膜厚度变薄、结构紊乱，下直肌胶原纤维增多；miR-335-5p 表达降低、VWF 表达升高，细胞凋亡增加，且 Caspase3、VWF、自噬蛋白 LC-3 II 及 Beclin-1 表达升高，BDNF 表达降低。

结论：TAO 患者眼眶脂肪组织来源的外泌体，可通过抑制 miR-335-5p 表达，解除其对 VWF 的抑制作用，进而促进细胞凋亡与自噬，最终影响 TED 进展。该研究结果为 TED 的早期诊断标志物筛选及靶向治疗方案制定提供了重要理论依据。

甲状腺眼病限制性肌病的脑活动和功能连接改变

第一作者：**Zilin FANG**

共同作者：**Xianqun FAN, Mengda JIANG, Duo Jin XIA, Haiyang ZHANG, Huifang ZHOU**

目的：甲状腺眼病 (thyroid eye disease, TED) 存在眼外肌受累，可导致限制性肌病，出现限制性斜视、复视和眼球运动受限。TED 限制性肌病对大脑的影响初有提示，但其脑结构功能重塑机制尚不明确。本研究旨在探究 TED 限制性肌病的脑活动和功能连接改变，并分析眼外肌测量指标与脑功能改变的关联。

方法：前瞻性招募 45 位 TED 患者，根据是否出现限制性肌病分为两组。每位受试者接受脑功能磁共振及眼眶磁共振成像，计算低频振幅 (amplitude of low frequency, ALFF)、功能连接 (functional connectivity, FC)，测量眼外肌长、短径。同时收集患者相关临床资料。比较两组受试者脑活动和功能连接改变，并通过相关性分析，探究脑功能与眼外肌磁共振测量指标、其他临床指标之间的关联。

结果：与 TED 非限制性肌病患者相比，TED 限制性肌病患者眼内压显著升高，甲状腺眼病生活质量问卷视功能评分显著降低，下直肌长、短径显著增加。TED 限制性肌病患者左颞中回 (left middle temporal gyrus, MTG.L) ALFF 显著升高，进一步基于种子点的 FC 分析发现，MTG.L 与双侧额中回 (middle frontal gyrus, MFG)、右小脑 FC 显著增强，提示存在代偿机制。相关性分析结果表明，在 TED 限制性肌病患者中，MTG.L 的 ALFF 值和垂直斜视度数 ($r = 0.3958, p = 0.0371$)、外直肌短径 ($r = 0.3984, p = 0.0396$) 正相关，

MTG.L 与右小脑的 FC 值和外直肌长径负相关 ($r = -0.5354, p = 0.0058$)，MTG.L 与 MFG.R 的 FC 和突眼度正相关 ($r = 0.4080, p = 0.0429$)、和上直肌长径 ($r = -0.4600, p = 0.0207$)、上直肌短径 ($r = -0.4538, p = 0.0227$) 负相关，MTG.L 与 MFG.L 的 FC 和突眼度 ($r = 0.4778, p = 0.0157$) 正相关、和上直肌短径负相关 ($r = -0.4746, p = 0.0165$)。

结论：本研究首次揭示了 TED 限制性肌病的脑功能改变，并发现其与眼外肌磁共振测量指标以及其他临床指标存在关联。值得注意的是，作为限制性斜视的典型代表，TED 限制性肌病的脑功能改变为未来探索这一复杂斜视脑重塑提供了初步的证据。

眼眶静脉畸形硬化摘除术一例

第一作者：**Chengzhen GONG**

共同作者：**Rongxin CHEN, Chenqi XING**

目的：眼眶静脉畸形是成人最常见的眼眶脉管畸形之一，病变常呈进行性发展，可引起急性出血或眶尖综合征，严重时可导致视神经压迫性萎缩。由于其病变界限不清、术中易出血、手术切除困难，单纯手术或栓塞治疗均存在一定局限性。本文报道一例 46 岁女性左眼眶静脉畸形的诊治过程，旨在探讨硬化剂联合手术切除在该类弥散型病变中的临床应用价值。

方法：患者女，46 岁，因“左眼下睑无痛性隆起 7 年”就诊，影像学检查提示左眼眶外下象限静脉畸形伴静脉石形成，视神经受压移位。在全麻下经下穹窿结膜切口入路，显露暗红色血管团，按压颈静脉可见肿物隆起。术中先释放畸形血管内血液，随后于血管团内注入医用耳脑胶进行硬化处理，待病变组织硬化、边界清晰后，仔细分离并切除 2 团不规则肿物，术中注意保护眶下神经及其他重要结构。

结果：手术过程顺利，术后病理证实为眼眶血管畸形。患者术后视力保持术前水平 (BCVA 1.0)，眼球活动度良好，下睑隆起基本消失，双眼对称。术后 1 月复查未见明显并发症，影像学评估显示病变切除较为彻底。随访计划包括定期 MR 检查及视力、视野监测，以评估远期疗效及残留病症复发可能。

结论：对于范围广泛、结构复杂的眼眶静脉畸形，术中联合使用硬化剂 (如医用耳脑胶) 可有效减少出血、明确病变边界，有助于在保护重要结构的前提下实现较完整的病变切除。该策略有助于降低术中风险及术后复发概率。未来应结合基因与表观遗传学研究，进一步明确病变机制，并为个体化治疗及早期诊断提供依据。

眼科首诊颈动脉海绵窦瘘术一例

第一作者: Pengxuan WANG

共同作者: Pengxuan WANG

目的: 通过一例眼科首诊颈动脉海绵窦瘘患者病例分析该病的诊断及治疗。

方法: 患者, 男, 24 岁, 因“右眼随体位改变胀痛 2 月, 右侧头痛 1 周余”就诊, 专科查体: 视力右眼 1.0, 左眼 1.0, 眼压右眼 14 mmHg, 左眼 15 mmHg。右眼睑轻度水肿, 结膜充血(+), 角膜透明, 前房清, 晶体透明, 眼底未见明显异常, 眼球转动可、自诉眼球转动疼痛。辅助检查: 眼科 B 超: 右眼眶内眼上静脉明显增粗、呈搏动性, 上直肌、内直肌肥厚。颈动脉彩超, 脑血管超声未见明显异常。头颅 DSA 提示: 右侧眼上静脉、岩上静脉提前显影并伴有扩张增粗, 右侧颈动脉海绵窦区硬脑膜动静脉瘘。神经外科介入治疗: 术前造影见动脉期眼上静脉增粗、返流, 术中导管经面静脉、内眦静脉、眼上静脉抵达海绵窦, 对海绵窦瘘口进行填塞弹簧圈及生物胶, 术后造影经动脉期眼上静脉未再显影。术后患者眼痛缓解, 5 天后眼部红肿基本消退。术后 2 月复查, 患者自诉视物重影, 复查 CTA 示动脉期眼上静脉未再显影, 造影剂无渗漏, 高压氧舱治疗后患者自诉视物重影缓解。

结果: 本例患者以眼部疼痛为首发症状就诊于我院眼科, 经影像学检查后明确诊断, 并行介入手术治疗。患者术后疼痛症状消失, 自诉有视物重影症状, 复查 DSA 示病灶区栓塞治疗效果良好未见明显渗漏, 高压氧舱治疗后患者症状缓解。

结论: 颈动脉海绵窦瘘作为颅内血管异常疾病, 通常由于受累部位不同可就诊于神经外科、眼科或其他相关科室。过询问病史、仔细查体及相关影像学检查可以辅助诊断, DSA 作为该病的诊断金标准, 可以作为该病的重要诊断依据。海绵窦区神经、血管、组织走行复杂, 通常不建议行手术治疗, 介入手术治疗具有较为安全、治疗效果显著等优点而作为该病目前常用的治疗手段。

纳米氧化铈抑制甲状腺相关眼病眼外肌纤维化的作用机制及靶向干预研究

第一作者: Bowen WANG

共同作者: Meng XIE

目的: 甲状腺相关性眼病(TAO)是一种眼眶自身免疫性疾病, 常见症状包括眼突、眼红、眼球运动

障碍等, 可导致眼外肌纤维化和眼眶炎症反应等病理改变。氧化铈纳米颗粒(CeO₂-NPs, CNPs)以其抗氧化性质而被熟知。近年来, 由于 CNPs 潜在的抗纤维化和抗炎特性, 其在眼科中的应用逐渐增加。有研究指出 JNK 磷酸化与氧化应激密切相关, 而 JNK 调控纤维化进程在其他研究中亦有报道。本研究旨在探讨 CNPs 对 TAO 眼眶成纤维细胞(OFs)纤维化和炎症的抑制作用, 并探索 JNK 信号通路在其中发挥的作用, 为 TAO 的药物治疗提供新的理论依据。

方法: 手术获得 TAO 患者眼眶脂肪组织, 通过原代培养获得 OFs。CCK8 检测 CNPs 安全作用浓度, 在诱导纤维化的同时加入不同浓度 CNPs, 利用划痕实验检测 OFs 的纤维化程度, RT-PCR 和 WB 检测各组纤维化指标的表达式, ELISA 检测各组透明质酸分泌。Anisomycin 是常见的 JNK 激动剂。利用 CCK8 检测 Anisomycin 安全作用浓度, WB 检测 JNK 磷酸化水平, 并再次检测纤维化相关指标。利用 ROS 试剂盒检测细胞内活性氧(ROS)的生成。利用 RT-PCR 和 ELISA 检测炎症因子白介素-6(IL-6)和肿瘤坏死因子- α (TNF- α)的表达式。

结果: 成功培养获得 TAO-OFs。当 CNPs < 100 μ g/mL, Anisomycin < 5 μ M 时, 对 OFs 增殖无影响。CNPs 可抑制 OFs 纤维化, 与纤维化指标的表达式。CNPs 通过抑制 JNK 磷酸化发挥这些作用, 而 JNK 激动剂可以逆转这一过程。CNPs 抑制细胞内 ROS 的生成, Anisomycin 可改善这一过程。CNPs 降低 OFs 炎症因子的 mRNA 水平与分泌。

结论: CNPs 可通过降低 JNK 磷酸化抑制 TAO-OFs 的纤维化, 并可剂量依赖性地抑制 TAO-OFs 的 ROS 生成和炎症反应。CNPs 可作为一种潜在的 TAO 治疗药物。

腺病毒 TSHRA 构建小鼠甲状腺相关眼病模型的研究

第一作者: Wenqian CHEN

共同作者: Mingwei ZHAO, Li ZHU

目的: 甲状腺相关眼病(TAO), 又称为 Grave's 眼病(GO), 是眼眶常见的自身免疫性炎症性疾病。从轻微的不适到严重的眼外肌扩张、眼球突出、眼麻痹、暴露性角膜病变和视神经病变。中重度的 TAO 患者多有结缔组织和眼外肌水肿改变引起, 这是由透明质酸细胞外积聚引起的。然而 TAO 的小鼠模型较少且表型出现不稳定, 对于在研究 TAO 相关机制的实验造成了极大的困扰。既往文献表明向小鼠肌肉注射载有人 TSHRA 腺病毒可以引起小

鼠甲状腺功能亢进及眼部眼睑增生等表现。本研究拟对该模型的眼部表现进一步探索，以寻求稳定高效的 TAO 小鼠模型。

方法：准备健康 6 周龄雌性 BALB/c 小鼠和载有 TSHRA 的腺病毒（Ad-TSHRA）。每次每只小鼠大腿肌肉注射共含有 10^8 PFU Ad-TSHRA 的 50 μ l 生理盐水（每条大腿注射 25 μ l），每只小鼠一共接受 9 次注射——初始免疫：前 3 次以 3 周为间隔注射；加强免疫：后 6 次以 4 周为间隔注射。不同时间节点分别进行甲状腺功能检测、眼眶核磁及 Masson 染色实验。

结果：1. 小鼠血清甲状腺功能出现明显异常，T3 和 T3/T4 明显增高；2. 第 4 次注射开始小鼠眼部陆续出现眼睑异常增生、眼睑肿胀，眼睑炎症，到第 7 次注射，80% 的小鼠出现稳定的眼睑肿胀或眼睑炎症；3. 小鼠肌肉注射第 34 周进行眼眶的 Masson 染色，Ad-TSHRA 组未见明显纤维化，但可见显著眼外肌纤维肥大；4. 眼部核磁显示 Ad-TSHRA 组小鼠可见眼外肌明显增粗，眶内容物体积增加。

结论：腺病毒 TSHRA 小鼠模型可以较稳定出现 TAO 眼病特征样眼外肌增粗、眶内容物增加的表现。

摘要编号：208177

调节性 B 细胞参与甲状腺相关性眼病免疫失衡的研究

第一作者：Yuehui ZHANG

共同作者：Ningyu AN, Qian LI, Yan MA, Yang ZHENG

目的：甲状腺相关眼病（Thyroid-associated ophthalmopathy, TAO）是一种多种免疫细胞参与的器官特异性自身免疫性疾病，其发病机制尚不明确，可能涉及免疫细胞互作的失衡。调节性 B 细胞（Regulatory B Cells, Bregs）具有抑制炎症、抗肿瘤、调节纤维化形成等多种作用，但其在 TAO 的免疫失衡中是否同样发挥一定作用，研究还不明确。

方法：本研究共纳入 54 名健康志愿者和 125 名 TAO 患者，通过单细胞转录组测序、免疫组库测序，分析了 TAO 患者外周血中的 Bregs 的转录异质性，与其他免疫细胞的相互作用和可能机制。通过分离外周血单个核细胞（Peripheral Blood Mononuclear Cell, PBMC），采用 CpG、CD40L、IL-35 等方法体外诱导 Bregs，利用流式细胞术分析 IL10⁺ Bregs 及 IL-35⁺ Bregs 的数量差异。进一步将 CD4⁺ T 细胞与耗竭 Bregs 的 PBMC 共培养，研究 Bregs 在 TAO 患者和健康对照组中的免疫调节功能差异，并采用 Chip、qPCR、Western Blot 等对其机制进行了初步探索。

结果：TAO 患者外周血中 IL-10⁺ Breg 和 IL-35⁺ Bregs 的比例均显著高于健康对照组，且 TAO 患者的 B 细胞表现出向 IL-10⁺ Bregs、IL-35⁺ Breg 表型转化的潜在障碍。Bregs 中包括 RORA、CEBPD、PRDM1、FOSL2 和 EOMES 等在内的 B 细胞分化相关转录因子显著高表达。活动期 TAO 患者外周血中 Bregs 的 BCR 多样性明显升高。富集分析结果显示 Bregs 上调的基因主要富集于炎症和细胞进程相关通路。TAO 活动性患者 Bregs 可通过 CD22-PTPRC 和 BTLA-TNFRSF14 等作用显著增强的受体配体对等对树突状细胞、单核细胞进行调控。TAO 中 Bregs 抑制 IFN- γ ⁺ T 细胞和 IL-17⁺ T 细胞活化的能力存在缺陷，其免疫调节功能的发挥可能与 TSH/AKT/NF- κ B 信号通路有关，TSHR 抑制剂可部分阻断 TSH 激活 AKT 和 NF- κ B。

结论：活动期 TAO 患者外周血中 Bregs 数量反馈性升高，这种变化可能与 B 细胞向 Bregs 表型转化存在障碍，以及 Bregs 对其他免疫细胞的免疫调节功能受损有关。

青少年血泪查因分析

第一作者：Huiling QING

目的：本文旨在通过详细分析三例反复发作的青少年单侧血泪（血性泪液）病例，揭示其潜在的发病因素，并总结相关的诊断策略，为临床实践提供参考。

方法：本回顾性病例系列分析三名青少年患者（1 例男性，2 例女性；年龄范围 13-17 岁），均表现为反复发作的自发性单侧血泪（血性泪液）。采用裂隙灯检查、泪道冲洗、鼻内镜检查、泪道内镜检查、血液及凝血功能筛查以及影像学检查。对患者采用了综合诊断策略并进行针对性治疗。

结果：对所有患者均进行针对性治疗成功消除血泪症状，无进一步后遗症。值得关注的是，在随访期内，所有病例均未观察到复发。

结论：本系列病例表明，青少年反复发作的单侧血泪（血性泪液）存在多元化的潜在病因。强调早期规范评估对改善预后的关键意义。

额、筛窦复杂骨瘤的手术治疗

第一作者：Wang YI

目的：总结额、筛窦复杂骨瘤的手术指征、手术入路设计及术中技巧，评估治疗效果及并发症。

方法：回顾性分析我院 2023 年 1 月至 2025 年 6 月间诊治的 4 例额、筛窦复杂骨瘤病例资料。年龄 18-32 岁，男性 1 例，女性 3 例。右侧 2 例，左侧 1 例，双侧 1 例。临床表现为眼球突出并下移位 2 例，眼球突出并外侧移位 1 例。额部隆起 2 例。所有患者无视力下降，眼球转动诱发一过性黑矇 1 例，主诉周边视野复视 1 例，头痛 1 例。2 例眼球运动上转受限，2 例内转受限。术前行眼眶轴位、冠位及矢状位 CT 扫描，通过骨窗 CT 判断肿瘤基底与鼻窦的关系，尤其关注额窦的顶壁和后壁是否被肿瘤累及。通过软组织窗 CT 判断肿瘤与眼外肌、视神经的位置关系。3 例肿瘤与前颅底骨质关系密切，其中累及额窦后壁 3 例，累及筛骨水平板 1 例。

结果：均在全麻下手术，1 例肿瘤主体位于额窦，采用眉弓上皮肤切口，1 例肿瘤主体位于额、筛窦，采用 Lynch 皮肤切口，1 例肿瘤位于双侧额窦和筛窦，无眼眶受累，采用 Lynch 皮肤切口联合鼻内镜经筛入路，1 例肿瘤主体位于筛窦，采用泪阜结膜入路联合鼻内镜经筛入路。采用皮肤切口者行额窦前壁（必要时含鼻骨）截骨开窗，显露窦腔内肿瘤后采用磨钻和骨凿相结合的方式分块切除肿瘤，在接近前颅底时避免磨穿或撕裂硬脑膜风险。肿瘤切除后使用钛钉和钛板复位额窦前壁。2 例联合鼻内镜入路处理筛窦内的肿瘤基底和后缘。钛网重建眶内壁 2 例。术毕需保持额窦开口充分扩大和引流通畅。术后复查 CT 显示肿瘤切除均彻底，病理诊断均为骨瘤，术后随访 3-12 个月，未见肿瘤复发。2 例患者出现眶上神经支配区感觉丧失，无其它并发症。

结论：巨大的额、筛窦骨瘤影响眼部外观和功能，手术切除预后良好。术前需根据 CT 判断肿瘤与颅底、眼眶重要结构的关系，额窦前壁开窗和鼻内镜技术有助于肿瘤的显露和切除，磨钻和骨凿结合使用使肿瘤切除更加安全和高效。

GLP-1 受体激动剂通过 PKA/CREB1 信号通路拮抗全反式视黄醛诱导的视网膜变性

第一作者：Bei Ting HE

共同作者：Yalin WU

目的：阐明 GLP-1 受体激动剂 Exendin-4 在干性 AMD 和 STGD1 治疗中的作用与潜在机制。

方法：对视黄醛清除障碍的 ABCA4^{-/-}RDH8^{-/-} 模型小鼠腹腔注射 20 ug/kg Exendin-4，一天一次，持续一周，评估光暴露后小鼠的视网膜电图、眼底形态，视网膜厚度，评估小鼠的视功能和视网膜的损伤程度，并验证 GLP-1R/PKA/CREB1 的表达。在负载全反式视黄醛的感光细胞系 661W 细胞中以 1-100 nM 的 Exendin-4 干预，评估细胞活力、凋亡相关蛋白 Caspase3、以及 GLP-1R/PKA/CREB1 的表达水平，并进一步抑制 PKA、CREB1 评估该信号通路对感光细胞死亡的作用。

结果：Exendin-4 可显著改善负载全反式视黄醛的 661W 光感受器细胞的形态，并使活力回调 15-20%，给予 Exendin-4 的光暴露 ABCA4^{-/-}RDH8^{-/-} 小鼠的视网膜 a 波、B 波均回调 30% 以上，同时显著减轻了视网膜水肿和 RPE 退化，相应地，GLP-1R/PKA/p-CREB1 在 Exendin-4 干预后表达升高，凋亡相关蛋白 cleaved-Caspase3、cleaved-PARP1、γH2AX 均显著下调。

结论：GLP-1 受体激动剂通过激活 PKA/CREB1 信号通路拮抗全反式视黄醛诱导的视网膜变性。

上游补体 C3 抑制：一种优于末端 C5 阻断的 RPE 细胞保护策略

第一作者：Zhidong CHEN

共同作者：Huiqin LIU, Feng QIAN, Mingshuang WANG

目的：抑制补体蛋白 C3 和 C5 已经在临床上被证明可以减缓地图样萎缩（GA）的进展速率，但补体系统激活造成视网膜色素上皮细胞（RPE）损伤的具体机制尚未被阐明。本研究通过系统研究补体级联反应中的主要效应分子对于 RPE 表型和功能的影响，揭示补体激活造成 RPE 损伤的机制，为下一代补体药物设计提供科学基础。

方法：研究表明，脂褐质 A2E 的积累是老龄化 RPE 细胞功能退行的重要诱导因素和临床病理特征。本研究采用 A2E 负载的人 RPE 细胞（ARPE-19）作为 GA 体外细胞模型，使用正常人血清激活完整的补体级联反应，全面评估补体激活对 RPE 细胞生存、紧密连接及屏障功能、线粒体代谢、溶酶体活性、POS 吞噬等重要功能的影响，并对比抑制各补体蛋白（C3、C5、C3a、C5a 等）对 RPE 细胞保护效果的异同。

结果：补体级联反应通过多个效应分子、多重机制造成 RPE 细胞的功能退行：上游效应分子 C3a 驱动线粒体功能障碍；C3b 沉积造成溶酶体 -POS 吞噬系统功能损伤；补体终末激活在 RPE 细胞表面

形成膜攻击复合物 (MAC) 导致急性细胞裂解。末端 C5 阻断能完全阻止 MAC 介导的细胞裂解, 但仅部分挽救 (25%–50%) 线粒体和溶酶体功能, 无法逆转 RPE 细胞的整体功能异常。相比之下, 上游 C3 的抑制通过阻断所有致病效应分子 (C3a、C3b、C5a 及 MAC) 的产生, 实现了对 RPE 细胞功能退行的全面逆转。

结论: 补体介导的 RPE 细胞退行性损伤由末端 (MAC/C5a) 和上游 (C3a/C3b) 的补体通路共同驱动。这种多因素致病机制使得末端 C5 阻断不能实现完全的 RPE 细胞损伤保护, 而上游 C3 抑制策略能为 RPE 细胞功能带来全面保护。本研究表明, 实现补体抑制策略对 GA 治疗效果的最大化需要完全抑制补体上游枢纽 C3 的激活, 为下一代补体药物研发提供了药理层面的科学依据。

CETP 通过 HDL-CE 与 HDL-TG 介导早期 AMD 的因果效应: 一项中介孟德尔随机化研究

第一作者: Naiyuan ZHANG

共同作者: Jiahui CAO, Yu HUANG, Yuqiao LIAO, Chenyu MA, Yunhong SHI, Yong WANG, Honghua YU

目的: 高密度脂蛋白 (HDL) 与年龄相关性黄斑变性 (AMD) 风险升高相关。高活性胆固醇酯转运蛋白 (CETP) 可降低 HDL 水平。本研究旨在评估 CETP 与不同阶段 AMD 之间的因果关联, 并探究多种已知 HDL 亚组分的中介作用。

方法: 从 IEU OpenGWAS 项目和 eQTLGen 联盟获取血清脂质、CETP 及不同阶段 AMD 的全基因组关联研究 (GWAS) 数据。采用双样本、多变量孟德尔随机化 (MR) 及基于汇总数据的 MR (SMR) 方法, 以 GWAS 汇总数据和单核苷酸多态性 (SNP) 作为 AMD、HDL 及 CETP 的工具变量, 并评估 HDL 亚组分的中介作用。为确证结果稳健性, 采用 MR-PRESSO、Cochran's Q 检验和 MR-Egger 截距检验进行敏感性分析。

结果: MR 研究揭示特定脂质与早期 AMD 存在因果关联。HDL (OR = 1.21; 95% CI: 1.10–1.33) 是早期 AMD 的危险因素, 而甘油三酯 (OR = 0.78; 95% CI: 0.71–0.85) 则具有保护作用。进一步发现, HDL 中胆固醇酯 (HDL-CE) 的影响最强 (OR = 1.23; 95% CI: 1.11–1.36), 而 HDL 中甘油三酯 (HDL-TG) 呈现疾病保护效应 (OR = 0.83;

95% CI: 0.75–0.91)。HDL 颗粒大小并非早期 AMD 的主要决定因素。遗传学层面 CETP 与早期 AMD 显著相关 (OR = 0.59; 95% CI: 0.47–0.74; $P_{SMR} < 5 \times 10^{-6}$)。CETP 表达升高与 HDL-CE 降低 (OR = 0.25; 95% CI: 0.21–0.30)、HDL-TG 升高 (OR = 1.45; 95% CI: 1.35–1.57) 及早期 AMD 风险降低 (OR = 0.59; 95% CI: 0.47–0.74) 相关。中介 MR 分析显示, CETP 对早期 AMD 的作用部分由 HDL-CE 和 HDL-TG 水平介导。敏感性分析证实研究结果具有稳健性。

结论: DL-CE 升高会增加早期 AMD 风险, 而 CETP 通过降低 HDL-CE 和升高 HDL-TG 发挥保护作用。

SB-HHD-CDs 抑制高糖诱导的晶状体上皮细胞氧化应激并防治糖尿病性白内障的实验研究

第一作者: Xueying YANG

目的: 探讨中药衍生碳点 (Scutellaria barbata and Herba Hedyotis diffusae and Carbon dots, SB-HHD-CDs, 后称 CDs) 对高糖环境下晶状体上皮细胞氧化应激的保护作用, 及对链脲佐菌素 (Streptozotocin, STZ) 诱导的糖尿病小鼠白内障的影响。

方法: 体外培养人晶状体上皮细胞 SRA01/04, 分为正常对照组 (Ctrl; 4.5 mM 正常葡萄糖浓度)、高糖组 (HG; 60 mM 葡萄糖)、低浓度 CDs 组 (HG + low dose CDs; 60 mM 葡萄糖 + 25 μ g/ml CDs)、中浓度 CDs 组 (HG + middle dose CDs; 60 mM 葡萄糖 + 50 μ g/ml CDs) 和高浓度 CDs 组 (HG + high dose CDs; 60 mM 葡萄糖 + 100 μ g/ml CDs)。采用 CCK-8 试验检测细胞活力, DHE 染色及流式细胞术检测细胞内活性氧 (Reactive oxygen species, ROS) 水平, Tunel 染色及流式检测细胞凋亡程度。在体内, STZ 诱导 C57BL/6J 小鼠建立 1 型糖尿病模型, 分为正常组 (Ctrl, n = 10)、糖尿病造模组 (DM, n = 15) 及糖尿病造模联合 CDs 滴眼液干预组 (DM + CDs, n = 15)。干预 12 周后进行裂隙灯检查、HE 染色观察临床及病理表现。Western blot 检测氧化应激相关蛋白 NOX-4、HO-1、NQO1, 炎症蛋白 TNF- α 及凋亡相关蛋白 Bax 和 Bcl-2 的表达。其次, 使用 RayPlex[®] 流式多因子对晶状体组织中的炎性细胞因子进行定量分析。

结果: 高糖培养 72 小时后, SRA01/04 细胞活力下降, 表现出明显的氧化应激, 细胞凋亡增加。中、高剂量 CDs 可降低氧化应激及细胞凋亡水平。CDs

能明显保护晶状体结构并改善其混浊程度, DM 组有 10 例晶状体混浊, DM + CDs 组仅有 3 例。与正常组相比, 糖尿病组小鼠晶状体中 NOX-4 表达显著升高, 并伴有 HO-1 和 NQO1 的下调, 而 CDs 给药能显著抑制氧化应激蛋白表达, 上调抗氧化应激蛋白水平, 并且可以逆转糖尿病诱导的晶状体组织中促炎细胞因子的上调。此外, 与糖尿病组相比, CDs 治疗组可以降低 Bax 表达及 tunel 阳性细胞比例。

结论: CDs 可通过清除 ROS、减轻氧化应激损伤及炎症反应, 保护高糖诱导的 SRA01/04 细胞凋亡, 从而减轻糖尿病小鼠晶状体混浊, 抑制糖尿病性白内障。且本研究证明, CDs 具有良好的组织穿透性和生物安全性, 可作为防治糖尿病性白内障的潜在药物, 具有巨大的临床转化前景。

STAT3 的 SUMO 化修饰调控巨噬细胞 M2 极化在脉络膜新生血管生成中的作用

第一作者: Kaixuan CUI

共同作者: Guoming ZHANG

目的: 探讨 STAT3 的小泛素相关修饰物 (SUMO) 化修饰调控巨噬细胞极化在脉络膜新生血管 (CNV) 形成中的作用机制, 并评估以 STAT3 的 SUMO 化修饰为靶点的干预策略对湿性年龄相关性黄斑变性 (AMD) 的影响。

方法: 收集湿性 AMD 患者和特发性黄斑前膜患者增殖膜样本, 观察 STAT3、pSTAT3、SOCS3、巨噬细胞极化标志物及 SUMO 化修饰相关蛋白的表达和定位情况。分别对巨噬细胞特异性 SENP1 基因敲除小鼠及对照小鼠构建激光诱导 CNV 模型, 分析敲除 SENP1 后 STAT3 的 SUMO 化修饰对 CNV 病损大小及血管渗漏情况的影响, 并检测 STAT3 的磷酸化、泛素化水平以及巨噬细胞极化标志物的表达变化。接下来体外分离并培养各组小鼠的原代腹腔巨噬细胞, 进一步研究 STAT3 的 SUMO 化修饰对 STAT3 的泛素化、磷酸化、核浆定位变化和蛋白质稳定性的影响, 以及对巨噬细胞极化状态的作用。同时, 将原代腹腔巨噬细胞与小鼠脉络膜血管内皮细胞 (CVECs) 体外共培养, 观察 SUMO 化修饰介导的巨噬细胞极化对 CVECs 生物学特性的影响。随后, 我们在小鼠 RAW264.7 巨噬细胞系中探索 STAT3 可能发生 SUMO 化修饰的关键位点。最后干预此位点, 分析其对 STAT3 介导的巨噬细胞 M2 极化的影响及对 CNV 生成的调控作用。

结果: 与特发性黄斑前膜患者相比, 在湿性 AMD 患者纤维血管增殖膜中, SUMO 化修饰蛋白 SUMO1 及 SUMO2/3/4 水平升高, 伴随 pSTAT3、STAT3 及 Arg1 的上调, 而 STAT3 负反馈因子 SOCS3 表达则下降。在激光诱导 CNV 小鼠模型中, 巨噬细胞条件敲除 SENP1 导致 SUMO 化修饰增强, 诱导巨噬细胞 M2 极化, 并加重 CNV 病变及血管渗漏。在原代腹腔巨噬细胞极化模型中, 巨噬细胞条件敲除 SENP1 引起 STAT3 的 SUMO 化修饰增加, 泛素化修饰减少, 蛋白稳定性增强, 促进 STAT3 入核。通过生物信息学预测及体外实验验证, STAT3 的 SUMO 化修饰位点可能为 K451、K354、K340 和 K679, 其中 K451 位点突变可显著降低 STAT3 蛋白的稳定性, 提示是 STAT3 的 SUMO 化修饰的关键位点。

结论: 本研究揭示了 STAT3 的 SUMO 化修饰调控巨噬细胞极化进而促进 CNV 生成的新机制, 提出以 STAT3 的 SUMO 化修饰为干预靶点的治疗策略, 丰富了湿性 AMD 发病机制的理论基础, 为 CNV 相关眼病的精准靶向治疗及基因编辑技术应用提供了新的思路和依据。

SkQ1 对 Leber 遗传性视神经病变患者皮肤成纤维细胞线粒体功能的保护作用与 PINK1/PRKN 介导的线粒体自噬有关

第一作者: Jin XU

目的: 本研究旨在通过使用 Leber 遗传性视神经病变 (LHON) 患者的皮肤成纤维细胞, 评估 SkQ1 对改善线粒体功能的作用及其分子机制。

方法: 从携带 m.G11778A 突变的 LHON 患者和健康志愿者的皮肤组织中构建了永生化成纤维细胞系 (iFBs)。利用 CCK8 评估细胞活力。LHON-iFBs 先用 20 nM SkQ1 或 DMSO 预处理 7 天, 随后用 200 μ M 过氧化氢处理 45 分钟。通过 DCFH-DA 和 MitoSOX 检测细胞质和线粒体中的活性氧 (ROS) 水平。使用 JC-1 检测试剂盒和线粒体通透性转换孔 (MPTP) 检测试剂盒评估线粒体膜稳定性。此外, 采用网络药理学和分子对接技术探索 SkQ1 的潜在靶蛋白。通过 Western blot 验证了鉴定出的枢纽靶蛋白。

结果: 经 SkQ1[20 nM/7 d] 预处理的 LHON-iFBs 细胞中, 细胞质和线粒体活性氧水平均显著降低。JC-1 单体与聚集体的比例及线粒体膜电位 (MPTP) 的开放程度均有所下降, 表明预处理可增强线粒体膜稳定性。网络药理学分析和分子对接实验证实, SkQ1 与 SOD2、PINK1 蛋白具有高亲和力。热稳

定性实验 (CETSA) 显示, SkQ1 能提升 PINK1 和 SOD 的热稳定性。蛋白质印迹分析结果表明, SkQ1 预处理可下调 SOD2 和 PINK1 的表达水平。

结论: 在携带 m.G11778A 突变的皮肤成纤维细胞中, SkQ1 通过清除线粒体活性氧 (ROS) 并可能修复 PINK1/Parkin 介导的自噬过程, 从而保护线粒体功能。

加强民营眼科医院后勤管理重要性的探析

第一作者: 张静

目的: 绪言: 随着经济社会的不断发展, 政策法规的不断完善和逐步系统化的监督机制, 以及医疗消防安全事故、医疗纠纷伤医事件等, 体现大众对医疗的要求越来越高, 也对生产安全、服务提升等保障工作有了更高的要求, 只有夯实了后勤管理工作, 才能为临床工作提供更加安全的保障。目的: 通过学术的交流引起行业更多地对后勤管理工作的重视和共鸣。一、后勤管理的工作内涵 (一) 物业管理方面, 保障水电气正常供应; 确保就诊环境卫生, 做好防跌倒等防范工作; 保障消防安全, 环保要求 (如排污许可等) 达标; (二) 人事管理方面, 劳动合同的合规、职称评审、内部提拔机制等, 这不仅影响员工的积极性和职业发展, 也十分考验民营医院的综合实力; (三) 医疗投诉方面, 医患矛盾和自媒体的普及, 矛盾的曝光率越来越高, 医院也需应对处理; (四) 设备管理方面, 设施设备的维修保养, 良好的保养能够降低设备的故障率。

方法: 本文采用文献综述与实际工作结合, 进行综合分析, 提出相应的建议。二、民营眼科后勤管理工作现状 (一) 编制设置相对较少 专科属性规模相对小, 人员编制或部门设置较少或不全的情况屡见不鲜, 正因相对薄弱的配置, 工作中难免出现因疏忽导致的隐患。(二) 经费投入相对较少 日常工作中经费更多偏向核心医疗业务, 这很重要; 但却相对忽视了生产安全上的经费投入。

结果: 现民营眼科医院的后勤管理能力已有很大提高, 但薄弱环节也确实存在, 需持续提升, 引入精细化的管理, 以确保医院运营的高效和稳定。三、对民营眼科后勤管理工作的建议 (一) 管理层高度重视 从顶层设计就高度重视生产安全, 每年在经费上合理投入并配置合理编制, 以确保后勤管理工作顺利开展。(二) 加强内外交流学习 管理部门到全体员工, 从根本上认识到后勤工作的重要性, 多参加交流学习, 以提高自身的认知水平和实践能力。

结论: 重视后勤管理工作, 把生产安全作为第一首要课题, 只有安全为前提才能创造一个安心、舒适的环境, 才能更好更高质量地为群众提供更多的医疗服务。

动物眼操作提升青年医师显微手术技能

第一作者: Qing WANG

共同作者: Guiping MA, Jia MU, Lingyun SUN, Yan ZHANG

目的: 将临床显微手术培训的理论与实践经验运用到了青年医生培养的教学方案中, 以期在住院医师学习期间逐渐掌握显微手术技巧。将平面教学转为新型的、立体的、感性的多元化的教学模式。

方法: 训练的医生分组: 一组: 主治医师及高年资住院医师——白内障超声乳化手术组 12 名, 有临床医学理论知识, 有无菌操作知识, 掌握外科基本操作规程, 具备显微手术基础。二组: 住院医师——翼状胬肉切除组 8 名, 有一定熟练的临床医学知识, 有无菌操作知识, 掌握外科基本操作规程, 初步具备显微手术基础。三组: 住院医师——角结膜裂伤缝合组 16 名, 有较完善的医学临床知识, 有无菌操作知识, 掌握外科基本操作规程, 无显微手术基础。对以上三组医生, 每周五下午 1 点至 5 点进行显微手术培训 4 小时, 每组 2 个练习台, 按分组每 1 小时轮换, 连续 22 月, 培训基地开放 78 次, 时间近 300 小时。

结果: 3 组青年医师显微手术技能得到大幅提高, 白内障手术在爱尔集团手术技能考核中通过率为 75%; 翼状胬肉手术在爱尔集团手术技能考核中通过率为 83%。

结论: 临床青年医生的动物眼显微手术训练作为过渡桥梁, 只有经过严格的训练, 熟练掌握显微手术的基本操作技术, 才能进行实际的人眼临床操作, 更高质量的完成眼科显微手术, 减少手术并发症, 提高手术成功率。我们用动物眼进行显微手术操作训练对于青年医师的培训与发展具有重要意义。

教学与授课

第一作者: Qing WANG

共同作者: Guiping MA, Jia MU, Lingyun SUN, Yan ZHANG

目的: 医生不仅是治病救人, 还要带教实习医生、规培医生和青年医生。在现代医学中, 临床医生未

经师范教师的专业培训，学习掌握教育教学方法，能更高效地传递经验和知识，更好地履行医生这个复合型角色的核心职责，提高专业水平教育教学能力，更好培养青年医生。

方法：一、通过学习“1. 以学生为中心、教学教育理念 2. 建立形成性评价机制 3. 线上线下混合式教学模式实施 4. 采用多维成效评估 5. 对混合式教学的其他思考”等教学方法，有效组织：PBL、CBL、RBL、翻转课堂、MOOC，在教学中与青年医生开展有效的互动、激发青年医生学习动机的形成性评价、利用临床病例进行基础医学教学，提高面对社会信息化、全球化、学习途径和资源多样化的能力。二、授课：教授功课，是教学的基本组成形式，是教学过程的中心环节。通过“说课”及教学授课技巧的演练，提高教学能力及授课水平。

结果：1. 知识传递与人才培养；2. 提升临床教学质量；3. 促进医生自我提升；4. 推动医学教育改革与创新。临床医生参与教学与授课，在知识、思维、沟通和职业精神四个维度上实现全面的、螺旋式的上升。促进人才梯队建设，保证医学事业的传承与发展，是现代临床医生的基本素养。

结论：临床医生学习教育教学，是其职业发展的必然要求与核心能力，保障医学人才的高质量培养、推动临床教学规范化，反向促进自身知识体系迭代，最终助力医疗质量与医学行业的长远发展。

泛凋亡对视网膜色素变性发生发展的影响及其治疗探索

第一作者：Shibo TANG

共同作者：Qihang KONG, Ying XU

目的：视网膜色素变性（Retinitis Pigmentosa, RP）是一种遗传性视网膜疾病，以视网膜光感受器细胞的进行性退化为特征，主要影响视杆细胞和视锥细胞，最终导致失明，目前尚无有效治疗方法。本研究旨在探讨 Z-DNA 结合蛋白 1（Z-DNA binding protein 1, ZBP1）在视网膜感光细胞退变中的作用机制，并评估基因干预手段对视网膜退变的潜在治疗效果。

方法：本研究采用 rd10 小鼠模型，检测 ZBP1 及其泛凋亡通路关键蛋白的表达水平，分析其在视网膜退变中的激活状态。同时，构建 AAV 介导的 ZBP1 过表达模型，研究其对野生型小鼠感光细胞及泛凋亡通路的影响。此外，通过 siRNA 和 AAV-shRNA 介导的基因干预手段，评估其对 rd10 小鼠视网膜泛凋亡通路及感光细胞退变的影响。结合视网膜电图、黑白箱、视动检测等视觉功能检测方法，

以及 Western blot、免疫荧光等分子生物学技术，系统评估 ZBP1 基因干预的疗效和机制。

结果：本研究发现，rd10 小鼠视网膜中 ZBP1 及其泛凋亡通路关键蛋白表达显著升高，表明 ZBP1 及泛凋亡通路在视网膜退变中被异常激活。AAV 介导的 ZBP1 过表达在野生型小鼠中直接诱导感光细胞死亡，并激活泛凋亡通路，证实了 ZBP1 激活与感光细胞死亡的因果关系。siRNA 介导的 ZBP1 敲低在短期内显著抑制 rd10 小鼠视网膜中的泛凋亡通路，并改善感光细胞退变程度。AAV-shRNA 介导的 ZBP1 长效敲低能够减缓感光细胞退变，显著保护视网膜结构并恢复视觉功能。

结论：ZBP1 是泛凋亡通路的关键调控分子，在视网膜退变中发挥重要作用。通过基因干预手段（如 siRNA 和 AAV-shRNA）敲低 ZBP1 表达，能够有效抑制视网膜泛凋亡，保护感光细胞结构和功能。本研究为 RP 的基因治疗提供了新的靶点和理论依据，展示了基因干预策略的潜在应用价值。

眼外肌病教育探索：程控双目眼动仪的开发、实施与认知

第一作者：Lei XIONG

共同作者：Ruihua JING, Jianming WANG, Lijun WANG

目的：眼外肌的运动功能解剖以及眼外肌病是眼科学习的一个困难区域，但是对于眼科专业学生又是必要的。为了提高学习效果，我院开发了程控双目眼动仪（已授权实用新型专利），请专家评估，并在临床教学中使用，以明确对眼外肌教学的改进的效果。（我们 2017 年研制“程控单目眼动仪”授权了发明专利，样机在临床教学中应用，并发表了 SCI 论著。本项目是原有项目的改进）。

方法：在本研究中，设计并用 3D 打印技术 + 程控技术制造了一个 1:5 的具有逼真眼眶及眼球的结构、能够模拟单眼六条眼外肌单纯运动、双眼协同运动、眼科检查法以及常见的病理性斜视的模型。请 7 位眼科教授评估此模型的效果并填写调查问卷，并且通过将 30 名一年级医学生分为模拟组和传统讲授学习组，对程控双目眼动仪的效用进行了评估，以了解此程控双目眼动仪如何辅助他们学习眼外肌病学。

结果：7 名眼科教授均表明程控双目眼动仪能有助于医学教学。用结果：7 名眼科教授均表明程控双目眼动仪能有助于医学教学。用 10 道基于眼外肌运动及眼外肌病的填空题的测验两组同学。结果表明，模拟教学组的成绩显著优于传统教学组（ $p = 0.0206$; $p < 0.05$ ），Cohen's $d = 0.927$ （大效应），

说明模拟教学法产生了具有实际教学意义的显著改进, 优势比 (Odds Ratio) 2.85:1, 表明模拟教学组学生成绩优于传统组的概率是近 3 倍。

结论: 这项研究证明, 程控双目眼动仪有助于眼外肌病的教育, 增进知识理解, 并能丰富学生的学习体验。

眼部疾病中的线粒体转移

第一作者: **Wei XU**

共同作者: **Hongtao LIU, Luina LIU**

目的: 眼睛长期暴露于外界微环境中极容易受到各种线粒体损伤剂的迫害。因线粒体功能受损导致的活性氧含量升高与眼部疾病的发生密切相关。作为维持细胞代谢的关键细胞器, 线粒体在各种压力和能量需求条件下经常发生形态改变或位置变化。除了在细胞内定位的改变, 线粒体也可以在应激刺激下发生细胞间转移。因此, 在这篇综述中我们对其发生细胞间转移的不同方式及潜在的机制进行了阐述。

方法: 回顾了线粒体转移的方式包括隧道纳米管、微泡、缝隙连接等。同时也总结了眼部疾病中存在的线粒体损伤及目前关于线粒体转移在眼部的研究。

结果: 对于退行性眼部疾病, 线粒体转移或许是一个研究的新兴领域并成为治疗和治愈各种眼部疾病的新途径。

结论: 细胞间线粒体转移是一个令人欣喜的发现, 它对于受体细胞线粒体功能的恢复起到了重要的作用, 其潜在的靶向性为眼部疾病的治疗提供了巨大的机会。虽然线粒体转移有多种不同的方式而且驱动线粒体转移的具体信号机制仍然未知, 但 Miro1、Myo10、M-sec 和 Cx43 等关键分子的参与已经为可能的靶向治疗方式打开了大门。眼部退行性疾病中普遍存在着氧化应激损伤以及线粒体的损害, 尤其在眼表和视网膜中。干细胞移植已被证明在以线粒体转移的方式挽救组织损伤。尽管仍有许多关键问题需要解决, 但进一步了解线粒体转移的最佳条件可能会在临床上实现线粒体转移和移植的突破。

综合设计性实验教学改革探索——以《眼视光技能学》课程为例

第一作者: **Xiao LIN**

共同作者: **Guoping LI, Peipei LIU, Yidi LIU, Peiran SI, Jianfeng WU**

目的: 探讨综合设计性实验教学模式在提升学生学习效果、实践能力、创新思维和临床技能等方面的效果。

方法: 选取山东中医药大学 2022 级眼视光医学专业 122 名学生作为实验组, 2022 级眼视光学专业 121 名学生作为对照组。实验组采用融入科学研究的综合设计性实验, 对照组采用以演示和操作练习为主的传统实验教学。通过满意度调查问卷 (10 级量表) 评估教学效果, 采用 SPSS 软件进行问卷信度、效度以及 Mann-Whitney U 非参数检验的统计学分析。

结果: 实验组眼视光医学专业学生共 122 人, 回收调查问卷 90 人, 回收率 73.77%; 对照组眼视光学专业学生共 121 人, 回收问卷 90 份, 回收率 74.38%。在实验实施方面, 实验组的实验内容满意度 (9.56 ± 0.84) 显著高于对照组 (8.07 ± 1.71); 实验组实验设备和材料满意度 (9.59 ± 0.75) 高于对照组 (8.24 ± 1.91); 实验组实验时间安排满意度 (9.54 ± 0.85) 高于对照组 (7.76 ± 2.02); 实验组实验考核方式满意度 (9.54 ± 0.85) 高于对照组 (7.82 ± 1.91); 实验组教师授课效果满意度 (9.59 ± 0.76) 高于对照组 (8.33 ± 1.78)。实验组和对照组间差异均有统计学意义 ($P < 0.05$)。满意度调查问卷的信效度良好 (Cronbach's $\alpha = 0.990$, KMO = 0.921), 支持研究结果的可靠性。在知识掌握方面, 实验组专业学习相关度 (9.58 ± 0.81) 高于对照组 (8.47 ± 1.64); 实验组对专业学习的帮助方面的满意度 (9.57 ± 0.82) 高于对照组 (8.08 ± 1.89); 实验组在理论知识理解方面满意度 (9.57 ± 0.82) 显著高于对照组 (8.07 ± 1.98)。实验组和对照组间差异均有统计学意义 ($P < 0.05$)。在能力提升方面, 实验组实践操作能力满意度 (9.57 ± 0.79) 高于对照组 (8.08 ± 1.84); 实验组在解决问题能力提升方面满意度 (9.56 ± 0.81) 高于对照组 (7.98 ± 2.01); 实验组在数据分析能力提升方面满意度为 (9.53 ± 0.82), 高于对照组 (7.83 ± 2.09)。实验组和对照组间差异均有统计学意义 ($P < 0.05$)。在素质培养方面, 实验组团队合作意识培养的满意度为 (9.61 ± 0.75), 高于对照组 (8.16 ± 1.77); 实验组在科研创新思维培养方面满意度

(9.56 ± 0.81)，显著高于对照组 (7.86 ± 2.01)。实验组和对照组间差异均有统计学意义 ($P < 0.05$)。

结论：综合设计性实验教学模式能显著提高学生的满意度，有效提高《眼视光技能学》教学效果，对培养学生专业技能、科研创新思维以及实践能力具有一定帮助，是一种适合眼视光学专业的高效教学模式。

跨人群研究揭示 Fuchs 角膜内皮营养不良中 ADARB1 通过编辑 IGFBP7 mRNA 影响细胞周期的致病机制

第一作者：Kai-tong YANG

共同作者：Jian-huan CHEN

目的：本研究聚焦 Fuchs 角膜内皮营养不良 (FECD) 这一以角膜内皮细胞进行性丢失为特征的退行性疾病，针对其表观遗传调控机制尤其是 A-to-I RNA 编辑的作用不明问题，基于两个独立 FECD 人群的角膜内皮转录组公开数据，通过生物信息学方法鉴定差异 RNA 编辑位点，并结合功能富集分析、基因表达相关性分析及体外细胞实验，系统探究 A-to-I RNA 编辑 (由 ADAR 蛋白家族介导) 在 FECD 中的潜在作用机制，旨在为 FECD 的表观遗传学发病机制及治疗策略提供新视角。

方法：基于两个独立 FECD 人群角膜内皮转录组数据，通过生物信息学分析鉴定差异 RNA 编辑位点，分析编辑水平、基因及位点数量变化，检测 ADARB1 等编辑酶表达；结合功能富集分析和基因表达相关性分析锁定关键基因 (如 IGFBP7)；开展体外细胞实验，比较 IGFBP7 野生型与编辑型 (p.K95R) 对细胞周期、凋亡及关键蛋白 (如 p53、p21) 的影响，验证 ADARB1 过表达对 IGFBP7 编辑及下游效应的调控，并通过转录组测序分析编辑型 IGFBP7 对相关基因 (如 NDUFA7、SLC9A8) 的调控。

结果：研究发现，两个 FECD 人群的角膜内皮均呈现平均 RNA 编辑水平降低、编辑基因及位点数量减少，但 RNA 编辑酶 ADARB1 表达显著升高；差异编辑基因主要富集于细胞周期调控、自噬及癌症相关通路。其中，IGFBP7 的表达及其错义编辑 (p.K95R) 在两个队列中均显著上调，且与 ADARB1 表达呈正相关。体外实验证实，编辑型 IGFBP7 比野生型更显著诱导细胞周期 G2/M 期阻滞和凋亡，并上调 p53、p21 表达；ADARB1 过表达可增强 IGFBP7 的编辑水平，同时上调上述凋亡相关蛋白。转录组测序进一步显示，编辑

型 IGFBP7 过表达影响线粒体电子传递链基因 (如 NDUFA7) 及眼病相关基因 (如 SLC9A8) 的表达。

结论：ADARB1 通过编辑 IGFBP7 mRNA 影响细胞周期，参与 FECD 发病机制。从而为该疾病的表观遗传机制及潜在治疗策略提供了新的视角。

摘要编号：208891

面板编号：ART-1276

骨髓间充质干细胞调控 Müller 细胞铁死亡缓解糖尿病神经视网膜病变的作用机制研究

第一作者：Xinlu LI

共同作者：Yan MEI

目的：糖尿病视网膜病变 (Diabetic Retinopathy, DR) 传统上被定义为糖尿病微血管并发症，现已被认识为神经血管性疾病。糖尿病神经视网膜病变 (Diabetic neuropathy in the retina, DNR) 是以神经元和胶质细胞损伤为特征，破坏神经-血管单元 (Neurovascular unit, NVU) 稳态，最终导致糖尿病患者视觉质量下降，且缺少有效的治疗手段。骨髓间充质干细胞 (bone marrow mesenchymal stem cells, BMSCs) 具有组织修复潜能，被认为是治疗 DR 的安全有效策略。本文旨在探究 BMSC 对高糖诱导的视网膜损伤的保护作用及分子机制，为 DNR 防治提供新思路。

方法：1. 建立家兔玻璃体腔 BMSC 注射模型，结合 ERG、VEP、Optos UWF、FFA 及 HE 染色评估视网膜功能与结构。体外 BMSC-Müller 共培养采用 CCK-8、划痕、ELISA 及流式检测细胞增殖、迁移与炎症反应。2. 单细胞转录组分析探讨高糖下神经微环境变化及 BMSC 疗效，筛选铁死亡通路关键基因。3. 检测体内外模型 ROS、MDA、GSH、 Fe^{2+} 及 GPX4、FSP1、DHODH、ACSL4、xCT、DUSP6 表达。4. 构建 DUSP6 敲减 Müller 细胞与 BMSC 共培养模型，通过 TEM 及 Western Blot 分析超微结构与铁死亡相关分子。

结果：1. 成功构建 BMSC 干预糖尿病神经视网膜损伤家兔模型，表现为 ERG-Ops 波振幅改善，HE 染色显示视网膜结构恢复。成功构建 BMSCs 与 Müller 细胞共培养模型，细胞活性和细胞迁移能力增强，G0/G1 期增加，S 期减少，IL-6、IL-1 β 、TNF- α 水平改善。2. 单细胞转录组分析显示，BMSCs 治疗组中铁死亡通路的富集显著下调。Müller 细胞的激活状态显著降低，Müller 细胞与视锥、视杆细胞之间的信号交流显著增强，DUSP6 表达上调。3. BMSCs 移植干预后，视网膜超微结构改善，线粒体数量增多、膜及嵴结构恢复，GSH 水平上升，MDA 与 Fe^{2+} 含量下降。ACSL4 表达降低，DHODH、FSP1、GPX4 及 xCT 表达显著

恢复, 同时发现 DUSP6 表达上调。Müller 细胞与 BMSCs 共培养后, 改善线粒体形态, 降低 ROS、MDA、 Fe^{2+} , GSH 升高, 调控上述分子表达。4. 成功构建敲减 DUSP6 的 Müller 细胞与 BMSC 共培养模型, BMSC 共培养可恢复线粒体数量和结构, 降低 ROS、MDA 及 Fe^{2+} , 提升 GSH 水平, 并上调 DHODH、FSP1 及 GPX4 蛋白表达。

结论: BMSCs 可介导关键基因 DUSP6 的表达上调 GPX4/DHODH/FSP1 轴抑制 DNR 铁死亡, 从而发挥对 DNR 的保护作用。

TCM-OphthaLLM: 基于思维链增强的中医眼科大语言模型的研究

第一作者: Jieru LIU

共同作者: Juzhao ZHANG, Haidong ZOU

目的: 中医眼科学以其整体观、辨证论治的理念在眼病防治中独具优势, 但面临诊疗标准化困难与人才短缺等问题。大语言模型为此提供了潜在解决方案, 却受限于中医眼科领域训练语料匮乏、辨证推理能力薄弱的局限。本研究旨在构建与中医眼科知识高度契合、具备辨证推理能力的专业大语言模型, 以提升该领域智能诊疗的准确性。

方法: 为解决中医眼科训练语料稀缺的问题, 研究提出双大语言模型协同过滤策略, 从多个开源中医语料库筛选中医眼科相关数据, 结合专家审核构建高质量专用数据集 TCM-Ophthalmology。在此基础上, 采用预训练与 LoRA 微调方法, 使模型有效对齐中医眼科的语言范式与知识体系。同时, 设计创新的 OphthaCoT 推理框架, 通过自我启发式推理机制, 将中医眼科“五轮学说”等核心辨证理论与 Chain of Thought (CoT) 思维链机制融合, 引导模型逐步模拟中医医师的诊断思路, 实现具备逻辑解释能力的临床推理。

结果: 在中医考试任务中, TCM-OphthaLLM 准确率达 71.09%, 显著优于 Huatuo (49.75%)、ShenNong-TCM-LLM (56.94%) 等中医大模型及通用模型 ChatGPT-4 (68.77%), 验证了领域特定训练语料对于提升模型理解能力的关键作用。在中医辨证推理任务中, TCM-OphthaLLM 全面优于对比模型, 准确率、宏平均 F1 值、宏平均召回率及宏平均精确率分别为 79.83%, 42.51%, 48.42%, 51.89%。以上结果共同表明,

OphthaCoT 的结构化推理提示与自启发机制能显著增强模型模拟中医辨证推理的逻辑思维能力。

结论: 作为首个专注中医眼科的专业大语言模型, TCM-OphthaLLM 通过创新的数据集构建策略与融合中医眼科领域理论的思维链推理框架, 克服了语料稀缺和复杂辨证推理的难题, 为中医眼科的智能化辅助诊断与决策提供了强有力的工具, 有望缓解医疗资源短缺问题, 并推动中医药向标准化、现代化方向持续发展。

基于个体特征建立 nomogram 模型预测近视儿童对 0.01% 阿托品的应答程度

第一作者: Yue Jia PANG

共同作者: Jie CHEN, Wenyan XU

目的: 本研究旨在基于基线特征及用药期间临床数据的早期变化来确定用于评价近视儿童对 0.01% 阿托品滴眼液应答程度的指标并建立预测模型。

方法: 采用回顾性研究, 以来自温州医科大学附属眼视光医院的 101 例近视儿童为训练集, 并以来自沈阳兴齐眼科医院的 46 例近视儿童为验证集。所有儿童均每晚使用 0.01% 阿托品滴眼液点眼 1 次, 双眼各 1 滴, 随访 1 年。纳排标准: 1. 年龄在 4~17 岁; 2. 非睫状肌麻痹下眼光 ≤ -0.50 D; 3. 最佳矫正视力 ≥ 4.9 ; 4. 随访期间未使用其它近视防控方法及未患有严重眼病。将 1 年眼轴长度 (AL) 的进展不超过 0.2 mm 的儿童被归类为良好应答者, 反之为不良应答者。基于回归模型筛选应答程度的评价指标后建立 nomogram 预测模型, 并通过受试者工作特征曲线的曲线下面积 (AUC) 及校准曲线对模型性能进行评估。

结果: 二元 Logistic 回归结果显示, 基线年龄、基线 AL、6 个月等效球镜度 (SE) 和 AL 变化量可用于预测近视儿童对 0.01% 阿托品滴眼液的应答程度。基线年龄较大 (OR = 2.058, $P < 0.001$)、基线 AL 较短 (OR = 0.993, $P = 0.025$)、6 个月 SE 近视进展较小 (OR = 1.638, $P = 0.019$) 及 6 个月 AL 增长较小 (OR = 0.914, $P = 0.002$) 的近视儿童更有可能对 0.01% 阿托品滴眼液应答良好。基于这些预测指标建立的 nomogram 模型在训练集中的 AUC 为 0.903 (95% CI: 0.845~0.962), 在验证集中的 AUC 为 0.808 (95% CI: 0.683~0.934)。校正曲线显示, 训练集的 Brier 评分为 0.124, 验证集的 Brier 评分为 0.180, 误差在可接受范围内。

结论: 6 个月的治疗期是评估 0.01% 阿托品滴眼液近视防控效果的合适时间窗。基于基线年龄、

基线 AL、6 个月 SE 变化量、6 个月 AL 变化量建立的 nomogram 模型可以直观地预测近视儿童对 0.01% 阿托品滴眼液的应答程度。

基于干眼分析仪探究罹患西北燥证人群干眼发病特征

第一作者: Yiyun HUANG

目的: (1) 探讨罹患西北燥证人群干眼病的发病特征, 为临床治疗提供理论依据。(2) 明确甘油三酯 - 葡萄糖 (TYG) 指数对干眼症的预测价值。

方法: 本研究为横断面研究, 纳入新疆医科大学附属中医医院眼科门诊患者。根据是否为干眼症患者及是否符合西北燥证诊断标准, 将研究对象分为三组: 健康人群组、西北燥证干眼组和西北燥证非干眼组。通过非接触式泪膜破裂时间 (NIBUT)、泪河高度、脂质层厚度、睑板腺缺失率等眼表指标, 以及甘油三酯 - 葡萄糖 (TYG) 指数, 比较不同组别间的差异, 评估这些指标与西北燥证干眼症发病的关系。

结果: 分析结果显示, 西北燥证干眼组的泪膜破裂时间显著较短 ($P < 0.05$), 泪河高度显著较低 ($P < 0.05$), 表明该组患者的眼表稳定性较差, 干眼症状较为严重。相比之下, 健康人群组和西北燥证非干眼组在泪膜破裂时间和泪河高度上的差异较小, 提示西北燥证干眼组的眼表功能异常更加明显。尽管如此, TYG 指数与干眼症的发生并未表现出显著相关性 ($P > 0.05$), 表明其在干眼症的预测中作用有限。

结论: 本研究证实了西北燥证对干眼症发病的显著影响, 尤其在眼表功能方面, 西北燥证干眼组表现出较短的泪膜破裂时间和较低的泪河高度, 提示该人群的干眼症状更加严重。而 TYG 指数未能与干眼症的发生具有显著关联, 可能不足以作为干眼症的有效预测标志物。研究结果为新疆地区干眼症的防治提供了新的理论依据, 进一步揭示了西北燥证作为地方性证候在干眼症发病机制中的潜在作用, 并为临床治疗提供了地方性指导。

眼科手术后感染性眼内炎危险因素及病原学分析

第一作者: Wenwen ZHANG

目的: 探讨眼科手术后感染性眼内炎的影响因素, 了解病原菌及其对感染症状和愈后的影响。

方法: 以 2014 年 1 月至 2025 年 6 月收治的眼科手术后感染性眼内炎患者 65 例和同期相同术式非眼内炎患者 195 例患者为研究对象, 开展病例对照研究。收集患者的基础资料、术前检查结果、病原菌、术后治疗及愈后等资料。年龄、身体质量指数及感染症状出现时间等符合正态分布以均数 $\pm$ 标准差表示, 两组间比较采用独立样本 t 检验, 多组间比较采用单因素方差分析, 当差异有统计学意义时, 进一步采用 SNK 法进行两两比较; 合并糖尿病、严重疾病史、术前血红蛋白低、术前血清白蛋白低、术前使用抗菌滴眼液、急诊手术、术前有其他感染病灶、术后眼污染史等计数资料, 采用卡方检验。不同病原菌患者愈后视力不符合正态分布采用中位数和四分位间距描述, 多组间比较采用 Kruskal-Wallis 秩和检验, 差异有统计学意义时, 进行两两比较。采用多因素 logistic 回归分析感染眼内炎的危险因素。

结果: 65 例感染性眼内炎患者中白内障手术 51 例, 玻璃体切割术 2 例, 玻璃体切割 + 白内障手术 6 例, 青光眼 + 白内障手术 4 例, 玻璃体腔药物注射 2 例; 手术三级医院 24 例, 二级医院 31 例, 民营医院 10 例; 超急性眼内炎 40 例, 亚急性眼内炎 25 例, 慢性眼内炎 0 例。经单因素和多元 logistic 回归分析, 合并糖尿病、术前血清白蛋白低、严重疾病史及术后眼污染史是患者术后发生感染性眼内炎的危险因素 ($OR = 2.039, 3.021, 2.803, 3.095; P < 0.05$)。65 例感染患者中标本检出病原菌 41 株, 无真菌感染病例, 检出率为 63.08%。其中, G+ 杆菌 1 株、G+ 球菌 26 株及 G- 杆菌 14 株, 分别占 2.44%、63.41% 及 34.15%。65 例患者术后感染症状出现时间为 (4.48 ± 4.46) d。经方差分析, G+ 菌、G- 菌及无菌生长患者的感染症状出现时间比较, 差异有统计学意义 ($F = 5.61, P < 0.05$)。经秩和检验, G+ 菌、G- 菌及无菌生长患者的愈后视力比较, 差异有统计学意义 ($H = 13.09, P < 0.05$)。

结论: 糖尿病、术前血清白蛋白低、严重疾病史及术后眼污染史均可能增加眼科手术部位感染风险, 不同致病菌对术后感染症状出现时间和视力愈后有影响。

视网膜动脉闭塞后卒中和心肌梗死的风险及其时间依赖性: 系统回顾和荟萃分析

第一作者: Chuansen WANG

共同作者: Xuan XIAO

目的: 视网膜动脉闭塞 (RAO) 是一种可能提示潜在在心血管疾病的眼科急症。卒中和心肌梗死与 RAO 有相似的病理生理机制和危险因素。本系统综述旨在评估 RAO 发病后卒中和心肌梗死的风险, 重点关注其风险的时间依赖性变化。

方法: 检索 PubMed、Embase 和 Web of Science 中报道 RAO 术后卒中和心肌梗死发生率的文章。采用纽卡斯尔-渥太华量表评价研究质量。采用随机效应模型计算 RAO 后脑卒中和心肌梗死的相对危险度 (RR), 并分析其随时间的变化趋势。

结果: 纳入 12 项研究, 涉及 319748 人。综合分析显示, RAO 与卒中风险显著增加相关 ($RR = 3.64$, 95% CI: 2.53–5.25, $p < 0.0001$), 特别是在 RAO 后的第一个月内。RAO 后心肌梗死风险呈上升趋势 ($RR = 1.38$, 95% CI: 0.80 ~ 2.40, $p = 0.2478$), 但未达到统计学意义。时间分层分析显示, RAO 后 30 天内卒中和心肌梗死发生率最高。

结论: RAO 与卒中短期风险升高密切相关, 这强调需要在 RAO 发病后第一个月内及时进行脑血管评估和监测。尽管 RAO 和心肌梗死之间的关联在统计学上不太显著, 但对患者的心血管评估仍然是有必要的。这些发现强调了 RAO 是需要及时干预的可预示系统性血管疾病的重要事件。

3 例眼睑 Merkel 细胞癌

第一作者: Weng Hang WONG

共同作者: Hui REN

目的: 通过回顾 3 例诊治过的眼睑 Merkel 细胞癌病例, 总结眼睑 Merkel 细胞癌的临床特点, 借此在眼科临床工作上加强对该罕见恶性肿瘤的识别, 作出合适的诊治安排

方法: 通过搜索复旦大学附属眼耳鼻喉科医院眼科自 2013 年以来病理诊断为“Merkel 细胞癌”的病例, 回顾病例的临床资料、诊治经过, 分析归纳病例的异同。

结果: 一共回顾 3 例病理诊断符合眼睑 Merkel 细胞癌的病例, 就诊时年龄 64~91 岁 (平均 80.33 岁), 男女比例 2: 1, 皆为单眼发病, 一例为眼睑肿物切除后复发, 两例就诊时皆为初发, 3 例患者皆无其他肿瘤病史、不符合免疫抑制状态, 3 例患者眼睑肿物变大的病程皆小于 3 个月, 3 例患者皆接受手术治疗 (局部眼睑肿物切除), 3 例术后病理皆可见细胞核旁点状细胞角蛋白 20 的表达。

结论: 眼睑 Merkel 细胞癌多见于老年人, 男性患者比例相对大, 肿物较小时注意与麦粒肿、霰粒肿相鉴别, 治疗以完整手术切除为主, 老年人眼睑肿物标本都应该送病理检查。

CD155 通过 Cyclin E1/CDK4 介导细胞周期重编程促葡萄膜黑色素瘤转移的机制研究

第一作者: Junyang PAN

共同作者: Yao LV, Nan MA, Yuhua MA, Chunli WU, Lu ZHANG

目的: 葡萄膜黑色素瘤是成人最常见的原发性眼内恶性肿瘤, 50% 患者因转移死亡, 其中 90% 转移至肝脏, 转移后中位生存期不足 12 个月, 且缺乏有效的全身治疗方案。CD155 在多种肿瘤中高表达, 参与免疫调节与肿瘤进展, 但在 UM 中的机制尚未明确。本研究旨在揭示 CD155 在 UM 转移中的功能及其通过细胞周期调控的分子机制, 为靶向治疗提供理论依据。

方法: 整合生物信息学与功能实验: 基于 GSE139829 单细胞数据集, 分析 CD155 在恶性细胞中的表达及预后价值 (Cox 回归); 结合患者转移状态、GEP 评分 (≥ 2) 和 PRAME 表达评估临床关联; 利用 CopyKAT 计算 CD155 阳性细胞的染色体不稳定性 (CNV 评分)。对 CD155 高/低表达组 (各 $n = 5$) 进行 RNA-seq 差异分析和 GO 富集分析。体外选用 C918 和 Mum2B 细胞, 构建 CD155 稳定敲低细胞株 (shRNA, 敲低效率 $> 70\%$), 通过 Western Blot、划痕愈合、Transwell 迁移及克隆形成实验验证 CD155 对恶性表型及细胞周期蛋白 (CDK4、Cyclin E1) 的影响。

结果: 单细胞分析显示, UM 恶性细胞中 CD155 表达较正常细胞上调约 3.5 倍, 且在转移患者中进一步升高。CD155 高表达与患者不良预后显著相关。CopyKAT 提示 CD155 高表达群体中恶性细胞比例达 92%。差异表达基因富集于 MAPK 通路、细胞黏附与凋亡过程。敲低 CD155 后, 381 个基因显著富集于细胞周期通路, 并抑制细胞克隆形成 (减少 70%, $p < 0.05$)、迁移 (划痕愈合率降至

32%) 和侵袭 (Transwell 细胞数减少 65%, $p < 0.05$)。Western Blot 显示 CD155 敲低使 CDK4 和 Cyclin E1 表达分别下降 62% 和 58%, 表明其通过 Cyclin E1/CDK4 通路驱动细胞周期重编程。

结论: CD155 是 UM 转移的关键分子, 其高表达与转移风险、GEP 评分及 PRAME 状态相关。机制上, CD155 通过激活 Cyclin E1/CDK4 通路促进细胞周期进展与恶性表型。本研究为 UM 提供了新的治疗靶点, 尤其对现有免疫疗法抵抗的患者具有潜在转化价值。

一例视网膜色素变性合并 VHL 综合征病例分析

第一作者: Guojiao SONG

共同作者: Wenbin WEI, Hanqing ZHAO

目的: 报告一例罕见的 CNGA1 双等位基因突变所致视网膜色素变性与 VHL 基因杂合突变所致 VHL 综合征共病的病例, 分析其临床特征与遗传学特点, 为该双基因共病的临床诊疗提供参考。

方法: 回顾性病例分析, 病例资料经患者知情同意。

结果: 女性, 33 岁。右眼视力进行性下降 1 年。自幼夜盲。查体: 右眼视力 0.2, 左眼视力 0.8。眼前节检查未见明显异常。眼底检查: 双眼周边视网膜骨细胞样色素沉着, 右眼颞上方视网膜见一橘红色球形瘤体, 直径约 1 DD, 瘤体周边大量黄白色渗出。荧光血管造影示瘤体早期高荧光、晚期渗漏。OCT 显示, 双眼外层视网膜萎缩, 右眼黄斑区视网膜水肿增厚。初步诊断为双眼视网膜色素变性, 右眼视网膜毛细血管瘤。建议进行抗 VEGF 治疗以稳定视网膜血管瘤。进一步完善全身检查和基因检测以明确病因和全身情况。头颈 MRA 示右侧大脑前动脉 A1 段缺如、左侧椎动脉纤细。腹部超声示右肾囊肿, 可疑胰腺囊肿和脾脏囊肿。未发现中枢神经系统血管母细胞瘤、嗜铬细胞瘤及肾细胞癌证据。基因检测提示 CNGA1 基因存在 1 个纯合突变 (c.253del(p.Leu85PhefsTer4), 全外显子测序), VHL 基因存在杂合突变 (c.194C > G)。由于未收到患者父母样本, 未进行基因变异来源验证。对其家系成员 (两名儿子) 进行基因检测验证, 显示两名子代均为 VHL 基因杂合突变携带者, 未携带 CNGA1 基因突变。目前两名子代未表现出异常表型。

结论: CNGA1 双等位基因突变所致视网膜色素变性与 VHL 基因杂合突变所致 VHL 综合征在临床与分子水平同时出现极为罕见。该病例表明单基因病与多系统综合征可共存, 同一患者可同时携带隐性致盲突变与显性肿瘤易感突变。二者在视网膜病

变上存在夜盲、视野缺损等重叠表现, 患者若同时出现神经系统病变、肾脏囊肿等多系统症状应考虑多基因致病可能, 建议采用高通量测序联合家系验证全面评估致病基因以避免漏诊, 并同时在家系开展肿瘤-视功能联合随访, 明确发病风险。

似瘤非瘤的结膜粉红色肿块的诊疗思考

第一作者: Lingxi ZHANG

共同作者: Jianhao CAI, Zeyi LI, Cangeng XU

目的: 探讨穹隆结膜粉红色肿块是淋巴瘤肿块还是炎性肿块的诊疗方法。

方法: 回顾分析在我院就诊的穹隆结膜粉红色结膜肿块 16 例, 男 7 例, 女 9 例, 双眼发病 3 例。都行 B 超和眼眶 CT/MRI 检查。穹隆结膜肿块侵入眶内 7 例。4 例行结膜下注射地塞米松 3 mg 共注射 2 次, 手术切除结膜肿块联合病理检查 + 免疫组化 13 例, 其中 1 例为结膜下注射地塞米松后再手术。随访 3~6 个月。

结果: 穹隆结膜粉红色结膜肿块 16 例中, 结膜下注射地塞米松 2 例肿块缩小但不能完全消退, 2 例无效; 13 例手术并病理检查, 9 例诊断为淋巴瘤, 4 例为炎性肿块。淋巴瘤患者转肿瘤专科进一步全身检查或化疗。

结论: 穹隆结膜粉红色肿块建议手术切除, 病理免疫组化检查才能确诊结膜淋巴瘤或炎性肿块, 淋巴瘤部分患者需全身化疗。

基于 BRAF 突变的结膜黑色素瘤患者的系统治疗疗效: 一项来自中国队列的回顾性研究

第一作者: Yongyun LI

共同作者: Xianqun FAN, Renbing JIA, Shiqiong XU, Tianyu ZHU

目的: 评估全身系统治疗对伴或不伴远处转移的结膜黑色素瘤 (conjunctival melanoma, CoM) 患者的疗效与安全性。

方法: 这是一项关于接受系统治疗的 CoM 患者及对照病例的回顾性单中心研究。研究纳入了 41 例经病理确诊、并在术后接受系统治疗的 CoM 患者, 以及 41 例对照病例。采用倾向评分匹配法对对照病例进行匹配。主要治疗方案包括免疫检查点抑制剂 (immune checkpoint inhibitor, ICI)、靶向治疗 (targeted therapy, TT) 和化疗。通过 Kaplan-Meier 法计算生存结局, 并

采用对数秩检验进行比较。使用 Cox 比例风险模型评估风险比。主要结局指标包括总体生存期 (overall survival, OS)、从远处转移至死亡的时间、无远处转移生存期 (distant metastasis-free survival, DMFS) 和无复发生存期 (relapse-free survival, RFS)。同时分析了最佳总体疗效 (best overall response, BOR)、疾病控制 (disease control, DC) 率、治疗开始后的无进展生存期 (progression-free survival, PFS) 和 OS, 以及不良事件 (adverse events, AEs)。

结果: 本研究共纳入 82 例患者, 其中 41 例接受系统治疗, 41 例未接受系统治疗。治疗开始后的中位随访时间为 13.1 个月。在 OS 方面, M0 期患者中, 系统治疗组的中位 OS 未达到, 非系统治疗组为 48 个月 ($p = 0.022$); M1 期患者中, 两组从远处转移至死亡的时间分别为 12.8 个月和 6 个月 ($p = 0.066$)。在 DMFS 方面, M0 期患者两组中位 DMFS 分别为未达到和 58.2 个月 ($p = 0.044$)。在 RFS 方面, N0M0 期患者手术切除后, 两组中位 RFS 分别为未达到和 37.6 个月 ($p = 0.048$)。85.4% 的患者达到 DC 为 BOR。在接受一线 ICI、TT 和化疗的患者中, 预估 1 年 PFS 率分别为 58.8%、71.4% 和 66.7%, 预估 1 年 OS 率分别为 76.5%、100% 和 100%。治疗相关的 1-2 级 AE 发生率在 ICI 组为 51.4%, TT 组为 40%, 化疗组为 37.5%。

结论: 系统治疗对伴或不伴远处转移的 CoM 患者均具有临床获益。针对 BRAF 野生型 CoM, 建议将 ICI 作为一线治疗方案。对于 BRAF 突变型 CoM, TT 可带来更高的缓解率和更优的生存结局。

复发性葡萄膜黑色素瘤的组织病理与遗传学转化: 病例报告

第一作者: **Jingting LUO**

共同作者: **Yuning CHEN, Wenbin WEI**

目的: 探讨复发性葡萄膜黑色素瘤 (UM) 的组织病理及遗传演化特征。

方法: 对一名 42 岁女性患者的原发 (PUM) 及复发 (RUM) UM 组织进行配对全外显子测序 (肿瘤 300 X、外周血 100 X)。数据经 fastp、bwa、GATK (突变分析)、Control-FreeC (拷贝数变异)、clusterProfiler (富集分析) 处理。

结果: RUM 的组织病理类型由梭形细胞型转变为上皮样细胞型。RUM 中共检测到 1,079 个突变 (PUM 为 1,201 个), 其中移码缺失比例增加, 且 FLG 基因突变频率升高。PUM 和 RUM 共享

突变基因包括 ANKRD36、ZNF717、PABPC3。染色体突变热点存在差异: PUM 主要集中于染色体 1、3、11、13、19、21, 而 RUM 集中于 1、3、5、13、14、19。RUM 特异性突变基因 (418 个) 富集于中枢神经系统发育、免疫细胞分化及 Wnt/Notch 等信号通路。拷贝数变异亦发生改变: PUM 主要表现为 chr 4/7/8/21 扩增及 chr 3 缺失; 而 RUM 表现为 chr 15 扩增、chr 7/21 缺失。

结论: 复发性 UM 显示出明显的遗传及染色体动力学变化 (包括移码突变和 CNVs) 以及组织病理类型转化。RUM 特异性突变基因涉及多条关键通路, 提示其在肿瘤复发进程中可能具有驱动作用, 反映出 UM 的复杂分子演化过程。

巩膜外敷贴放射后补充经瞳孔温热疗法治疗脉络膜黑色素瘤的临床研究

第一作者: **Heng WANG**

共同作者: **Yueming LIU, Wenbin WEI, Ruiheng ZHANG**

目的: 探讨经瞳孔温热疗法作为巩膜外敷贴放射后补充治疗脉络膜黑色素瘤的效果及预后。

方法: 收集 2008 年 1 月至 2019 年 3 月于首都医科大学附属北京同仁医院眼科接受碘 125 PRT 治疗的 CM 患者 601 例 (601 眼)。其中男性 306 例 (306 眼), 女性 295 例 (295 眼), 年龄 13 ~ 85 岁, 平均 (46.62 ± 11.94) 岁。全部患者接受术前、术后间接检眼镜、眼底荧光血管造影 (FFA)、吲哚青绿脉络膜血管造影 (ICGA)、彩色多普勒超声、肝功、腹部超声检查。对于 PRT 后瘤体血管残留区域采取 TTT 补充治疗。收集性别、年龄、治疗前眼压、肿瘤形状、高度、最大基底径, 肿瘤与视盘的关系、是否合并玻璃体积血和视网膜下液, 以及治疗后眼球摘除、转移、死亡情况。年龄、肿瘤高度、肿瘤最大基底径符合正态分布, 比较采用独立样本 t 检验。随访时间、眼球摘除时间、转移时间、死亡时间不符合正态分布, 以中位数和四分位数描述。性别、肿瘤形态、累及视盘、合并视网膜下液和玻璃体积血的眼数、眼摘例数、转移例数、死亡例数以频数和百分比表示。性别、肿瘤形状、累及视盘、合并视网膜下液和玻璃体积血眼数的比较采用卡方检验或精确概率法。眼球摘除、转移和归因死亡累积概率的分析采用 Kaplan-Meier 生存分析。眼球摘除、转移及死亡的危险因素采用 Cox 比例风险回归模型分析。

结果: 在纳入的 601 例 (601 眼) 中, 60 例 (60 眼) 存在 PRT 后肿瘤血管残留, 并随后接受 TTT 补充治疗, 占整体的 9.98%。其中 51 例 (51 眼) 仅需

要一次 TTT, 占其中 85.0%。存在肿瘤血管残留与无残留的患者平均年龄分别为 (42.27 ± 12.11) 岁和 (47.11 ± 11.84) 岁, 差异有统计学意义 ($t = 3.00$, $P < 0.05$)。接受补充治疗的 60 例 (60 眼) 3 年、5 年眼摘率分别为 6.7% (95% CI: 2.6 ~ 6.8) 和 18.9% (95% CI: 10.9 ~ 31.6), 3 年、5 年转移率分别为 3.3% (95% CI: 0.8 ~ 12.7) 和 10.2% (95% CI: 7.7 ~ 21.3), 3 年及 5 年归因死亡率分别为 1.7% (95% CI: 0.2 ~ 11.2) 和 6.7% (95% CI: 2.6 ~ 16.9)。经多因素分析, 肿瘤最大基底径、肿瘤累及视盘与眼球摘除的相关性有统计学意义 ($HR = 1.22$, 4.35; 95% CI: 1.11 ~ 1.34, 1.84 ~ 10.23; $x^2 = 4.14$, 3.36; $P < 0.05$)。肿瘤最大基底径、视网膜下液与肿瘤转移的相关性有统计学意义 ($HR = 1.26$, 6.31; 95% CI: 1.16 ~ 1.37, 1.94 ~ 20.51; $x^2 = 5.44$, 3.06; $P < 0.05$)。肿瘤最大基底径、年龄、眼压 ($HR = 1.23$, 1.52, 1.10; 95% CI: 1.11 ~ 1.35, 1.20 ~ 1.91, 1.02 ~ 1.19; $x^2 = 4.15$, 3.53, 2.42; $P < 0.05$) 与归因死亡的相关性有统计学意义。

结论: FFA 联合 ICGA 可用于评估 PRT 术后肿瘤血管残留情况。TTT 作为补充治疗可针对性应用于残留区域。肿瘤最大基底径作为不良预后的危险因素需高度重视。

敲低 KLF4 抑制血管内皮细胞衰老和葡萄膜黑色素瘤细胞迁移

第一作者: Liang MA

目的: 探讨葡萄膜黑色素瘤 (UM, uveal melanoma) 转移过程中内皮细胞的作用, 发现转移性 UM 的内皮细胞呈现显著衰老特征, 并揭示 Kruppel 样因子 4 (KLF4, Kruppel-like factor 4) 促进肿瘤转移的机制。研究结合单细胞测序和实验验证, 提出靶向清除衰老内皮细胞或阻断 KLF4 可能是抑制 UM 肝转移的新策略, 为临床治疗提供潜在靶点。

方法: (1) 基于公共数据库, 分析单细胞数据, 进行细胞分群、差异基因分析和衰老评分, 解析细胞间互作。(2) 体外实验验证, H_2O_2 处理人脐静脉内皮细胞, 通过 SA- β -gal 染色、蛋白与 RNA 检测确认衰老表型。Transwell 迁移实验验证衰老内皮细胞对葡萄膜黑色素瘤细胞迁移的促进作用。

结果: (1) 单细胞测序分析显示转移性葡萄膜黑色素瘤中内皮细胞占比较多; (2) 转移性葡萄膜黑色素瘤的内皮细胞具有显著衰老趋势; (3) KLF4 高表达是内皮衰老的潜在驱动因素; (4)

转移性葡萄膜黑色素瘤患者衰老内皮细胞中 KLF4 高表达; (5) KLF4 过表达的衰老内皮促进肿瘤细胞转移。

结论: 本研究揭示了内皮细胞衰老在葡萄膜黑色素瘤转移中的关键作用机制。通过整合单细胞测序分析和功能实验, 研究人员发现转移性 UM 中内皮细胞呈现显著衰老特征, KLF4 被鉴定为驱动这一过程的核心转录因子。实验证实, KLF4 通过上调 P21 诱导内皮细胞衰老, 同时促进肿瘤细胞迁移能力的增强。深入机制研究表明, 衰老内皮细胞通过分泌 CXCL12 等 SASP 因子激活肿瘤细胞的迁移能力。临床样本分析进一步验证了 KLF4 高表达与肝转移风险和不良预后的显著相关性。此外, 研究还发现衰老内皮细胞可能招募 Treg 细胞, 参与促进免疫抑制性微环境的形成。这些发现不仅阐明了内皮细胞衰老促进 UM 转移的分子机制, 更提供了靶向清除衰老内皮细胞或阻断 KLF4 的治疗新思路。该研究为开发针对转移性 UM 的联合治疗策略奠定了重要理论基础, 具有潜在的临床应用价值。

泪腺区占位性病变手术入路选择

第一作者: Hongfei LIAO

目的: 探讨泪腺区占位性病变的类型特征及不同手术入路的选择策略, 以实现良好的手术暴露、完整切除及美观修复。

方法: 结合本院近年来泪腺区占位病例的临床实践, 总结不同病理类型 (包括感染性泪腺炎、炎性假瘤、结节病、肉芽肿性多血管炎、IgG4 相关性眼病、淋巴组织增生性病变、上皮源性肿瘤、转移性肿瘤及泪腺导管囊肿等) 的影像学特征与手术处理方式。根据病变性质、体积及术野暴露需求, 选择重睑入路、眉下入路或眉部入路进行切除与活检。

结果: 炎性假瘤及 IgG4 相关性眼病体积较小或高度怀疑炎性病变者, 可尝试糖皮质激素诊断性治疗; 其他明确占位性病变宜行手术切除。上皮源性肿瘤 (包括多形性腺瘤、腺样囊性癌、肌上皮癌等) 无论良恶性, 均应选择暴露充分的入路, 连同眶骨膜一并切除。重睑入路及眉部入路因瘢痕隐蔽、美容效果好, 适用于良性病变或小体积病变; 眉下入路虽暴露充分, 但瘢痕较明显。临床应综合病变部位、大小及术者经验, 灵活选择“扬长避短”的手术路径。

结论: 泪腺区占位性病变病理类型多样, 手术入路应个体化选择。合理的入路选择可兼顾手术视野、肿瘤切除完整性及术后美观。良性上皮性肿瘤仍需警惕潜在恶变, 术后应进行全面病理检查及长期随访。

眼眶肿瘤外侧壁开眶手术的治疗策略

第一作者: Zeyi LI

共同作者: Jianhao CAI, Cangeng XU

目的: 探讨眼眶肿瘤外侧壁开眶手术的治疗策略。

方法: 回顾近 5 年在我院进行外侧壁开眶手术几类眼眶大肿瘤: A. 泪腺混合瘤 25 例, B. 泪腺囊样腺癌 8 例, C. 眼眶淋巴瘤 12 例, D. 眼球后海绵状血管瘤 8 例, E. 眼眶神经纤维瘤 5 例, F. 眼眶神经鞘瘤 4 例。术前 CT 或 / 和 MRI 检查, 确定外侧壁开眶手术的适应症。以颧额缝为解剖标志电锯电钻切开眼眶外侧壁, 暴露手术视野, 切除眶内肿瘤。2 例神经纤维瘤同时做内侧泪阜切口协助分离肿瘤。标本送病理检查明确诊断。术后随访 5 年。

结果: 术中泪腺混合瘤、泪腺囊样腺癌和海绵状血管瘤均能完整摘除, 眼眶淋巴瘤无法切除干净, 眼眶神经纤维瘤和神经鞘瘤分离比较困难。眼球运动障碍为术后最常见的并发症, 未行放疗或化疗的 5 例淋巴瘤出现肿瘤复发。

结论: 眼眶内大肿瘤采用外侧壁开眶手术, 扩大术野, 有利于手术操作, 减轻或避免术中对眼球、眼外肌和视神经的牵拉挤压, 减少并发症。术前 CT、MRI 检查至关重要。

胸膜间皮瘤脉络膜转移癌一例

第一作者: Jie YANG

目的: 探讨胸膜间皮瘤脉络膜转移癌的临床表现、诊断及治疗预后, 以提高对该罕见疾病的认识和诊疗水平。

方法: 回顾性分析 1 例 42 岁女性胸膜间皮瘤脉络膜转移癌患者的临床资料。患者因左眼突然视物模糊 20 余天就诊, 既往有胸膜间皮瘤病史 3 年, 曾行切除术及多次化疗。对患者进行详细的眼科检查, 包括视力、眼压、眼前节及眼底检查, 以及视野、B 超、P-VEP、OCT 等辅助检查, 并结合血常规、血沉、C 反应蛋白等全身检查结果进行综合分析。同时, 进行头颅眼眶 MRI 及增强检查, 以明确眼部病变的性质及范围。

结果: 回顾性分析 1 例 42 岁女性胸膜间皮瘤脉络膜转移癌患者的临床资料。患者因左眼突然视物模糊 20 余天就诊, 既往有胸膜间皮瘤病史 3 患者左眼视力 0.12, 眼底检查显示视盘色红、边界欠清, 视网膜皱褶, 黄斑区水肿, 中心凹光反射欠清。视

野检查示左眼颞侧视野损害, B 超示左眼玻璃体混浊、局部视网膜脱离及眼球壁异常回声, P-VEP 示左眼 P100 波峰时延迟, OCT 示左眼盘周视神经纤维层局部增厚。血常规检查示白细胞、中性粒细胞数目升高, 血红蛋白、红细胞压积、平均血红蛋白量下降, 血小板数目升高, C 反应蛋白、血沉及尿素氮升高。头颅眼眶 MRI 及增强检查示左侧球后壁异常信号, 考虑转移瘤或网膜下出血, 左眼视神经管内段稍增粗。最终诊断为脉络膜转移癌。患者出院后赴天津肿瘤医院进一步检查, 发现多处癌细胞转移, 继续化疗, 但病情恶化, 于同年 12 月逝世。

结论: 胸腺间皮瘤脉络膜转移癌是一种罕见且恶性程度高的疾病, 其眼部表现多样, 易与其他眼部疾病混淆。早期诊断困难, 需结合详细的眼科检查及全身检查结果综合判断。头颅眼眶 MRI 及增强检查对明确眼部病变性质及范围具有重要价值。该病预后极差, 确诊时多已处于晚期, 治疗以内科化疗为主, 但疗效有限, 生存期短, 需引起临床医生的高度重视, 以提高对该病的警惕性和诊断准确性, 为患者提供更及时的治疗和预后评估。

自体睑板移植修复眼睑恶性肿瘤切除术后眼睑缺损

第一作者: Zeyi LI

共同作者: Jianhao CAI, Weihao CAI, Cangeng XU

目的: 探讨自体睑板移植修复眼睑恶性肿瘤切除术后眼睑缺损的手术方法。

方法: 回顾最近 4 年在我院手术的眼睑恶性肿瘤 23 例, 其中基底细胞癌 14 例, 睑板腺癌 9 例。全眼睑切除 8 例, 大于 1/2 眼睑切除 15 例; 下眼睑病变 13 例, 上眼睑病变 10 例。手术方法: 1. 眼睑恶性肿瘤扩大切除 + 冰冻切片; 2. 根据术眼缺损区的大小, 取同一眼上眼睑的睑板或对侧眼上眼睑的睑板; 3. 被取自体睑板包括睑结膜面, 宽度约 5 ~ 6 mm, 仅保留睑缘 3 ~ 4 mm 的睑板; 4. 自体睑板移植到手术缺损区, 睑结膜面紧贴眼球, 6-0 可吸收缝线对位缝合睑板并缝合眼睑皮肤; 5. 睑板缝合尽量处于内翻状态。术后随访 3 ~ 6 个月。

结果: 23 例移植的自体睑板愈合好, 无睑板坏死; 病变的穹隆结膜稍变浅, 无眼球运动障碍; 术后 3 个月有 12 例眼睑闭合不全 2 ~ 3 mm, 多为全眼睑切除病例; 有 2 例轻度眼睑外翻。

结论: 自体睑板移植修复眼睑恶性肿瘤切除术后眼睑缺损, 取材方便, 睑板移植易成活, 修复的眼睑缺损区比较符合正常眼睑生理, 重建眼睑效果好。

视网膜母细胞瘤患儿父母病耻感现状及影响因素分析

第一作者: Wei XU

目的: 了解视网膜母细胞瘤 (retinoblastoma, RB) 患儿父母的连带病耻感现状及其影响因素。

方法: 选取 135 例视网膜母细胞瘤患儿的父亲或母亲, 采用一般资料调查表、社会影响量表、社会支持评定量表、一般自我效能感量表、简易应对方式量表对其进行调查。

结果: 视网膜母细胞瘤患儿照顾者病耻感量表总分为 55.00 (49.00, 63.00) 分, 社会支持总分为 31.00 (23.00, 37.50) 分, 一般自我效能感总分为 21.00 (16.50, 26.00) 分, 积极应对评分 (26.44 ± 8.599) 分, 消极应对评分 (12.54 ± 5.406) 分。多因素分析结果显示社会支持总分、疾病分期、应对倾向、医保类型为 RB 父母病耻感的影响因素, 合计解释总变异的 37.2%。

结论: RB 患儿父母病耻感处于较高水平, 有待进一步改善。临床护理人员应关注 RB 患儿的疾病分期、医保类型、应对倾向, 正确引导, 提高社会支持利用度, 降低患儿父母的病耻感水平, 全面配合患儿更好的治疗。

AB-800 与 IOLMaster 700 在儿童眼生物学参数测量中的一致性分析

第一作者: Liu YUTONG

共同作者: Yang SHUO, Li XIAONING

目的: 评价 AB-800 免散瞳生物测量仪与 IOLMaster 700 在测量儿童眼生物学参数的一致性和相关性。

方法: 横断面研究。选取 2025 年 9 月至 10 月在长沙爱尔眼科医院视光研究所就诊并符合入组标准的具有远视储备儿童 91 例, 年龄 6-13 岁, 男 50 例, 女 41 例。所有受试者均分别使用 AB-800 和 IOLMaster 700 进行眼轴长度 (AL)、角膜曲率 (K1/K2)、晶体厚度 (LT)、前房深度 (ACD) 及角膜直径 (WTW) 等生物学参数的测量。采用组内相关系数 (ICC) 和 Pearson 相关分析评价两台仪器测量结果的一致性和相关性, 并通过 Bland-

Altman 分析进一步评价两台仪器测量结果之间的一致性。

结果: AB-800 与 IOLMaster 700 测得 AL、LT、ACD、K1、K2、WTW 等测量值高度相关 (均 $P < 0.001$) 两台仪器的测量结果 ICC 值均在 0.95 以上, Pearson 相关系数 r 均 > 0.97 (均 $P < 0.001$), 显示两仪器测量结果具有极高的一致性和相关性。Bland-Altman 分析显示, 两台仪器测量各参数的平均差接近于 0, 95% 一致限界范围较窄, 绝大多数测量点均落在一致限界之内, 未见明显系统偏差。

结论: AB-800 与 IOLMaster 700 在测量儿童眼轴长度、晶体厚度、前房深度及角膜曲率等参数时结果高度一致。AB-800 测量结果准确可靠, 可为儿童眼部生物学参数检测及远视储备监测提供有益参考, 为儿童视力健康管理提供有力支持。

视网膜结构特征与肺癌发病风险的关联: 一项基于英国生物银行队列的前瞻性研究

第一作者: Yi ZHANG

共同作者: Cong LI, Lei LIU, Yun REN, Xiaohong YANG, Honghua YU

目的: 肺癌是全球第一大常见恶性肿瘤, 早期发现是改善预后的关键。本研究旨在首次基于英国生物银行 (UK Biobank) 大规模前瞻性队列, 探讨光学相干断层扫描 (Optical Coherence Tomography, OCT) 测得的视网膜结构改变与未来肺癌发病风险之间的关联。

方法: 本研究纳入 UK Biobank 队列中 36,676 名基线无肺癌且具备质量合格的视网膜 OCT 影像的受试者。暴露变量为视网膜结构参数, 研究终点为新发肺癌病例。采用多变量 Cox 比例风险回归模型评估视网膜结构与肺癌发病风险的关联。通过亚组分析、敏感性分析排除潜在偏倚, 并利用限制性立方样条模型探究剂量 - 反应关系。

结果: 在中位随访 11.27 年期间, 306 名 (0.8%) 受试者发生肺癌。完全调整混杂因素后, 基线视网膜黄斑总厚度减小 ($HR = 0.99$, 95% $CI: 0.98-1.00$) 及外层视网膜厚度减小 (中央区 $HR = 0.97$, 95% $CI: 0.94-0.99$; 外环区 $HR = 0.94$, 95% $CI: 0.91-0.97$) 与肺癌发生风险显著相关。亚组分析提示, 此关联在年龄超过 60 岁的受试者及吸烟人群中更为显著。剂量 - 反应关系分析证实二者存在稳健的线性负相关。

结论: 基线视网膜黄斑总厚度及外层视网膜厚度减小是肺癌发生的独立危险因素。作为一种无创、快

速且经济的成像技术，OCT 所捕获的视网膜结构改变，有望成为一种新颖的生物标志物，用于肺癌高危人群的风险分层与早期预警，为癌症的无创筛查提供了重要的新思路。

1 例截肢患者眼动脉溶栓治疗术后动脉阻塞护理

第一作者：张雨

共同作者：张娜，闫淼

目的：患者为男性，45 岁，因“右眼视物不清 1 天，加重 3 小时”入院，于 1 天前无明显诱因出现右眼视物模糊，未诊治，于 3 小时前醒后发现右眼视物模糊加重，仅有眼前手动，遂来我院。患者既往 2 型糖尿病、2 型糖尿病性视网膜病变、2 型糖尿病性足，右眼因“玻璃体积血”行玻璃体切除术，2 型糖尿病性足致左下肢膝以下切除术，专科检查：右眼视力眼前 50 cm / 手动，左眼视力 0.5，眼底视乳头色淡红，OCT 检查示：右眼血流密度减低、血流淤滞，右眼视网膜层间水肿，右眼 CRAO 诊断基本明确，予以右眼动脉溶栓治疗，术后视野基本恢复正常（略有遮盖），视力正常。目的：报道该疾病的护理和体会，希望对该类患者的治疗和护理提供理参考。

方法：监测视力和血压，在入院和出院时均给予 HAMILTON 焦虑测量评分，明确患者在焦虑改善情况，鼓励患者配合医护的治疗及护理。完善跌倒风险评估。配合患者完善术前检查，常规腹股沟区备皮，准备术中介入材料。术后叮嘱患者和家属穿刺部位压迫 8 小时，伸直制动，加强远端肌肉按摩，嘱患者大量饮水，持续床旁心电监护，密切观察皮温、穿刺点及足背动脉搏动情况。指导患者严格糖尿病饮食，严密监测血糖。

结果：该者住院期间跌倒风险评估为 35 分，属于中风险患者，对其实施正确有效的防跌倒干预措施非常重要。HAMILTON 焦虑测量分值 < 14 分，较入院时减轻，跌倒坠床评分为 25 分，为低风险患者。该患者出现高血糖相关并发症，说明患者对该病认知不足。患者经过治疗和护理后病情好转，患眼视力较入院时得到明显改善，治疗期间，未发生其他并发症及不良事件。

结论：针对本例截肢合并糖尿病视网膜病变玻璃体切除术后发生 CRAO 的患者，经眼动脉介入溶栓治

疗，并实施以视力与血压监测、焦虑评估、跌倒风险防控及血糖管理为重点的系统性护理干预后，患者视力显著改善，焦虑状态缓解，跌倒风险等级降低，未发生并发症，表明该综合护理方案对保障治疗效果及患者安全具有重要临床意义。

光学相干断层成像评估高血压性视网膜病变神经元损伤应用价值的研究

第一作者：Runze ZHAO

共同作者：Guorui DOU

目的：本研究以光学相干断层成像检查为检查手段，探究其在高血压性视网膜病变中神经元损伤评估中的应用和重要价值。

方法：纳入 2019 年 3 月 -2020 年 7 月于 Hospital Clínico Quirúrgico “Hermanos Ameijeiras”

（HHA 医院）就诊的 102 例高血压患者为研究对象，同时纳入 45 名健康受试者，监测 24 h 动态血压，取 24 h 舒张压和收缩压的平均动脉血压值，测量眼压，计算眼灌注压。检测视盘区视网膜神经纤维（RNFL）厚度和黄斑区神经节细胞复合层（GCC）厚度。依据血压控制情况将患者分为血压控制组（n = 51）和血压未控制组（n = 51），45 名健康受试者为对照组。采用 Pearson 相关性分析或 Spearman 秩相关分析探究血压、眼灌注压、视网膜病变与 GCC 厚度和血压、眼灌注压与视网膜病变的相关性，采用 R 3.5.3 软件进行中介作用分析。

结果：3 组研究对象人种、收缩压、舒张压、平均动脉压、眼压、眼灌注压、视网膜病变比较，差异有统计学意义（ $P < 0.05$ ）。血压未控制组平均 RNFL 厚度低于对照组（ $P < 0.05$ ），血压控制组、血压未控制组 GCC 平均厚度低于对照组，血压未控制组 GCC 最小值低于对照组（ $P < 0.05$ ）。相关性分析结果显示，GCC 平均厚度、上方 GCC 厚度、颞下方 CCG 厚度与收缩压、舒张压、眼灌注压、视网膜病变呈负相关（ $P < 0.05$ ），颞上方 GCC 厚度与收缩压、舒张压、眼灌注压呈负相关（ $P < 0.05$ ），下方 GCC 厚度与舒张压呈负相关（ $P < 0.05$ ），视网膜病变与收缩压、舒张压、眼灌注压呈正相关（ $P < 0.05$ ）。中介效应结果显示，“收缩压→GCC 平均厚度→高血压性视网膜病变”效应显著，收缩压与 GCC 平均厚度呈正相关，GCC 平均厚度与高血压性视网膜病变呈正相关（ $P < 0.05$ ）。收缩压对高血压性视网膜病变发生风险具有直接影响（ $\beta = 0.013$ ，95% CI = 0.007 ~ 0.020， $P < 0.001$ ），GCC 平均厚度部分介导了收缩压对高血压性视

网膜病变发生风险的影响 ($\beta = 0.117$, 95% CI = 0.014 ~ 0.360, $P = 0.04$) , 中介效应占总效应的 11.7%。

结论: 光学相干断层成像检查是一种无创的眼科检查方法, 可优于普通眼底检查提前发现高血压性视网膜神经元受损情况, 对高血压导致视神经受损的不可逆盲和高血压靶器官受损进行早期预防和预警。

双硫仑 /CNTF 自复制 mRNA 共递送系统通过调控小胶质细胞焦亡促进视神经损伤修复的作用研究

第一作者: Qianyue ZHANG

共同作者: Yingzhi CHEN, Xianqun FAN, Jipeng LI, Yusha LIU, Qin WEI, Huifang ZHOU

目的: 创伤性视神经病变 (TON) 是导致不可逆性视力丧失的重要病因, 目前缺乏有效临床治疗手段。其核心挑战在于视网膜神经节细胞 (RGC) 再生能力有限, 以及损伤后存在的破坏性炎症微环境。本研究旨在探究小胶质细胞焦亡在 TON 中的作用机制, 并开发一种协同治疗策略, 以同时抑制神经炎症和促进 RGC 存活与再生。

方法: 本研究首先证实了在 TON 模型中, 机械性创伤及后续神经炎症通过激活 NLRP3/CASP1/GSDMD 信号通路, 诱导小胶质细胞发生焦亡, 进而通过小胶质细胞 - 神经元相互作用加剧炎症级联反应和 RGC 退行性变。为克服此双重障碍, 我们设计并构建了一种可靶向小胶质细胞的脂质纳米颗粒 (LNP) 共递送系统。该系统同时包载了可选择性抑制 GSDMD 蛋白的双硫仑 (DSF) 以及编码睫状神经营养因子 (CNTF) 的自复制 mRNA。通过综合性的体外细胞实验和体内动物模型, 评估了该联合疗法在抑制焦亡、减轻神经炎症、促进 RGC 存活、轴突再生以及恢复视觉功能方面的效果。

结果: 研究结果表明, 机械损伤确实通过 NLRP3/CASP1/GSDMD 通路触发了小胶质细胞焦亡。我们开发的靶向 LNP 平台能够有效地将治疗载荷递送至小胶质细胞。该联合策略展现出协同治疗效应: DSF 有效抑制了 GSDMD 介导的焦亡, 从而显著减轻了炎症反应; 同时, 自复制 mRNA 能够在局部持续表达 CNTF, 为 RGCs 提供了强大的神经营养支持。体内外功能评估证实, 该疗法显著提高了 RGC 的存活率, 促进了受损视神经的轴突再生, 并最终导致了视觉功能的明显恢复。

结论: 本研究发现小胶质细胞焦亡是 TON 病理进程中一个关键的炎症放大机制。我们成功开发的靶向小胶质细胞的 LNP 共递送平台, 通过协同抑制焦亡 (DSF) 和提供神经营养支持 (CNTF mRNA), 有效克服了 TON 的炎症和再生双重障碍, 实现了显著的结构保护与功能恢复。这项工作不仅强调了协调多靶点治疗策略在神经修复中的重要性, 也凸显了 RNA 与小分子药物联合递送系统在治疗神经炎症及神经退行性疾病方面具有广阔的转化应用前景。

后部缺血性视神经病变早期诊断与综合性治疗的临床疗效分析

第一作者: Xingjiu WANG

共同作者: Rirong CONG, Yi YAO, Xiuqin ZHAO

目的: 探讨后部缺血性视神经病变的早期诊断和综合治疗临床效果。

方法: 回顾性分析我院 2009~2024 年住院确诊的 13 例后部缺血性视神经病变 (PION), 其中男 4 例, 女 9 例, 年龄 51 岁 ~79 岁, 平均年龄为 66.3 岁。有原发性高血压病史 7 例, 多发性腔隙性脑梗塞 2 例, 糖尿病和高血压病史 3 例, 颈动脉阻塞伴高血压 1 例。所有患者均为单眼发病。均表现为突然发生的无痛性视力障碍及视野缺损。神经系统检查: 手足无 Raynaud 现象; 无头痛及眼痛。13 例患者均无视盘水肿, 眼底正常, 仅有 2 例视盘鼻侧略淡。辅助检查: 13 例患者血脂均高。CT 检查, 有不同程度的多发性腔隙性脑梗塞或脑动脉血栓形成。入院治疗经过: 1、降纤: 纤溶酶 100 u, 静点, 日一次, 改善脑供血。2、丁苯酞氯化钠注射液 100 ml, 日一次, 静滴。清除自由基。3、金纳多注射液 17.5 mg, 生理盐水 250 ml, 静滴, 地塞米松 5 mg, 日一次, 测管滴入。连续 5 天。复方樟柳碱 2 ml, 颞浅动脉旁、球后交替注射, 14 天一疗程。高压氧治疗每次 10~20 分钟。

结果: 经过如上治疗, 所有患者均有不同程度的视力提升, 随访 6 个月至 2 年, 视力保持稳定。最好的一例患者视力从指数恢复至 1.2。附病例 1: 孙 XX, 女, 59 岁。右眼无诱因的突然视物不清 3 天, 无眼痛。曾在当地医院眼科诊查, 眼底未发现异常。嘱回家适当休息。3 天后视力仍未见好转, 故来我院就诊, 既往高血压病史 10 年。检查: 视力: 右眼指数 / 20 CM, 左眼 1.2, 眼底检查: 视盘边界清; C/D = 0.3, 鼻侧略淡。颈部彩超提示: 双侧颈动脉斑块形成; CT 提示: 多发性腔隙性脑梗塞。诊断: 1. 右眼后部缺血性视神经病变; 2. 多发性腔隙性脑

梗塞；3. 原发性高血压。经治疗第六天时，右眼视力由指数恢复至 0.4，第 16 天时，视力恢复至 1.0。图 1~5 为治疗前、后眼底像、OCT 及视野检查。

结论：PION 是一种相对少见的疾病。发病初期临床特征不明显，阳性体征少，诊断困难。初始视盘正常，但在约 5-6 周后，视盘出现萎缩性变化。本组病例给予降纤、改善脑供血等药物，综合治疗之后，获得了良好疗效。提高本病的识别力和及时恰当治疗，对于本病取得有效疗效至关重要。

多发性硬化症在三国患者中的眼部表现：一项基于网络的调查

第一作者：**Runze ZHAO**

共同作者：**Maria TOLEDO**, 张国勋

目的：本研究旨在评估中国、西班牙和古巴多发性硬化症 (MS) 患者的流行病学特征、眼科临床表现以及不同的治疗方案。

方法：采用自行设计的问卷，对 MS 患者进行一项可比性的描述性横断面研究。调查内容包括患者的人口统计学资料、与 MS 相关的眼部表现以及三国所采用的治疗方法。在线调查使用问卷星平台设计，并通过 WhatsApp、微信和电子邮件分发调查链接。定量数据以均数和标准差表示，非参数变量采用 Kruskal-Wallis 检验。定性数据以例数和百分比表示。采用卡方检验比较各组的应答类别。当 $p < 0.05$ 时认为差异具有统计学意义。

结果：三国的男女比例均为 2-3:1，且复发缓解型 MS (RRMS) 在三国中均为最常见类型。三国中均有一半患者的视力丧失是缓慢且渐进性的，无显著差异 ($p = 0.524$)。与其他两国患者相比，中国患者接受类固醇治疗的百分比更高 ($p < 0.001$)，在传统药物使用方面也观察到类似趋势。在三国中，几乎有三分之一未接受任何治疗的患者出现了自发性恢复 ($p = 0.097$)。

结论：MS 更常以复发缓解型的临床形式出现，并且有明显的女性 predominance。MS 的首次眼部危象或临床发作的特点是缓慢、渐进性的视力损害，并在其病程发展中出现并累积其他眼部表现。在 MS 病程中，视神经炎发作后出现自发性视力恢复是可能的。

多病因眶尖综合症的临床特征及诊疗分析

第一作者：**Ting CHEN**

共同作者：**Zhenyu JI, Xuan XIAO**

目的：探讨多病因眶尖综合症的临床特征及诊疗策略。

方法：采用病例系列研究，对 3 例不同病因所致眶尖综合症患者的临床特征进行回顾性分析，从眼球运动、视力、眼前节、眼底、视神经功能及影像学特征等方面进行系统性评估。

结果：3 例患者均以患眼上睑下垂、眼球运动多方向受限为共同表现，伴随不同程度视力下降甚至失明。病例 1：老年女性，合并视盘水肿，眼眶 MRI 提示视神经眶内段至交叉前段增粗、边缘模糊，增强扫描呈明显不均匀强化及“轨道征”，临床考虑炎症可能（不排除肿瘤性病变）。经糖皮质激素治疗后，眼外肌功能恢复，但视力未改善，最终确诊为眶尖部炎性假瘤。病例 2：产后女性，表现为患眼眼球突出（17 mm）、最佳矫正视力 0.1、眼压升高（27 mmHg）及球结膜血管迂曲。CTA 提示左侧颈内动脉眼段动脉瘤（17.3 mm × 19.3 mm），海绵窦段管腔轻度狭窄，伴海绵窦区迂曲血管影、眼上静脉扩张，转神经外科行弹簧圈栓塞术，术中发现颈内动脉海绵窦段动脉瘤破裂致颈内动脉-海绵窦瘘，综合诊断为海绵窦综合征累及眶尖。病例 3：美容相关性病例，因额部胶原蛋白填充术突发眼眶疼痛及视力下降，眼部 OCT 显示内核层高反射信号。经对症治疗后，上睑下垂及眼球运动功能恢复，视力从无光感提升至光感。

结论：眶尖综合症临床表现具有异质性，需结合病史、眼部体征及影像学检查综合判断病因。强调早期精准病因诊断及多学科协作诊疗的重要性，对进行性视力丧失或严重神经压迫患者需紧急干预，以最大限度挽救视力并降低永久性神经损伤风险。

她眼中的伪装大师

第一作者：**Jie YANG**

目的：探讨以炎性假瘤为影像学表现的鼻窦恶性肿瘤的临床特点、误诊原因及诊疗策略。

方法：探讨以炎性假瘤为影像学表现的鼻窦恶性肿瘤的临床特点、误诊原因及诊疗策略。

结果：1. 临床特征：首发表现为单眼视力骤降（0.08）、相对性瞳孔传入障碍（RAPD+）、视盘

水肿；影像学呈多窦腔及颅眶交界区弥漫性病变，激素治疗短期有效（视力恢复至 1.0）；复发期出现面部麻木、头痛，活检病理确诊鼻窦未分化型非角化性癌。2. 误诊分析：影像学表现与炎性假瘤重叠（鼻窦及眶内炎性浸润）；激素治疗暂时改善症状（视力、视盘水肿），掩盖恶性本质。3. 病理转折：二次手术活检示肿瘤细胞呈巢状浸润，免疫组化符合非角化性癌（未分化型）。

结论：1. 临床特征：首发表现为单眼视力骤降（0.08）、相对性瞳孔传入障碍（RAPD+）、视盘水肿；影像学呈多窦腔及颅眶交界区弥漫性病变，激素治疗短期有效（视力恢复至 1.0）；复发期出现面部麻木、头痛，活检病理确诊鼻窦未分化型非角化性癌。2. 误诊分析：影像学表现与炎性假瘤重叠（鼻窦及眶内炎性浸润）；激素治疗暂时改善症状（视力、视盘水肿），掩盖恶性本质。3. 病理转折：二次手术活检示肿瘤细胞呈巢状浸润，免疫组化符合非角化性癌（未分化型）。

常染色体显性遗传性出血性毛细血管扩张症合并视神经萎缩病例报告 1 例

第一作者：Weijia WANG

目的：患者男性，28 岁，双眼视野缺损 1 年余，无其余不适。高度近视病史，肺动静脉瘘封堵术后，否认吸烟、饮酒史及家族遗传病史。眼科查体：BCVA：右眼 0.8，左眼 1.0。双眼前节（-），RAPD（-），豹纹状眼底，视盘颞侧色淡，鼻侧充血，边界清，C/D 约 0.5，盘周萎缩弧。眼压：右眼 21 mmHg，左眼 17 mmHg。

方法：辅助检查：右眼鼻上、左眼鼻下方视野局限性缺损。双眼视盘 RNFL 层厚度均变薄，黄斑区视网膜各方位均受累且节细胞层变薄。FVEP 及眼眶核磁未见明显异常。基因分析：chrM: 15301, G > A, 阳性，良性同义变异。初步诊断：1、双眼视神经萎缩 Leber 遗传性视神经病变可能性大；2、双眼高度近视；3、先天性肺动静脉瘘术后。

结果：病例分析：1、高度近视性视神经病变为高度近视合并视盘鼻侧或鼻上方 RNFL 层变薄和对应颞侧或颞下方视野缺损，该病例体征不符合此诊断；2、盘沿宽度不符合 ISNT 法则，但其视杯不大，左眼视野不符合典型青光眼视野缺损表现，暂不考虑正常眼压型青光眼；3、否认中心视力下降，其视野缺损与 LHON 体征不符；4、线粒体基因 15301 位点突变为良性同义变异，不能直接导致 LHON 发病。追问家族史：患者、患者母亲及姥姥均有反复自发性鼻衄病史，母亲肝脏血管瘤病史。完善腹

部超声提示：肝右后上端偏高回声结节，血管瘤可能性大。我们根据患者鼻衄、肺动静脉瘘、肝脏血管瘤及一级亲属体征等证据，考虑患者遗传性出血性毛细血管扩张症（HHT）可能性大。完善全外显子组遗传疾病基因检测：ENG 基因杂合变异 [c.145G > T (p.Val49Phe)，错义突变]。最终诊断：1、双眼视神经萎缩；2、双眼高度近视；3、遗传性出血性毛细血管扩张症；4、先天性肺动静脉瘘术后；5、肝血管瘤。

结论 我们报道了第一例 HHT 合并的视神经萎缩。研究证明 TGF- β 可为视网膜提供营养支持及神经保护，保护视网膜神经节细胞免受氧化应激损伤，并被认为是有助于筛板重塑。我们考虑本例患者的发病机制可能为慢性低氧血症、血红蛋白增多症、血液粘滞度增高、反向栓子导致的长期视神经供血供氧不足，以及长期 TGF- β 通路异常导致的视神经保护作用损伤。

慢性硬膜下血肿继发双眼视乳头水肿一例报告

第一作者：Wenqi SU

共同作者：Wei ZHOU

目的：报告一例因慢性硬膜下血肿导致的双侧视乳头水肿病例，分析其临床表现、影像学线索与诊疗过程，强调对隐匿性颅内病变的警惕及重复神经影像学检查的重要性。

方法：患者男性，52 岁。既往 7 周前发生车祸，初期无明显外伤体征，约 3 周后出现间歇性头痛，4 天前出现左眼无痛性视力模糊而就诊。入院初步眼科评估：右眼最佳矫正视力（BCVA）1.0，左眼 BCVA 0.2；左侧存在相对传入性瞳孔障碍（RAPD）；眼底检查见双侧视乳头高度充血、水肿，视盘周围大片火焰样出血。OCT 显示双侧视神经水肿并伴双眼黄斑下视网膜液；视野检查示双侧盲点明显扩大（左 > 右）。FFA 呈视盘早期低荧光、乳头旁血管扩张迂曲及静脉充盈延迟，视盘进行性渗漏。眶部 MRI 提示视神经鞘增宽及鞍上池受压征象，提示颅内压增高。基于上述可疑颅内病变体征，给予复查颅脑影像学检查以明确病因。

结果：复查脑 MRI 提示同侧慢性硬膜下血肿，行钻孔引流术后随访 1.5 个月：左眼 BCVA 由 0.2 恢复至 0.6；眼底检查示视乳头水肿完全消退，出现乳头苍白及乳头前胶质反应；OCT 显示黄斑下积液消失；视野范围较术前明显恢复。随访说明视功能部分可逆，且颅内病因治疗对视乳头水肿具有决定性意义。

结论：慢性硬膜下血肿虽为引起视乳头水肿的少见原因，但在有外伤史或提示颅内压力升高的系统性或影像学线索时，应提高警惕。即使初次影像学检查未见明确异常，当临床表现与颅内高压不相符或病情进展／未解释时，需及时进行系统性评估并考虑重复神经影像学检查以避免延误诊断与治疗。眼科医师在面对双侧视乳头水肿时，应与神经外科／神经影像科密切协作，确保早期识别可逆的颅内病变以改善预后。

罕见线粒体 DNA 点突变致老年 Leber 遗传性视神经病变一例

第一作者：Xiuli CHEN

共同作者：Ying ZHAO

目的：展示一例老年男性双眼视力下降患者的确诊经过。

方法：抽丝剥茧分析一例老年双眼视力下降患者的临床及影像学资料，患者感冒后双眼视力下降 1 个月，右眼矫正视力 0.2，左眼矫正视力 0.05，双眼瞳孔直接对光反应灵敏，RAPD (-)，视盘边界清，色泽可。双眼视盘 RNFL 在正常值范围，右眼黄斑部 GCL 轻度变薄，双眼黄斑 OCT 未见异常，双眼视野中心暗点，3 个月后复查，双眼视力进一步下降，右眼矫正视力 0.02，左眼 FC/50 cm，双眼 RNFL 厚度在正常值范围，双眼 GCL 变薄，PVEP 结果提示双眼 P100 波潜时延迟，振幅降低，ERG 提示双眼震荡电位振幅明显降低。患者血常规、血生化、感染组套、免疫指标、维生素 B12、叶酸等结果在正常值范围，颅脑磁共振未见明显异常。患者吸烟 20 年，每天 20 支左右，否认吸旱烟及饮酒，糖尿病 5 年，血糖控制欠佳，余健康状况良好，无特殊药物服用史，无毒物接触史，无眼部疾病及全身疾病家族史。根据神经眼科定位、定性、定因及鉴别诊断诊疗思路，排除其他诊断，考虑线粒体相关遗传性视神经病变，最后基因检查结果显示 14487T > C 线粒体 DNA 点突变。随访 8 个月，患者视力稳定，全身神经系统无其他症状。

结果：患者最终诊断为双眼 Leber 遗传性视神经病变。

结论：1. 掌握线粒体相关疾病的临床特点。2. 线粒体相关基因检测，有助于明确诊断。

肉毒毒素注射后激发系统性红斑狼疮引起脱髓鞘视神经炎一例

第一作者：Shu-ting KUO

目的：病例报告：中年女性，皱眉肌群注射肉毒毒素 3 天后出现左眼视物不清，如雾障感，伴眼球转动时眉弓下方轻度酸痛，既往否认糖尿病、高血压，多次 RPR (+)，TRUST (-)。查体：左眼手动视力，右眼最佳矫正视力 1.0，双眼眼压正常，双眼前节无殊，左眼 RAPD (+)。左眼视盘充血，轻度隆起，边界欠清，视盘及视网膜静脉血管扩张。辅助检查：VEP：1. 右侧 P100 波潜伏期延长；2. 左侧 P100 波潜伏期明显延长，波幅减低。MRI：左侧视神经眶内段内上象限小斑片状异常信号，考虑为脱髓鞘性视神经炎；左侧横窦、乙状窦较细小，乙状窦小蛛网膜颗粒压迹。免疫学检查：dsDNA 抗体强阳性，抗核小体抗体 (AnuA)、抗中性粒细胞胞浆抗体 (pANCA)、抗细胞核抗体 ANA)、ENA-SSB 抗体，皆为阳性；HLA-B27 阳性；抗 AQP4 抗体强阳性。狼疮抗凝物初筛试验 (LA1)：高于正常。狼疮初筛 / 狼疮确认 (LA1/LA2)：高于正常。蛋白 C 高于正常。诊断：1. 狼疮性神经炎：双眼视神经炎；2. 系统性红斑狼疮 (SLEADI-2k 评分 16 分中重度活动度)；3. 干燥综合症；4. 强直性脊柱炎。

方法：经激素冲击治疗；联用生物制剂贝利尤单抗，其为可溶性 BLYS 的特异性人 IgG1 单克隆抗体，通过阻断可溶性 BLYS 与 B 细胞上的受体的结合，抑制 B 细胞的存活，让更多的自身反应性 B 细胞发生凋亡，从而减少血清中的自身抗体；联用吗替麦考酚酯控制系统性红斑狼疮，及予以抗凝治疗及对症支持治疗有效。

结果：因本例追溯病因及时，治疗根源，患者抗体降低明显，视力恢复显著。

结论：视神经炎可由多种因素引起，并且因患者本身生理条件而各有表现，如何追溯根本原因，才能控制疾病进展及控制复发。

角膜知觉测量在角膜神经痛中的应用

第一作者：Mingyue MA

目的：本研究旨在使用新型非接触式角膜感觉检查仪评估角膜神经痛 (NCP) 患者的角膜知觉状态，以及角膜知觉和各种眼表指标的相关性，以探究该设备对此类疾病评估的潜在作用。

方法：本研究包括 44 名角膜神经痛患者的 44 只眼睛（均取左眼）。所有受试者均通过填写眼表疾病指数（OSDI）评分量表、无创泪河高度（NITMH）检查、非接触式角膜感觉检查、无创泪膜破裂时间（NIBUT）测量、Schirmer 试验、泪液 IgE 检测、眼前节光学相干断层扫描、荧光素钠染色、睑板腺红外成像获得疾病的主观症状及客观数据指标。使用 SPSS 进行相关性分析。

结果：角膜知觉与 NIBUT 无显著相关性（ $p = 0.55$ ）；泪膜不稳定组（ $NIBUT \leq 5$ s）、临界状态组（ 5 s $< NIBUT \leq 10$ s）、稳定组（ $NIBUT > 10$ s）中，组间数据具有显著性差异（ $p = 0.025$ ），临界状态组角膜知觉最差，其余两组知觉较灵敏。在主观症状方面，角膜知觉与 OSDI 评分无显著相关性（ $p = 0.81$ ）；以 OSDI 分级划分的四组数据中，非参数检验无差异显著性（ $p = 0.81$ ）。在无异物感组和有异物感组中，数据有差异显著性（ $p = 0.033$ ），有异物感组患者的角膜知觉显著差于无异物感组。角膜知觉在以其他主观症状分组的情况下无组间差异显著性。角膜知觉与其他眼表指标无显著相关性（包括 NITMH，Schirmer 实验结果，泪液 IgE 含量，中央角膜厚度，角膜荧光素染色评分，上睑板腺缺失比例），以及在这些指标的各自分组中，角膜知觉指标也无组间差异显著性。

结论：本研究证实，NCP 患者的角膜知觉与多数常规眼表客观指标无显著相关，支持了角膜神经功能异常是该病的独立病理机制。更重要的是，研究发现角膜知觉的异常并非随机分布，而是与特定的临床表现紧密关联：一方面，它与主观异物感症状显著相关；另一方面，它与泪膜稳定性呈独特的非线性关系（临界状态组知觉最差）。这些关联性结果共同表明，非接触式角膜感觉检查仪能够量化神经功能障碍异常，为在复杂的眼表体征中识别以神经病理为核心的患者提供了客观工具。

针刺治疗视野缺损 1 例

第一作者：Boyuan ZHENG

目的：本文旨在探讨针刺治疗视野缺损的效果，总结罗燕教授针刺治疗经验，并从经络及配穴角度予以详细分析。

方法：本文选取了我科收治的一位右侧枕叶脑出血后出现双眼同侧（左侧）视野缺损的患者，在接受两个疗程的针刺治疗后视野缺损情况较前好转的病例。

结果：患者在接受两个疗程（每日 1 次，10 天一个疗程，时隔周行第二个疗程）的针刺治疗后，视野及视力均较治疗前好转。

结论：现代医学认为，针刺治疗可以提高视力及光敏感度，改善视野缺损，改善眼动脉血流动力学改变，促进局部气血运行从而营养受损的神经，针刺相较于现代医学疗法，其操作便捷、疗效显著、安全无副作用。本案取穴根据罗燕教授多年临床经验，以足三阳经及其表里经为主，眼周局部取上睛明、攒竹、丝竹空、阳白、太阳、瞳子髎、四白，可改善眼周血液循环；取足三里以扶正培元、通经活络、行气散结；取三阴交以疏通三阴气血，此二者相配，可通经络、调气血、宣通全身气机；曲池走而不守，合谷升而能散，二穴相配，清热散风，扫邪清障；刺光明联络肝胆气血，针阴陵泉健脾除湿化痰；取太冲，以疏肝理气明目，取养老以充养阳气，头皮针取头维、百会、四神聪，此三者配伍具益脑、开窍、通经之效，以调节全身气血阴阳；以上穴位配合灵龟八法开穴，共奏调理阴阳、通络明目之效。

青年女性颈内动脉眼段动脉瘤压迫视神经 1 例

第一作者：Jie YANG

目的：旨在讨论颈内动脉眼段动脉瘤压迫视神经临床表现及鉴别。

方法：患者女，23 岁，因右眼突然视物模糊 20 d 伴头疼于 2021 年 12 月 01 日到河北省眼科医院就诊。患者既往体健，眼科检查：右眼视力 0.1 矫正视力：-1.75 DS = 0.3；左眼视力 0.4 矫正 -1.75 DS = 1.0；双眼眼压均为 15 mm Hg。右眼瞳孔圆，直径 5 mm，直接对光反射迟钝，晶状体及玻璃体无明显混浊。眼底检查：双眼视盘颜色正常，边界清楚，视网膜血管走行正常，黄斑组织欠清，中心凹光反射不见。视野检查，右眼中心暗点，下方光敏感度明显降低。左眼上方局限性光敏感度降低。P-VEP 检查，右眼 P100 波峰时延迟，P 波振幅较左眼轻度下降，左眼大致正常波形。头颅 MRI 平扫 + DWI 眼眶 MRI 平扫 + 增强扫描磁共振血管成像（MRA）：1、右侧颈内动脉眼段动脉瘤可能性大；2、右侧颈内动脉交通段未见显示；3、右侧大脑前动脉右左侧颈内动脉发出；4、右侧右侧大脑中动脉狭；5、右侧颈内动脉颈段变细，C2-C5 狭窄；6、右侧大脑后动脉血管硬化。

结果：患者的 MRI 检查显示右侧颈内动脉眼段动脉瘤可能性大，且鞍区右前方占位压迫视神经。这种动脉瘤的形成可能是由于动脉壁的局部薄弱，在长期血流动力学冲击下逐渐扩张而形成。动脉瘤的

扩大可能直接压迫视神经，导致视神经的机械性损伤，影响神经传导功能，从而出现视力下降、视野缺损等症状。

结论：颈内动脉与视神经在颅内的关系密切。颈内动脉在进入颅腔后，经过海绵窦段、眼动脉段等部位，与视神经、视交叉等视觉通路结构相邻。在某些病理情况下，如动脉瘤形成、血管畸形、动脉硬化等，可能会导致血管异常扩张、扭曲或压迫周围的视神经结构，从而引发视功能损害。对于动脉瘤，可考虑血管内介入治疗或外科手术夹闭，以消除动脉瘤对视神经的压迫，预防破裂出血等严重并发症。

RGP 联合个性化视觉训练在成年屈光参差性单眼弱视中的应用

第一作者：Wang DUQIN

目的：观察硬性透气角膜接触镜（the rigid gas permeable contactlens, RGPCL）联合视觉训练在成人屈光参差性单眼弱视矫治中的临床疗效。

方法：选取 2023.07-2024.07 在我院就诊成年并曾佩戴框架眼镜的屈光参差性单眼弱视患者（ ≥ 18 周岁）5 例。常规眼部检查及散瞳验光后，配戴 RGP 进行个性化弱视训练：多媒体弱视训练、双眼调节融合功能及立体视觉训练，3 个月后对配戴 RGP 后弱视训练的效果进行评估。

结果：经过 3 个月配戴 RGP 加个性化视觉训练后，5 例矫正视力提高 2 行及以上者 4 例，1 行者 1 例，立体视 5 例患者均较之前提高。

结论：高透氧硬性角膜接触镜（RGP）联合弱视个性化综合训练矫正成人屈光参差性弱视是一种安全、有效、快捷的方法。尤其是对于立体视的建立尤为有效。值得在临床上推广。

专业运动员静态视觉功能与运动视觉功能的相关性研究

第一作者：Wenzheng DU

共同作者：Min GAO, Yanglin JIANG, Lihua LI, Chenzhe WANG

目的：分析专业运动员的视力、对比敏感度等静态视觉功能与动态视力、反应时间等运动视觉功能的相关性。

方法：本研究受试者招募自天津体育学院的现役排球、棒球专业青年运动员。所有受试者均接受静态视觉功能评估（包括日常生活视力、最佳矫正视力、立体视以及明视觉、暗视觉下的对比敏感度）以及运动视觉功能测试（包括动态视力、远近交替注视灵敏度、反应时间、识别速度、预判能力）。采用 Pearson 相关分析静态视觉功能与运动视觉功能的相关性，并采用典型相关分析来进行标准化典型相关模型的构建、典型结构分析、典型冗余分析以探究静态视觉功能与运动视觉功能整体之间的关系。

结果：共纳入受试者 35 名，年龄为 19.91 ± 2.06 岁。Pearson 相关分析显示，日常生活视力、矫正视力、立体视与动态视力均呈正相关（ $r = 0.610$ ； 0.663 ； 0.419 ，均为 $P < 0.05$ ）；日常生活视力、明视觉对比敏感度与远近交替注视灵敏度均呈正相关（ $r = 0.515$ ； 0.505 ，均为 $P < 0.05$ ）。典型相关分析提取出两对具有统计学意义的典型变量，典型相关系数分别为 0.839 、 0.721 ，特征值贡献率分别为 58.6% 、 26.8% ，表明静态视觉功能与运动视觉功能存在显著正相关，相关性主要由第一对典型相关变量解释。典型结构分析显示，日常生活视力和最佳矫正视力在静态视觉功能典型变量中起主导作用，载荷分别为 -0.684 和 -0.856 ，交叉载荷进一步显示，日常生活视力和最佳矫正视力对运动视觉功能具有较强预测作用，交叉载荷分别为 -0.573 和 -0.718 。典型冗余分析表明，静态视觉功能对运动视觉功能的方差解释率 24.2% 高于后者对前者的解释率 12.6% ，静态视觉功能对运动视觉功能的预测作用更强。

结论：专业运动员的静态视觉功能与运动视觉能力存在显著的正相关关系，即静态视觉功能越好，运动视觉功能越好，其中视力是影响运动视觉能力的核心因素，在运动员的选拔与训练中应重视屈光矫正和视力保护，通过提升视力等基础静态视觉功能来提升运动视觉能力，进一步优化运动表现。

肠道微生物组、免疫特征与近视的因果路径解析：一项整合性孟德尔随机化与中介分析研究

第一作者: Guandong ZHU

共同作者: Xuejiao QIN

目的: 近视的发病是遗传与环境因素复杂交互的结果, 近年“肠-眼轴”假说提示肠道菌群可能通过免疫调节参与其病理过程。然而, 肠道微生物是否与近视存在因果关联, 以及免疫细胞与炎症因子是否在其中扮演中介角色, 尚不明确。本研究旨在利用孟德尔随机化方法, 系统阐明肠道微生物、免疫细胞、炎症因子与近视之间的因果关系及潜在机制路径。

方法: 本研究整合了大规模全基因组关联研究的遗传数据, 包括: 肠道微生物组 (来自 MiBioGen 联盟)、731 种免疫细胞特征、91 种循环炎症因子以及近视 (来自 UK Biobank 等大型数据库)。采用两样本孟德尔随机化作为核心分析方法, 以遗传变异作为工具变量评估因果关系。为确保结果稳健, 我们综合应用逆方差加权法、MR-Egger、加权中位数等多种方法, 并进行多效性检验与敏感性分析。针对显著的暴露-结局对, 我们进一步进行了中介分析, 以量化免疫细胞与炎症因子在肠道微生物影响近视路径中的中介效应比例。

结果: MR 分析鉴定出 12 个与近视风险存在潜在因果关联的肠道菌属。其中, *Bacteroides* (OR = 1.15, 95% CI: 1.06–1.25) 和 *Ruminococcus* (OR = 1.12, 95% CI: 1.03–1.22) 等的相对丰度增加是近视的风险因素, 而产短链脂肪酸菌属 *Faecalibacterium* (OR = 0.87, 95% CI: 0.79–0.95) 则显示出保护作用。同时, 多种免疫细胞特征 (如初始 CD4⁺ T 细胞比例的降低、活化树突状细胞比例的升高) 与炎症因子 (如 IL-6、TNF- α 水平升高) 也被证实与近视存在因果关联。关键的中介分析揭示, 特定免疫细胞 (如活化的 CD4⁺ T 细胞) 和炎症因子 (如 IL-6) 在肠道微生物 (如 *Bacteroides*) 影响近视的因果路径中承担了显著的中介效应, 中介比例范围为 8.5% 至 15.2%。

结论: 本研究从遗传学视角为“肠-眼轴”假说提供了强有力的因果证据, 构建了一条从“肠道微生物失调”到“免疫系统激活/炎症状态改变”再到“近视发病”的潜在因果路径。我们的发现不仅证实了肠道微生物是近视的独立风险因素, 更重要的是揭示了免疫调节是该过程中的关键中介机制。这为未来开发通过调控肠道微生态或靶向免疫通路来预防和干预近视的新型策略, 奠定了重要的理论基础。

30 例微孢子虫感染的临床诊治及体会

第一作者: Yan HE

共同作者: Bing HAN, Yang ZHANG

目的: 分析中国大陆地区微孢子虫性角结膜炎 (MKC) 患者的临床特征、病原学种类及治疗效果, 以提升临床医师对该病的认知与诊疗能力。

方法: 对 2024 年 9 月至 2025 年 9 月期间在我院确诊的 30 例 MKC 患者的临床资料进行回顾性分析。所有患者均接受了角膜刮片细胞学检查、细菌/真菌/阿米巴培养、病毒核酸检测、宏基因组测序 (mNGS) 及巢式聚合酶链反应 (PCR) 检测, 以进行病原体鉴定。治疗方案包括与动物隔离、环境消毒、口服阿苯达唑 400 mg, 每日 2 次, 持续 2–4 周, 以及局部应用 0.04% 聚己基双胍 (PHMB) 每日 6 次, 并联合使用莫西沙星滴眼液。

结果: 30 例患者的年龄范围为 4–67 岁 (中位数年龄为 35 岁), 其中女性 23 例, 男性 7 例。所有患者均存在明确的动物接触史, 特别是与鸟类和家养动物的接触。临床表现方面, 28 例患者为上皮性角结膜炎, 2 例患者为基质性角膜炎。病原体鉴定结果显示, 24 例为海伦脑炎微孢子虫感染, 4 例为肠道微孢子虫感染, 2 例为混合感染。鸟类接触史, 尤其是鹦鹉接触史, 与海伦脑炎微孢子虫感染存在显著关联。实施充分动物隔离措施的患者预后良好, 而持续接触动物、既往使用糖皮质激素或诊断延误的患者则出现病程迁延或治疗失败的情况。

结论: MKC 展现出独特的流行病学特征, 主要通过动物传播给人类, 尤其是感染海伦脑炎微孢子虫的宠物鹦鹉作为传播媒介。完全动物隔离和适当的抗微孢子虫治疗是成功治疗的关键, 而糖皮质激素可能导致复发和病程迁延。

AIF-1 通过 MAPK 和 PI3K/AKT/mTOR 信号通路促进炎症性巨噬细胞活化驱动角膜新生血管

第一作者: Qinghua LI

目的: 本研究旨在阐明同种异体移植物炎症因子-1 (AIF-1) 介导的炎症性巨噬细胞激活在角膜新生

血管 (CNV) 发病中的精确机制, 并确定潜在的治疗靶点。

方法: 采用碱烧伤法建立小鼠 CNV 模型。利用 Western blot (WB) 和免疫组化检测 AIF-1、CD86 及 VEGFA 的蛋白水平。将靶向 AIF-1 的小干扰 RNA (siRNA) 转染巨噬细胞后, 采用免疫荧光和流式细胞术分析巨噬细胞活化情况。随后将 AIF-1 siRNA 行结膜下注射给药, 通过 WB 和免疫荧光评估炎症性巨噬细胞的募集及促炎细胞因子表达。裂隙灯照相及组织病理学分析用于评价 CNV 的炎症与血管生成程度; WB 进一步检测 MAPK 及 PI3K/AKT/mTOR 信号通路相关蛋白的磷酸化水平。

结果: AIF-1 呈阶段依赖性上调, 与 CNV 严重程度平行, 并伴随 CD86 和 VEGFA 的协同高表达。沉默 AIF-1 显著抑制炎症性巨噬细胞活化。AIF-1 促进巨噬细胞向角膜募集, 并上调 TNF- α 、IL-1 β 、IL-6、VEGFA 表达, 进一步加剧炎症、氧化应激及血管生成; AIF-1 敲除后 CNV 严重程度明显减轻。机制研究发现 AIF-1 通过激活 MAPK 和 PI3K/AKT/mTOR 信号通路驱动 CNV 进展。

结论: AIF-1 在 CNV 进展中发挥关键作用, 通过 MAPK 和 PI3K/AKT/mTOR 信号通路促进炎症性巨噬细胞活化, 加重角膜炎症与新生血管化, 为 CNV 的治疗提供新的理论依据与潜在靶点。

HUMSC 细胞膜片修复角膜上皮损伤的实验研究

第一作者: Guoqiang TANG

共同作者: Miaomiao CHI, Jing HONG, Rongmei PENG

目的: 评估人脐带间充质干细胞 (HUMSC) 细胞膜片对角膜上皮损伤的治疗效果, 通过体外和体内实验验证其修复机制及临床应用潜力。

方法: 在体外实验中, 使用羧基氰化物间氯苯胺 (CCCP) 建立角膜上皮细胞损伤模型, 将 HUMSC 细胞膜片与损伤细胞共培养。通过检测活性氧 (ROS) 水平、CCK-8 法评估细胞增殖以及 Annexin V/PI 流式细胞术分析凋亡率评估 HUMSC 的拯救作用。在体内实验中, 建立大鼠角膜上皮碱烧伤模型, 局部移植 HUMSC 细胞膜片。通过裂隙灯显微镜观察、前节照相、荧光素钠染色及前段光学相干断层扫描 (AS-OCT) 动态评估角膜修复情况。处死大鼠后, 行免疫组织化学及 HE 染色分析组织形态学变化。

结果: 体外实验显示, HUMSC 共培养组显著降低 ROS 水平 ($P < 0.05$), 促进细胞增殖 (CCK-8 吸光度值增加) 及凋亡率下降 (AV/PI 流式显示早期凋亡减少)。体内实验证实, 移植 HUMSC 膜片的大鼠角膜上皮缺损面积缩小, 裂隙灯及 AS-OCT 显示角膜透明度改善、上皮层厚度增加, 荧光素染色评分显著低于对照组 ($P < 0.01$)。免疫组化及 HE 染色提示 HUMSC 组角膜上皮层结构完整, 炎症细胞浸润减少。

结论: HUMSC 细胞膜片可通过抗氧化、促进增殖和抑制凋亡等机制, 有效修复角膜上皮损伤, 在碱烧伤等角膜疾病中展现出治疗潜力, 为临床转化提供实验依据。

Lisch 角膜营养不良的“二次打击”与边界效应

第一作者: Mengzhen XIE

共同作者: Ying JIE

目的: 本报告旨在通过一例典型的 Lisch 上皮性角膜营养不良病例, 阐述其独特的临床表现、及组织学特征, 并探讨其基于角膜缘干细胞功能障碍的发病机制。重点在于通过观察手术干预后的复发模式, 验证并深入理解 LECD 的“二次打击”假说, 从而为开发根治性疗法提供理论依据。

方法: 一名 58 岁女性, 无其他病史, 因左眼视力下降伴阴影感一月余就诊。我们对其进行了全面的眼科检查, 包括最佳矫正视力、裂隙灯检查、IVCM 以及 AS-OCT。鉴于其临床表现高度提示 LECD, 我们进一步对患者血液样本进行了全基因组测序以寻找可能的种系突变。为治疗其视力下降, 患者接受了 20% 酒精辅助的上皮松解及病变上皮清创术, 并对切除的病变组织进行了印迹细胞学检查, 使用 MUC5AC 和 CK7 抗体进行染色, 以鉴定上皮细胞的类型和来源。

结果: 裂隙灯检查显示左眼角膜上皮存在特征性的涡旋状、羽毛状灰色混浊, 从角膜缘延伸至视轴, 中央宽而周边尖细。IVCM 揭示了上皮细胞高反射伴胞浆内空泡化的典型 LECD 表现。AS-OCT 证实病变局限于上皮层。全基因组测序未发现致病性突变。术后, 患者视力 20/20, 角膜恢复透明。然而, 术后四个月, 病变从完全相同的角膜缘位置复发, 形态与术前近乎一致。印迹细胞学结果显示, MUC5AC 和 CK7 阳性, 这不仅证实了源于异常角膜缘干细胞的空泡化角膜上皮细胞, 还揭示了结膜杯状细胞的存在, 表明角膜缘的屏障功能已遭破坏。

结论：本病例证实了 LECD 根源在于角膜缘干细胞的病理克隆。术后在原位、以原形态复发的现象，强有力地支持了 LECD 的“二次打击”发病机制假说：即个体可能携带赋予易感性的种系突变（第一次打击），而关键的致病事件使特定角膜缘干细胞克隆内发生的体细胞突变（第二次打击）。单纯的上皮清创术仅能移除终末分化的异常细胞，但无法根除角膜缘的突变干细胞，因此会早期复发。病变独特的羽毛状形态，通过突变干细胞作为固定来源，其产生的细胞在向心迁移过程中与周围正常上皮细胞发生“边界竞争”来完美解释。本研究强调，任何旨在根治 LECD 的治疗策略，必须靶向并彻底消融其位于角膜缘的病理性干细胞群。

Piezo-1 是流体剪切力影响角膜上皮稳态的关键分子

第一作者：Li LI

共同作者：Yijie HONG, Weiwei LI, Yufan LI

目的：干眼症（DED）是一种多因素慢性眼部疾病，其特征为角膜上皮稳态的失衡。临床发现，DED 患者眨眼频率异常增高，泪膜稳定性下降等眼表泪膜动力学紊乱，但其致病机制，尤其是流体剪切应力的作用尚不明确。Piezo-1 作为机械敏感离子通道，在角膜上皮组织中高表达，可能介导角膜表面剪切应力等机械刺激的信号传导。本研究旨在探究层流剪切应力（LF）和湍流剪切应力（TF）对角膜上皮稳态的影响，明确 Piezo-1 在介导剪切应力诱导的眼表炎症和组织损伤中的关键作用。

方法：通过建立强迫眨眼小鼠模型以模拟不同的剪切应力，利用角膜荧光素染色评分和酚红棉线试验评估角膜上皮损伤。体外培养人角膜上皮细胞（HCECs），构建层流和湍流实验条件，使用 Piezo-1 激动剂 Yoda 1 和慢病毒介导的基因敲低技术调控 Piezo-1 表达。采用 EdU 检测、划痕实验、透射电镜（TEM）和免疫荧光染色评估细胞增殖、迁移、焦亡和细胞间连接状态。运用 Western blot 分析蛋白表达水平，qRT-PCR 定量 mRNA 表达水平，从分子层面探索机制。

结果：强迫瞬眼造成的异常剪切应力破坏小鼠角膜上皮稳态，显著上调角膜组织中 Piezo-1 表达，加重小鼠角膜损伤。体外实验表明，不同模式剪切应力均激活 Piezo-1，通过钙内流促进细胞增殖和迁移，其中湍流剪切应力比层流剪切应力的激活与促进作用更显著。层流剪切应力促进了细胞间紧密连接的形成，维持细胞存活；而湍流剪切应力则下调细胞间连接，破坏细胞屏障，触发细胞焦亡。

Piezo-1 敲低可显著逆转上述剪切应力诱导的细胞行为改变，证实 Piezo-1 在角膜上皮力-化耦合效应中的核心作用。

结论：流体剪切应力通过机械敏感性离子通道 Piezo-1 参与调控角膜上皮稳态。在层流剪切应力作用下，Piezo-1 表达被激活，进而促进角膜上皮细胞的增殖与迁移，并增强细胞间连接，有助于维持上皮稳态；而在湍流剪切应力条件下，Piezo-1 被过度激活，导致细胞连接结构破坏，并加剧细胞焦亡与炎症反应，最终破坏角膜上皮的稳定状态。本研究证实 Piezo-1 是流体剪切力影响角膜上皮稳态的关键分子，为通过靶向调控 Piezo-1 活性防治干眼症提供了新的潜在策略。

一例新型 TACSTD2 基因突变——凝胶滴样角膜营养不良家系分析

第一作者：Reziwan MAIMAITIMING

共同作者：Ru ZHAO

目的：凝胶滴样角膜营养不良症（GDLD）是一种罕见的常染色体隐性遗传疾病，以双侧角膜淀粉样变性为特征。在此，我们报告了一例由新型 TACSTD2 基因突变引起的 GDLD 病例，并总结了 GDLD 患者临床表型与基因型的相关性。

方法：我们分析了一名 42 岁男性 GDLD 患者的临床特征和治疗结果。角膜样本用刚果红和苏木精、伊红染色。对所有家庭成员进行了基因检测和临床评估，此外，我们还对以前报道过的肿瘤相关钙信号转导子 2（TACSTD2）基因发生致病性突变的 GDLD 患者进行了文献回顾。

结果：对该患者的基因测序发现，TACSTD2 基因存在一个新的无义突变 c.588C > A。组织病理学分析显示，角膜上皮区域有大量淀粉样蛋白沉积。我们总结了之前报道的 37 例 TACSTD2 基因突变的 GDLD 患者的临床特征。

结论：研究报告了一名中国 GDLD 患者的新型无义突变，从而扩大了 TACSTD2 基因的突变谱。

不同厚度内皮角膜移植供体用于圆锥角膜深板层角膜移植术的临床结局研究

第一作者: Yinghan ZHAO

共同作者: Kaiyue DU, Jing HONG

目的: 评估在圆锥角膜患者中, 采用内皮角膜移植术获取的剩余供体角膜用于深板层角膜移植术后的临床效果。

方法: 本研究为一项回顾性、对照性临床研究, 共纳入 103 只接受 DALK 手术的圆锥角膜眼, 其中 67 只眼接受了来自后弹力层剥离自动化角膜内皮移植术 (DSAEK) 的薄供体角膜植片, 36 只眼接受了来自后弹力层角膜内皮移植术 (DMEK) 的厚供体角膜植片。评估指标包括基线及术后中央角膜厚度、下方角膜厚度、未矫正远视力、最佳矫正远视力、角膜散光、平均角膜曲率、角膜生物力学特性及并发症发生率等。

结果: 移植术后 6 个月, 薄片组中央角膜厚度为 $455.1 \pm 43.0 \mu\text{m}$, 显著低于厚片组的 $546.7 \pm 44.2 \mu\text{m}$ 。薄片组在中央及下方角膜厚度方面均显著低于厚片组 (以 Pentacam 测量, 36 个月时 $P < 0.001$), 该差异在术后 5 年随访期内持续存在。两组在术后 logMAR 未矫正远视力、logMAR 最佳矫正远视力、角膜散光及平均角膜曲率方面差异均无统计学意义 (36 个月时 P 值分别为 0.335、0.286、0.680 及 0.365)。角膜生物力学分析显示, 在术后 2 年时, 薄片组在第一次压平时的角膜刚度参数显著高于厚片组 ($P = 0.036$), 而其他生物力学参数无显著差异。

结论: DALK 术中使用不同厚度供体角膜组织的临床效果相当, 提示采用不同类型的分层角膜移植术处理圆锥角膜患者均具有可行性。

不同高能紫外线照射去上皮快速角膜胶原交联术 (A-CXL) 治疗圆锥角膜的远期临床疗效分析

第一作者: 徐懿

共同作者: 文丹

目的: 探讨采用不同高能紫外线照射去上皮快速角膜胶原交联术 (A-CXL) 治疗圆锥角膜的治疗效果, 为临床合理化手术提供客观依据。

方法: 本研究收集 2020 年 7 月至 2025 年 7 月于中南大学湘雅医院眼科中心接受高能紫外线去上皮

快速角膜胶原交联术 (A-CXL) 治疗的圆锥角膜患者 45 例 (56 只眼), 进行回顾性病例对照研究。将全部患者分为两组, A 组患者共 21 例 (27 只眼), 采用 5.4 J 高能 (30 mw/cm², 照射时间为 4 min) 紫外线进行照射; B 组患者共 24 例 (29 只眼), 照射能量为 7.2 J 高能 (30 mw/cm², 照射时间为 4 min)。两组患者的手术操作及围手术期处理均相同。随访 3 年, 对两组患者行视力、角膜地形图、角膜共聚焦等检查, 比较两组术前及术后 1 月、3 月、6 月、12 月、1 年、2 年、3 年视力参数 [裸眼远视力、最佳矫正视力]、形态参数 [平坦角膜曲率、陡峭角膜曲率、最大角膜曲率 (Kmax)、中央角膜厚度、最薄点角膜厚度] 及角膜上皮神经纤维参数 [神经纤维总长、神经纤维密度, 神经纤维总数、神经纤维分支数]。统计方法采用两因素重复测量方差分析和 Pearson Chi-Square tests 检验。

结果: 术后随访 3 年, A、B 两组患者术后裸眼视力、最佳矫正视力均有不同程度的提高, 平坦角膜曲率、陡峭角膜曲率、最大角膜曲率 (Kmax) 角膜地形图指标均有不同的程度下降。A、B 两组患者在平坦角膜曲率、陡峭角膜曲率、最大角膜曲率 (Kmax)、中央角膜厚度、最薄处角膜厚度组间差异均无统计学意义 ($p < 0.05$); 分别将 A、B 两组患者的形态参数各项指标与术前进行比较, 只有 Kmax 下降的差异具有统计学意义 ($P < 0.05$); 分别将 A、B 两组患者角膜上皮神经纤维参数进行比较: 术后 1 个月, 两组中央角膜神经纤维缺失, 差异无统计学意义 ($P > 0.05$), 周边角膜神经生长情况 B 组角膜上皮神经纤维参数均高于 A 组 ($p < 0.05$), 差异有统计学意义。随着时间延长, A 组和 B 组神经纤维均逐渐生长, 表现为细长、迂曲, 带有分支的神经纤维, 周边神经纤维密度高于中央神经纤维密度; 在术后 3 月、术后 6 月、术后 1 年, 两组的神经参数相比, 神经纤维总长和神经纤维密度差异有统计学意义 ($p < 0.05$), 神经纤维总数、神经纤维分支数差异无统计学意义 ($P > 0.05$); 在术后 2 年和术后 3 年中, 两组神经纤维参数差异均无统计学意义 ($P > 0.05$)。

结论: 采用 5.4J 高能紫外线去上皮 A-CXL 治疗圆锥角膜与采用 7.2J 高能紫外线去上皮 A-CXL 治疗圆锥角膜具有相似的远期疗效。但 7.2J 高能紫外光照射时间短, 可明显缩短手术时间。且对角膜上皮神经纤维损伤程度小, 故 7.2J 高能紫外线去上皮 A-CXL 是角膜交联术治疗圆锥角膜的一个较好选择, 但其确切的疗效还需更多样本的进一步验证。

仿生全层角膜的研发: 面向供体短缺的力学增强与水屏障功能调控新策略

第一作者: 杨尚

目的: 全层角膜移植是治疗终末期角膜盲的主要手段, 但供体角膜严重短缺, 特别是需要健康内皮的全层移植。现有的人工角膜并非理想的供体替代材料, 而脱细胞角膜等替代物仅能用于部分层移植, 无法替代全层。因此, 研发可模拟天然角膜生物物理学特征的全层替代材料是当前领域的迫切需求。本项目旨在研发一种具有力学增强和水屏障调控功能的胶原基仿生全层角膜, 以解决全层角膜移植供体匮乏的核心难题。

方法: ① 仿生基质构建: 借鉴天然蛛丝合成机制, 对甲基丙烯酸酯化重组人胶原 (RHCMA) 进行分层正交拉伸, 随后通过光聚合锁定其仿生正交板层结构, 并利用盐析效应进一步强化, 以获得高强度和韧性的胶原基支架。② 仿生内皮构建: 采用显微光刻技术在支架内面构建正六边形疏水单元阵列, 以实现可控的水屏障功能; 阵列间隙填充聚乙二醇 (PEGDA) 水凝胶, 赋予其抗细胞 / 蛋白粘附功能和界面稳定性。

结果: 经正交拉伸 50% 的仿生基质最大缝线撕裂力为 2.51 ± 0.58 N, 而未经力学强化的普通水凝胶最大缝线撕裂力为 0.15 ± 0.02 N, 证明经正交拉伸训练的仿生基质抗缝线撕裂能力显著提升。为期 1 周的溶胀测试结果显示, 仿生角膜吸水率为 $43.13 \pm 0.75\%$, 而对照组吸水率超过了 800%。仿生角膜上表面微球粘附数为 131.4 ± 18.9 个 / mm^2 , 内皮面微球粘附数为 8.3 ± 1.8 个 / mm^2 , 减少了将近 15 倍。我们对新西兰兔进行了穿透性角膜移植, 在手术过程中仿生角膜能够耐受器械牵拉和外科缝合。术后第 3 天角膜保持透明, 前房形成, 未发生房水渗漏和明显炎症反应。OCT 显示, 植片与植床整合良好, 且仿生角膜基质未发生明显水肿, 厚度与天然角膜相近。

结论: 仿生基质展现出与天然角膜相匹配的力学强度, 能够耐受手术缝合; 仿生内皮则有效调控了水合作用, 并在体外模型中显示出良好的抗成纤维细胞粘附效果。动物实验初步验证了其良好的生物相容性。该研究为开发无需供体角膜的全层移植材料提供了全新的技术路径, 填补角膜修复材料领域的技术空白, 推动角膜移植从“供体依赖”向“生物制造”的范式转变, 具有重要的科学价值与临床转化前景。

儿童干眼临床特征与问卷评估研究

第一作者: Le SUN

共同作者: Jinghua BU, Yang WU

目的: 分析单中心中国儿童干眼患者的人口学特征、生活方式及临床亚型, 并参考 OSDI 问卷, 评估不同干眼问卷在本群体中的适用性。

方法: 采用横断面研究设计, 纳入 2023 年 1 月 1 日至 2024 年 6 月 30 日于厦门市儿童医院就诊的 105 例 2~15 岁患儿 (男 57 例, 女 48 例)。通过问卷调查收集基线信息、生活方式及病史, 对于眼症状、眼表特征与泪膜参数进行评估, 明确干眼亚型诊断, 并采用多因素 logistic 回归, 对各亚型与相关参数之间的关联性进行分析。使用 OSDI、中国干眼问卷及眼部舒适指数量表三种工具评估干眼症状, 采用 Cronbach α 系数和 Spearman 相关分析对问卷内部一致性与效度进行评价, 并对不同问卷诊断干眼加重的效能进行 ROC 曲线分析。

结果: 患儿平均年龄为 7.86 ± 3.13 岁, 以男性居多 ($p = 0.003$)。7~13 岁学龄组占比最高 (54.29%)。所有患儿均伴有睑板腺功能障碍 (MGD), 且 92.38% 合并水液缺乏, 构成混合型干眼。单因素分析显示, 年龄 ($p = 0.012$)、户外活动时间 ($p = 0.029$) 与水液缺乏型干眼相关; 睡眠时间与干眼症严重程度相关 ($p = 0.091$)。问卷比较显示, 中国干眼问卷和眼部舒适指数量表应答率 100%, 后者内部一致性最佳 (Cronbach $\alpha = 0.919$); OSDI 在判断儿童干眼加重方面具一定诊断价值 ($\text{AUC} = 0.620$)。

结论: 本研究队列中儿童干眼以混合型为主, 多合并 MGD, 相关影响因素有年龄、户外活动及睡眠时间。眼部舒适指数量表内部一致性良好, OSDI 对评估病情加重有参考价值。研究结果能够为儿童干眼的针对性筛查与管理提供临床参考。

光热效应联合化疗药物抑制 CNV 的发展

第一作者: Jinfa YE

共同作者: Chengchao CHU

目的: 角膜新生血管 (CNV) 是指血管生成和抗血管生成细胞因子之间的平衡被打破, 在角膜无血管区出现血管。在此, 我们提出了一种生物相容性的聚乳酸 - 乙醇酸共聚物 (PLGA) 来制备 SU6668 和 ICG 纳米复合材料来处理 CNV。将 SU6668 的抗新生血管能力与 ICG 的 PTT 特性相结合, 在靶

向新生血管的细胞囊泡的帮助下，通过滴眼液将纳米材料递送到 CNV 部位。ICG 在血管中产生的 PTT 会堵塞血管腔，阻碍血液的正常流动。因此，通过这种联合治疗效果可以有效治疗 CNV。

方法：将 SU6668 和 PLGA 一起溶解在二甲基亚砜 (DMSO) 中，得到 SU6668-PLGA 混合溶液。然后将该混合溶液逐滴加入到 5 毫升含 1 毫克/毫升吲哚菁绿 (ICG) 的聚乙烯醇 (PVA) 溶液 (5%, w/v) 中，混合物超声 1 分钟。之后，将 8 毫升 PVA 溶液 (1%, w/v) 逐滴加入到所得乳液中，并再次超声 2 分钟。室温下搅拌过夜。所得产物用 35 kDa 半透膜透析以去除 DMSO 和 PVA。对于膜涂层，将表达抗 VEGFR2-scFv 的 293T 细胞膜与 PLGA 核心以 3: 1 (w/w) 的比例混合，然后使用微型挤出机依次通过 400 纳米膜挤出。

结果：载有 SU6668 和 ICG 的 PLGA 纳米颗粒 (AbVr2-SU6668/ICG@PLGA) 通过靶向新生血管的细胞膜囊泡被递送至脉络膜新生血管 (CNVs)，并能够被血管内皮细胞摄取。通过光声成像双模态成像，可以清楚地看到纳米药物在血管中富集，而正常部位的药物则被机体清除。在近红外激光照射下，ICG 会产生大量热能，导致细胞凋亡，并增加热休克蛋白 (HSP) 家族蛋白的表达以拯救细胞。光热治疗 (PTT) 还能使 PLGA 解聚并释放 SU6668，从而下调 HSP70 蛋白的表达，促进血管内皮细胞凋亡。同时，释放的 SU6668 是一种受体酪氨酸激酶 (RTK) 抑制剂，能有效抑制血管内皮生长因子 (VEGF) 诱导的新生血管形成，防止新生血管的形成，从而达到持续治疗的目的。此外，SU6668 对细胞增殖的抑制作用还能防止治疗期间角膜中仍存在的某些新生血管细胞因子诱导的血管生成。

结论：通过这种靶向药物—光热治疗联合治疗，将药物精确递送到患处，可以减少药物的使用、药物耐受性和药物不良反应。同时，利用近红外光激发可以降低激光能量，为临床治疗 CNV 提供了一种安全的治疗方法。

免疫调控微球复合响应型水凝胶体系治疗炎症性角膜损伤的作用及机制研究

第一作者：Ma LINYAN

共同作者：Han YI, Liu ZUGUO

目的：眼表炎症可能导致角膜混浊、新生血管形成，甚至导致失明。传统的滴眼剂型由于眼表药物清除作用，存在药物生物利用度低的问题，且难以满足各种类型眼表炎症的治疗需求。可注射微球通过长

效缓释机制，能够显著提高眼表的药物生物利用度。本研究通过构建角膜炎症小鼠模型，探讨免疫调控微球在治疗炎症性角膜损伤中的作用机制，并开发了一种微球-自由基响应性水凝胶体系，以进一步提高不同类型眼表炎症的治疗效果。此研究为眼表炎症相关疾病的治疗提供了新的理论依据和创新药物剂型。

方法：本研究通过角膜缘干细胞清除 (LSCD) 或碱烧伤建立小鼠角膜损伤和炎症模型。利用裂隙灯检查、荧光素钠染色和光学相干断层扫描 (OCT) 评估小鼠眼表损伤和炎症状态，进而评估微球在角膜损伤修复及炎症治疗中的效果。通过免疫荧光染色分析角膜组织中与炎症和纤维化相关的标志物，进一步评估微球对角膜纤维化的抑制作用。此外，收集小鼠角膜组织进行转录组测序，并通过 qPCR、WB 和免疫荧光染色检测微球对角膜炎症与纤维化的抑制效果。最后，构建免疫调控微球复合响应型水凝胶体系，并评估其在治疗重度炎症损伤引起的新生血管中的应用效果。

结果：通过 LSCD 与碱烧伤构建的小鼠角膜炎症模型，在结膜下注射微球后显著促进角膜损伤修复，并减缓炎症进展。转录组分析和免疫荧光染色结果表明，微球通过调控巨噬细胞的转化，减缓角膜炎症，并抑制纤维化进程。此外，免疫调控微球复合响应型水凝胶体系能够有效抑制急性角膜炎症模型中引起的角膜新生血管形成，同时调控巨噬细胞功能，调节人角膜基质细胞 (HCSC) 与人脐静脉内皮细胞 (HUVEC) 之间的相互作用，阻止血管内皮细胞的侵袭。

结论：可注射免疫调控微球通过长效缓释和对巨噬细胞的免疫调控作用，显著提升眼表炎症和纤维化的治疗效果与安全性。此外，免疫调控微球复合响应型水凝胶体系能快速响应病灶微环境，释放药物以迅速控制急性炎症，并通过微球缓释抑制慢性炎症。

副交感神经在睡眠相关性干眼中对泪腺稳态维持的作用

第一作者：Lifan YANG

共同作者：Xin HE, Wei LI

目的：阐明睡眠剥夺所致干眼中副交感神经功能紊乱对泪腺稳态的影响，验证毛果芸香碱是否通过激活 NGFSREBP2 信号通路，调节泪腺脂质代谢、减轻炎症与神经损伤，从而恢复泪液分泌功能。

方法：建立睡眠剥夺小鼠干眼模型，设毛果芸香碱干预组与对照组；采用转录组学、脂质组学结合

qPCR、Western Blot 分析泪腺基因表达与脂代谢变化；运用组织化学（HE、Masson）、免疫荧光（Ki67、TUNEL、 β III-tubulin）评估泪腺结构、增殖、凋亡及神经形态；检测泪液中乙酰胆碱含量及泪液分泌量等。

结果：睡眠剥夺导致泪腺脂质沉积、乙酰胆碱减少、NGF 与 SREBP2 表达下降，泪液分泌降低；毛果芸香碱逆转转录组紊乱，缓解内质网应激与炎症，促进细胞连接与结构修复；毛果芸香碱激活 NGFSREBP2 通路，调控脂质合成、转运与分解相关基因，减少脂质沉积；毛果芸香碱减轻泪腺炎症与纤维化，促进增殖、抑制凋亡，并修复泪腺与角膜神经。

结论：睡眠剥夺引起副交感神经功能抑制与泪腺脂代谢紊乱，毛果芸香碱通过激动 M3 受体激活 NGFSREBP2 通路，多靶点改善脂质代谢、炎症与神经损伤，恢复泪腺分泌功能，为水液缺乏型干眼提供了新的治疗策略与理论依据。

双眼不明原因棘阿米巴角膜炎一例合并文献复习

第一作者：Ru ZHAO

共同作者：Reziwan MAIMAITIMING

目的：报道一例双眼不明原因棘阿米巴角膜炎（AK）的临床特征、诊断与治疗过程，并通过文献回顾分析双眼 AK 的流行病学特点、危险因素及诊疗策略。

方法：分析一例 22 岁男性双眼 AK 患者的临床表现、诊断经过及治疗反应，结合活体共聚焦显微镜（IVCM）检查及组织病理学结果明确诊断。同时系统性回顾 2005–2023 年国内外报道的双眼 AK 病例，总结其发病特点、误诊情况、危险因素及治疗结局。

结果：患者初期误诊为病毒性角膜炎，经 IVCM 检测到角膜上皮棘阿米巴包囊结构确诊为双眼 AK。接受局部聚六亚甲基双胍（PHMB）与氯己定联合治疗后症状显著改善。文献回顾显示，双眼 AK 患者中位年龄 22.5 岁，女性占 61.1%，94.4% 与角膜接触镜（CL）使用相关，误诊率达 72.2%（其中 61.5% 误诊为病毒性角膜炎）。糖皮质激素使用可掩盖体征、延迟诊断。IVCM 在早期诊断中具有重要价值。

结论：双眼 AK 虽罕见但致盲风险高，CL 使用是主要危险因素，IVCM 是早期诊断的关键工具，应避免未明确诊断前使用糖皮质激素，联合抗阿米巴治疗有效，预后良好。

回顾性评估酒石酸伐尼克兰对干眼症患者治疗 1 个月的短期疗效

第一作者：Yalin REN

共同作者：Haiyan LIN, Zhi LUO, Xiaobo YANG

目的：回顾性评估酒石酸伐尼克兰鼻喷剂（商品名：Tyrvaya）在干眼患者使用 1 个月后泪液分泌量（以麻醉状态下 Schirmer 试验评分，SIT）以及泪膜稳定性（泪膜破裂时间，BUT）的改善水平，为干眼症短期临床疗效提供治疗选择。

方法：收集 2023 年 12 月至 2025 年 6 月在香港大学深圳医院确诊为干眼症且接受酒石酸伐尼克兰鼻喷剂治疗的患者临床资料，纳入标准为：符合《中国干眼专家共识（2024 年）》诊断标准，患者在首次使用酒石酸伐尼克兰鼻喷剂 0.03 mg 每日 2 次，双侧鼻孔各 1 喷。从 140 名患者中选取保留基线及治疗 1 个月后的 SIT、BUT 测量数据，排除其他眼部疾病（如结膜炎、角膜炎、睑缘炎急性发作、眼外伤、眼表手术等）、还有随访不及时、无随访数据的患者。最后纳入 26 例患者（52 眼），总共有男性患者 16 例（32 眼），女性 10 例（20 眼），平均年龄为 48.50 ± 14.45 岁。采用威尔科克森符号秩检验比较治疗前及治疗 1 个月后患者的 SIT 值、BUT 值，统计学显著性设定为 $P \leq 0.05$ 。

结果：26 例患者（52 眼）治疗 1 个月后，SIT 较基线显著提高；BUT 较基线有少许提高。

结论：酒石酸伐尼克兰鼻喷剂对 SIT 的改善明显优于 BUT 改善，且安全性良好，可为干眼症的短期治疗疗效提供新的参考。

基于 AGREE II 的中国干眼临床指南及共识的质量评价研究

第一作者：Jianping HU

共同作者：Yilin LI, 骆非

目的：近年来，中国眼科领域临床实践指南与专家共识呈“井喷式”增长，数量的激增与质量的参差不齐现象引发广泛关注。为应对这一挑战，本研究聚焦于了解中国干眼领域临床指南及共识的质量现状，识别其制订的科学性、实用性和可信度，以推动干眼相关临床指导原则的质量提升，促进科学证据在临床实践中的有效应用。

方法：横断面研究设计，纳入最新发布的 12 部中国干眼相关临床指南 / 共识，其中包括 1 部指南和 11 部专家共识。由三位评估者使用国际通用的临

床指南质量评价工具 AGREE II 进行质量评估。采用极差法计算六个领域的标准化得分并进行汇总分析,同时使用组内相关系数 (ICC) 检验评估者的可靠性。

结果: 三位评估者对 12 部中国干眼临床指南/共识评价的 ICC 均 > 0.80 , 评价结果可靠。12 部眼临床指南/共识的 AGREE II 六个领域的汇总分析显示, 其在范围和目的、清晰性方面表现良好, 但在参与人员、严谨性、应用性和编辑独立性方面有待提升。其中, 严谨性领域得分较低, 主要问题在于未进行全面系统的证据检索、证据评价, 推荐意见形成方法不透明等。

结论: 近年来, 中国干眼临床指南/共识在范围和目的、清晰性方面表现良好, 希望今后制定类似指南/共识过程中, 应进一步重视方法学顶层设计, 并确保过程严谨透明、报告规范、参与成员多样化, 以进一步提升我国干眼指南的整体质量和临床实用性。

基于 TOPSIS 模型与 Corvis ST 的顿挫型圆锥角膜诊断新指数的开发研究

第一作者: Lanting YANG

共同作者: Shihao CHEN, Honghu JIANG, Jingyin ZHU

目的: 探索 Corvis ST 参数和眼压及中央角膜厚度的相关性关系, 并在匹配中央角膜厚度的基础上开发一种在准确性、可靠性和预测价值方面均表现优秀的新指数, 以区分顿挫型圆锥角膜与正常角膜。

方法: 本研究回顾性地纳入 182 名健康参与者的 Corvis ST 参数、DCT-IOP 和 CCT 数据; Corvis ST 参数与 DCT-IOP 和 CCT 的相关性分析采用 Pearson 相关性检验或 Spearman 秩和检验; 首先使用右眼数据进行相关性分析, 然后使用左眼数据对相关分析结果进行验证, 探讨在两眼结果中 CCT 及 DCT-IOP 与 Corvis ST 参数的相关性关系; 在后续开发 FFKC 指数时, 共纳入 102 只健康眼和 97 只顿挫型圆锥角膜眼, 通过倾向得分匹配后, 共纳入 53 只健康眼和 53 只顿挫型圆锥角膜眼的数据, 包括人口统计学信息和 Corvis ST 检查结果。对 Corvis ST 的动态角膜响应参数进行了 AUC (受试者工作特征曲线下面积)、灵敏度、特异度、ICC (组内相关系数)、正似然比和负似然比的计算。采用 TOPSIS 模型客观综合评估了 Corvis ST 的动态角膜响应参数, 后续利用 Logistic 回归确定了能够准确区分顿挫型圆锥角膜眼与正常眼的最佳参数组合。

结果: 共 182 名中国健康受试者 (男性 65 人, 女性 117 人) 的 364 只眼接受了 Corvis ST 测量, 研究发现右眼有 29 个参数和 CCT 相关, 21 个参数和 DCT-IOP 显著相关; 左眼结果有 30 个参数和 CCT 相关, 20 个参数和 DCT-IOP 显著相关。本研究在 FFKC 指数的开发研究中通过最佳参数组合形成了一个新的 FFKC 指数, 包括以下几个动态角膜响应参数: SP A1、SP HC、A1 Time、DA Ratio Max 2 mm、DA Ratio Max 1 mm、Integrated Radius 和 SSI2。ROC 曲线分析显示该 FFKC 指数 AUC 为 0.971, 截断值为 0.425, 准确率 95.283%, 特异度 94.340%, 灵敏度 96.230%, 正似然比和负似然比分别为 17.000 和 0.040, ICC 值为 0.777, 该新指标的诊断效能优于传统的 Corvis ST 指数。

结论: Corvis ST 参数中有不少和眼内压以及中央角膜厚度存在相关关系, 其结果也会受到眼内压和中央角膜厚度的影响, 新开发的 FFKC 指数基于角膜厚度匹配的数据, 且表现出较高的灵敏度、特异度和 AUC 值, 以及良好的似然比和 ICC 值, 该参数在准确性、可靠性和预测价值方面表现优秀, 其应用价值还需要外部数据进一步验证。

基于循证构建干眼症中西医结合护理方案及其应用效果评价

第一作者: Meng Yao WANG

共同作者: Li Na CHENG

目的: 构建一套科学、规范的干眼症中西医结合护理方案, 并初步验证其临床可行性及有效性。

方法: 通过系统检索国内外相关文献, 结合科室临床实践和专家会议法, 初步构建护理方案草案。采用德尔菲专家咨询法对 20 名眼科及中医护理专家进行 2 轮函询, 对方案条目进行修改和完善。选取 30 例患者应用构建的方案进行预试验, 通过护士执行度、患者依从性及满意度问卷评价方案的可行性。

结果: 2 轮专家函询的积极系数均为 100%, 权威系数分别为 0.87 和 0.89, 肯德尔和谐系数分别为 0.136 和 0.152 ($P < 0.01$), 最终形成的方案包括中医辨证评估、技术操作、健康教育和效果评价 4 个一级指标和 17 个二级指标。本干眼症中西医结合护理方案的核心内容基于“病证结合”原则, 包含四大模块, 模块一进行中医辨证分型评估, 由护士初步辨识肝肾阴虚、肺阴不足等证型, 为精准施护奠定基础。模块二实施分层干预, 所有患者接受健康用眼、环境及饮食指导等基础护理; 在此基础上, 根据分型开展辨证施护, 如为肝肾阴虚型推荐

枸杞菊花茶，为肺阴不足型实施中药雾化熏眼。模块三规范执行核心技术，包括标准化操作流程下的中药雾化熏眼、睑板腺按摩及穴位按摩。模块四建立个体化健康教育计划与定期随访机制，以监督依从性并动态调整方案。该方案旨在通过系统性的中西医结合护理，缓解症状、改善体征，并提升患者生活质量。预试验显示，方案执行度高，患者依从性为 93.3%，满意度评分为 (96.4 ± 3.2) 分。

结论：构建的干眼症中西医结合护理方案专家意见集中，科学可靠，具有较好的临床可行性和接受度，为中西医结合护理在干眼症的标准化应用提供了参考依据。

摘要编号：209263

基因视角揭示炎症与角膜结构在圆锥角膜中的关键作用

第一作者：Guandong ZHU

共同作者：Xuejiao QIN

目的：圆锥角膜传统上被认为与免疫炎症无关，但其潜在发病机制尚不明确。本研究旨在利用遗传学方法，系统评估循环炎症因子与圆锥角膜的因果关系，并重点通过药物靶点分析与 SMR 分析，探寻具有干预潜力的特异性治疗靶点。

方法：基于大规模全基因组关联研究数据，我们采用 MR 分析，评估多种炎症因子对圆锥角膜风险的因果效应。通过中介分析，检验中心角膜厚度等角膜指标在其中的作用。进而，针对显著关联的炎症因子，重点开展药物靶点分析与 SMR 分析，以评估其作为干预靶点的潜力。

结果：研究发现 PD-L1、MMP-10、IL2R β 等多种炎症因子与圆锥角膜风险存在显著因果关联，其中部分效应通过中心角膜厚度介导。关键发现集中于 PD-L1：药物靶点 MR 与 SMR 分析显示，与单抗药物 BMS-986189 所介导的 PD-L1 水平升高相关的遗传变异，与圆锥角膜风险呈负相关。这一结果提示提升 PD-L1 水平或激活 PD-1/PD-L1 免疫通路，可能对圆锥角膜具有保护作用。

结论：本研究不仅揭示了炎症因子通过角膜结构影响圆锥角膜的因果路径，更通过药物靶点遗传学分析，首次将 PD-L1 确立为具有潜在治疗价值的干预靶点。这为圆锥角膜的免疫调节治疗提供了全新的理论依据与精准干预方向。

复方中草药眼贴对过敏性结膜炎的疗效探究

第一作者：Ruochen WANG

共同作者：Mengya CAO, Caihong HUANG, Zuguo LIU, Bing YAN, Lizhi ZHANG

目的：过敏性结膜炎是一种极为常见的眼部疾病，通常其以眼红、眼痒、畏光为主要临床表现，高发于季节交替之时，特别是冬春交替之时。本研究所用眼贴以中医古籍为蓝本，对口服方剂进行改良，以适应眼部外用。以过敏性结膜炎模型小鼠为载体，探究眼贴对于过敏性结膜炎的治疗作用。

方法：试验使用 BALB/c 小鼠，通过卵白蛋白 (Ovalbumin, OVA) 注射及点眼致敏建立过敏性结膜炎模型。研究分为预防组与治疗组，两组内再分为正常对照组、模型组、溶剂眼贴组及中药眼贴组。试验开始前三周每间隔 7 天腹腔注射一次含氢氧化铝佐剂的卵清蛋白溶液，实验过程中每日使用卵清蛋白溶液点眼刺激小鼠过敏反应 1 次，连续刺激 10 天，对于预防组自点眼刺激开始使用眼贴，而治疗组自点眼刺激第 6 天开始使用眼贴。通过眼部症状的评分、挠眼的频率及泪液分泌量以评估其症状强度；通过测定血清中 OVA-IgE 水平、qPCR 与 Western blot 分析 IL-1 β 、IL-6、IL-10、IFN- γ 、TNF- α 等炎症因子的表达以评估其过敏的强度；通过 HE、PAS 等组织学方法以评估其眼部组织的状态。

结果：根据实验结果可知，复方中草药眼贴在预防与治疗两种情况下均能显著缓解眼部过敏症状。在裂隙灯下可见睑缘水肿明显缓解，同时泪液分泌量降低，虽未恢复到正常值但已与模型组产生显著差异。组织学染色中可观察到中草药眼贴组相较于模型组结膜水肿和充血均有不同程度改善。通过 qPCR 与 WB 方法对炎症因子进行分析，中草药眼贴组的 IL-1 β 、IL-6、TNF- α 等炎症因子水平在结膜和血清中的水平较模型组显著下降。使用 Elisa 方法对血清中 OVA-IgE 进行检测，发现中草药眼贴组相较于模型组有显著下降。在预防组与治疗组的对比中发现，相较于治疗组，预防组眼部症状更轻、炎症因子表达量更低、组织形态均更加良好。

结论：综上所述，在过敏性结膜炎的预防和治疗过程中，经过改良的中草药眼贴均能发挥良好的作用，但受过敏的累计影响，在已发生过敏性结膜炎的情况下使用眼贴治疗尚无法取得与预防时相同的效果，故在实际使用时了解自身的过敏原并尽量远离过敏源也是至关重要的。同时，复方中草药作为日常保健使用，可降低过敏性结膜炎的发生概率。

复方菊花眼贴联合冷热敷对蓝光诱导的 MGD 的疗效研究

第一作者: Ruochen WANG

共同作者: Mengya CAO, Caihong HUANG, Zuguo LIU, Zixuan YANG, Lizhi ZHANG

目的: 在既往研究中发现, 以菊花为主要成分的复方眼贴在缓解蓝光诱导的小鼠睑板腺功能障碍模型中具有显著疗效。本研究在此基础上进一步探究了冷敷或热敷是否能增强该眼贴的疗效。

方法: 将 C57BL/6J 小鼠随机分为预防组与治疗组, 再将两组分别分为正常对照组、蓝光照射组、溶剂眼贴组、单独冷敷组、单独热敷组、复方菊花眼贴组、冷敷联合复方菊花眼贴组和热敷联合复方菊花眼贴组。除两个正常对照组外, 其它各组均接受 28 天蓝光照射, 预防组全程给予干预治疗, 治疗组在蓝光照射第 15 天开始干预治疗。疗效通过角膜荧光素钠染色、组织学分析、qPCR 和 Western blot 检测炎症因子 (IL-1 β 、IL-6、TNF- α 、IL-17、IFN- γ) 的变化进行评估。

结果: 经过蓝光照射, 小鼠出现角膜上皮损伤、睑板腺开口阻塞和睑板腺腺体萎缩的症状。治疗性使用眼贴可改善角膜上皮结构完整性, 减少睑板腺口阻塞, 其中热敷联合复方菊花眼贴效果最佳。HE 染色提示冷热两种物理辅助均能预防性改善腺体形态, 减少结构紊乱, 其中热敷联合复方菊花眼贴最为有效。PAS 染色提示冷热两种物理辅助联合复方菊花眼贴均可改善结膜杯状细胞密度。Oil Red O 染色提示预防大组中热敷联合复方菊花眼贴干预能有效抑制腺体萎缩。qPCR 与 Western blot 提示眼贴干预能够抑制炎症标志物的升高, 且冷敷联合眼贴干预可显著降低睑板腺组织中的 IL-1 β 和 TNF- α , 以及角膜组织中的 IL-6。此外, IKK α 的表达也有所减少, 提示干预可能抑制了 NF- κ B 通路。

结论: 蓝光暴露会导致显著的角膜上皮损伤、睑板腺开口阻塞、睑板腺腺体萎缩等多个症状, 而复方菊花眼贴对上述症状具有一定的改善作用。在研究中可知, 热敷联合复方菊花眼贴在预防方面效果更佳, 而冷敷联合复方菊花眼贴在治疗中表现更好。同时 qPCR 和 WB 结果分析表明, 冷敷联合复方菊花眼贴具有更强的抗炎作用, 更适用于治疗阶段; 而热敷联合复方菊花眼贴则在早期干预中提供了更好的结构保护。综上所述, 冷热敷联合复方菊花眼贴在睑板腺功能障碍的预防和治疗中具有良好的应用前景, 其机理更待后续研究。

大学生眼表健康状况流行病学调查及危险因素分析

第一作者: Xinrui ZOU

共同作者: Yunxia LENG

目的: 调查中国广州市大学生群体中干眼症的患病率和危险因素。

方法: 共纳入 304 名就读于广州卫生职业技术学院和广东工业大学大一、大二的大学生。由经过培训的研究人员进行问卷调查 (OSDI 量表和危险因素问卷)。眼科检查由专业医师完成, 含非侵入性泪膜破裂时间、泪河高度等干眼诊断指标以及视调节力指标。

结果: 在 305 名大学生中 (148 名男性, 157 名女性), 296 名 (97%) 完成了问卷。152 名有干眼症状 (72 名男性, 80 名女性, $p = 0.527$, OR, 1.159, 95% CI, 0.734–1.830), 245 名有干眼体征 (112 名男性, 133 名女性, $p = 0.47$, OR, 1.781, 95% CI, 1.003–3.164), 124 名有干眼症 (54 名男性, 70 名女性, $p = 0.112$, OR, 1.456, 95% CI, 0.915–2.317)。研究发现, 近距离用眼后出现眼疲劳的个体有更大的概率患有干眼症 ($p < 0.001$, OR, 2.970, 95% CI, 1.732–5.092)。多因素逻辑回归显示: 黑暗环境中看电子屏幕 ($p = 0.026$, OR, 1.964, 95% CI, 1.085–3.555)、平均每天使用 VDT ≥ 4 小时是干眼症的危险因素 ($p = 0.006$, OR, 4.192, 95% CI, 1.495–11.759), 而平均每天户外活动时间 ≥ 6 小时是干眼症的预防因素 ($p = 0.038$, OR, 0.330, 95% CI, 0.116–0.940), 研究发现佩戴隐形眼镜与干眼症之间并无显著统计学关联, 但与干眼体征之间存在微弱关联 ($p = 0.136$, OR, 2.670, 95% CI, 0.735–9.699)。干眼体征的患病率中女性 (84.7%) 显著高于男性 (75.7%, $p = 0.47$, OR, 1.781, 95% CI, 1.003–3.164)。

结论: 干眼在大学生群体中普遍存在。黑暗环境看电子屏及日均 VDT 使用 ≥ 8 小时的人群中患干眼的风险会增加, 而日均户外 ≥ 6 小时则可以减少干眼症的发生。此外, 女性相较于男性更容易出现干眼体征, 且干眼体征者视功能调节差。针对可改变风险的相关措施可能会对大学生眼表健康产生积极影响。

大豆异黄酮通过抑制 NF- κ B 信号通路调控角膜基质细胞中 MMPs 的表达: 对圆锥角膜的潜在治疗作用

第一作者: Xianli DU

目的: 探讨大豆异黄酮 (Soy isoflavones, Si) 在抑制角膜基质细胞中基质金属蛋白酶 (MMPs) 表达方面的作用, 并阐明其通过调控 NF- κ B 信号通路延缓圆锥角膜 (Keratoconus, KC) 进展的潜在机制。

方法: 本研究通过小分子药物筛选在 88 种 FDA 批准的药物中筛选出可抑制 MMP 释放的候选化合物; 随后采用 qPCR、Western blot、免疫荧光和 ELISA 检测大豆异黄酮对角膜基质细胞中 MMP1 和 MMP3 的表达影响。通过 RNA 测序 (RNA-seq) 分析大豆异黄酮处理后细胞的转录组变化, 并结合 NF- κ B 通路抑制剂 (JSH-23) 验证其信号通路机制。此外, 采用胶原酶诱导小鼠圆锥角膜模型评估其在体内的安全性与疗效, 利用 OCT 及纳米压痕测试检测角膜厚度与生物力学性质变化。

结果: 在体外药物筛选中, 大豆异黄酮显著抑制角膜基质细胞 MMP1 和 MMP3 的表达, 并优于其他候选化合物。RNA 测序及 GSEA 分析显示, Si 显著下调 NF- κ B 信号通路的活性; NF- κ B 蛋白表达水平明显降低。采用 NF- κ B 抑制剂 JSH-23 验证后, 发现其对 MMPs 的抑制作用与 Si 一致, 提示 Si 通过 NF- κ B 通路发挥作用。在胶原酶诱导的小鼠模型中, Si 显著减轻角膜变薄并提高角膜弹性模量, 且未见明显毒副作用。

结论: 大豆异黄酮可通过抑制 NF- κ B 信号通路下调 MMPs 表达, 从而减缓角膜基质降解并增强角膜生物力学强度。该研究为圆锥角膜的药物治疗提供了新的分子靶点和潜在治疗策略。

宁夏地区 2 例斑块状角膜营养不良家系机制研究

第一作者: Jinjin ZHANG

共同作者: Bo CAI, Zichun LIN, Xiaoyu YANG, Jiangnan ZHAO, Yan ZHU, Wenjuan ZHUANG

目的: 基于全外显子测序和空间转录组研究宁夏地区 2 例斑块状角膜营养不良患者发病原因并分析基因型与临床特点。

方法: 收集宁夏眼科医院 2 例行角膜移植的斑块状角膜营养不良家系外周血及临床资料, 所有家系成员进行 WES 检测及 Sanger 验证, 完成变异位点的保守性分析并应用多种生物信息学软件进行致病性分析; 首次对斑块状角膜营养不良患者角膜组织行空间转录组测序, 探索突变基因关键通路。

结果: 共收集 2 个斑块状角膜营养不良患者家系, 家系 1 先证者携带 CHST6 两个无义突变: c.369G>A(p.Trp123) 和 c.760G>T(p.Glu254), 家系 2 先证者携带 CHST6 错义突变 c.382G>A(p.Ala128Thr), 这些突变均位于进化保守区域。CHST6 c.369G>A(p.W123) 首次在我国病例中检出, 扩大我国 CHST6 突变谱; c.382G>A(p.A128T) 杂合突变则是一个在伊朗与我国均有报道的已知位点; 而 c.760G>T(p.E254) 既往报道均为国人, 提示其可能是中国人特有的突变类型。在角膜样本空转分析中, CHST6 在 CD 组和对照组之间存在表达差异。CHST6 表达的细胞数量显著高于对照组, 尤其在基质细胞群体中更为明显。富集分析结果表明, CHST6 与多个关键通路密切相关, 特别是在 Glycosaminoglycan biosynthesis-keratan sulfate (hsa00533) 通路中, CHST6 作为关键酶参与角质硫酸合成, 影响角膜基质的结构与透明度。此外, TGF- β 和 MAPK (JNK/p38) 信号通路也显著富集, 提示 CHST6 可能通过角质硫酸合成缺陷在该病中影响角膜基质的稳定性与透明性。

结论: CHST6 是该研究中 2 例斑状角膜营养不良患者的致病基因, CHST6 与角质硫酸合成 (hsa00533) 通路显著相关, 并可能通过 TGF- β 和 MAPK (JNK/p38) 信号通路影响角膜基质的稳定性和透明性。

面板编号: CDE-1361

巩膜镜对角膜形态影响的系统性综述

第一作者: Wenjia ZENG

共同作者: Di CHEN, Ying LI

目的: 系统评估巩膜镜佩戴对角膜形态学参数的影响, 包括前后表面曲率、角膜中央厚度、顶点角膜厚度及角膜水肿程度, 以探讨其短期形态变化及生理机制, 为巩膜镜的安全配戴与角膜监测提供依据。

方法: 按照 PRISMA 声明要求, 在 PubMed、Embase、Web of Science 及 Cochrane Library 数据库中检索截至 2025 年 6 月的相关文献, 检索词包括 “scleral lens”、“corneal topography”、“corneal thickness”、“corneal edema” 等。纳入符合标准的 23 篇研究, 提取巩

膜镜配戴前后角膜曲率 (Kmax、Kmean、前后表面曲率) 及角膜厚度 (CCT、TCT) 等定量指标。采用定性合成方法综合分析不同研究间的趋势及影响因素。

结果: 多数研究报道巩膜镜短期佩戴后中央角膜厚度轻度增加 (约 0.5%–2.0%)，提示轻度可逆性水肿；水肿程度与镜片厚度、后泪液储留层厚度及氧透过系数 (Dk/L) 密切相关。前后表面曲率及 Kmean、Kmax 变化幅度较小，多数恢复至配戴前基线。部分研究指出，角膜前后表面变化主要集中于中央及下方区域，反映局部负压与泪液动力学作用。总体而言，巩膜镜配戴对角膜形态影响有限，表现为轻度、可逆的生理性改变。

结论: 现有证据表明，巩膜镜短期佩戴可导致轻度角膜水肿及厚度增加，但对整体角膜曲率及形态稳定性影响较小。角膜形态变化受镜片厚度、氧透过率及泪液层厚度共同调控。建议临床在长期佩戴及圆锥角膜患者中加强影像学监测，以优化巩膜镜设计与个体化管理。

干燥综合征患者的自体血清可减轻高渗诱导的角膜上皮细胞中的铁死亡

第一作者: Qi ZHANG

共同作者: Jiao WANG

目的: 研究自体血清 (AS) 通过铁死亡途径缓解高渗诱导的角膜上皮细胞 (HEC-T) 中的作用。

方法: 从干燥综合征患者体内提取并制备 AS。通过将 HCE-T 细胞暴露于 90 mM NaCl 溶液建立体外高渗性干眼模型，随后分别用 AS 或铁死亡抑制剂处理。采用蛋白质印迹法分析蛋白表达水平。采用 FerroOrange 和 2',7'-二氯二氢荧光素二乙酸酯 (H₂DCFDA) 荧光探针测定细胞内 Fe²⁺ 及活性氧 (ROS) 水平，使用试剂盒测定细胞丙二醛和谷胱甘肽含量。通过透射电镜观察线粒体超微结构。

结果: 高渗条件下，HCE-T 细胞出现脂质过氧化和铁含量增加，伴随铁死亡相关标志物表达显著改变及线粒体形态特征性改变，表明细胞出现铁死亡。经测试，20% 和 50% AS 展现显著治疗效果，可显著提高细胞存活率和迁移能力，降低 ROS 和 Fe²⁺ 水平，减轻线粒体损伤。此外，AS 通过 Xc-/谷胱甘肽过氧化物酶 4 (GPX4) 通路有效抑制铁死亡。

结论: AS 能降低高渗诱导下 HCE-T 细胞的脂质过氧化水平，并通过 Xc-/GPX4 通路抑制铁死亡。

性激素水平对女性干眼症患者影响的研究

第一作者: Yigang LI

目的: 探讨性激素水平对女性干眼症患者的影响

方法: 选取 2021 年 8 月 -2023 年 8 月我院妇产科及生殖医学中心患者共计 80 例，按照疾病类型分为正常育龄期组、不孕不育激素正常组、不孕不育激素异常组、围绝经期女性干眼患者组各 20 例 (40 只眼)，所有患者均行性激素全套检查，眼前节检查，干眼检查及 Oculus Keratograph 5M 眼表综合分析仪检查，观察 4 组患者雌激素指标、孕激素指标、泪河高度测量、泪膜破裂时间 (BUT) 以及睑板腺的情况。

结果: 围绝经期女性干眼患者组雌激素、孕激素水平均低正常育龄期组、不孕不育激素正常组、不孕不育激素异常组 ($P < 0.05$)；围绝经期女性干眼患者组的泪河高度测量和泪膜破裂时间 (BUT) 较短，与其它各组比较，显示异常表现 ($P < 0.05$)；围绝经期女性干眼患者组睑板腺功能受损程度明显较重，与其他组相比存在显著差异 ($P < 0.05$)。

结论: 性激素水平对女性干眼症患者具有重要影响，特别是围绝经期女性，雌激素和孕激素水平的下降与干眼症的发病机制有关，进一步的研究和干预措施有助于改善围绝经期女性干眼患者的症状和生活质量。

成人泪囊囊肿的计算机断层扫描及计算机断层扫描泪囊造影影像学特征: 一项回顾性研究

第一作者: Wen XUETIAN

共同作者: Lan GONG, Tong LIN, Yan WANG, Wushuang WANG

目的: 本研究旨在总结泪囊囊肿 (LSCs) 患者的计算机断层扫描 (CT) 及计算机断层扫描泪囊造影 (CT-DCG) 影像学特征，明确其放射学分型与泪道系统 (LDS) 解剖学改变，为该疾病的临床分类、鉴别诊断提供参考依据，同时为泪囊鼻腔吻合术 (DCR) 等手术方案的制定提供解剖学指导，填补现有研究中缺乏特异性影像学模式及泪道解剖变化分析的空白。

方法: 本研究为单中心回顾性病例对照研究。纳入经确诊的泪囊囊肿患者，排除有既往眼部相关手术史、外伤史、肿瘤病史及甲状腺相关眼病病史的个体；对照组为因其他无关疾病接受 CT 检查且泪道系统正常的受试者。收集所有研究对象的临床资料，

均行 CT 及 CT-DCG 检查, 分析其放射学影像学特征; 同时进行解剖学测量, 包括鼻泪管 (NLD) 宽度、泪囊窝 (LSF) 相关维度及鼻腔异常情况, 并记录中鼻甲腋 (MTA) 至泪囊窝上下缘的距离。

结果: 本研究共纳入 60 名受试者, 其中女性 50 名、男性 10 名, 平均年龄为 47.43 ± 13.60 岁。CT 及 CT-DCG 检查共发现 4 种特征性放射学模式: 造影剂反流且泪囊无强化、囊肿壁部分薄环强化、液平面征、囊腔呈“灯泡征”(液体积聚表现)。多数患者存在鼻泪管阻塞, 泪囊囊肿组织活检结果显示囊壁存在慢性炎症。解剖学测量结果显示, 中鼻甲腋 (MTA) 至泪囊窝 (LSF) 上缘的平均距离为 3.34 ± 3.37 mm, 至泪囊窝下缘的平均距离为 11.00 ± 4.40 mm, 该数据可作为 DCR 手术的关键解剖标志。与对照组相比, 泪囊囊肿患者表现为泪囊窝增宽、额突变薄及泪骨角度增大, 提示囊肿存在导致骨重塑现象; 上述影像学特征及解剖学测量结果为 DCR 手术的规划与实施提供了重要参考。

结论: 放射学影像学检查 (CT 及 CT-DCG) 与详细的解剖学评估在泪囊囊肿的诊断与临床管理中具有关键作用。通过识别造影剂反流无强化、囊肿壁薄环强化等特异性放射学模式, 以及鼻泪管阻塞、泪囊窝增宽、泪道系统结构改变等解剖学异常, 临床医生可显著提高泪囊囊肿的诊断准确率, 为手术方案制定 (尤其是 DCR 手术) 提供精准指导, 对优化该疾病的临床诊疗流程具有重要意义。

损伤致角膜纤维化中骨膜蛋白表达和他克莫司干预研究

第一作者: Li LI

共同作者: Yishan SUN, Rong WANG, Fanru ZHAO

目的: 角膜损伤后无序瘢痕化是临床致盲难题。骨膜蛋白 (periostin, 由人源性 POSTN / 鼠源性 Postn 基因编码) 是损伤后肌成纤维细胞活化关键分子, 参与器官纤维化; 他克莫司为角膜移植一线免疫抑制剂, 可通过 TGF β /Smad 通路抗纤维化。本研究旨在明确 Postn 在角膜纤维化中的作用机制, 及他克莫司的干预效应。

方法: 构建小鼠机械性角膜损伤模型, 分析 Postn 与纤维化的关联; 利用 C57 mT/mG;Postn-CreERT2 荧光示踪小鼠示踪体内 Postn 表达, 通过 Postn 敲除小鼠验证其对损伤修复及纤维化的影响。建立人原代角膜基质细胞 (CSCs) 纤维化模型及 POSTN 抑制模型, 结合他克莫司干预, 探究 TGF- β 1/Smad 通路调控机制。

结果: 角膜损伤可诱导 Postn 表达, 其表达与纤维化、炎症反应时空趋势一致; Postn 敲除导致角膜伤口修复延迟, 纤维化及 TGF β -1/Smad2 通路激活不足, 晚期异常活化细胞存在并干扰角膜正常修复。体外抑制 POSTN 可下调人原代角膜基质细胞 (CSCs) 纤维化指标; 体外他克莫司干预可显著降低纤维化、Postn 及炎症因子表达。

结论: 骨膜蛋白是角膜损伤后纤维化与炎症的早期潜在生物标志物, 且为调控角膜有序修复的关键分子。体内抑制骨膜蛋白表达可减轻纤维化但加剧慢性炎症; 他克莫司可通过 TGF β -1/Smad 通路抑制 CSCs 纤维化, 为角膜纤维化防治提供新靶点与干预方向。

整合应激反应介导的细胞凋亡与炎症在干眼中的作用

第一作者: Rongrong ZHANG

共同作者: Jinghua BU, Wei LI, Weijie OUYANG

目的: 探讨整合应激反应 (integrated stress response, ISR) 在干眼发生发展中的作用机制。

方法: 在体实验采用干燥应激法建立 C57BL/6 小鼠干眼模型; 在体外实验中, 以高渗培养基处理人角膜上皮细胞 (HCE), 构建细胞模型。分别采用 ISR 抑制剂 ISRIB 和其溶剂对照进行小鼠点眼或细胞培养处理, 同时以 ISR 激动剂 SAL003 滴眼诱导小鼠角膜 ISR 激活。通过角膜荧光素染色、PAS 染色及酚红棉线实验评估眼表损伤情况; 采用免疫荧光和蛋白印迹检测 p-eIF2 α 与 ATF4 蛋白水平; TUNEL 染色及流式细胞术用于分析细胞凋亡。

结果: 无论是干眼小鼠还是高渗应激处理的 HCE 细胞, 均表现出 p-eIF2 α 和 ATF4 显著上调。局部应用 ISRIB 可有效抑制上述分子升高, 减轻眼表损伤, 并减少细胞凋亡。而 SAL003 的使用则可诱导出现干眼样眼表病变。

结论: 干眼状态下整合应激反应被激活, 并通过介导细胞凋亡与炎症参与眼表损伤的发生。药物性抑制该通路能够缓解干眼相关病理改变, 这可能成为干眼防治的潜在新靶点。

淡紫紫孢霉性角膜炎的临床与病原学特征分析

第一作者: Lu XIUHAI

目的: 探讨淡紫紫孢霉性角膜炎的临床和病原学特征, 并评估其治疗预后。

方法：回顾性系列病例研究。收集 2018 年 1 月至 2024 年 1 月于山东省眼科医院明确诊断为淡紫色霉菌性角膜炎的患者 15 例（15 只眼），统计分析患者的人口学资料、实验室检查数据、治疗方法和临床转归等资料。

结果：15 例患者中 11 例为农民；3 例为角膜移植术后，2 例有迷眼史，2 例有明确的植物外伤史，其余 8 例均无明显诱因。15 例患者裂隙灯显微镜下角膜病变表现为：病灶形态类圆形，范围相对局限，溃疡处炎症反应轻，1 例见内皮斑，2 例可见菌丝苔被，3 例可见伪足，4 例可见 1~2 mm 的前房积脓。在 15 例患者的角膜刮片和激光共聚焦显微镜检查中均发现完整的菌丝结构，其中 13 例患者的两项检查中均发现成串分布的圆形及椭圆形的分生孢子。将角膜标本培养分离到的 15 例菌株进行形态学和 ITS 测序鉴定。体外真菌药物敏感性试验表明，该菌对伏立康唑和泊沙康唑表现出较低的 MIC 值，而对两性霉素 B、氟康唑、伊曲康唑、阿尼芬净、卡泊芬净、米卡芬净和 5-氟胞嘧啶均表现出较高的 MIC 值。3 例溃疡患者溃疡灶深度小于整个角膜厚度 1/3，通过单纯的药物治疗而痊愈。6 例患者溃疡灶深度小于整个角膜厚度 2/3，均接受了角膜溃疡清创术以及结膜瓣覆盖术。3 例患者溃疡灶深度超过角膜厚度的 2/3，进行了穿透性角膜移植术。其余 3 例患者为角膜移植术后的，其中 2 例进行了穿透性角膜移植术，1 例进行了眼内容物剜除术。除 1 例眼内容物剜除，其余 14 例均达到临床治愈，其中 10 例患者的视力得到不同程度的改善，4 例患者因病灶处在角膜近中央位置，溃疡愈合后遮挡视力，导致视力不同程度下降。

结论：淡紫色霉菌性角膜炎较为罕见，主要危险因素为农业生产环境和免疫抑制。早期的病原学诊断和抗真菌体外药物敏感性试验，对治疗具有重要意义。尽快进行角膜清创术可以促进溃疡面的愈合。

皮肤与肠道菌群在干眼病中的因果作用：基于孟德尔随机化的免疫调节中介机制探索

第一作者：Guandong ZHU

共同作者：Xuejiao QIN

目的：干眼病是一种复杂的眼表疾病，其发病涉及泪膜不稳定与免疫调节异常。近年研究发现，皮肤与肠道菌群失调可能通过免疫途径参与干眼病的发生，但其因果关系尚不明确。本研究旨在利用孟德尔随机化方法，探讨皮肤与肠道菌群对干眼病的因果性影响，并揭示其中潜在的炎症介导机制。

方法：采用孟德尔随机化分析方法，以遗传变异作为工具变量，推断微生物组特征与干眼病之间的因果关系。基于大规模基因组关联研究数据，我们系统评估了多种肠道与皮肤菌群对干眼病风险的影响，并进一步通过中介分析检验了炎症因子在“菌群-眼轴”通路中的介导作用。

结果：特定肠道与皮肤菌群与干眼病之间存在显著的因果关联。其中，Subdoligranulum、Sutterella 和 Prevotella 属对干眼病具有保护作用，而厚壁菌门则会增加患病风险。皮肤菌群中的 Oscillospira 和 Faecalibacterium 与眼部结构参数相关，提示其可能间接影响干眼病发生。中介分析进一步表明，肠道菌群对干眼病的影响部分是通过调控炎症因子实现的。

结论：本研究从遗传学角度证实了肠道与皮肤微生物群对干眼病的因果作用，支持“肠-眼轴”通过免疫调节影响眼表健康的理论框架。所发现的保护性与风险性菌群，以及炎症因子的中介作用，为理解干眼病的发病机制提供了新视角，也为未来开展针对微生物群的干预策略提供了潜在靶点。

翼状胬肉患者眼表微生物群落的变化

第一作者：Gege TIAN

目的：探讨翼状胬肉患者眼表菌群的变化及不同观看电子设备时间下的菌群多样性。

方法：本研究共纳入 31 名单眼翼状胬肉患者，采集双眼结膜拭子样本，利用 16SrRNA 测序技术鉴定细菌的种类及丰度，并通过生物信息学方法对微生物群落组成进行注释与可视化分析。

结果：在翼状胬肉患者中，观看电子设备时间长的患病组眼表菌群丰富度显著高于对侧健康组，不同观看电子设备时间的患病组眼表菌群多样性有显著差异，而患病组与对侧健康组之间的菌群多样性更为相似。菌群物种分析结果表明，翼状胬肉患者患病组的恶臭假单胞菌相对丰度显著升高，而多形拟杆菌相对丰度显著降低。

结论：翼状胬肉患者的患病眼眼表机会致病菌定植增加，长时间观看电子设备导致的过度蓝光暴露可能是翼状胬肉的潜在风险因素。

自身免疫性疾病患者干眼的临床特征分析

第一作者: Xinyi WU

共同作者: Huimin SHAN

目的: 免疫性疾病与干眼的发生密切相关, 本研究旨在描述免疫性疾病患者的干眼发病比例, 探究不同种类的免疫性疾病相关干眼的临床特征, 分析免疫性疾病患者发生干眼与否以及与干眼严重程度相关的临床因素。

方法: 纳入确诊为自身免疫性疾病的患者, 通过问卷调查及眼科检查对所有参与者进行干眼诊断。分析干眼与非干眼患者之间的临床特征差异, 进一步按干眼严重程度分为轻度、中度、重度 3 类, 分析各免疫性疾病组干眼严重程度的差异; 利用血沉 (Erythrocyte sedimentation rate, ESR)、C 反应蛋白 (C-reaction protein, CRP) 分析免疫性疾病活动度与干眼严重程度之间的关系; 将干眼按临床特点不同分为水液缺乏型、蒸发过强型、混合型干眼 3 类, 分析各免疫性疾病组干眼的类别特点; 最后采用单因素及多因素 logistic 回归分析, 探究免疫性疾病患者发生干眼的独立危险因素。

结果: 在 247 例自身免疫性疾病患者中, 类风湿性关节炎 54 例、系统性红斑狼疮 90 例、Sjögren 综合征 34 例、银屑病 38 例、其他免疫性疾病 (强直性脊柱炎、皮炎、系统性血管炎、黏膜类天疱疮、青斑样血管炎、特应性皮炎) 31 例。干眼患病率为 29.1%, 其中干燥综合征 (SS) 患者干眼患病率最高 (61.8%), 银屑病患者最低 (13.2%)。不同干眼严重程度组间在自身免疫性疾病类型 ($P < 0.001$)、年龄 ($P = 0.013$)、ESR ($P = 0.001$) 及 CRP 水平 ($P = 0.026$) 上存在显著差异。SS 患者的干眼严重程度显著高于其他自身免疫性疾病患者。水液缺乏型与蒸发过强型干眼为最常见的两种类型。多因素 Logistics 分析显示, 自身免疫性疾病类型 ($P < 0.001$) 和 ESR 水平 ($P = 0.028$) 是干眼的独立危险因素。

结论: 免疫性疾病患者的干眼发病比例高, 自觉症状及临床体征重, 尤以 Sjögren 综合征为甚。干眼严重程度与免疫性疾病种类、年龄、ESR 水平、CRP 水平等因素相关。免疫性疾病相关干眼患者的泪膜异常兼有水液缺乏和蒸发过强两种因素。免疫性疾病种类、ESR 水平是免疫性疾病患者发生干眼的独立相关因素。提示需对此类人群进行及时筛查与干预。

荧光素笔: 一种用于角膜荧光素染色的具有良好的易用性的新型工具

第一作者: Huilin GUAN

共同作者: Yingying GAO, Runhua LV

目的: 本研究的目的是验证一种荧光素笔在角膜染色中的应用, 并将这种新型技术与两种传统工具进行比较。

方法: 本文所述的中国实用新型专利荧光素笔主要用于角膜染色。该荧光素笔提供给 15 名眼科医生, 用于与另外两种工具 (标准荧光素条和 1 毫升注射器法) 相比评估其使用便捷性。每支荧光素笔被多次使用, 并每周进行微生物培养。如果微生物培养结果为阴性, 该笔将一直使用到笔芯中的荧光素用完为止。对 20 名患者使用三种工具进行角膜荧光素染色。在裂隙灯钴蓝光下拍摄图像, 以评估图像质量和最高染色等级 (Gmax)。

结果: 荧光素笔的平均使用时长为 87.7 ± 17.0 天 ($n = 15$)。在使用期间, 所有样本均未检测到微生物生长。眼科医生通过五点李克特量表对易用性进行评估, 荧光素笔、试纸和 1 毫升注射器法的评分分别为 4.93 ± 0.27 、 2.60 ± 0.83 和 2.20 ± 0.68 ($P < 0.0001$)。荧光素笔组达到角膜荧光素 Gmax 的时间为 36 ± 10 秒, 试纸组为 348 ± 63 秒, 1 毫升注射器组为 212 ± 29 秒。三组之间的时间差异具有统计学意义 ($P < 0.0001$)。

结论: 荧光笔相比传统染色方法具有多个优势, 包括使用更简便、染色时间更短以及适合多次使用且安全。

虚拟现实 (VR) 眼表环境模拟训练对视频终端型干眼患者眨眼行为及症状改善的随机对照试验

第一作者: Ying SHAO

目的: 评估虚拟现实 (VR) 眼表环境模拟训练对改善视频终端型干眼 (VDT-DED) 患者眨眼行为及症状的疗效, 验证其作为数字行为疗法的临床价值。

方法: 研究采用单中心、评估者盲法、随机对照设计, 选取 2024 年 6 月至 2025 年 5 月山西省三甲医院眼科 80 例中重度 VDT-DED 患者 ($OSDI \geq 33$) 为研究对象, 随机分为干预组 (40 例, VR 训练联合人工泪液) 与对照组 (40 例, 仅人工泪液)。VR 系统通过头显模拟泪膜蒸发破裂、红外眼动仪

监测眨眼，并在虚拟办公场景中以视觉警报（屏幕模糊）引导完全性眨眼（眼睑闭合 $\geq 90\%$ ）。主要终点为不完全眨眼率、泪膜破裂时间（TBUT），次要终点包括 OSDI 评分、角膜荧光素染色（CFS）评分及依从性，采用混合效应模型分析。

结果：干预组 4 周时不完全眨眼率较对照组显著降低 18.3% ($p < 0.001$)，疗效持续至 12 周 ($p < 0.001$)；TBUT 延长显著 ($p < 0.001$)。次要终点中，OSDI 评分显著改善 ($p < 0.001$)，CFS 评分显著下降 ($p < 0.001$)，依从性显著提高 ($p = 0.003$)，且无 VR 相关不良反应。

结论：VR 眼表环境模拟训练通过沉浸式生物反馈，有效矫正不完全眨眼行为，显著提升泪膜稳定性并改善主观症状，且患者依从性优异。该技术为干眼行为干预提供了可量化、可持续的数字疗法新路径，具有临床转化潜力。

摘要编号：210081

角膜上皮异常增生伴异位角化一例

第一作者：Lijuan FENG

目的：探讨角膜中央孤立性上皮异常增生伴异位角化的临床特点、诊断策略及治疗意义，分析其潜在发病机制，结合国内外研究分析其与角膜不典型增生及变性类疾病的鉴别要点，为临床诊疗提供经验。

方法：回顾性分析一例 28 岁女性右眼角膜中央灰白色隆起性病变的诊疗过程。通过裂隙灯显微镜、UBM、OCT 评估病灶形态及深度；行病灶切除术联合碘酊烧灼，术后辅以角膜绷带镜及抗感染治疗；组织病理学检查明确病变性质，并与淀粉样变性、遗传性角膜营养不良等疾病进行鉴别；随访 3 月观察视力及复发情况。

结果：病灶位于角膜中央视轴区，呈灰白色隆起，荧光素染色 (-)，辅助检查提示病灶局限于上皮及浅基质层，与角膜缘无关联，手术切除联合碘酊烧灼后，角膜上皮修复完整，术后 6 月视力维持 0.8，仅残留云翳，无复发；微生物培养及炎症因子检测均阴性。病理学显示鳞状上皮角化过度伴异位角化。本例可能与既往研究中提出的“角膜中央干细胞活化假说”有关，可能与隐匿性理化刺激诱导上皮异常分化相关。

结论：角膜中央孤立性上皮异常增生伴异位角化罕见，需与淀粉样变性、遗传性角膜营养不良及恶性上皮内瘤变鉴别；手术切除是视轴区病变的首选方案，碘酊烧灼可有效抑制角化细胞残留，术后需长期监测泪膜功能以预防复发；异位角化虽未伴异型增生，但其存在可能提示局部微环境失衡，虽无典

型癌前特征，仍需长期随访以监测潜在恶变风险。本研究为角膜中央非炎症性增生性病变的诊疗提供了实践依据，强调早期手术干预对预防视力损害及病变进展的重要性。

摘要编号：209543

角膜移植术的手术指征演变与临床趋势 - 基于大连市第三人民医院七年病例资料的回顾性分析。

第一作者：He DONG

目的：本研究旨在探讨辽南地区角膜移植患者的人口学特征及原发角膜疾病谱系，并分析角膜移植术式与移植材料选择的变化趋势。

方法：本研究回顾性分析了大连市第三人民医院眼科 2017 至 2023 年间接受角膜移植术的 537 例患者的病历资料，并对患者的人口统计学特征（年龄与性别）、原发角膜疾病类型、角膜移植术式及移植材料数据进行了统计分析。

结果：本研究共纳入 7 年研究期间接受角膜移植术的 537 例患者。患者平均年龄为 56.35 ± 15.93 岁，年龄范围 5-90 岁。其中男性 348 例 (64.8%)，女性 189 例 (35.2%)，男女比例为 1.84:1。在原发性角膜疾病中，感染性角膜炎最为常见 (243 例, 45.25%)，其后依次为角膜白斑 (73 例, 13.59%)、角膜内皮功能失代偿 (48 例, 8.94%)、外伤性角膜损伤 (36 例, 6.70%)、角膜移植排斥反应 (34 例, 6.33%)、免疫性角膜溃疡 (33 例, 6.15%)、圆锥角膜 (32 例, 5.96%)、角膜营养不良与变性 (28 例, 5.21%) 以及角膜肿瘤 (10 例, 1.86%)。在感染性角膜炎病例中，具体病因分布如下：真菌性角膜炎 (154 例, 63.37%)、细菌性角膜炎 (54 例, 22.22%)、病毒性角膜炎 (34 例, 13.99%) 及阿米巴性角膜炎 (1 例, 0.41%)。根据角膜移植术式分类，穿透性角膜移植术 (PKP) 最为常见 (265 例, 49.35%)，其次为深板层角膜移植术 (129 例, 24.02%)、前板层角膜移植术 (116 例, 21.60%) 和内皮角膜移植术 (27 例, 5.03%)。PKP 仍是角膜移植的主要术式，但接受 DALK、ALK 和 EK 术式的患者比例正逐步上升。移植材料分类显示：新鲜供体角膜移植片 (297 例, 55.31%)、脱水保存供体角膜移植片 (166 例, 30.91%)、角膜基质透镜 (4 例, 0.74%) 及生物工程角膜移植片 (70 例, 13.04%)。

结论：由于经济发展与产业分布等因素影响，感染性角膜炎已成为中国辽南地区角膜移植的首要病因，真菌感染是感染性角膜炎最主要的致病因素。角膜移植术式已从传统的穿透性角膜移植转向成分角膜移植。移植材料选择亦显著丰富，除人类供体

角膜外，现已涵盖角膜基质透镜与生物工程角膜等多种类型。本研究系统阐述了角膜移植术式演变与材料创新趋势，为区域眼科医疗政策制定提供了重要参考依据。

载 NGF 的电沉积人工角膜延缓圆锥角膜进展并促进角膜神经修复的实验研究

第一作者：Tianze CUI

共同作者：Meiyan LI, Ruoyan WEI, Xingtao ZHOU, Ziqing FENG

目的：本研究旨在建立新西兰兔角膜神经损伤模型，通过飞秒激光制作角膜基质囊袋并植入负载神经生长因子的电沉积人工角膜，评估该技术在动物模型中延缓圆锥角膜进展并促进角膜神经再生与功能修复的有效性及安全性研究。

方法：选取 12 只健康新西兰兔，自身对照，每只新西兰兔左眼为实验组，右眼为对照组。实验组采用飞秒激光制作角膜基质囊袋，植入负载 NGF 的电沉积人工角膜。对照组植入未载药的人工角膜。术后 1 天、2 周、4 周、12 周采用 Cochet-Bonnet 角膜知觉计检测角膜知觉，使用 Schirmer 泪液试纸测量泪液分泌量。随访结束后获取角膜组织，通过全角膜免疫荧光染色观察角膜神经末梢的再生与分布。同时记录术后角膜透明度、新生血管及炎症排异反应。

结果：所有手术兔均未发生植入物排异反应，植入物生物相容性良好。术后 12 周，实验组的角膜知觉较对照组显著提高 ($P < 0.05$)。泪液分泌量评估显示，实验组的泪液分泌量显著增多 ($P < 0.05$)。角膜神经染色结果证实，实验组在植入物周围及角膜中央区域观察到密集且形态规则的新生神经末梢再生，而对照组神经未见明显再生。

结论：飞秒激光囊袋技术植入负载 NGF 的电沉积人工角膜，在新西兰兔模型中显示出良好的安全性。该技术能有效促进角膜神经末梢的再生，改善角膜知觉及泪液分泌功能。

遗传机制未明的家族性结膜纤维瘤性病变 1 例 (投稿“女医生专场”——非斜视类儿童眼病疑难病例分享)

第一作者：Hanzhi BEN

共同作者：Jing HONG

目的：男性患儿，3 岁，出生后不久发现双眼角膜下方类结膜样纤维血管组织侵入，病变逐渐进展至瞳孔区。母亲、外婆均有类似眼部病变，且在接受肿物切除联合角膜移植术后均出现早期复发及病变迅速增殖，最终进展为全角膜覆盖失明。

方法：对患儿及家人进行全基因组测序，未能识别出与疾病表现显著关联的致病性基因变异。对患儿施行双眼表肿物切除 + 角膜板层移植术。肿物病理提示为纤维瘤性病变。术后 2 月肿物复发，再次行肿物切除术，并于结膜下多次注射抗增殖药物氟尿嘧啶。治疗后肿物增殖得到有效控制，但继发持续性角膜上皮缺损，经两次羊膜覆盖术后角膜上皮最终愈合。

结果：密切随访，术后两年半，患儿眼部病情稳定，未见植片溶解、排异或肿物复发等。

结论：本病例临床表现罕见且病因未明，推测可能与局部细胞增殖调控失衡有关，亦可能涉及尚未明确的致病基因变异。

摘要编号：208283

重症病毒性角膜炎的非手术治疗策略：病例系列分析

第一作者：Xilin JING

共同作者：Yun FENG, Jingyi LI

目的：伴有前房积脓及角膜内皮斑的重症病毒性角膜炎与真菌或细菌性角膜炎的临床表现高度相似，因此极易被误诊；同时，在合并活动性感染的情况下，患者可能接受紧急治疗性穿透性角膜移植术 (TPK)，导致临床预后不佳。本病例系列探讨严重病毒性角膜炎伴前房积脓及角膜内皮斑的临床特征、诊断及非手术治疗策略，评估保守治疗在此类复杂病例中的可行性及效果。

方法：本研究为回顾性病例系列分析，纳入 5 例单眼严重感染性角膜炎患者。所有患者均表现为大面积中央溃疡、前房积脓 ≥ 3 mm、角膜内皮斑及角膜知觉减退，并排除细菌或真菌感染可能。所有患者接受全面眼科检查，包括角膜知觉检查、角膜刮片镜检与培养、眼前节相干光断层扫描 (AS-OCT)、

实时聚合酶链反应 (PCR) 及活体共聚焦显微镜 (IVCM) 检查。治疗方案包括全身及局部更昔洛韦抗病毒治疗、局部糖皮质激素, 部分患者加用静脉注射免疫球蛋白 (IVIG) 或玻璃体内更昔洛韦注射。

结果: 5 例患者年龄范围为 42-68 岁, 初诊视力均为数指及以下。AS-OCT 显示所有患者角膜内皮斑与角膜内皮之间存在清晰界限, IVCM 未见真菌菌丝。PCR 检测中 3 例病毒阳性 (EBV、VZV、HSV-1), 2 例为阴性。所有患者均接受全身和局部更昔洛韦以及局部糖皮质激素治疗。对两名患者每周给予静脉注射免疫球蛋白 (IVIG), 持续 2 周。除一名患者因虹膜弥漫性前粘连接受了 TPK, 并于术后 10 天出现感染复发外, 其余所有病例均实现了病灶的完全消退。与其他患者相比, 接受 IVIG 的患者症状缓解得更早。

结论: AS-OCT 显示的特征性角膜内皮斑结合角膜知觉减退, 是诊断复杂性病毒性角膜炎的重要辅助指标。即便在微生物检测阴性情况下, 此类特征仍有助于早期正确诊断。积极的保守药物治疗 (全身与局部抗病毒药联合局部糖皮质激素) 可在多数重症病例中实现炎症完全消退, 避免急诊手术干预, 为后续光学角膜移植创造条件。IVIG 可能加速重症患者恢复, 这一发现值得我们进一步研究以验证其疗效与用药方案。

金珍滴眼液治疗干眼的有效性研究——一项随机、双盲、安慰剂对照临床试验

第一作者: **Guo YIHAN**

共同作者: **Jie YING**

目的: 干眼是最常见的眼表疾病之一, 影响全球数亿人, 造成沉重的社会及经济负担。目前干眼的治疗方法多样, 但传统中医治疗干眼的疗效仍不明确。本试验旨在评估一种传统中药组方——金珍滴眼液在中国人群中治疗干眼症的有效性和安全性。

方法: 在这项随机双盲安慰剂对照试验中, 干眼患者被随机分配到金珍滴眼液组或安慰剂 (0.9% 生理盐水) 组治疗 28 天。该研究的主要结局指标是角膜荧光染色评分和眼干燥评分在治疗前后的变化, 次要结局指标包括眼表疾病指数评分、视觉模拟量表评分、荧光素钠泪膜破裂时间、Schirmer I 试验及安全性评估。

结果: 在本研究中, 共随机入组 250 名患者, 最终有 236 名患者完成随访, 每组各 118 人。试验组治疗 28 天后, 角膜荧光染色评分和眼干燥评分均显著改善 (32.78 ± 1.86 vs 54.67 ± 22.29 , $p <$

0.0005 ; 2.79 ± 0.19 vs 4.17 ± 2.31 , $p < 0.0005$), 治疗后, 对照组及试验组角膜荧光染色评分和眼干燥评分的改善也差异显著 (-21.89 ± 1.538 vs -8.94 ± 1.581 , $P < 0.001$; -1.377 ± 0.218 vs -0.068 ± 0.236 , $P < 0.001$)。次要结局指标均表现出明显的改善 ($p < 0.05$)。另外, 金珍滴眼液的整体安全性良好, 试验组出现眼部不良事件 7 例 (5.6%), 对照组有 3 例 (2.4%) ($p < 0.05$)。

结论: 使用金珍滴眼液 28 天可显著改善干眼患者的症状和体征, 且安全性良好。这种传统中医组方为干眼的临床治疗提供了具有良好前景的替代方案。

香烟烟雾通过诱导 YAP O-GlcNAc 糖基化引发角膜上皮细胞铁死亡

第一作者: **Meng-yuan ZHANG**

共同作者: **Yong YAO**

目的: 香烟烟雾 (cigarette smoke, CS) 作为重要的室内空气污染物, 其暴露与眼表疾病风险增加密切相关。角膜作为眼表最外层的防御屏障, 对 CS 高度敏感, 然而 CS 引发角膜损伤的具体分子机制仍未完全阐明。本研究旨在探究 CS 暴露是否通过诱导铁死亡导致角膜上皮细胞损伤, 并重点阐明其上游调控机制。

方法: 体内研究建立了 C57BL/6J 小鼠 24 周 CS 慢性吸入模型, 通过 H&E 染色、角膜全铺片免疫染色技术评估角膜结构、神经密度和屏障功能, 并进行转录组测序。体外研究使用人源角膜上皮细胞 (human corneal epithelial, HCE) 构建香烟烟雾提取物 (cigarette smoke exposure, CSE) 暴露模型, 并利用铁死亡抑制剂 Fer-1 与去铁胺 DFO 进行干预, 通过 Calcein-AM/PI 双染、脂质过氧化探针和 Fe^{2+} 探针评估细胞死亡和铁死亡特征。利用 siRNA 技术敲低 ACSL4、TFRC 及 YAP 基因, 结合蛋白质印迹、免疫共沉淀、核质分离及放线菌酮追踪实验, 深入探究 YAP 的稳定性、亚细胞定位及其 O-GlcNAc 糖基化与泛素化修饰的交互作用。

结果: 体内实验表明, CS 暴露不仅导致小鼠角膜组织结构破坏、神经纤维减少及屏障功能受损, 更在转录组水平上显示出铁死亡通路的显著富集。体外实验证实, CSE 引发了剂量依赖性的 HCE 细胞活力下降, 并伴随典型的铁死亡特征, 包括细胞内 Fe^{2+} 特异性蓄积、剧烈的脂质过氧化以及线粒体膜电位崩溃, 而上述现象均能被铁死亡抑制剂 (包括 Fer-1 和 DFO) 有效逆转。其次, CSE 可通过

增加 TFRC 的表达上调细胞内铁水平，并通过增加 ACSL4 的表达促进脂质过氧化，而敲低 ACSL4 或 TFRC 的表达均可阻止 CS 诱导的铁死亡。进一步研究发现，CS 暴露后，转录共激活因子 YAP 蛋白稳定性增强并发生核转位，进而转录调控 TFRC 和 ACSL4 的表达。深入的分子机制揭示，CS 通过增强 OGT 活性，促进 YAP 发生 O-GlcNAc 糖基化。该修饰竞争性抑制了 YAP 的 K48 连接型泛素化，从而阻碍了其通过蛋白酶体途径降解，导致 YAP 在细胞内积累和活化。

结论：本研究阐明 CS 通过诱导 YAP O-GlcNAcylation，增强其稳定性并促进核转位，进而转录上调 ACSL4 与 TFRC，最终触发角膜上皮细胞铁死亡。这一发现揭示了 CS 致眼表损伤的新机制，为干预 CS 相关眼表疾病提供了潜在治疗靶点。

0.01% 阿托品对近视临床前期儿童脉络膜厚度的影响

第一作者：Luqiang WANG

共同作者：Bei DU, Meinan HE

目的：评价 0.01% 阿托品滴眼对近视临床前期儿童脉络膜厚度的作用，并探讨脉络膜厚度作为结构性生物标志物用于近视风险分层和疗效预测的潜力。

方法：本研究为双盲随机安慰剂对照试验，纳入 54 名 5~12 岁预近视儿童，随机分配至 0.01% 阿托品组或安慰剂组，连续用药 12 个月。每 3 个月通过 OCT/OCTA 测量脉络膜厚度，比较中央凹及黄斑各环区脉络膜厚度的变化。采用线性混合模型对纵向数据进行分析，控制双眼间相关性，并通过无监督聚类识别两类脉络膜厚度变化轨迹表型（“变薄主导型”和“稳定型”）。

结果：12 个月时阿托品组中央凹和黄斑内环脉络膜厚度基本保持基线水平，安慰剂组则显著变薄；两组上述部位脉络膜厚度变化差异具有统计学意义（ $p = 0.034, 0.028$ ）。聚类分析将脉络膜厚度变化轨迹分为“变薄主导型”和“稳定型”。变薄主导型呈现更大的等效球镜度降低（ -0.38 ± 0.32 D vs -0.32 ± 0.59 D）和眼轴延长（ 0.33 ± 0.15 mm vs 0.27 ± 0.17 mm）趋势，但组间差异无统计学意义（ $p = 0.532, 0.077$ ）。然而，效应量 Hedges' $g = 0.35$ 提示两组间仍存在中等程度差

异。基线脉络膜厚度与 12 个月时眼轴增长呈弱负相关（ $r = -0.20, p = 0.044$ ），与等效球镜度变化无显著相关（ $r = 0.07, p = 0.515$ ）。

结论：0.01% 阿托品滴眼可有效维持近视临床前期儿童脉络膜厚度，脉络膜厚度有望成为近视发生风险分层和干预疗效预测的结构性生物标志物。

4L 综合疗法对中低度青少年儿童近视的临床疗效观察

第一作者：Mao YIMING

目的：观察评估 4L 综合疗法对青少年儿童近视控制的临床疗效及安全性。

方法：采取前瞻性对照干预队列研究，选取 6~12 岁青少年作为研究对象。按照散瞳验光的等效球镜度数（spherical equivalent, SE）分为 4 组，即低度近视 4L 综合疗法治疗组（T1 组，50 眼， -1.00 D ~ -3.00 D）、低度对照组（C1 组，50 眼， -1.00 D ~ -3.00 D）、中度近视 4L 综合疗法治疗组（T2 组，50 眼， -3.25 D ~ -5.00 D）和中度对照组（C2 组，50 眼， -3.25 D ~ -5.00 D）。4L 综合疗法是指 Light（灯光改造）、Laser（低强度红光照射）、Long（远像光屏）和 Lead（周边近视离焦光学矫正）4 个首字母为 L 方法的集合。Light 要求家庭照明灯光选用全光谱或益光谱的吸顶灯及台灯（显色指数 $Ra \geq 95, R9 > 90$ ；色温 ≤ 4000 K；桌面照度 > 900 lux；环境照度 > 300 lux）。Laser 要求使用 650 nm 弥散漫透射红光治疗仪进行每天 3 分钟、早晚各 1 次的重复照射。Long 要求每天使用至少半小时。Lead 指佩戴周边近视离焦框架镜。对照组自愿佩戴框架镜，不做任何干预。观察比较基线时、3 个月及 6 个月的 SE 和 AL 的变化结果及 OCT、眼底照相等情况。

结果：基线时近视度数（SE）T1 组 -1.25 D（ $-1.75, -1$ ），C1 组 -1 D（ $-1.13, -0.63$ ）， $P = 0.001$ ；T2 组 -3.5 D（ $-3.75, -3.25$ ），C2 组 -3.25 D（ $-3.5, -3.25$ ）， $P = 0.035$ 。眼轴长度 T1 组 23.86 mm（ $23.36, 24.12$ ），C1 组 23.48 mm（ $22.47, 23.88$ ）， $P = 0.065$ ；T2 组 24.01 mm（ $23.19, 24.83$ ），C2 组 23.72 mm（ $23.25, 24.33$ ）， $P = 0.497$ 。3 个月的近视度数（SE）T1、C1、T2 及 C2 组均无变化。眼轴长度（AL）增加量 T1 组 0 mm（ $-0.07, 0.04$ ），C1 组 0.08 mm（ $0.06, 0.11$ ）， $P < 0.001$ ；T2 组 0.03 mm（ $-0.02, 0.08$ ），C2 组 0.12 mm（ $0.1, 0.2$ ）， $P < 0.001$ 。6 个月的近视度数增加量（SE）T1 组 -0.25 D（ $0, 0.25$ ），C1 组 0.25 D（ $-0.25, 0$ ）， $P = 0.001$ ；T2 组 0 D（ $0, 0.25$ ）， $P = 0.001$ ；C2 组 0.25 D（ $-0.25, 0$ ）， $P = 0.001$ 。

0.25), C2 组 0.38 D (-0.5, -0.25), $P < 0.001$ 。眼轴长度 (AL) 增加量 T1 组 0.01 mm (-0.03, 0.04), C1 组 0.13 mm (0.08, 0.16), $P < 0.001$; T2 组 0.09 mm (0.02, 0.12), C2 组 0.25 mm (0.17, 0.33), $P < 0.001$ 。其中通过基线时近视度数 (SE) T1 组 -1.25 D (-1.75, -1), C1 组 -1 D (-1.13, -0.63), $P = 0.001$; T2 组 -3.5 D (-3.75, -3.25), C2 组 -3.25 D (-3.5, -3.25), $P = 0.035$ 。眼轴长度 T1 组 23.86 mm (23.36, 24.12), C1 组 23.48 mm (22.47, 23.88), $P = 0.065$; T2 组 24.01 mm (23.19, 24.83), C2 组 23.72 mm (23.25, 24.33), $P = 0.497$ 。3 个月的近视度数 (SE) T1、C1、T2 及 C2 组均无变化。眼轴长度 (AL) 增加量 T1 组 0 mm (-0.07, 0.04), C1 组 0.08 mm (0.06, 0.11), $P < 0.001$; T2 组 0.03 mm (-0.02, 0.08), C2 组 0.12 mm (0.1, 0.2), $P < 0.001$ 。6 个月的近视度数增加量 (SE) T1 组 -0.25 D (0, 0.25), C1 组 0.25 D (-0.25, 0), $P = 0.001$; T2 组 0 D (0, 0.25), C2 组 0.38 D (-0.5, -0.25), $P < 0.001$ 。眼轴长度 (AL) 增加量 T1 组 0.01 mm (-0.03, 0.04), C1 组 0.13 mm (0.08, 0.16), $P < 0.001$; T2 组 0.09 mm (0.02, 0.12), C2 组 0.25 mm (0.17, 0.33), $P < 0.001$ 。其中通过 4L 综合疗法治疗的儿童 6 个月的近视度数均得到控制且无明显差异 (T1 组 -0.25 D (0, 0.25)、T2 组 0 D (0, 0.25), $P = 0.557$); 3 个月的眼轴均得到控制且无明显差异 (T1 组 0 mm (-0.07, 0.04)、T2 组 0.03 mm (-0.02, 0.08), $P = 0.018$); 而 6 个月的眼轴仍明显控制且低度近视儿童效果更显著 (T1 组 0.01 mm (-0.03, 0.04)、T2 组 0.09 mm (0.02, 0.12), $P < 0.001$)。

结论: 4L 综合疗法能有效延缓青少年儿童的近视度数增长和抑制眼轴增加, 且低度近视患者控制效果更为显著。治疗期间无视网膜损伤、结构性病变, 通过 OCT 及眼底图像检查均正常, 无不良事件发生, 安全性高。

650 nm 红光照射损伤: 通过 Drp1 诱导线粒体功能障碍导致人视网膜色素上皮 (ARPE-19) 细胞凋亡

第一作者: Mengyao WANG

共同作者: Yongchuan HE

目的: 1) 证明红光照射导致的人视网膜色素上皮 (ARPE-19) 细胞凋亡是由于其线粒体分裂蛋白 Drp1-S616 磷酸化水平升高引起, 从而促进线粒体过度分裂。2) 使用 Mdivi-1 抑制 Drp1 可预防红

光照射诱导的人视网膜色素上皮 (ARPE-19) 细胞泛凋亡。

方法: 1) 细胞实验: 目前大部分 650 nm 红光设备临床治疗的入眼强度约为 $0.39 \text{ mW} \pm 15\%$ - $1.5 \text{ mW} \pm 15\%$, 所以选用人视网膜色素上皮 (ARPE-19) 细胞系进行细胞实验, 分为: 正常对照组: 无光照。亚阈值组: 0.1 mW/cm^2 照射 10 分钟/天。临界阈值组: 1.5 mW/cm^2 照射 10 分钟/天。超阈值组: 2.0 mW/cm^2 照射 10 分钟/天。持续损伤组: 1.5 mW/cm^2 照射 6 小时/天。检测各组相关凋亡蛋白表达变化, 进一步利用共聚焦显微镜观察红光照射后细胞线粒体碎片化及活性氧变化情况, 随后检测与线粒体分裂融合相关蛋白的表达变化; 动物验证实验: 选用 C57BL/6J 小鼠分为上述同样六组进行红光照射, 并取视网膜组织观察病理改变及 TUNEL 染色。

结果: 结果显示亚阈值组、临界阈值组、超阈值组照射后凋亡蛋白没有明显变化, 而持续照射会促进细胞凋亡, 提示短期照射具有安全性, 而长时间照射可能会引起细胞凋亡。共聚焦显微镜观察长时间照射后细胞线粒体会发生碎片化, 伴有线粒体功能障碍和活性氧生成增多。检测与线粒体分裂融合相关蛋白的表达变化, 发现长时间照射会导致人视网膜色素上皮 (ARPE-19) 细胞线粒体分裂蛋白 Drp1-S616 磷酸化水平升高, 促进线粒体过度分裂。为了探究 Drp1 在其中的作用, 利用腺病毒和腺相关病毒在动物和细胞水平, 敲除和过表达 Drp1, 观察对细胞凋亡的影响, 结果显示对于长时间照射组敲除 Drp1 可以抑制细胞凋亡, 而对于短时间照射组过表达 Drp1 可以促进细胞凋亡, 提示 Drp1 引起的线粒体过度分裂, 是导致长时间照射引起细胞凋亡的主要原因。在动物验证实验中验证了上述同样结果。为了实现临床转化应用的可能, 我们进一步使用 Drp1 抑制剂, Mdivi-1 处理长时间照射细胞, 发现可以有效抑制线粒体分裂, 并抑制细胞凋亡。

结论: 短时间低剂量红光照射不会引起视网膜组织损伤及细胞凋亡, 但长时间照射会引起 Drp1 引起的线粒体过度分裂导致视网膜色素细胞凋亡。

不同周龄豚鼠巩膜生物力学变化趋势及其在近视发展中作用的研究

第一作者: Zhen LI

目的: 临床研究表明, 不同年龄儿童的近视进展速度差异显著, 呈现近视发生时年龄越小, 进展速度越快的趋势。通过测量正常发育状态下不同周龄豚

鼠后极部巩膜的剪切模量，明确巩膜生物力学随着豚鼠年龄增长的变化趋势，探究近视进展速度差异与发病时巩膜生物力学之间的相关性。通过透镜诱导建立不同周龄豚鼠近视模型，分析造模前后眼部生物学参数和巩膜剪切模量的差异，探究在近视发展过程中的巩膜生物力学的变化。

方法：纳入 2.5 w/3 w/4 w 三色豚鼠各 12 只，各周龄豚鼠随机分为对照组（NOR）和镜片诱导近视组（LIM），NOR 组豚鼠不做任何干预；LIM 组豚鼠右眼配戴 -10.00 D 镜片，左眼不干预。实验开始前，测量所有豚鼠屈光度、眼轴长度等，随后 NOR 组将豚鼠安乐死并取出眼球；LIM 组干预 2 周后，再次测量所有豚鼠如上眼部参数，随后将豚鼠安乐死并取出眼球。去除巩膜结缔组织，识别并标记 4 个方向：上侧、下侧、鼻侧、颞侧，使用光学相干弹性成像系统（OCE）测量各方向巩膜的生物力学参数；测量结束后，各组将一部分眼球即刻放入眼球固定液中固定，分上下、鼻颞 2 个切面进行包埋、切片、HE 染色，观察巩膜各方向胶原纤维的排列等。另一部分眼球分 4 个方向分离后极部巩膜组织，测量各方向巩膜组织密度，并通过 qPCR 探究巩膜胶原蛋白 I 的表达水平。

结果：不同周龄 NOR 组中，周龄越大，各方向巩膜的厚度越厚、力学性能更强、胶原纤维排列更紧密且胶原蛋白 I mRNA 表达越高，颞侧尤为显著。不同周龄 LIM 组中，造模结束后，周龄越小，近视发展速度越快；各方向巩膜力学性能降低越显著，胶原纤维束交联结构越松散，颞侧尤为显著。

结论：在眼球生长发育过程中，上、下、鼻、颞 4 个方向巩膜力学性能均增强且存在区域性差异。因眼轴主要向颞侧增长，巩膜的“力学适应性”会促进颞侧胶原纤维的主动重塑，通过胶原增粗和紧密交联维持高剪切模量，发生代偿性“硬化”。在近视发展时，4 个方向巩膜力学性能均降低且存在区域性差异。颞侧巩膜受到更大机械拉伸力，胶原纤维发生纤维变细、断裂或交联减少等重构及降解增多，力学性能降低更显著。年龄越小巩膜的力学性能越弱，巩膜更易变形，且出现近视后发展速度更快，颞侧尤为显著。

不同戴镜率对近用型多区正向离焦镜片（MDPs）延缓未近视儿童近视漂移的影响

第一作者：Guangyao RAN

共同作者：Xiaoning LI, Zhiwei LUO, Zhikuan YANG

目的：本研究旨在探讨不同近距离用眼戴镜率对近用型 MDPs 延缓未近视儿童近视漂移及眼轴增长有效性影响，并分析其可能机制。

方法：本研究为一项前瞻性自身对照研究，于 2023 年 1 月至 2025 年 1 月在长沙爱尔眼科医院开展。研究对象为 6-12 岁的未近视儿童，要求在近距离用时配戴 MDPs。研究随访时间为 1 年，每 6 个月进行一次随访，评估眼轴（AL）、等效球镜度（SER）、脉络膜厚度（CT）及脉络膜中大血管容积（CVV）等参数的变化。通过问卷调查收集受试者的父母近视人数、近距离用眼戴镜时间、近距离用眼时间等数据，计算近距离用眼戴镜率（近距离用眼戴镜时间/近距离用眼时间 × 100%），按照近距离用眼戴镜率，将受试者分为四组：0%-29.9% 组、30%-59.9% 组、60%-89.9% 组和 90%-100% 组。基于扫频光学相干断层成像技术（SS-OCTA）及 EDTRS 环分区对脉络膜厚度及脉络膜中大血管容积进行分析。

结果：本研究共纳入 112 名受试者，平均年龄为 7.69 ± 1.69 岁，男性占比 51%。12 个月随访期间，受试者 AL 平均增长量为 0.21 ± 0.10 mm，SER 变化为 -0.11 ± 0.35 D。AL 的增长与 SER 的变化（ $r = -0.55$, $p < 0.001$ ）、1 年近距离用眼戴镜率（ $r = -0.40$, $p < 0.001$ ）、年龄（ $r = -0.23$, $p = 0.024$ ）、1 年 CT 变化（ $r = -0.44$, $p < 0.001$ ）及 CVV 变化（ $r = -0.33$, $p = 0.001$ ）均呈显著负相关。在 12 个月随访时，近距离用眼戴镜率 90%-100% 组的 AL 增长量显著低于 0%-29.9% 组（0.13 ± 0.08 mm vs 0.31 ± 0.12 mm, $p = 0.001$ ）和 30%-59.9% 组（0.13 ± 0.08 mm vs 0.25 ± 0.17 mm, $p = 0.03$ ）。该组 SER 变化亦显著低于 0%-29.9% 组（0.02 ± 0.39 D vs -0.47 ± 0.43 D, $p = 0.001$ ）及 30%-59.9% 组（0.02 ± 0.39 D vs -0.20 ± 0.46 D, $p = 0.04$ ）。

结论：使用近用型 MDPs 延缓未近视儿童眼轴增长及近视漂移过程中，提高近距离用眼戴镜率是确保近用型 MDPs 有效性的关键因素。其作用机制可能与增加脉络膜血管容积导致脉络膜增厚有关。

中国近视儿童和青少年佩戴角膜塑形镜、离焦框架眼镜和单光框架眼镜的生活质量与临床效果的比较研究

第一作者: Guanhao QIN

共同作者: Wei HE, Xingru HE, Ruyi LI, Sile YU

目的: 评估并比较中国近视儿童和青少年佩戴角膜塑形镜、离焦框架眼镜和单光框架眼镜一年后在视觉相关生活质量方面的差异, 以及佩戴 6 个月和第 12 个月时眼轴变化的差异。

方法: 这项回顾性队列研究, 共计纳入 93 名佩戴光学矫正镜片 1 年的儿童青少年近视患者 (31 名角膜塑形镜, 31 名离焦框架眼镜, 31 名单光框架眼镜)。使用儿童屈光不正问卷对三组患者佩戴眼镜 1 年后的视力相关生活质量进行比较。收集各组患者戴镜前的等效球镜及眼轴长度等指标, 收集三组患者戴镜第 6 个月及 1 年的眼轴长度, 对三组患者的眼轴增长差异进行比较。

结果: 角膜塑形镜组、离焦框架眼镜组和单光框架眼镜组在学习方面和白天症状方面得分无显著差异 ($P > 0.05$)。角膜塑形镜组在整体视力、远视力、外观、满意度、活动和同伴看法方面得分显著高于离焦框架眼镜组和单光框架眼镜组 ($P < 0.05$)。在近视力方面角膜塑形镜组和单光框架眼镜组得分显著高于离焦框架眼镜组 ($P < 0.05$)。在清洁保养方面角膜塑形镜组得分显著低于单光框架眼镜组 ($P < 0.01$)。对于问卷总分角膜塑形镜组显著高于其他两组, 差异有统计学意义 ($P < 0.05$)。在第 6 个月时, 角膜塑形镜组、离焦框架眼镜组和单光框架眼镜组的眼轴变化分别为 0.10 ± 0.07 mm、 0.12 ± 0.05 mm、 0.19 ± 0.08 mm。结果显示, 角膜塑形镜组与离焦框架眼镜组的眼轴变化显著低于单光框架眼镜组 ($P < 0.05$)。但在第 12 个月, 角膜塑形镜组、离焦框架眼镜组和单光框架眼镜组的眼轴变化分别为 0.18 ± 0.08 mm、 0.27 ± 0.08 mm 和 0.36 ± 0.09 mm ($P < 0.05$)。与离焦框架眼镜组和单光框架眼镜组相比, 角膜塑形镜组眼轴增长量最小 ($P < 0.05$)。同时离焦框架眼镜组的眼轴增长量也显著低于单光框架眼镜组 ($P < 0.05$)。

结论: 与单光框架眼镜相比, 离焦框架眼镜和角膜塑形镜均能有效延缓近视进展。然而, 角膜塑形镜在控制眼轴增长和提高视力相关生活质量方面表现更为出色, 是儿童青少年近视防控的优选方案。

从力到分子: 高通量组学揭示角膜交联与后巩膜加固术介导细胞外基质重塑的共通与特异机制

第一作者: Lin YE

目的: 角膜交联术 (CXL) 与后巩膜加固术 (PSR) 分别是治疗圆锥角膜和病理性高度近视的常用术式, 其核心机制在于增强纤维膜结构的生物力学强度, 以抑制眼球壁的病理性扩张。术后生物力学变化刺激角膜及巩膜成纤维细胞, 介导后续细胞外基质 (ECM) 重塑。然而, 生物力学调控 ECM 重塑的内在分子机制尚未明确。本研究旨在通过高通量组学技术, 系统分析 CXL 与 PSR 分别对角膜及巩膜组织分子特征的影响, 探索眼部生物力学相关手术的内在机制, 并提供潜在优化策略。

方法: 1. 对角膜扩张模型新西兰兔行 CXL (370 nm, 10 mW/cm²), 手术前后通过角膜地形图、透射电镜、单轴拉伸力学测试及组织病理学评估角膜结构。术后 2 周取角膜组织进行高通量蛋白质组学分析, 筛选差异表达蛋白 (DEPs) 并进行功能注释和富集分析。2. 对实验兔进行 PSR (牛心包补片, Thompson 单条带法固定), 手术前后通过透射电镜、组织切片及单轴拉伸实验评估巩膜结构与力学性能。术后 4 周取加固区巩膜组织进行转录组测序, 筛选差异表达基因 (DEGs), 并进行功能注释和富集分析。3. 通过 qPCR 和 Western blot 验证组学中的关键分子。

结果: 1. CXL 增强角膜生物力学, 抑制角膜扩张。2. CXL 上调了 116 个 DEPs、下调 122 个 DEPs; 富集分析显示, CXL 影响免疫、破骨细胞分化和与激素代谢 (甲状腺素和雌激素等) 相关的通路; CD44 和 ALDH1A1 等 DEPs 可能起中央调控作用。3. PSR 显著增加巩膜生物力学结构和强度。4. PSR 上调了 1671 个 DEGs, 下调了 1114 个 DEGs。富集分析显示, PSR 主要改变了与免疫、破骨分化、胶原合成和钙离子通道相关的通路。KEGG 分析提示, 细胞膜上受体相关通路和 CCL、白介素家族和 TNF 等细胞因子可能起重要调控作用。

结论: CXL 与 PSR 均能通过影响刺激成纤维细胞, 调节 ECM 重塑, 通过激活免疫反应与破骨分化相关通路, 提示炎症和成纤维细胞分化在其中的重要作用, 后者可进一步改变角 / 巩膜生物力学性能。CXL 尤为影响激素代谢通路, 而 PSR 则显著改变细胞膜受体相关信号途径。本研究揭示了两类生物力学加固手术在分子层面的异同, 为眼部生物力学的研究提供新思路, 为未来手术策略优化提供新方向。

以临床问题为导向的近视防控研究

第一作者: Xiao YANG

共同作者: Yin HU, Mengyi WANG

目的: 基于临床问题, 探讨近视防控个性化策略。从循证医学视角分析近视防控临床经验与核心理念。

方法: 梳理并系统阐述本团队的临床研究成果与结论, 并结合领域内多个高质量近视防控研究, 构建“以临床问题为导向”的近视管理框架。围绕三个核心环节展开: 精准识别风险个体 (WHO), 创新优化手段 (WHAT), 科学决策干预 (HOW)。

结果: 在开展近视防控前, 需先判断患者的风险并分层。团队研究核心思维在于整合基线屈光状态与既往眼轴进展速率, 建立预早期发病的预警模型, 加强一级预防关口前移。有效回答了“谁具有风险? 谁需要干预?”的临床困惑。在干预优化层, 团队着重针对光学干预的量化与设计优化 (非对称离焦技术、数字化 OK 镜)、药物优化 (阿托品频次探索) 及联合治疗创新 (光学 - 药物联合), 解决难治性近视单一干预的效能等瓶颈开展探索。在良好的临床手段基础上, 团队进一步探究科学的临床决策和管理, 提出循证医学建设近视防控门诊的概念和实践标准。此外, 依托早期高效指标 (首月眼轴变化、脉络膜形态演变) 等构建远期疗效预判模型。通过结合决策模型和个体化风险, 最终形成“分层 - 干预 - 优化”的临床决策闭环, 有效回应临床诉求。

结论: 以临床问题为导向的近视防控, 在于建立临床需求与循证医学结合的体系, 将个性化的转化实践于临床路径。通过人群识别、优效干预、科学决策, 可以为破解近视进展提供系统性解决方案。

华中地区学龄前儿童近视及高度近视的临床表型与致病基因特征分析

第一作者: Rui CHEN

共同作者: Yuwei CEN, Ke DING, Wei LIU

目的: 探讨华中地区学龄前儿童早发近视与高度近视的临床表型及致病基因特征, 分析其对早期诊断与干预的启示。

方法: 收集 2024 年 7 月至 2025 年 10 月就诊的 76 名年龄 0 ~ 6 岁的近视或高度近视儿童, 进行全面的眼科检查, 包括散瞳屈光、眼轴长度、眼底照相、光学相干断层扫描 (OCT) 及视网膜电图 (ERG)。采用全外显子组测序 (WES) 检测致病基因变异,

并对早发近视组与早发高度近视组的临床及遗传特征进行比较分析。

结果: 76 例患儿中, 早发近视 25 例, 早发高度近视 51 例。两组男孩比例分别为 68% 和 53%; 屈光参差 ≥ 2.00 D 的分别为 16% 和 41.2%。伴有斜弱视、畏光或眼球震颤等眼部表现的比例分别为 24% 和 37.3%。家族近视史阳性者分别为 40% 和 45.1%。共发现 14 例 (18.4%) 孩子存在致病或可能致病基因变异, 涉及 OPN1LW (4 例)、CACNA1F (3 例)、TRPM1 (1 例)、GLRA2 (1 例)、NR2F1 (1 例)、COL11A1 (1 例)、GPR179 (1 例)、FBN1 (1 例) 等基因。

结论: 学龄前早发近视与高度近视表现出不同的临床及遗传特征。全外显子组测序揭示了多样的致病基因, 主要涉及光传导及细胞外基质相关通路。将基因检测纳入早期筛查有助于明确病因、避免误诊, 并指导个体化干预, 预防进展为病理性近视及严重视功能损害。

单眼近视儿童配戴角膜塑形镜后脉络膜厚度及视网膜周边离焦变化的随访研究

第一作者: Jingbin SI

共同作者: Huang RUIQIN

目的: 观察单眼近视儿童配戴角膜塑形镜前后脉络膜厚度及视网膜不同区域周边离焦 (RDV) 的变化。

方法: 回顾性研究。收集 2023 年 8 月至 2024 年 12 月就诊于石家庄爱尔眼科医院的配戴角膜塑形镜的青少年近视 71 例。年龄 (10.31 ± 1.34) 岁, 近视眼 SE (-2.01 ± 0.68) D 配戴 OK 镜, 对侧眼 SE (0.06 ± 0.44) D, 不做干预。使用 OCTA 测量黄斑中心凹下的脉络膜厚度, 多光谱屈光地形图 (MRT) 测量戴镜前、戴镜 6 个月时的 RDV。

结果: 基线脉络膜厚度: 近视眼侧 (285.33 ± 37.13) μm , 对侧眼为 (294.33 ± 48.13) μm ; 周边离焦总值 (TRDV): 近视眼为 (0.06 ± 0.27) D 呈现周边远视性离焦, 视网膜不同区域上方 (RDV-S)、下方 (RDV-I)、颞侧 (RDV-T)、鼻侧 (RDV-N) 分别为 (-0.65 ± 0.44) D、(0.09 ± 0.46) D、(0.02 ± 0.51) D、(0.28 ± 0.07) D, 除上方为近视性离焦外其余三个方向均为远视性离焦, 对侧眼为 TRDV (-0.34 ± 0.21) D 呈现周边近视性离焦, RDV-S、I、T、-N 分别为 (-0.25 ± 0.42) D、(0.10 ± 0.35) D、(-0.43 ± 0.49) D、(-0.33 ± 0.07) D, 除下方为远视性离焦外其余三个方向均为近视性离焦, ; 戴镜眼 6 个月后果膜增厚 (13.25 ± 19.26) μm ($P < 0.05$),

对侧眼脉络膜前后变化无统计学差异 ($P > 0.05$)，戴镜眼 TRDV、RDV-S、RDV-I、RDV-T、RDV-N 分别为 (-0.53 ± 0.76) D、 (-0.31 ± 0.55) D、 (-1.12 ± 1.36) D、 (-1.12 ± 1.51) D、 (0.50 ± 0.11) D，TRDV 呈现近视性离焦 ($t = 4.54$, $P < 0.05$)，其中下方和颞侧的近视性离焦变化最明显 ($t = 6.70, 5.85$; $P < 0.05$)，上方的近视性离焦变小，鼻侧的远视性离焦变大 (P 均 < 0.05)，对侧眼 RDV 前后变化无统计学差异 ($P > 0.05$)。

结论：单眼配戴角膜塑形镜 6 个月后脉络膜增厚，视网膜周边远视离焦总值由远视性离焦变为近视性离焦，其中下方和颞侧变化量最大，上方的近视性离焦变小，鼻侧的远视性离焦变大。

单眼近视儿童配戴角膜塑形镜晶体厚度的变化与眼轴长度的关系

第一作者：Jingbin SI

共同作者：Huang RUIQIN

目的：探讨单眼近视患者配戴角膜塑形镜后晶体厚度的变化与眼轴长度变化的关系。

方法：回顾性研究，(1) 选取 2023 年 8 月至 2024 年 8 月在我院视光门诊就诊的 8-13 岁的单眼近视患者 124 例，近视眼的等效球镜 (SE) 为 $-4.00 \sim -1.00$ D， 1.0 D $\leq$ 双眼 SE 差值 ≤ 2.50 D，双眼的最佳矫正视力 ≥ 0.8 ，根据矫正方式分为实验组和对照组：实验组 71 例为 OK 镜组，近视眼侧配戴角膜塑形镜 (OK 镜) 定义为 OK-近视眼组，对侧的非近视眼未做干预定义为 OK-非近视眼组；对照组 53 例为单光框架眼镜组 (SP 组)，近视眼侧用单光镜片矫正定义为 SP-近视眼组，对侧的非近视眼配戴平光镜片定义为 SP-非近视眼组。随访时间为 1 年，测量受试者的显然验光和眼前节参数，分析戴镜前及戴镜 1 年后双眼的平坦角膜曲率 (Kf)、晶体厚度 (LT)、前房深度 (ACD)、眼轴长度。采用配对 t 检验比较各组间参数有无差异，线性回归分析研究双眼晶体厚度的变化与眼轴长度增长的相关性。

结果：(1) LT 变化：OK-近视眼组戴镜前为 (3.25 ± 0.15) mm 增加至 (3.29 ± 0.16) mm，差异有统计学意义 ($t = -4.51$, $P < 0.001$)，OK-非近视眼组前后差异无统计学意义 ($P > 0.05$)。SP 组双眼的 LT 戴镜前后差异无统计学意义 (P 均 > 0.05)；(2) ACD 变化：OK-近视眼组前后差异无统计学意义 ($P > 0.05$)；OK-非近视眼组 (3.74 ± 0.20) mm 增长到 (3.78 ± 0.18) mm，差异有统计学意义 ($t = -1.83$, $P < 0.05$)。SP 组双眼

ACD 均增加，差异有统计学意义 (P 均 < 0.05)，(3) 眼轴变化：OK 镜组双眼 AL 分别增长 (0.10 ± 0.16) mm 和 (0.47 ± 0.20) mm，差异有统计学意义 ($P < 0.001$)。SP 组双眼 AL 均显著增加 ($P < 0.05$)，双眼差异无统计学意义 ($P > 0.05$)。线性回归分析：12 个月 LT 变化量与 AL 增长量呈负相关 ($r = -0.38$, $P < 0.05$)，基线 SE 与 AL 增长量呈正相关 ($r = -0.54$, $P < 0.05$)。

结论：随访 12 个月后，OK-近视眼组儿童的晶体厚度和眼轴长度增加均有显著性。基线近视程度较高和 LT 增加较多与单眼近视儿童的眼轴长度增长较少有关。

基于机器学习多模型集成的 NHANES 高度近视相关因素挖掘

第一作者：Honglin JIANG

共同作者：Jiamin WANG

目的：探讨机器学习多模型集成策略在挖掘高度近视关联因素中的应用价值，解决小样本高维数据中变量筛选与模型稳定性难题，为后续病因研究和风险预测提供线索。

方法：利用 NHANES 2007-2008 数据，纳入具备完整屈光度及系统性特征记录的 2612 例研究对象、121 个多维特征 (人口学、膳食、行为、人体测量、实验室指标等)。高度近视定义为任一眼屈光度 ≤ -6.00 D，同时排除既往近视矫正手术、白内障手术及其他眼科手术者。采用 18 种机器学习模型 (15 种传统模型 + 3 种表格学习模型)，通过分层随机抽样 (8:2)、ROSE 混合采样算法处理类别不平衡、10 折交叉验证优化训练过程。采用三种分类阈值策略 (默认阈值、Youden 指数最优阈值、高敏感度阈值) 评估模型性能，通过准确率、灵敏度、特异度、阳性预测值、阴性预测值、F1 值及 AUC 综合评估模型表现。计算模型中各个特征的 SHAP 值进行特征重要性排序，构建基于模型性能加权的特征排名集成方法，并绘制前 15 个最重要特征的综合排序图和 SHAP 依赖图。通过热图与 Spearman 相关性矩阵验证特征选择稳健性。

结果：研究对象平均年龄 48.64 ± 16.75 岁，男性 1303 例 (49.9%)、女性 1309 例 (50.1%)。模型性能分析显示，LightGBM 在最优 Youden 指数阈值下表现最佳 (AUC = 0.839，灵敏度 = 87.5%，特异度 = 66.6%)，其次为 TabICL (AUC = 0.778)、XGBoost (AUC = 0.769) 和 C5.0 (AUC = 0.765)。跨模型特征重要性集成分析识别出 15 个与高度近视关联最稳定的因素，包括嗜酸性粒细胞数、年

龄、番茄红素摄入量、慢性支气管炎史、饱和脂肪酸 SFA 8:0 摄入量、钠摄入量、血清 4-吡哆酸、血小板平均体积、多不饱和脂肪酸 PFA 22:5 摄入量、家庭贫困指数、嗜酸性粒细胞百分比、尿白蛋白、酒精摄入量、C 反应蛋白及血清 25 羟维生素 D3 浓度等。相关性分析表明 TabPFN 与神经网络在特征排序上高度一致 (Spearman $r = 0.86$)，番茄红素摄入量在多个高性能模型中均被识别为重要预测因子，验证了特征选择的稳健性。

结论：机器学习多模型集成策略有效解决了小样本高维数据特征筛选难题，稳健识别出与高度近视相关的系统性因素（炎症、营养及代谢指标），为高度近视的病因研究与防控策略提供新线索。

应用 SS-OCTA 探究近视人群视网膜微循环特征

第一作者：Hongyue WU

目的：本研究应用扫频源光学相干断层扫描血管成像 (SS-OCTA) 技术观察不同屈光程度近视患者黄斑区视网膜血管丛血流密度、视网膜厚度、中心凹无血管区范围数据的特点和差异，以期深入认识影响近视发生发展的视网膜微循环病理变化。

方法：本研究收集门诊近视患者，纳入符合标准共计 82 例患者 82 只眼，其中轻度近视患者 29 例，中度近视患者 25 例，高度近视患者 28 例。应用 SS-OCTA 采集受试者黄斑区视网膜血管丛血流密度、视网膜厚度以及中心凹无血管区范围数据，然后进行统计学分析。

结果：1. 不同屈光程度近视患者视网膜血管丛血流密度的差异：① SCP：高度近视组 CS、NI、II 区域低于轻度近视组。② DCP：高度近视组 CS 区域低于轻度近视组、中度近视组；高度近视组 TI、NO 区域低于轻度近视组。③ 全层视网膜血管丛：高度近视组 CS、TI、SI、NI、II 区域低于轻度近视组。2. 不同屈光程度近视患者 FAZ 范围的差异：① 不同屈光程度 FAZ 面积及周长不具有差异性；② 高度近视组的深层视网膜 FAZ 周长面积比低于轻度近视组。3. 不同屈光程度近视患者黄斑区视网膜厚度的差异：① 内层视网膜：高度近视组 TI、NI、II、TO、SO 区域低于轻度近视组。② 外层视网膜：高度近视组 TI、SI 区域低于轻度近视组、中度近视组；高度近视组 NI、TO、NO 区域低于轻度近视组；高度近视组 II 区域低于中度近视组。③ 全层视网膜：高度近视组 TI 区域低于轻度近视组与中度近视组；高度近视组 SI、II、TO、SO、IO 区域低于轻度近视组。4. 黄斑区视网膜血管丛血流密度与视网膜厚度的相关性：① CS、TI、SI、NI、

II、SO、NO、IO 区域 SCP 血流密度与内层视网膜厚度呈正相关；② CS、SI、II、TO、SO、IO 区域 DCP 血流密度与外层视网膜厚度呈正相关；③ CS、SI、NI、II、SO、NO、IO 区域全层视网膜血管丛血流密度与全层视网膜厚度呈正相关。

结论：1. 近视患者随着屈光度的增加，眼底微循环改变表现为黄斑区视网膜血管丛血流密度降低，以中心凹及内环区域变化最为显著；视网膜厚度变薄，以颞侧区域变化最为显著。2. 近视人群黄斑区视网膜血管丛血流密度与视网膜厚度呈正相关。

户外活动与阅读时间对近视发生的联合和交互作用：来自中国超过 21 万名儿童的证据

第一作者：Bei DU

目的：尽管大量研究已分别探讨了户外活动时间 and 阅读时间对近视的单独影响，但在大规模人群中这两种因素之间的相互作用仍鲜有研究。我们希望探索增加户外活动时间是否会降低长时间阅读带来的近视风险。

方法：本研究纳入了中国天津儿童眼健康研究中 219,802 名初始非近视的小学生，行为暴露数据通过问卷收集。采用 Cox 比例风险模型（以入学后的学期数作为时间尺度）来评估户外活动时间和阅读时间与近视发病之间的关联。使用广义倾向得分加权 Cox 模型评估在加性尺度上的交互作用效应，并通过交互作用导致的相对风险增加 (RERI)、归因比例 (AP) 和协同指数 (SI) 来量化。此外，还进行了亚组分析以评估结果的稳健性和一致性。

结果：在这 219,802 名儿童中，有 130,246 名发展为近视，三年内的累计发病率为 59.3%。增加户外活动时间 (1-2 小时：风险比 (HR) = 0.97, 95% 置信区间 (CI) = 0.95-0.98；2-3 小时：风险比 (HR) = 0.90, 95% CI = 0.88-0.92；超过 3 小时：风险比 (HR) = 0.86, 95% CI = 0.84-0.89) 与近视发病风险降低有关，而长时间阅读时间 (1-2 小时：风险比 (HR) = 1.02, 95% CI = 1.01-1.03；超过 2 小时：风险比 (HR) = 1.03, 95% CI = 1.01-1.05；超过 3 小时：风险比 (HR) = 1.05, 95% CI = 1.03-1.08) 则与近视发病风险增加有关。在户外活动时间和阅读时间的加性模型中，其交互作用效应具有显著性，风险比效应值为 RERI = -0.04 (-0.08, 0.00)，AP = -0.04 (-0.07, 0.00)，SI = 0.71 (0.50-0.93)，尤其是在年龄 ≤ 3 岁的儿童、男孩以及有近视家族史的儿童中。

结论：户外活动时间与阅读时间不仅各自与近视的发生有关，而且还会相互影响。这些发现强调了增

加户外活动时间和合理安排阅读时间的重要性，以便制定有针对性的近视预防策略。

新型 NYX 突变导致高度近视伴夜盲

第一作者: Xiaoyi XU

共同作者: Lili DAI, Liwen ZHANG

目的: 本研究旨在探究一个中国东北家系中导致高度近视与先天性夜盲症的致病基因突变

方法: 研究对家系成员进行了全外显子组测序以识别基因变异，并利用 AlphaFold2 预测了相关蛋白质的三维结构。分子动力学模拟通过评估该突变诱导的构象变化，对此分析进行了补充。同时，进行了全面的临床评估，包括详细眼科检查、屈光状态评估及眼底成像，以表征表型特征并将其与遗传学发现进行关联分析。

结果: 在 NYX 基因的第 3 号外显子中发现了一个新的移码突变 c.264dup (p.R89Afs*26)，该突变导致蛋白质 C 末端功能域发生提前截短。先证者表现为极度高度近视（等效球镜度 < -23.00 D）并伴有先天性夜盲症的典型症状。结构分析显示，突变蛋白发生了显著的构象变化，破坏了其与 mGluR6 的相互作用界面。系谱分析进一步支持了 X 连锁隐性遗传模式，这与患病家系内的临床和遗传学发现相符。

结论: 本研究首次报道 NYX 基因 c.264dup 突变是导致伴有极度高度近视的完全型先天性静止性夜盲症 (CSNB) 的病因，从而拓展了 NYX 基因的已知突变谱。这些发现对于加强针对受累个体及家庭的分子诊断与遗传咨询具有重要意义，并为揭示视网膜信号转导与病理性眼轴伸长相关联的分子机制提供了新的见解。

病理性近视眼的前部巩膜厚度

第一作者: Siqing HE

共同作者: Yanyun CHEN, Jing LI, Yaping LIU

目的: 本研究旨在利用高分辨率眼前节成像 (AS-OCT) 技术，测量病理性近视患者的前部巩膜厚度，描绘其空间分布特点，尤其关注人工晶状体 (IOL) 巩膜固定点的巩膜厚度及形态特点，探讨前部巩膜厚度与眼轴长度等关键眼部参数的相关性。

方法: 本研究为回顾性研究。使用 AS-OCT 设备，测量病理性近视（观察组）与正视眼（对照组）两组患者上 (S)、下 (I)、鼻 (N)、颞 (T)

四个方向距离巩膜突 1、2、3、4、5、6mm 处的前部深层巩膜厚度 (scleral stroma thickness, SST)，使用 IOLMaster 700 光学生物测量仪测量所有受试者的眼轴长度 (AL)、前房深度 (ACD)、白到白距离 (WTW)。分别比较两组巩膜厚度的空间分布特点，重点分析距离巩膜突 2~3mm 处的巩膜厚度及形态特点，分析巩膜厚度与眼轴等眼前节参数的相关性。

结果: 本研究共纳入 46 名患者 85 眼（观察组 32 名 62 眼，对照组 14 名 23 眼）。病理性近视组与对照组的年龄分别为 36.62 ± 12.94 岁 VS 56.78 ± 10.40 岁 ($P < 0.001$)，眼轴分别为 29.99 ± 2.66 mm VS 23.53 ± 1.01 mm ($P < 0.001$)，病理性近视组患者屈光度为 -14.70 ± 5.24 D。观察组与对照组相比，病理性近视患者的 SST 在各方向上与正视眼无统计学差异。病理性近视组与正视眼组患者 SST 在距离巩膜突 2~3 mm 处均表现为下方最厚，颞侧、鼻侧、上方次之。除距离下方巩膜突 3 mm 处的 SST 与眼轴有相关性 ($r = -0.372$, $P = 0.030$) 以外，本研究未发现病理性近视前部巩膜厚度与眼轴长度之间存在相关性。

结论: 病理性近视组与正视眼组患者的 SST 整体分布特点具有高度一致性，主要呈现为下方最厚，颞侧、鼻侧、上方次之的特点。病理性近视组在距离巩膜突 2~3 mm 处的 SST 与正视眼组相似，为高度近视患者行 IOL 巩膜层间固定的位置提供了重要的在体解剖数据。

离焦与复合点扩散镜片视觉质量比较研究

第一作者: Yushi ZHANG

共同作者: Hongyu CHEN, Mengtian KANG, Yaqi LI, Qianqian SONG, Wenjun XU

目的: 比较单纯离焦设计与离焦复合点扩散设计近视控制镜片对青少年视觉质量的影响。

方法: 随机平行对照试验研究。纳入 2024 年 7 月至 2025 年 2 月就诊的 6~14 岁近视儿童 48 例 (96 眼)，按计算机生成的随机序列 1:1 分为单纯离焦组（以中央直径 7.9 mm 区域为光学区，外围为微透镜离焦区）与离焦复合点扩散组（以中央直径 7.9 mm 区域为光学区，外围为微透镜区叠加光散射点区域）。使用 OQAS 视觉质量分析系统和 OPD-Scan III 波前像差分析仪分别对光学区 (4 mm) 和周边离焦区 (6 mm) 进行客观视觉质量检查，指标包括预测视力 (PredictedVA100%、VA20%、VA9%)、客观散射指数 (OSI)、调制传递函数截止频率 (MTF cutoff)、斯特列尔比以

及离焦区和光学区的像差（总像差、高阶像差、球差、慧差、三叶草差）。采用 36 项主观视觉质量问卷（quality of vision, Qov）评估眩光、光晕、星爆、视觉朦胧、视物模糊、变形、重影、视力波动、聚焦困难、远视力、近视力、周边视觉、舒适度及适应度等。定量资料比较采用 t 检验或曼-惠特尼秩和检验，分类变量采用卡方检验。

结果：共 46 例患者完成随访（应答率 95.8%）（男 22 例，女 24 例；年龄 9.6 ± 2.0 岁）。客观视觉质量方面，两组在 PredictedVA100%/VA20%/VA9%、OSI、MTF cutoff 等指标上均无统计学差异（ $P > 0.05$ ）。单纯离焦组在离焦区的球差显著低于离焦复合点扩散组（ 0.11 ± 0.08 vs. 0.22 ± 0.23 , $P < 0.05$ ）。两组镜片自身的光学区球差、慧差均低于离焦区（ $P < 0.05$ ）。主观视觉感受方面，单纯离焦组的周边视觉清晰度优于离焦复合点扩散组（ $\chi^2 = 12.562$, $P < 0.05$ ），其余主观视觉指标在两组间无统计学差异（ $P > 0.05$ ）。

结论：单纯离焦设计与离焦复合点扩散设计镜片均能为青少年近视患者提供良好的客观视觉质量，单纯离焦设计的离焦区球差更低。单纯离焦设计镜片的周边视觉清晰度主观感受优于离焦复合点扩散设计。该研究为临床中镜片的个性化选择提供了重要依据。

西安市临潼区青少年儿童散光的流行率及轴位的分布状况

第一作者：Yanying LI

共同作者：Zhaojiang DU

目的：通过统计西安市临潼区青少年儿童散光程度及轴位的分布状况，探索与散光分布特征相关的可能原因，并提出预防散光进展的方案。

方法：对 2023 年 9 月至 11 月期间在西安市临潼区接受屈光检查的学生进行横断面研究。所有学生均通过非睫状肌麻痹状态下的客观验光进行测量，并收集了学生的基本信息。使用 Spss 27.0 软件进行单变量和多变量相关性分析。散光的患病率已被确定。散光定义为柱镜 ≤ -0.75 D，低度散光定义为柱镜 ≤ -1.50 D，中度散光定义为柱镜 -3.00 D $\leq$ 且 ≤ -1.50 D，高度散光量定义为柱镜 ≤ -3.00 D。散光类型为：规则散光（WTR）（负柱轴 $180 \pm 30^\circ$ ）、反规则（ATR）散光（负柱轴 $90 \pm 30^\circ$ ）和斜散光（所有其他情况）。65127 名学生（51.0%boys, 7 - 19 岁），25,945（36.1%，95% CI: 35.52 - 36.68%）散光以及 1267（1.8%，

95% CI: 1.07 - 2.53%）具有高散光。计数资料采用百分率（%）表示，组间比较采用卡方检验。

结果：共有 65843 名青少年参与了研究，最终纳入研究的儿童为 65127 名。散光的患病率为 36.72%。学生的散光率随着年级的增长而增加，其中规则散光随着年级的增长而增加，而反规则散光和斜轴散光随着年级的增长而减少，且不同年级的学生中散光类型均为规则散光发病率最高，男女之间的发病率并无明显差异。

结论：西安市临潼区学生散光的患病率较高。西安市临潼区青少年散光患病率为 36.96%，包括高度散光为 1.57%。在该人群中，散光主要为规则散光型（77.00%），且在不同年龄组均为规则散光型发病率最高，发病率分别为：小学 73.12%、初中 78.46%、高中 76.4%。男性、近视或远视与高散光风险独立相关。

视盘形态学参数对儿童近视进展的预测价值：一项队列研究

第一作者：Tao YIJIN

共同作者：Zhong HUA, Xu HUILIN

目的：本研究旨在系统分析不同近视程度青少年视盘形态特征的差异，探讨视盘参数（包括视盘椭圆度指数、视盘面积、视盘旁萎缩弧面积）与近视进展之间的相关性，并构建一个基于视盘形态特征的列线图模型，以预测儿童近视进展风险。

方法：采用前瞻性队列研究设计，纳入 2023 年 10 月至 2024 年 10 月云南省保山市 328 名 8-16 岁学生。所有受试者在基线和 1 年随访时接受全面眼科检查，包括散瞳验光、眼轴长度（AL）测量、扫频源 OCT（SSOCT）成像等。使用 ImageJ 软件分析彩色眼底照片，测量视盘垂直径（VD）、水平径（HD）、椭圆度指数（OI）、视盘面积及视盘旁萎缩弧（PPA）面积。按年龄和等效球镜（SE）分组比较视盘参数差异，采用偏相关分析探讨其与 AL、SE、轴率比（AL/CR）及脉络膜厚度的关系。进一步以 1 年内 SE 变化量将近视儿童分为进展组（ $\Delta SE \leq -0.75$ D）与非进展组（ $\Delta SE \geq -0.50$ D），通过 LASSO 回归和二元 Logistic 回归筛选独立预测因素，并构建列线图模型，通过 ROC 曲线、校准曲线和决策曲线评估模型性能。

结果：视盘 OI 与 AL 呈正相关（ $r = 0.170$, $p = 0.002$ ），与等效球镜（SE）呈负相关（ $r = -0.170$, $p = 0.002$ ）；PPA 面积与 AL 正相关（ $r = 0.498$, $p < 0.001$ ）、与 SE 负相关（ $r = -0.535$, $p < 0.001$ ）。多因素分析显示，较小年龄（OR = 0.698，

95% CI: 0.523-0.914, $p = 0.011$)、较高基线 SE (OR = 1.474, 95% CI: 1.085-2.133, $p = 0.023$) 和较大 OI (OR = 2.840, 95% CI: 1.739-5.000, $p < 0.001$) 是近视进展的独立预测因素。列线图模型显示优良预测性能, 训练集 AUC 为 0.825 (95% CI: 0.752-0.897), 验证集 AUC 为 0.780 (95% CI: 0.623-0.936), 校准曲线与决策曲线分析证实模型具有良好的准确性与临床适用性。

结论: 视盘形态参数 (尤其是 OI 和 PPA 面积) 与儿童近视程度及进展显著相关。年龄小、基线 SE 较高、OI 较大是近视进展的独立危险因素。本研究构建的基于年龄、SE 和 OI 的预测模型具有良好的判别效力和临床实用性, 为儿童近视进展的早期识别与干预提供了新的可视化工具。

视网膜 Opn4-DA 是近视视网膜到巩膜发育的候选信号

第一作者: Zefeng KANG

共同作者: Zefeng KANG

目的: 验证视黑素 - 多巴胺 (Opn4-DA) 轴通过抑制近视视网膜及巩膜内质网应激, 延缓近视眼轴增长的作用。

方法: 选取 36 只 4 周龄 SPF 级雄性 C57BL/6J 小鼠, 随机分为正常组、形觉剥夺近视组 (FDM 组)、ipRGCs 消融组 (ipRGCs 组)。除正常组外, 其余各组均造 FDM 模型。造模 4 周后所有小鼠均进行屈光度和眼轴长度检测后, 取眼球及视网膜、巩膜组织。过碘酸雪夫染色 (PAS 染色) 观察视网膜、脉络膜、巩膜组织病理形态改变; 蛋白免疫印迹法 (Western blot) 检测视网膜组织中多巴胺 D1 受体 (DRD1)、转录因子 C/EBP 同源蛋白 (CHOP)、葡萄糖调节蛋白 78 (GRP78) 蛋白相对表达量含量; 巩膜组织中 CHOP、GRP78 蛋白相对表达量; 实时荧光定量聚合酶链式反应 (Real-time PCR) 检测视网膜中 Opn4、CHOP、GRP78 mRNA 相对表达含量及巩膜中 CHOP、GRP78 mRNA 相对表达量; 免疫荧光染色 (IF) 检测视网膜组织 Opn4、DRD1 表达。

结果: 与正常组比较, FDM 组小鼠屈光度明显向近视偏移 ($P < 0.05$) 且眼轴长度显著增加 ($P < 0.05$), 视网膜各层较薄, 神经节细胞数量较少, 巩膜层间胶原纤维排列疏松有明显空隙, 视网膜组织中 Opn4、DRD1 蛋白及 mRNA 表达显著降低 ($P < 0.05$), 视网膜及巩膜组织中 CHOP、GRP78 蛋白及 mRNA 表达显著升高 ($P < 0.05$); 与 FDM 组比较, ipRGCs 组小鼠屈光度及眼轴长度进一步加 ($P < 0.05$), 视网膜、脉络膜、巩膜组织更薄

且层间更加疏松, 视网膜组织中 Opn4、DRD1 蛋白及 mRNA 表达更低 ($P < 0.05$), 视网膜及巩膜组织中 CHOP、GRP78 蛋白及 mRNA 表达更高 ($P < 0.05$)。

结论: 小鼠视网膜 Opn4-DA 轴可以通过抑制视网膜及巩膜内质网应激, 延缓近视眼轴增长及屈光度加深。

评估便携式自动验光仪 2WIN-S 在儿童睫状肌麻痹验光中的一致性和重复性

第一作者: Guanghao QIN

共同作者: Wei HE, Xingru HE, Sile YU, Yibing ZHOU

目的: 评估使用便携式自动验光仪 2WIN-S (Adaptica, 帕多瓦, 意大利) 在儿童人群中睫状肌麻痹验光检查的一致性和重复性

方法: 使用 ARK-1 (尼德克, 蒲郡, 日本)、2WIN-S 以及主观验光 (SR) 测量球镜和等效球镜 (SE)。主要结果是上述三种方法测量的 SE、J0 和 J45 值。采用组内相关系数 (ICC) 评估测量的重复性, Bland-Altman 评估每两种方法之间的一致性。

结果: 对 158 名儿童 (平均年龄 10.33 ± 2.10 岁) 进行了屈光不正筛查。2WIN-S 与 ARK-1 和 SR 相比, 在球镜、SE、J0 和 J45 在临床上具有可接受的差异 (± 0.50 D 范围内) 且具有一致性。2WIN-S 与 ARK-1 的球镜、SE、J0 和 J45 在 ± 0.50 D 以内的差值分别为 81%、75%、86% 和 88%。2WIN-S 与 SR 的球镜、SE、J0 和 J45 在 ± 0.50 D 以内的差值分别为 83%、71%、89% 和 89%。2WIN-S 三次重复测量球镜的 ICC 系数为 0.95, SE 的 ICC 系数为 0.97。

结论: 使用 2WIN-S 在儿童睫状肌麻痹下的屈光不正检查与 ARK-1 和 SR 的测量结果相比具有相当高的一致性。2WIN-S 的测量结果可作为主观验光的基础。这种类型的设备有助于在社区和学校开展大规模的屈光不正筛查。

重复低强度红光控制近视的疗效、安全性及其对脉络膜厚度的影响: 系统评价与荟萃分析

第一作者: Hongyue WU

目的: 本研究旨在评估重复低强度红光治疗对儿童及青少年近视控制的效果及其安全性, 并探究其对黄斑区脉络膜厚度的影响。

方法：本研究遵循 PRISMA 2020 指南开展。系统检索了 PubMed、Web of Science、EMBASE、Cochrane Library、EBSCO、Scopus、中国知网 (CNKI)、维普 (VIP) 及万方数据库。纳入研究类型为评估重复低强度红光 (RLRL) 治疗对儿童及青少年近视控制的随机对照试验 (RCT) 及对照研究。采用 RevMan 5.4 软件对提取的数据进行荟萃分析，并对纳入文献的偏倚风险进行了评估。主要结局指标包括眼轴长度 (AL)、球镜等效屈光度 (SER) 及黄斑中心凹下脉络膜厚度 (SFCT) 的变化。

结果：最终共纳入 16 项研究，其中包括 12 项随机对照试验和 4 项对照研究。荟萃分析结果显示，与对照组 (单光眼镜) 相比，干预组 (重复低强度红光治疗联合标准眼镜) 在眼轴增长方面具有显著的抑制作用 ($MD = -0.36$, $95\% CI: -0.44 \sim -0.28$, $P < 0.00001$)，显著抑制了球镜等效屈光度的增加 ($MD = 0.65$, $95\% CI: 0.34 \sim 0.97$, $P < 0.00001$)，并促进了黄斑中心凹下脉络膜厚度的增加 ($MD = 21.15$, $95\% CI: 1.36 \sim 40.94$, $P < 0.00001$)。此外，该疗法安全性较高，且其疗效随随访时间延长而呈累积增强趋势。

结论：根据本次荟萃分析结果显示，重复低强度红光治疗 (RLRL) 是一种有效的近视控制疗法，主要通过抑制眼轴长度增长、改善球镜等效屈光度以及促进脉络膜增厚发挥作用。然而，其长期疗效、安全性及治疗稳定性仍需进一步研究与验证。

高度近视眼虹膜形态重塑的 SS-OCT 微观解析

第一作者：Jiaqi MENG

共同作者：Yanwen FANG, Ching KANG, Xiangjia ZHU

目的：通过新型眼前节扫描光学相干断层扫描 (SS-OCT) 解析高度近视人群的虹膜形态特征。

方法：本回顾性病例对照研究纳入 100 例拟行白内障手术患者的 100 只眼，按眼轴长度分为对照组 (22 mm-24.5 mm) 和高度近视组 (≥ 26 mm)。采用 SS-OCT 测量虹膜容积、虹膜前表面面积、虹膜后表面面积、平均虹膜厚度、前房容积和 500 μm 处小梁-虹膜间隙 (TISA 500)；并进一步分析影响虹膜形态特征的关键因素。

结果：与对照组相比，高度近视组的虹膜容积、虹膜前表面及后表面面积均显著更大 (均 $P < 0.001$)，而两组间的平均虹膜厚度无统计学差异。在虹膜各象限中，上方和鼻侧象限的虹膜容积呈现与整体一致的变化趋势；除颞侧象限外，其余各象限的虹膜前、后表面面积变化趋势与整体一致。相关性分析显示，虹膜容积、虹膜前/后表面面积均与眼轴长

度呈正相关 (均 $P < 0.001$)。多元线性回归模型表明，虹膜容积增大与前房容积增大相关，虹膜前、后表面面积增大均与男性、眼轴更长、前房容积更大及 TISA 500 更小相关。

结论：高度近视眼的虹膜容积及虹膜表面积均大于对照眼，提示随着眼轴长度增加，虹膜呈冠状扩张趋势；虹膜形态与前房角结构存在相关性。

1 型 Stargardt 病的临床特征及遗传学研究

第一作者：Zijie CHEN

共同作者：Xuyang LIU

目的：对 23 个中国汉族 1 型 Stargardt 病 (STGD1) 家系进行临床表型特征与遗传学分析，寻找可能的致病变异位点，探讨表现型-基因型间的关联性。

方法：于 2019 年 9 月~2024 年 12 月在厦门大学附属厦门眼科中心收集 23 个常染色体隐性遗传 STGD1 的家系。本研究通过了相关医学伦理委员会审查 (受理号: XMYKZX-KY-2022-001)。所有家系均签署知情同意书。收集先证者病史及家族史，并对家系中所有患者及部分健康成员进行详细的眼科检查和全身检查。采集先证者外周静脉血 3 ml，进行全外显子组测序。分析所有变异位点，结合其有害性、致病性、人群频率等结果，筛选出可疑的致病基因。通过 Sanger 测序、拷贝数变异检测、实时荧光定量 PCR 检测验证筛选出的致病基因变异。使用 ProtParam、SOPMA、Protsacle、RDCC 等生物信息学程序软件分析变异位点对蛋白质可能产生的影响。

结果：在 23 个 STGD1 家系中共有 26 名患者。所有家系中的患者成员均有相似的眼部表现，符合 STGD1 的临床诊断。发病年龄在 10 岁以下的患者表型要稍重于发病年龄 10 岁~20 岁的患者。10 年以上病程时间的患者表型要稍重于 10 年以下病程时间的患者。所有患者均被检测到存在 ABCA4 基因的复合杂合或者纯合变异。本研究共鉴定出 32 个 ABCA4 基因的变异位点，其中包括 9 个新鉴定的变异位点，分别是 c.2900C > A:p.Ala967Asp、c.613T > C:p.Cys205Arg、c.3862+1G > A、c.4066C > T:p.Gln1356X、c.5195_5196del:p.Ile1732fs、c.3812delA:p.Glu1271fs、c.3468C > G:p.Tyr1156X、c.1913C > G:p.Pro638Thr 和 ex15_16del。通过变异致病性分析和生物信息学分

析均提示有害性。家系成员测序分析显示, 这些致病变异与疾病表型共分离, 符合常隐遗传特征。

结论: 研究共鉴定出 32 个不同变异位点, 其中 9 个是新鉴定的变异位点。研究显示患者的临床表现及严重程度与变异的类型、变异位点所在位置有关。本研究扩大了 ABCA4 基因在中国汉族 STGD1 人群中的变异谱, 有助于开展专业的遗传咨询服务, 为优生优育提供帮助。

POAG 患者房水脂肪因子表达谱及脂联素对小胶质细胞的作用

第一作者: Ziyao XIA

共同作者: Chun ZHANG

目的: 研究原发性开角型青光眼患者、白内障患者和白内障合并代谢异常患者房水中脂肪因子表达水平。进一步研究脂联素在 LPS 诱导的小胶质细胞炎症模型中的保护作用及分子调控机制。

方法: 通过 Luminex 液相芯片技术, 检测 POAG 组 22 例 22 眼、白内障组 24 例 24 眼和白内障合并代谢异常患者 (白内障 + 代谢异常组) 24 例 24 眼的房水样本中 15 种脂肪因子表达水平, 并分析房水脂肪因子水平与 POAG 患者术前 IOP、视野 MD 值、术前青光眼药物的使用数量及特定青光眼药物的使用情况等临床指标的相关性。为研究 Adiponectin 对小胶质细胞的作用, 使用不同浓度 adiponectin 处理 BV2 细胞 12 小时后观察其对细胞活力的影响。收集 5 $\mu\text{g/mL}$ adiponectin 处理 12 小时后 BV2 细胞, 进行转录组测序分析。采用 qRT-PCR、ELISA 和 Western Blot 技术, 观察 Adiponectin 对 LPS 诱导的小胶质细胞激活的形态学改变和促炎细胞因子释放的影响, 以及对小胶质细胞炎症反应的调控通路。

结果: POAG 组房水中 Adiponectin、Leptin、Adipsin、RBP4、Angiopoietin-2、ANGPTL4、CCL2)、IL-8 和 IL-18 的水平显著高于白内障组 ($p = 0.010$ 、 $p = 0.012$ 、 $p = 0.004$ 、 $p < 0.001$ 、 $p = 0.001$ 、 $p = 0.021$ 、 $p = 0.027$ 、 $p = 0.025$ 、 $p = 0.035$)。此外, POAG 组的 Angiopoietin-2 水平高于白内障 + 代谢异常组 ($p = 0.002$)。在 POAG 组中, 脂肪因子水平与 IOP、MD 或青光眼药物数量之间未发现显著相关性, 溴莫尼定使用与 Angiopoietin-2 浓度呈中等相关 ($r = 0.449$, $p = 0.036$)。Adiponectin 对 BV2 细胞无明显毒性作用, 且呈现出促进 BV2 细胞增殖的效果。转录组测序并进行 GO 和 KEGG 分析发现, Adiponectin 引起 BV2 细胞多个与免疫和炎症相

关的生物过程被激活, 细胞因子 - 细胞因子受体相互作用、趋化因子信号通路和 IL-17 信号通路显著富集。Adiponectin 能够有效抑制 LPS 诱导的小胶质细胞促炎细胞因子 TNF- α 和 IL-1 β 的释放。Adiponectin 可拮抗 LPS 对 AMPK 磷酸化的抑制作用, 并抑制 LPS 诱导的 NF- κB 核转位作用。

结论: POAG 患者与白内障患者的房水脂肪因子水平存在显著差异, 房水脂肪因子的水平可能反映青光眼炎症状态。Adiponectin 对 BV2 细胞具有促进增殖的作用。Adiponectin 可有效抑制 LPS 诱导的 BV2 细胞促炎细胞因子释放, 其机制与 AMPK/NF- κB 通路介导的炎症反应抑制相关。

Piezo1/2 离子通道作为视乳头旁巩膜硬度调控靶点在慢性青光眼中视神经保护的机制研究

第一作者: Huan DU

共同作者: Yuan HE, Liu XU

目的: 青光眼是一组以视神经进行性损伤和视网膜神经纤维层缺损为特征的慢性神经退行性疾病。近年研究发现, 巩膜生物力学特性 (如硬度、应力分布) 可能通过影响筛板形变直接参与视网膜神经节细胞 Retinal ganglion cell, RGC) 轴突损伤评估不同时期的慢性青光眼大鼠模型中乳头旁巩膜 (Parapillary Scleral, PPS) 硬度变化与 RGC 丢失的关系, 确定 PPS 硬度发挥视神经保护作用的临界值。探究 Piezo1/2 在调控 PPS 硬度中的作用, 最终通过调控 Piezo1/2 干预 PPS 硬度实现视神经保护作用。

方法: 选取健康 SD 大鼠, 右眼建立慢性高眼压青光眼模型, 左眼为正常对照组, 分别在青光眼疾病进程的早、中、晚三个时期, 取 PPS 进行冰冻切片并用原子力显微镜 (atomicforce microscope, AFM) 测 PPS 弹性模量; 视网膜铺片进行 RGC 计数; 视乳头 (Optic Nerve Head, ONH) 进行 PPD 染色对 RGC 轴突计数; 通过 qPCR 以及 Western Blotting 检测 Piezo1/2 表达水平, 通过钙成像等技术明确 Piezo1/2 在高眼压 PPS 力学性质中的作用。后续分别 Piezo1/2 抑制剂 / 激活剂作用于早期、晚期青光眼大鼠 PPS, 随后对 PPS 弹性模量进行测定; 对 RGC 以及 RGC 轴突进行计数。

结果: 随着青光眼病程发展, HE 结果显示: GCC 层变薄, RGC 进行性丢失。Masson 染色结果显示: 在高眼压 2、3 周时, PPS 区域胶原明显沉积; 原子力显微镜检测 PPS 弹性模量, 结果显示高眼压 2、3 周时, PPS 弹性模量显著升高。且 PPS 弹性模量与 RGC 数量两变量存在中等强度的线性相关,

这种关联具有统计学意义。高眼压 1 周时 PPS 中 Piezo1/2 呈现显著高表达。

结论：青光眼病程中，PPS 弹性模量与 RGC 数量存在中等强度的线性相关性，提示 PPS 力学微环境改变可能参与 RGC 损伤过程；高眼压可诱导 PPS 区域 Piezo1/2 的 mRNA 水平，且 Piezo1/2 在高眼压早期即出现异常上调；调控 Piezo1/2 有望通过改善 PPS 力学特性实现神经保护，为青光眼的靶向治疗提供了新的潜在策略。

面板编号：GLA-1396

Synemin 通过抑制小梁网细胞吞噬功能升高原发性开角型青光眼眼压的作用及机制

第一作者：郭涛

目的：探究靶向敲低 Synemin 抑制小梁网（TM）细胞外基质（ECM）蛋白，降低眼压的作用及机制。

方法：利用无标记定量蛋白质组学技术筛选转化生长因子 2（TGF β 2）诱导的 TM 显著上调的蛋白质。采用蛋白质印迹（WB）、实时定量 PCR（RT-qPCR）、免疫细胞化学（ICC）和流式细胞术评估 SYN、ECM 蛋白（如 FN，LN，COL-IV）及相关信号通路分子的表达，并在小鼠中验证。通过 FACS 分析 pHrodo™ 标记的金黄色葡萄球菌的吞噬情况，并利用荧光显微镜观察肌动蛋白交联网络（CLANs）的形成及细胞骨架变化。

结果：原发性开角型青光眼患者 TM 样本和 TGF β 2 诱导的 HTM 细胞中的 Synemin 蛋白水平显著升高。Synemin 敲除逆转了 TGF β 2 诱导的 HTM ECM 过度积累，并恢复了受损的 HTM 吞噬功能。单独的过表达 Synemin 足以损害 HTM 吞噬作用，并促进 ECM 蛋白沉积。Synemin 可能参与了 HTM 细胞内 CLANs 的形成，这是一种与青光眼相关的病理特征。在小鼠高眼压模型中，敲低 Synemin 能够降低小鼠眼压。

结论：我们揭示了 Synemin 参与 TM ECM 蛋白积累升高眼压的作用机制，表明敲低 Synemin 可能为降低 ECM 蛋白积累，降低眼压的潜在治疗方法。

丝裂霉素缓释载体辅助 Ahmed 青光眼引流阀植入术治疗新生血管性青光眼的临床疗效研究

第一作者：Yu Qi ZHAO

共同作者：Yue Dong HU

目的：对比分析丝裂霉素缓释载体辅助 Ahmed 青光眼引流阀植入术（Ahmed glaucoma valve implantation, AGVI）与常规 AGVI 对新生血管性青光眼（Neovascular glaucoma, NVG）疗效的区别。

方法：收集自 2024 年 1 月至 2025 年 5 月就诊，经玻璃体腔内注射抗 VEGF 药物联合局部与全身应用降眼压药物治疗，眼内压（intraocular pressure, IOP）仍高于 21 mmHg 的 NVG 患者 58 例（61 眼）作为研究对象。随机分为 A 组（试验组）36 眼和 B 组（对照组）25 眼。A 组患者接受携带 0.03% 的丝裂霉素的缓释载体 NasoPore，辅助 AGVI，B 组患者接受常规 0.03% 的丝裂霉素辅助的 AGVI。随访 6 个月，比较两组患者手术用时，不同时间点的 IOP、最佳矫正视力、术后相关并发症、手术成功率和降眼压药物使用情况。术后不使用降眼压药物， $21 \geq IOP \geq 6$ mmHg 定义为手术完全成功；使用降眼压药物， $21 \geq IOP \geq 6$ mmHg 定义为手术条件成功；使用降眼压药物 IOP 仍 > 21 mmHg， $IOP < 6$ mmHg，或需要再次行抗青光眼手术定义为手术失败。手术完全成功率加手术条件成功率定义为手术总体成功率。

结果：A 组手术步骤进行了改良，显著缩短了手术用时（ 54.53 ± 15.83 min vs 80 ± 29.21 min, $P < 0.0001$ ）。IOP 方面，两组患者术后 1 天、1 周、1 个月、3 个月和 6 个月的 IOP 较术前均显著下降（ $P < 0.05$ ）。与 B 组患者相比，A 组患者术后 1 周、1 个月、6 个月的 IOP 显著低于 B 组，差异具有统计学意义（ $P < 0.05$ ）。A 组术后 3 个月、6 个月总体成功率均显著高于 B 组（94.4% vs 76%, $P < 0.05$ ）。A 组术后 1 个月、3 个月、6 个月的 BCVA 较术前有所提高（ $P < 0.05$ ）；术后两组间同一时期 BCVA 差值对比在 1 月时有明显差别（ $P < 0.05$ ）。A 组术后 3 个月内高眼压发生率低于 B 组（12% vs 38.9%）。预测手术结局与术前多个因素的关系中，唯一与手术失败有统计学意义的因素是既往有平坦部玻璃体切除术病史。

结论：与常规 0.03% 的丝裂霉素辅助的 AGVI 相比，应用 0.03% 的丝裂霉素的缓释载体 NasoPore 辅助 AGVI 治疗 NVG 可能是一种更加有效的方法。节省手术时间的同时具有相似安全性，降低术后 3 个月内高眼压阶段的发生率，可能提高远期成功率。

两例中国汉族 X 连锁视网膜色素变性家系的分子遗传学分析

第一作者: Nanxin LIU

共同作者: Mahri HOMMODOVA, Xuyang LIU, Jijing PANG, Yue REN

目的: 研究两例中国汉族 X 连锁遗传视网膜色素变性 (X-linked retinitis pigmentosa, XLRP) 家系的临床表型和致病基因。

方法: 本研究纳入两例视网膜色素变性先证者及其家系成员, 系统收集其临床资料并采集外周静脉血提取基因组 DNA。采用全外显子组测序技术对先证者进行致病基因筛查, 通过 Sanger 测序对候选变异位点进行家系验证。结合遗传学数据库检索及文献回顾, 使用 SIFT、Mutation Taster、CADD、RDDC 等程序软件对鉴定出的基因变异进行致病性分析。

结果: XLRP01 先证者, 双眼眼底颞侧可见多发性点状色素沉着, 呈骨细胞样分支状排列。OCT 显示视网膜色素细胞层 (Retinal Pigment Epithelium, RPE) 局灶性增厚伴椭圆体带反射消失, ERG 记录没有可检测到的视锥或视杆反应。XLRP02 先证者, 自幼视力不佳, 患儿 8 个月大体检时发现双眼散光偏大。4 岁时开始行弱视训练, 双眼视力无提高。ERG 提示双眼视锥视杆细胞功能异常, 暗适应状态下: 双眼 a 波振幅降低、潜伏期正常、b 波振幅降低、潜伏期延迟; 明适应状态下: 双眼 a、b 波振幅降低、潜伏期正常。全外显子测序和 Sanger 测序结果共同显示 XLRP01 家系先证者存在 RP2 c.353G > C:p.Arg118Pro 半合错义变异, 该变异在 gnomAD 中未收录。XLRP02 家系先证者存在 RPGR c.2405_2406del:p.Glu802Glyfs*32 的杂合变异。经 ACMG 遗传变异分类标准与指南评估, 这两个变异被分类为可能致病。

结论: 本研究鉴定出两个 XLRP 相关基因 RP2 c.353G > C:p.Arg118Pro 和 RPGR c.2405_2406del:p.Glu802Glyfs*32, 为家系的遗传咨询和产前诊断奠定了基础, 也有利于深入研究 XLRP 的分子病理诊断和基因治疗。其中 RP2 c.353G > C:p.Arg118Pro 为首次报道。

他氟噻吗滴眼液治疗开角型青光眼或高眼压症的随机、双盲、平行对照、多中心研究

第一作者: Xinghuai SUN

目的: 在中国开角型青光眼或高眼压症受试者中, 评估不含防腐剂的 0.0015% 他氟前列素和 0.5% 噻吗洛尔复方制剂的降眼压疗效是否优于 0.0015% 他氟前列素滴眼液单药治疗, 并比较两者的安全性。

方法: 采用随机、双盲、平行对照、多中心研究设计。纳入既往接受过前列腺素类或 β -肾上腺素阻滞剂降眼压药物治疗但需进一步降压的开角型青光眼或高眼压症患者。经过 2 周 0.0015% 他氟前列素观察期和 4 周洗脱期后, 符合标准的受试者随机接受无防腐剂他氟噻吗或无防腐剂他氟前列素治疗 (每日一次, 每次一滴, 持续 3 个月)。在基线、第 2 周、第 6 周和第 3 个月时进行日间眼压测量。主要终点为基线至第 3 个月平均日间眼压的变化。

结果: 共纳入 219 例患者, 他氟噻吗组 (n = 110) 和他氟前列素组 (n = 109)。第 3 个月时, 他氟噻吗组的降眼压疗效显著优于他氟前列素组 (与他氟前列素相比的平均差异 [SE]: -1.312 [0.3318], 95% CI: -2.01 至 -0.696)。与他氟前列素组相比, 他氟噻吗组中眼压降低 $\geq 25\%$ (风险差: 15.299%, 95% CI: 1.57% 至 28.4%, p = 0.0284) 和 $\geq 30\%$ (风险差: 13.274%, 95% CI: -0.338% 至 26.0%, p = 0.0320) 的应答者比例更高, 差异具有统计学显著性。共 71 位 (32.4%) 受试者报告了不良事件: 他氟噻吗组 35 位 (31.8%), 他氟前列素组 36 位 (33.0%), 大多数不良事件为轻度。共 51 位 (23.3%) 受试者报告了眼部相关不良事件: 他氟噻吗组 22 位 (20.0%), 他氟前列素组 29 位 (26.6%)。最常见的眼部相关不良事件为结膜充血, 共计 12 位, 他氟噻吗组 3 位 (2.7%), 他氟前列素组 9 位 (8.3%)。

结论: 在中国开角型青光眼或高眼压症受试者中, 他氟噻吗滴眼液在降低平均日间眼压方面优于他氟前列素单药治疗, 且安全性和耐受性良好。

光响应双气体纳米药物在青光眼治疗中的潜能探索

第一作者: Liu JIAMIN

共同作者: Xinghuai SUN, Tian YI

目的: 青光眼是全球导致不可逆性失明的主要原因, 其特征为视神经损伤, 常与眼压升高相关。尽管气

体治疗在青光眼治疗中展现出潜力，但单一气体策略的局限性限制了其疗效。

方法：本研究开发了一种用于青光眼靶向治疗的光响应双气体纳米药物（PdH-D-S）。PdH-D-S 通过合成具有高效储氢能力和丰富孔道的介孔氢化钯（meso-PdH），并在其表面修饰 DSPE-mPEG，同时负载一氧化氮（NO）供体硝普钠（SNP）而制备而成。经局部给药后，PdH-D-S 能够穿透角膜到达调节眼压的组织，包括小梁网和 Schlemm 管。在 808 nm 激光照射下，PdH-D-S 可控释放氢气（H₂）和 NO。

结果：H₂ 可激活 AKT/p-AKT/eNOS/sGC 信号通路，而 NO 可与可溶性鸟苷酸环化酶（sGC）结合，将鸟苷三磷酸（GTP）转化为环鸟苷酸（cGMP），从而使小梁网细胞松弛并增强房水外流。本双气体系统在降低眼压方面表现出较高的治疗效果。

结论：本研究所开发的光响应性 PdH-D-S 纳米药物能够协同递送 H₂ 和 NO 至眼部房水排出组织，并显著降低眼压。该双气体策略在青光眼治疗中实现了机制性突破，有效克服了单一气体治疗的局限性。

四个中国家族中 PITX2 单倍剂量不足与 Axenfeld-Rieger 综合征的关联研究

第一作者：Zhou ZHOU

共同作者：Jiaoyue HU, Chumou LIU, Nanxin LIU, Xuyang LIU

目的：研究 4 个中国无亲缘关系 Axenfeld-Rieger 综合征（ARS）家系的临床表型特征及其致病基因变异。

方法：通过对中国 4 个汉族 Axenfeld-Rieger 综合征（ARS）家系患者进行系统的临床评估及基因组数据分析，明确其表型与基因型特征。对所有纳入研究的个体进行全面体格检查及眼科专项检查。从受试者外周静脉血中常规提取基因组 DNA。为明确致病基因变异及其与表型的关系，本研究采用全外显子组测序（WES）及候选基因验证（含拷贝数变异测序 CNV-seq 与 qPCR 验证）。

结果：来自 4 个无亲缘关系的中国 ARS 家系的所有受累个体均表现出特征性眼前节发育异常，包括虹膜缺损、虹膜角膜粘连及后胚胎环。其中 1 号家系 1 例、2 号家系 4 例及 4 号家系 2 例患者并发继发性青光眼。所有受累个体均存在系统发育异常，包括小牙畸形、牙齿发育不全及脐周皮肤皱褶或脐膨出；2 号家系所有患者均表现出上唇变薄特

征；3 号家系 1 例患者存在视网膜骨细胞样色素变性。基于 GRCh37/hg19 基因组版本，CNV-seq 及 qPCR 分析证实，4 个家系均存在影响 PITX2 基因全长的杂合突变：1 号家系存在 449.97 kb 缺失（chr4:111124809-111574778），涵盖 PITX2 基因的 2 个蛋白质编码区及 ENPEP 基因；2 号家系存在 4.34 kb 缺失（chr4:111539280-111543616），涉及 PITX2 基因 3 个外显子；3 号家系存在 206 bp 缺失（chr4:111543411-111543616），包含 PITX2 基因第 1 外显子；4 号家系 PITX2 基因在第 419 和 420 位置的原碱基分别变为 G 和 A，使得原苯丙氨酸变成终止密码子，转录提前终止。

结论：本研究纳入 4 个中国 ARS 家系，通过遗传学分析，在 PITX2 基因区域鉴定出 4 个位于 4q25 区域的新型单倍剂量不足性微缺失，结果表明，PITX2 基因内 chr4:111543411-111543616 区域对眼部发育及全身结构（如唇、齿及脐部）的发育具有关键调控作用。这提示 PITX2 基因可能需要维持完整的基因剂量，以确保其正常生理功能的发挥。

基于 OCTA 定量成像的近视合并青光眼早期诊断量化指标的研究

第一作者：Wen SUN

共同作者：Chixin DU, Jiayan FANG, Yimin XU, Tianxiang YU, Tianxia ZOU

目的：应用光学相干断层扫描血管成像技术（OCTA）观察近视合并原发性开角型青光眼（POAG）患者视网膜及脉络膜各层血管密度的改变，评估在去除视盘旁萎缩区（PPA）前后眼底不同分层下血管密度的不对称性参数的变化及其对近视合并青光眼早期诊断能力。

方法：89 名受试者（18~45 岁）均排除可能影响眼部血流的眼部及全身疾病，并接受全面的眼科检查，89 只眼分为非高度近视组、高度近视组、非高度近视合并青光眼组、高度近视合并青光眼组。广角扫描 OCTA 以 15 mm×15 mm 模式进行采集，扫描中心位于黄斑和视乳头连线中点，采用统一定制化的方法对图像进行预处理，包括定位视盘中点、黄斑中点、上下均分图像、手动圈选 PPA、裁剪等，利用内置系统进行分层后导出图像。分析不同分组间各参数的差异，并比较去除 PPA 前后各层上下半区血管密度的不对称性参数诊断近视合并青光眼的的能力。

结果：1、表层视网膜微血管密度在四组间呈梯度下降趋势，脉络膜中大血管层血管密度出现随近视程度加重而递减趋势。2、POAG 特异性降低表层

视网膜微血管密度 ($P = 0.006 < 0.05$)，并与高度近视存在协同效应 ($P = 0.009 < 0.05$)。3、不对称性参数分析发现，各层去除 PPA 前后的不对称性参数显著相关 (0.843-0.977)。进一步受试者工作特征 ROC 曲线分析预测显示：表层视网膜微血管密度绝对值不对称性指数 (AAI) 和相对不对称性指数 (RAI) 在去除 PPA 前后的 AUC 分别为 0.778-0.814 和 0.819-0.850，敏感度为 61.8%-73.5% 和 61.8%-64.7%，特异度为 83.7%-88.4% 和 95.3%-97.7%。

结论：高度近视和 POAG 对视网膜及脉络膜微血管系统的影响存在差异：POAG 特异性地降低表层视网膜微血管密度，并与高度近视具有协同作用；高度近视与脉络膜中大血管层血管密度的下降存在紧密关系。表层视网膜微血管密度 AAI 和 RAI 对合并近视的早期 POAG 具有一定诊断能力，其中 RAI 拥有更高的诊断价值。这些发现显示了合并近视的青光眼患者视网膜和脉络膜微循环的改变，强调了上下半区血管密度的不对称性参数变化是诊断青光眼合并近视特别是高度近视患者敏感指标。

基于眼前节光相干断层扫描的小梁切除术围术期滤过泡形态与预后的相关性研究

第一作者：Mingkai LIN

共同作者：Zhuoyi WU

目的：利用眼前节光相干断层扫描 (Anterior-Segment Optical Coherence Tomography, AS-OCT) 观察小梁切除术 (Trabeculectomy, Trab) 后滤过泡内部形态学参数在围手术期的变化，分析各参数与眼内压 (IOP) 之间的关系，指导术后滤过泡的维护。

方法：本研究前瞻性纳入符合入组标准的 40 名需行 Trab 的青光眼患者的 41 只眼，分别于术后第 1 天、第 1 周、第 2 周、第 3 周、第 4 周对术眼滤过泡区进行 AS-OCT 扫描并获得影像资料，测量滤过泡参数，包括滤过泡总高度 Total bleb height (TBH)，滤过泡壁厚度 Bleb wall thickness (BWT)，滤过泡液腔高度 Bleb fluid-filled cavity height (BCH)，记录滤过泡壁微囊 (microcyst) 及条纹现象 (Shading phenomenon) 的存在情况，同时收集患者的基本人口统计学信息、相关临床资料、历次随访的眼压，并进行统计学分析。

结果：术后 6 个月，37 只眼 IOP 得到控制。术后第 3 周无条纹现象眼 IOP 中位数 (16.70) 显著高于有条纹现象眼 (10.70)，差异有统计学意义

($z = 3.192$, $p = 0.001$)；无微囊眼的 IOP 中位数 (18.55) 显著高于有微囊眼 (12.50)，差异有统计学意义 ($z = 2.417$, $p = 0.016$)。术后第 1 天 TBH 与 IOP 之间有显著负相关 ($r = -0.291$, $p = 0.024$)，术后第 3 周 BWT 与 IOP 之间有显著负相关 ($r = -0.302$, $p = 0.024$)，其余时间点参数与 IOP 无显著相关性。术后第 3 周及第 4 周是否存在条纹现象与术后 6 月 IOP 的差异有统计学意义 ($z = 2.213$, $p = 0.02$)，其余时间点参数与术后 6 月 IOP 相关的 p 值均无统计学意义。

结论：术后第 1 天 TBH、术后第 3 周 BWT 与同期 IOP 呈显著负相关；第 3 周滤过泡的微囊与条纹现象的存在与更低的同期 IOP 相关，术后第 3 周及第 4 周滤过泡的条纹现象与术后 6 月的 IOP 相关，提示这些影像学特征可作为短期至中期滤过功能良好的预后指标。AS-OCT 在术后早期观察滤过泡结构变化方面具有重要价值，可为术后管理提供参考依据。

家族性渗出性玻璃体视网膜病变合并青光眼的诊疗决策与治疗策略

第一作者：Liu ZHIHAO

目的：探讨家族性渗出性玻璃体视网膜病变 (FEVR) 合并青光眼患者的诊疗过程和手术策略，特别是在复杂房角关闭情况下的治疗方案。

方法：通过对一例 39 岁男性患者的病例分析，结合影像学检查、诊断决策、手术方案和术后评估，深入分析 FEVR 合并青光眼的治疗策略。

结果：患者右眼因青光眼已失明，左眼出现房角关闭，且伴有白内障及角膜变性。根据多模态影像学检查，最终确定患者为双眼 FEVR 合并闭角型青光眼。手术采用白内障超声乳化术、人工晶状体植入术和房角切开术，术后左眼房角开放，前房深度增加，术后检查显示黄斑及视网膜结构有所改善。

结论：FEVR 合并青光眼的治疗需要个体化方案，手术决策应在全面评估患者病情和风险的基础上进行。通过多模态影像学评估和“医学+”思维指导，能更好地平衡手术风险与预期效果，提高患者生活质量。此病例提醒我们，早期诊断和干预对于 FEVR 患者至关重要。

带状结构与原发性闭角型疾病眼前节参数的关系研究

第一作者: Chukai HUANG

目的: 探究玻璃体带后插入区与晶状体后赤道之间的带状结构 (PVZ INSLE) 和玻璃体带在 PACD 眼中的缺失率及其与眼前节参数的关系。

方法: 收集 90 只 PACD 眼和 30 只白内障眼。利用 UBM 评估 PVZ INS-LE 结构和玻璃体带的有无, 并测量眼前节参数。分别比较基线眼部特征和 UBM 眼前节参数。利用 Logistic 回归分析探究 PACD 眼中与 PVZ INS-LE 结构和玻璃体带缺失的相关因素。

结果: 本研究共纳入 90 名受试者的 120 只眼进行分析, 其中 30 只 CPACD、30 只 APACD 眼、30 只 APACD 对侧眼和 30 只白内障眼。男性占 34.4%, 女性占 65.6%, 平均年龄为 65.70 ± 10.70 岁。结果表明 71.1% PACD 眼和 40.0% 白内障眼 PVZ INS-LE 结构缺失, 22.2% PACD 眼玻璃体带缺失, 所有白内障眼均有玻璃体带。CPACD 眼的 PVZ INS-LE 结构缺失情况与白内障眼相似, APACD 及其对侧眼缺失率高于前两者 ($P < 0.05$)。玻璃体带在所有 PACD 眼中的缺失率相似, 均高于白内障组 ($P < 0.05$)。无 PVZ INS-LE 结构组眼轴更短, 睫状体 - 睫状体夹角更大, $500/750 \mu\text{m}$ 处小梁网 - 睫状突距离更短。短眼轴是 PVZ INS-LE 结构缺失的独立危险因素。较小的小梁网 - 睫状体夹角是玻璃体带缺失的独立危险因素。

结论: APACD 及其对侧眼 PVZ INS-LE 结构缺失情况较 CPACD 及白内障眼严重; 所有 PACD 眼玻璃体带的缺失情况较白内障眼严重。短眼轴是 PACD 眼 PVZ INS-LE 结构缺失的独立危险因素。

抑制 PGK1 介导的细胞凋亡促进青光眼视网膜神经节细胞存活

第一作者: Ruyue LI

共同作者: Ningli WANG

目的: 视网膜神经节细胞 (RGC) 的死亡发生在多种眼部疾病中, 包括创伤性视神经病变、青光眼和其他视神经病变。RGC 死亡通常会导致不可逆性视力损失, 甚至失明。大量证据支持细胞凋亡是导致视神经损伤、实验性青光眼和人类青光眼中 RGC 死亡的主要机制。磷酸甘油酸激酶 1 (PGK1) 是糖酵解过程中第一个产生 ATP 的酶。近年来的多项

研究初步证明, 过表达 PGK1 能减少神经元凋亡, 然而尚未有研究验证 PGK1 在眼部神经退行性疾病中的作用。本研究首次验证 PGK1 在青光眼动物模型中的表达情况, 以及干预 PGK1 表达对青光眼 RGC 的保护作用。

方法: 建立视神经挤压伤 (ONC) 和缺血再灌注 (I/R) 模型。采用蛋白质印记和 PCR 实验评估视网膜中 PGK1 和热休克蛋白 90 (HSP90) 的表达情况。通过玻璃体腔注射腺相关病毒 (AAV) 2/2-PGK1 实现 PGK1 的上调。通过计数 RBPMS 阳性 RGC 对 RGC 存活进行定量分析。通过 fVEP 评估视功能。

结果: 在 ONC 模型中, 1 周后表现出 PGK1 的 mRNA 和蛋白质水平明显下调, HSP90 相应下调。玻璃体腔注射 AAV-PGK1 2 周后, PGK1 在视网膜稳定表达。过表达 PGK1 后, ONC 模型中, RGC 存活率从 42% 恢复至 62%; I/R 模型中, RGC 存活率从 21% 恢复至 38%。fVEP 显示, N1-P1 有所提高。TUNEL 染色显示过表达 PGK1 后凋亡信号减少。

结论: 本研究首次证明, PGK1 在青光眼 RGC 凋亡中发挥关键作用。青光眼动物模型中 PGK1 表达下调; 过表达 PGK1 可促进 RGC 存活, 并改善视功能。

无晶状体眼中由残留晶状体皮质引起的一例迟发性晶状体溶解性青光眼

第一作者: Hang REN

目的: 晶状体溶解性青光眼是晶状体蛋白渗漏引发的继发性开角型青光眼, 多见于 60-70 岁人群, 表现为突发眼痛、视力骤降及眼压升高。其病理机制为巨噬细胞吞噬晶状体蛋白阻塞小梁网, 诊断依赖眼压测量、裂隙灯和房角镜检查及细胞学分析。无晶状体眼患者因残留晶状体皮质溶解引发迟发性晶状体溶解性青光眼的病例报道较少。本文通过探讨一例 62 岁男性患者因 30 年前白内障术后残留晶状体皮质导致迟发性晶状体溶解性青光眼的诊疗过程及病理机制, 为研究晶状体溶解性青光眼的发病机制提供科学依据。

方法: 通过前节照相、房角镜、B 超记录患者的前后节情况, 玻璃体切割术中分别取出前房沉积物和玻璃体腔内晶状体碎片行病理学分析明确成分及炎症反应特征。

结果: 患者 62 岁, 急性起病的右眼疼痛、发红、视力下降伴眼压升高, 检查发现双眼房角开放, 前节照相显示右眼结膜充血、角膜水肿、晶状体缺失,

以及前房内遍布白色颗粒沉积物，这些沉积物表明疑似晶状体物质发生了溶解（A）。术后前节照相显示这些白色颗粒从前房内被显著清除（B）。术前和术后的前节图像提示中央前房深度超过角膜厚度的一半（C 和 D）。此外，B 超扫描显示玻璃体腔内存在一个高密度圆形结构，进一步证实了眼内存在疑似晶状体的碎屑（E），其与术中取出的一块雪花状晶状体碎片一致（F）。对前房白色颗粒和玻璃体碎片行病理学分析显示其内均存在晶状体上皮细胞，并伴有炎症细胞浸润和大量红细胞，表明存在活跃的炎症反应（G）。值得注意的是，观察到巨噬细胞正在吞噬晶状体上皮细胞（红色*，H）。

结论：本例证实无晶状体眼患者因残留晶状体皮质溶解可引发迟发性晶状体溶解性青光眼，且在前房和玻璃体腔内均发现晶状体上皮细胞，并观察到巨噬细胞正在吞噬晶状体上皮细胞的现象。提示患者眼内前后节中长期存在慢性、活跃的炎症反应。

枸杞多糖通过其抗炎、抗衰老和抗凋亡特性缓解视网膜缺血再灌注损伤

第一作者：Chunlin ZHAO

共同作者：Chao TANG

目的：本研究旨在探讨枸杞糖肽（LbGp）对缓解视网膜缺血再灌注损伤（RIRI）的治疗潜力，RIRI 作为青光眼等疾病的关键病理机制，涉及炎症、细胞衰老及凋亡等过程，并导致视网膜神经节细胞（RGCs）退化与视神经损伤。

方法：研究采用体内与体外模型进行评估。在体内实验中，通过升高 C57BL/6J 小鼠眼内压并再灌注诱导 RIRI，同时口服给予 LbGp；体外实验则利用 R28 细胞进行 OGD/R 造模模拟 RIRI，并在培养物中添加 LbGp。通过光学相干断层扫描（OCT）、OCT 血管造影（OCTA）及苏木精-伊红（HE）染色评估视网膜结构与功能；采用免疫荧光、酶联免疫吸附测定（ELISA）、衰老相关 β -半乳糖苷酶（SA- β -gal）染色、TUNEL 测定及流式细胞术（FCM）分析炎症标志物（IL-6、IL-1 β 、TNF α ）、衰老标志物（p21、p16）及细胞凋亡情况。

结果：LbGp 处理能够有效恢复视网膜血流，减轻视网膜变薄，并显著提高视网膜 RGCs 的存活率。同时，LbGp 显著降低了炎症、衰老及凋亡相关标志物的表达水平。

结论：研究结果表明，枸杞糖肽在缓解视网膜缺血再灌注损伤方面具有显著潜力，可作为青光眼及其

他缺血性视网膜疾病的有前景的治疗候选药物，值得进一步研究其作用机制及临床疗效。

灵芝多糖通过调节小胶质细胞 M1/M2 极化、抑制神经炎症和抑制 JAK2/STAT3 通路减轻视网膜缺血再灌注损伤

第一作者：Guangyu ZHU

共同作者：Yujie LIU, Xuejing LU, Shichun LUO

目的：灵芝多糖是灵芝的关键生物活性提取物，已被证明具有有效的抗神经炎症特性，但其对视网膜缺血再灌注损伤的确切影响仍未完全阐明。本研究探讨灵芝多糖靶向抑制小胶质细胞介导的神经炎症对视网膜缺血再灌注损伤的恢复作用和机制。

方法：通过将眼内压升高至 80 mmHg 持续 60 分钟，在 Sprague-Dawley 大鼠中诱导视网膜缺血再灌注损伤模型，用灵芝多糖进行干预，观察大鼠视网膜炎症因子水平、M1/M2 型小胶质细胞标记物水平和 JAK2/STAT3 通路相关蛋白的水平。

结果：灵芝多糖抑制促炎细胞因子的分泌，促进抗炎细胞因子的分泌，从而显著缓解缺血再灌注后视网膜神经炎症过程。此外，施用灵芝多糖还促进了小胶质细胞从 M1 表型向 M2 表型的极化。对机制的进一步研究表明，灵芝多糖的调节作用可能是通过抑制 JAK2/STAT3 信号通路介导的。

结论：提供灵芝多糖减轻视网膜缺血再灌注损伤的作用、机制的新见解。

热带爪蟾视神经激光损伤及再生研究

第一作者：Xuyang LIU

目的：本研究采用 YAG 激光构建热带爪蟾视神经损伤模型，探讨视神经损伤后自我修复的形态学变化及分子机制研究。

方法：在裂隙灯显微镜下利用 YAG 激光对 st52-54 野生型热带爪蟾三角区的视神经精确定位后发射激光（能量：0.6 mJ $\times$ 1 次），确认造模成功后置于系统水中饲养。选取若干只野生型热带爪蟾，实验组为左眼作 YAG 激光视神经损伤处理，右眼为对照不做处理，并分别于第 1 天、6 天、12 天处死，作 HE 染色后分析爪蟾视神经损伤后自我修复的病理变化。

结果：通过 HE 染色发现，视神经激光损伤后第 1 天视神经鞘膜完整，与对照组相比肿胀明显，视神

经内神经纤维稀疏；损伤后第 6 天视神经持续肿胀，部分萎缩，视神经鞘膜破损，内部神经纤维膨出伴胶质细胞溢出，胶质细胞排列紊乱不规则；损伤后第 12 天视神经内胶质细胞重排，胶质细胞增多并向中心聚拢。

结论：爪蟾视神经损伤后第 1、6、12 天视神经及胶质细胞均呈现出不同的形态，且表现出视神经逐渐修复的趋势。本研究成功构建了热带爪蟾视神经的 YAG 激光损伤模型，作为视神经具有终生再生能力的热带爪蟾，该模型的成功构建为视神经损伤后修复的分子机制研究和视神经保护及治疗的研究提供了新的思路。

线粒体轴浆运输组件在青光眼视神经保护中的研究

第一作者：Yongzhen YU

共同作者：Yuanbo LIANG, Lewei TANG

目的：线粒体轴浆运输障碍是青光眼性视神经病变的早期表现，然而目前关于介导线粒体轴浆运输的关键组件 Syntabulin (STB) 衔接蛋白、KIF5A 驱动蛋白和 Syntaphilin (SNPH) 锚定蛋白在视网膜和视神经中的定位以及它们在青光眼视神经损伤中发生的作用尚不明确。本研究的目的是探究 STB、SNPH 和 KIF5A 在正常小鼠视网膜和视神经中的表达定位青光眼小鼠模型中的表达是否发生改变，探究通过玻璃体腔注射 AAV 过表达 STB 是否可以急性高眼压小鼠视神经起到保护作用。

方法：本研究采用的是前房灌注生理盐水诱导的缺血再灌注急性青光眼小鼠模型，分别通过对眼球进行石蜡切片 HE 染色观察视网膜厚度和视网膜铺片观察 RGC 数量的方法验证模型的可靠性。分别对正常和模型组小鼠的视网膜和视神经进行 Western Blot、q-PCR 和石蜡切片免疫荧光等实验来探究 STB、KIF5A 和 SNPH 在小鼠视网膜及视神经中的定位以及表达的改变。采用视网膜铺片 RGC 计数和 CTB 轴突示踪技术验证 AAV-STB 的视神经保护效果。

结果：STB、KIF5A 和 SNPH 特异性高表达于小鼠视网膜的神经纤维层、内层状层以及视神经中，与 RBPMS、GFAP、Vimentin 不共定位，与 COX4、 β -III Tubulin 呈现共定位，急性高眼压小鼠模型中，STB、KIF5A 和 SNPH 在视网膜和视神经中的表达下降，并且其分布出现了紊乱。注射 AAV-STB 后的高眼压模型小鼠的 RGC 数目和轴突长度较对照组高眼压模型小鼠增加。

结论：STB、KIF5A 和 SNPH 在小鼠视网膜和视神经中存在特异性的表达和分布，并表明它们在青光眼模型小鼠视网膜和视神经中的表达下降。AAV 过表达 STB 可以在青光眼模型小鼠中起到视神经保护作用。从线粒体轴浆运输的角度为青光眼视神经损伤机制、早期生物标志物和视神经保护研究提供了新思路。

联合虹膜周边切除术对急性闭角型青光眼合并白内障患者术后眼压控制的早期疗效分析

第一作者：Xindan MENG

共同作者：Xiaohong ZHOU

目的：收集急性闭角型青光眼合并老年性白内障患者病例，通过对比行白内障超声乳化摘除人工晶体植入联合房角分离术时，术中是否联合虹膜周边切除手术的患者视力与眼压状况，为急性闭角型青光眼合并老年性白内障患者的治疗提供新思路。

方法：纳入 2025 年在我院就诊的原发性急性闭角型青光眼合并老年性白内障患者 47 例。将行白内障超声乳化房角分离术的患者分为 A 组（17 例），行白内障超声乳化房角分离联合虹膜周边切除术的患者分为 B 组（30 例）。记录并比较两组术前、术后 1 天、1 周及 1 月的视力和眼压，进行统计学分析。同时，对比 A 组与 B 组在术前、术后 1 天、1 周和 1 月的眼压变化幅度，以及术后 1 月的视力变化情况。

结果：与术前相比，A 组和 B 组在术后 1 个月视力均有显著提升（A 组： $Z = -3.440$, $P = 0.001$ ；B 组： $Z = -4.665$, $P = 0.000$ ）。A 组术后 1 天的眼压无明显改善（ $Z = -1.035$, $P = 0.301$ ），但术后 1 周和 1 月的眼压均较术前显著好转（术后 1 周： $Z = -2.606$, $P = 0.009$ ；术后 1 月： $Z = -2.777$, $P = 0.005$ ）。B 组在术后 1 天、1 周和 1 月的眼压均较术前显著改善（术后 1 天： $Z = -4.143$, $P = 0.000$ ；术后 1 周： $Z = -3.774$, $P = 0.000$ ；术后 1 月： $Z = -4.498$, $P = 0.000$ ）。A 组和 B 组的视力改善情况无明显差异（ $Z = -1.090$, $P = 0.276$ ）。在眼压下降幅度方面，A 组与 B 组相比，术后 1 天无明显差异（ $Z = -1.836$, $P = 0.066$ ），但术后 1 周和 1 月均有显著差异（术后 1 周： $Z = -2.017$, $P = 0.044$ ；术后 1 月： $Z = -2.019$, $P = 0.044$ ）。

结论：原发性急性闭角型青光眼合并老年性白内障的患者在接受两种手术后，视力与眼压均获得显著改善。两种手术方式术后首日眼压无明显差异；联合实施虹膜周边切除术后 1 周及 1 个月，眼压下降幅度更为显著。然而，青光眼患者往往更关注远期

(半年以上) 疗效, 未来研究可进一步探讨房角开放度、前房深度以及远期的视力与眼压控制情况。

超声睫状体成形术与 Ahmed 青光眼引流阀植入术治疗新生血管性青光眼的临床疗效及安全性对比分析

第一作者: Yanjiang FU

共同作者: Shanshan HU, Shulian JI, Xiaolin LI, Shuang ZHANG

目的: 评估超声睫状体成形术 (UCP) 与 Ahmed 青光眼阀 (AGV) 植入术治疗新生血管性青光眼的临床疗效及安全性。

方法: 本研究纳入接受 UCP (40 例, 40 眼) 和 AGV (40 例, 40 眼) 治疗的新生血管性青光眼患者。分别于术后第 1 天、1 周、1 个月、3 个月和 6 个月进行常规眼科检查, 记录眼压、使用的降眼压药物数量、疼痛评分、最佳矫正视力及术后并发症。手术完全成功标准: IOP 较基线下降 $\geq 20\%$, $5 \text{ mmHg} < \text{IOP} \leq 21 \text{ mmHg}$, 无需添加降压药物或再次手术干预。合格的手术成功标准: 不使用降眼压药物眼压 $> 21 \text{ mmHg}$ 且眼压降低 $\geq 20\%$ 和 $> 5 \text{ mmHg}$, 或使用降眼压药物数量少于术前, 眼压可维持在 $5-21 \text{ mmHg}$ 。

结果: 两组术前基线特征无统计学显著差异 ($P > 0.05$)。UCP 组和 AGV 组术前平均眼压分别为 $47.38 \pm 11.92 \text{ mmHg}$ 和 $44.93 \pm 10.65 \text{ mmHg}$ ($P = 0.284$)。术后 1 天, AGV 组的眼压下降趋势显著大于 UCP 组 (AGV 组为 $14.90 \pm 6.64 \text{ mmHg}$, UCP 组为 $39.10 \pm 16.72 \text{ mmHg}$, $P < 0.001$)。术后 6 个月, UCP 组和 AGV 组的眼压降低率分别为 67.4% 和 59.9% ($P < 0.001$), 使用的降眼压药物数量分别为 0.450 ± 0.667 和 0.950 ± 1.080 ($P < 0.05$), 疼痛评分分别为 0.125 ± 0.334 和 0.425 ± 0.594 ($P < 0.001$), 手术成功率分别为 72.5% 和 62.5% ($P > 0.05$)。AGV 组术后并发症的发生率与复杂程度均高于 UCP 组, 尤其以引流管阻塞和瓣膜暴露等装置相关并发症为特征。

结论: UCP 和 AGV 均能有效降低新生血管性青光眼患者术后眼压, 但 AGV 术后眼压波动性大且并发症发生率高, 而 UCP 术后眼压更平稳、并发症更少, 安全且舒适。

超声睫状体成形术治疗青光眼的临床及病理研究

第一作者: Guo LIU

共同作者: Zijie CHEN, Xuyang LIU

目的: 观察超声睫状体成形术 (UCP) 治疗前后患者的眼压、视力以及眼前节参数等的差异以及非灵长类模型动物接受 UCP 治疗后的眼前节病理改变。

方法: 采用回顾性病例观察研究设计, 收集 2021 年 1 月至 2023 年 5 月间于厦门眼科中心与深圳人民医院行 UCP 手术患者共 56 例 (56 只眼睛)。对术前、术后 1 天、术后 1 周、术后 1 月、术后 3 月及术后 6 月复查病人分别行眼压与视力测量, 采用超声生物显微镜 (UBM) 对术前及术后 1 周患者行眼前节检查, 分别测量前房深度 (ACD)、中央角膜厚度 (CCT)、前房宽度 (ACW)、晶状体矢高 (LV)、瞳孔直径 (PD) 和睫状突-睫状突距离 (CP-CP distance), 应用图像处理软件 CorelDRAW 与 ImageJ 测量房角开放度 (ACAn)、房角开放距离 500 (AOD500) 和前房面积 (ACAr)。恒河猴两只, 选随机一眼行 UCP 手术, 对侧眼做阴性对照。术后一周, 动物安乐死后取眼球作石蜡切片, H&E 染色, 观察眼前节病理改变。

结果: 患者术前平均眼压为 $39.08 \pm 14.75 \text{ mmHg}$, 术后 1 天、术后 1 周、术后 1 月、术后 3 月及术后 6 月的平均眼压分别为 $22.57 \pm 8.56 \text{ mmHg}$ 、 $17.89 \pm 7.93 \text{ mmHg}$ 、 $19.63 \pm 8.68 \text{ mmHg}$ 、 $21.5 \pm 10.08 \text{ mmHg}$ 、 $20.24 \pm 8.79 \text{ mmHg}$, P 值均 < 0.05 。术后 1 天复查患者视力, 40 例视力没有变化, 14 例视力好转, 2 例视力下降; 术后 1 周复查患者 53 例, 28 例视力没有变化, 23 例视力好转, 2 例视力下降; 术后 1 月复查患者 36 例, 13 例视力没有变化, 21 例视力好转, 2 例视力下降; 术后 3 月复查患者 25 例, 10 例视力没有变化, 14 例视力好转, 1 例视力下降; 术后 6 月复查患者 22 例, 10 例视力没有变化, 12 例视力好转。较术前相比, 术后 1 周 ACD 由 $2.10 \pm 0.91 \text{ mm}$ 加深至 $2.20 \pm 0.88 \text{ mm}$, PD 由 $3.94 \pm 1.07 \text{ mm}$ 增加至 $4.36 \pm 0.92 \text{ mm}$, ACAn 由 $9.10 \pm 3.44 \text{ mm}^2$ 扩大至 $10.05 \pm 3.02 \text{ mm}^2$, ACAn 由 $5.81^\circ \pm 15.64^\circ$ 增宽至 $8.96^\circ \pm 16.99^\circ$, 差异均有统计学意义 ($P < 0.05$)。其他眼前节参数包括 CCT、LV、ACW、CP-CP、AOD500 等变化均无统计学意义。猴眼 UCP 术后石蜡切片 H&E 染色显示睫状体双层上皮细胞形态基本完整, 睫状肌间隙显著扩大, 呈现典型的葡萄膜巩膜房水排出途径开放的组织形态。

结论：UCP 可有效降低青光眼患者眼压，且对患者视力影响小。患者术后出现 ACD 加深等现象，提示 UCP 除减少房水生成以及增加葡萄膜巩膜通道的房水外流，还存在其他的降眼压机制。对于患者术后瞳孔扩大的情况以及远期降压效果、视力情况仍需进一步观察与探讨。

雾里看花 – 右眼葡萄膜炎 – 青光眼 – 前房积血综合征 1 例

第一作者：**Li CAIYUN**

目的：报道有晶体眼后房型人工晶体（ICL）术后继发性青光眼 1 例。

方法：患者朱 XX，女性，28 岁，因“右眼突发性视力下降 1 天”就诊。3 月前“屈光不正”行双眼 ICL 植入术，术后无特殊。否认眼外伤史及全身疾病史。眼科查体：视力：右眼：HM/眼前；左眼：1.2；眼压：右眼：60 mmhg；左眼：20 mmhg。右眼角膜水肿，前房中深，前房积血，瞳孔区血块。左眼无特殊。右眼 B 超示：玻璃体轻度混浊。前房角镜检查：右眼窥不清，左眼鼻侧少量素色。入院初步诊断：1. 右眼葡萄膜炎 – 青光眼 – 前房积血综合征（UGH）？ 2. 双眼 ICL 术后。入院行右眼前房冲洗，给予全身及局部降眼压，抗炎对症处理。前房冲洗后 9 小时，查体：右眼：视力：HM/30 CM；眼压：60 mmhg。角膜水肿，前房浅，大量积血，遂行前房冲洗 + ICL 取出术，给与全身及局部抗炎，降眼压，预防感染等对症处理。UBM 检查示：右眼 6 点位周边虹膜前粘连，房角关闭。

结果：术后眼压明显下降，至术后 9 天，右眼：视力：FC/40 CM；眼压：15–19 mmhg，角膜基本透明，前房深浅可，房水清，瞳孔直径 6 mm。术后半月：右眼：视力：0.02；矫正视力：0.4；眼压：18 mmhg。至术后 2 月复查，眼压：41 mmhg（布林佐胺噻吗洛尔滴眼液 2 次 / 日）。

结论：UGH 综合征是一种与眼内植入物（尤其是人工晶状体）相关的罕见并发症，主要表现为葡萄膜炎、青光眼和前房积血的三联征。本病例 ICL 术后，考虑 UGH 综合征，尤其罕见。发病原因似乎与白内障手术 IOL 植入不太相似，是否与 ICL 的位置，拱高值偏大等因素相关？患者术后 2 月眼压高，房角关闭，其机制是什么？不典型的 UGH 综合征诊断相对困难，易发生漏诊和误诊。目前临床上存在 UGH 综合征的诱因还很多，需要加强术后的随访，定期随访有利于疾病的早期诊断，追踪患者病情发展变化，对一些可预见性并发症及早发现、

及早治疗，以免延误最佳治疗时机导致更严重的眼部并发症，减少对视神经不可逆的损伤。

AI 筛查工具在上睑下垂诊断中的应用研究

第一作者: Lili GUO

目的: 本研究旨在通过多维度对比分析, 系统评估我单位自行开发设计的上睑下垂 AI 筛查方法与传统人工检测方法在上睑下垂诊断方面的准确性、易用性, 筛查结果可重复性及工作效率方面的差异。

方法: 使用我单位自行开发设计的上睑下垂 AI 筛查工具, 回顾性研究分析我单位使用该工具对近两年 2600 名儿童疑似上睑下垂的测量数据。通过线上及现场对疑似上睑下垂儿童的面部图像进行采集, 采集标准以重复性最佳为准。AI 筛查工具自动对上睑下垂程度进行分级, 将 AI 分级结果与人工分级结果进行比较。最后评估该 AI 筛查系统在轻度、中度、重度儿童上睑下垂诊断的准确性, 同时对其易用性、筛查结果可重复性以及工作效率方面同步进行评价。

结果: 1. 准确性对比: AI 筛查工具整体诊断符合率较高, 与人工测量诊断率基本一致, 结果可靠。2. 可靠性与效率 单次测量耗时 AI 为 12.5 秒, 较人工 (4.8 分钟) 缩短 95.3% ($P < 0.001$)。工作效率显著提高。3. 特殊群体适用性 儿童患者 AI 配合率 99.3%, 较人工 (68.3%) 提高 31%, 测量失败率从 31.7% 降至 0.7%。AI 筛查工具用性强。4. 临床决策支持 AI 筛查工具给出的建议与专家治疗建议高度一致, 可以为临床决策做出良好的指导作用。

结论: 该技术通过手机终端实现“居家拍摄—云端分析”的轻量化流程, 在偏远地区可突破眼科医师资源匮乏的瓶颈 (我国基层眼科医师配比仅 0.4 人/10 万人口)。经测试, 在网络覆盖率 $> 90\%$ 的县域, AI 筛查的可及性较传统门诊明显提升, 为“互联网+医疗”在眼科领域的落地提供标准化解决方案。本研究证实, 上睑下垂 AI 筛查工具通过深度学习技术实现了从“经验诊断”到“精准量化”的跨越, 在准确性、效率及可重复性方面展现出显著临床价值。该技术不仅为眼科医师提供了标准化辅助工具,

更通过技术下沉推动医疗资源的公平分配, 对提升我国眼健康服务体系效能具有里程碑意义。

ROFI: 基于深度学习的眼科特征保留与可逆患者面部匿名化系统

第一作者: Min ZHOU

共同作者: Xianqun FAN, Xuefei SONG, Yuan TIAN, Guangtao ZHAI

目的: 患者面部图像为评估眼部疾病提供了便利手段, 同时也引发了隐私问题。尽管目前已有的部分方法能保护隐私, 但也严重改变了眼病诊断所需的临床体征。因此, 迫切需要开发能保留眼科体征的面部匿名化方法。

方法: ROFI 框架通过弱监督学习提取眼部临床体征, 并利用基于 Transformer 的身份转换器在私钥引导下改变面部特征以保护隐私。随后, 通过整合这两个输出, 将原始眼部特征嵌入匿名化特征图中, 并通过细化网络确保自然过渡, 最终生成高质量的匿名图像。为验证效果, 基于三家临床中心 17,753 名患者的数据评估证实, ROFI 在保留眼科体征完整性和支持 11 种疾病筛查方面具有良好临床可用性。

结果: 通过选择以下与大多数眼科疾病相关的典型眼部征象评估 ROFI 的有效性: 眼睑形状、虹膜形状、结膜疾病、泪器疾病、眼睑疾病和虹膜疾病。ROFI 在内部和外部验证集上都能准确保留眼科体征。在内部验证数据集上, 其关键点错误率最低, 眼睑/虹膜关键点错误率平均为 1.53%/1.64%, 远低于 Mosaic (5.51%/12.36%)、AIGC (3.19%/3.79%)、Face Swap (2.35%/4.16%)、Digital Mask (8.25%/6.84%) 和 G2Face (2.70%/3.18%)。在外部验证集上, 眼睑/虹膜关键点错误率仍然很小, 分别为 1.38%/1.37% 和 1.68%/2.07%。此外, ROFI 在按疾病比较中也优于其他方法。在面部匿名化过程中, ROFI 在保留与疾病相关的眼科体征方面具有优势, 经 ROFI 处理的影像在所有三个验证集上都与原始影像表现出显著一致性 (Cohen's $k \geq 0.81$)。我们的方法在所有三组验证集和所有眼病上均达到 $\kappa \geq 0.81$, 表明 ROFI 保护图像与原始图像之间在临床结果上具有极佳的一致性。使用

人脸识别算法评估隐私保护性能。在使用 AdaCos 时，ROFI 保护了 96.54% 的图像。

结论：目前广泛用于眼科部门以保护隐私的“危险”眼部裁剪策略并不安全。我们介绍、开发并验证的保护模型 ROFI 弥补了这一空白。ROFI 从真实患者数据中学习，优先保留对临床诊断至关重要的眼科病征特征，同时模糊患者的身份生物特征。通过利用深度学习在自主病征检测与识别保护方面的强大能力，并以大规模真实眼科患者数据集为驱动，ROFI 在临床诊断和隐私保护两方面均表现出卓越的性能。

摘要编号：202941

人工智能诊断视网膜母细胞瘤的价值：系统评价和荟萃分析

第一作者：Runzi YANG

共同作者：Jing LI, Rui LIU, Jianmin MA, Tingting REN, Nan WANG, Liangyuan XU

目的：目前人工智能在多项眼科疾病中体现出卓越的价值。在视网膜母细胞瘤诊断和诊断中也有研究报道人工智能的作用，但目前尚无统一结论。因此，我们进行了系统回顾和荟萃分析来评估人工智能的价值。

方法：根据 PRISMA 指南，对 Pubmed、Embase、Cochrane database 和知网、万方数据库进行搜索，使用关键词 + 自由词进行检索，检索时限从建库至 2024 年 9 月。共统计 862 项研究，我们纳入了诊断性研究以评估人工智能在基于眼底成像识别视网膜母细胞瘤中的准确性。由 2 名研究者独立筛选文献、提取资料并评价纳入研究的偏倚风险后，采用 R (4.51) 软件进行 Meta 分析。采用随机效应模型进行 Meta 分析。如果合并后存在明显的临床异质性，则采用亚组分析或敏感性分析等方法进行处理，或只行描述性分析。

结果：共纳入 8 项研究，Meta 分析结果显示，人工智能在诊断视网膜母细胞瘤中敏感性为 98.4%，特异性为 98.7%，AUC 为 0.991。敏感性分析提示结果较为可靠。

结论：当前证据表明，人工智能在诊断视网膜母细胞瘤中具有较高的敏感性和特异性。人工智能或许可以作为医师的辅助工具，也可作为高危人群中的筛查工具。受纳入研究数量和质量的限制，上述结论尚待更多高质量研究予以验证。

摘要编号：201902

人工智能赋能的跨场景眼科护理连续性保障方案

第一作者：Xianwei LI

目的：针对传统眼科护理中存在的“操作标准化程度低”、“患者依从性监测困难”、“并发症预警滞后”等痛点，本研究提出智能增强护理 (IA-Nursing) 新范式，旨在实现：(1) 基于患者生物力学特性的个性化护理方案生成；(2) 通过多模态感知实时评估护理质量；(3) 建立并发症风险的前瞻性预警系统。

方法：采用三项突破性技术：(1) 开发眼表数字孪生系统，整合共聚焦显微镜与 OCT 数据构建三维力学模型；(2) 设计具有触觉反馈的智能护理手套，内置 16 个压力传感器与微振动马达；(3) 应用时空图卷积网络 (ST-GCN) 分析护理操作视频流，自动识别不规范动作。创新性地将手术室级无菌标准引入居家护理场景。

结果：形成三大创新产出：(1) 角膜接触镜护理的误操作识别准确率达 92.3%；(2) 青光眼患者滴眼药依从性提升 57%；(3) 干眼症热敷护理的温度控制误差 $< 0.5^{\circ}\text{C}$ 。同时建立全球首个眼科护理操作知识图谱，包含 387 个标准动作节点。

结论：本研究证实了人工智能重构眼科护理流程的可行性，其核心价值在于：(1) 创建“数字建模—物理交互—质量评估”的闭环系统；(2) 发展基于生物力学的精准护理理论；(3) 提出护理操作可计算化新理念。下一步需重点解决老年患者的科技接受度问题，建议在术后护理场景优先推广。

摘要编号：209057

使用聚类分析为激光术后白内障患者筛选 IOL 屈光力计算公式

第一作者：Haiyan MI

共同作者：WanJun DONG, Jianfan YU

目的：在临床中，没有任何单一 IOL 计算公式对所有患者普遍最优，不同公式的准确性在不同特征的人群中存在显著差异。因此，为患者预先选择最精准的计算公式，是实现术后理想视觉质量的关键。本研究旨在探索一种基于患者术前生物测量参数的个性化 IOL 计算公式选择策略。通过聚类分析方法，对激光术后白内障患者进行分型，并评估不同公式在各患者亚组中的准确性差异，最终构建一个能够指导临床选择公式的分类模型。

方法：本研究为一项回顾性研究。收集既往接受激光术的白内障患者的术前资料，包括眼轴 (AL)、前房深度 (ACD)、角膜曲率 (Km) 等生物测量

参数。应用层次聚类算法，将患者划分为具有不同解剖特征的亚组。随后，回顾性计算并比较五种主流 IOL 计算公式（Barrett True-K, Haigis-L, EVO, HofferQST, PearlDGS）在各患者亚组中的预测准确性，主要评价指标为术后实际屈光偏差与预测偏差的差异（PE）、平均绝对误差（MAE）以及预测误差中位数（MedAE）。

结果：聚类分析将 455 个患者分为 4 个具有鲜明解剖学特征的亚组，分别为类别 1（AL: 25-27, ACD: 3.00-4.00, Km: 40-42）、类别 2（AL: 27-30, ACD: 3.25-3.75, Km: 37-39）、类别 3（AL: 26-28, ACD: 3.00-3.25, Km: 36-38）、类别 4（AL: 30-32, ACD: 3.00-3.75, Km: 32-35）。结果显示，不同 IOL 计算公式在各亚组中的表现存在系统性且显著的差异。整体来看，EVO, PearlDGS, Barrett True-K, HofferQST, Haigis-L, 准确率依次降低，所有公式在类别 1 准确率最高，随着眼轴增长总体呈现下降趋势。Haigis-L 受眼轴变化影响最大，只适合类别 1；EVO 普遍适用于四个类别；PearlDGS 适合前三个类别，不适合类别 4。类别 1 中 Barret True-K 最适用；类别 2 除了 Haigis-L, 其他四个公式误差差别小，均可使用；类别 3 中 PearlDGS 最适用；类别 4 推荐 EVO, 因为其他四个公式准确率下降更明显。统计每个类别 PE 在 ± 0.5 以内的占比，与上述有相似的结果，并且 PearlDGS 仅比 EVO 略低。

结论：本研究表明，基于术前生物参数进行聚类分析，能够有效识别出激光术后白内障患者中存在的不同解剖亚型，并且不同 IOL 计算公式的准确性确实具有群体特异性。

摘要编号：207912

利用自然语言处理技术 NLP 评估近视防控政策效果：对眼科医疗工作者的实践指导意义

第一作者：Jing SHEN

目的：随着全球近视问题越发严峻，各级政府和卫生机构不断出台近视防控政策，并发布大量公共卫生信息。尽管这些努力目的在于减缓近视发展趋势，但公众接受度和政策实际效果仍需进一步分析与验证。本研究旨在通过自然语言处理（NLP）技术分析社交媒体和在线健康社区中的公众反馈，从而评估近视防控政策和公共卫生信息的效果。特别地，本研究探讨这些分析对眼科医疗工作者在临床实践、患者教育和公共卫生宣传中的指导作用。

方法：数据收集：利用爬虫技术在主要社交媒体平台和健康论坛收集近视防控相关的公众讨论。数据预处理与情感分析：清洗数据并应用 NLP 情感分

析工具。主题识别：通过 LDA 等算法识别讨论主题。影响力与接受度评估：采用社交网络分析方法。

结果：研究表明公众对近视防控政策和信息的态度总体积极，但存在疑虑和担忧。分析结果具体揭示了公众关注的核心议题，包括预防策略、政策执行可行性等。

结论：提高临床决策质量：通过了解公众对近视政策的态度和感知，眼科医生可以更有效地进行临床决策，调整治疗策略。促进患者教育与沟通：识别公众的主要关注点和普遍误区，眼科专业人员可以设计更针对性的患者教育材料。优化公共卫生宣传：基于对公众接受度的深入分析，眼科医疗工作者可以参与到更有效的公共卫生宣传。推动政策建议与改进：通过收集和分析公众反馈，眼科医生和研究人员可以提供基于数据的建议，促使卫生政策制定者优化现有政策。

摘要编号：209725

基于 OCTA 与彩色眼底照片的深度学习模型用于分割视网膜静脉阻塞患者无灌注区：一项前瞻性多中心研究

第一作者：Meng WANG

共同作者：Weihong YU

目的：开发基于人工智能（AI）的深度学习（DL）模型，实现视网膜静脉阻塞（RVO）患者光学相干断层扫描血管成像（OCTA）与彩色眼底照片（CFP）中无灌注区（NPA）的自动检测。

方法：首先训练一个 DL 算法用于在 OCTA 图像与 CFP 中分割 NPA 区域；随后训练第二个 DL 算法，用于判断 OCTA 与 CFP 中 NPA 是否大于 5 个视盘直径（5 PD）。NPA 区域由 3 名眼科医师基于 OCTA 图像手动勾画，并通过图像配准技术自动映射至对应 CFP。

结果：共纳入 520 对 CFP/OCTA 图像作为内部数据集，划分为训练集 386 对、验证集 52 对和测试集 100 对。内部数据集包括 200 例分支 RVO、71 例中央 RVO 及 249 例正常图像。模型进一步在 272 对 CFP/OCTA 图像组成的外部数据集中进行验证。首个 DL 模型用于检测 CFP 中是否存在 NPA，在内部数据集中的敏感度、特异度与 F1 分数分别为 0.788、0.955 与 0.863，在外部数据集中分别为 0.716、0.782 与 0.748。第二个 DL 模型用于检测 CFP 中是否存在 ≥ 5 PD 的 NPA，在内部测试集中的精确度、敏感度、特异度与 F1 分数分别为 0.889、0.774、0.925 与 0.828，在外部数据集中分别为 0.804、0.783、0.860 与 0.793。

结论：本研究开发的深度学习模型能够基于 OCTA 与 CFP 对 RVO 患者的 NPA 进行自动分割与范围判断，并创新性地提出在无 OCTA 条件下直接通过 CFP 检测 NPA 的策略，为临床筛查提供可行替代方案。

摘要编号：208033

大型语言模型在眼科领域的评估：一项系统综述

第一作者：Zili ZHANG

共同作者：Xianqun FAN, Zhe PAN, Xuefei SONG, Yao WAN, Haiyang ZHANG

目的：大语言模型（LLM）在临床问答、影像解读与决策支持等任务中的应用正持续增长，然而眼科领域缺乏对其评估实践与证据质量的系统审视。本研究系统汇总已发表的相关量化评估，刻画证据现状与方法学特征，并在探索诊断类任务证据合成的可行性。

方法：在 PubMed、Web of Science、Embase 和 IEEE Xplore 四个数据库中系统检索至 2024-11-17 的文献，纳入在眼科领域中对 LLM 进行定量评估的原始研究。双人独立筛选与数据提取，从模型类型、评估模态、亚专科、任务类别、评价维度及与真实世界临床工作流的对齐程度六个方面进行分析。对方法学一致性最高的任务：开放式诊断的正确率进行荟萃分析（随机效应模型，logit 转化，DerSimonian-Laird τ^2 ），报告 I^2 ，并开展亚组与敏感性分析。

结果：共检索 817 条记录，纳入符合条件的 187 篇（22.9%）。其中，被纳入评估最多的三个模型系列分别是 ChatGPT（90.9%）、Gemini（31.0%）和 Copilot（17.1%）；对闭源模型的评估占主导，仅有 13.4% 的研究评估了开源 LLM。评估工作以纯文本为主，基于图像 - 文本的多模态评估仅 10.2%；除了综合眼科（38.5%）外，视网膜与玻璃体（17.1%）与青光眼（10.7%）是最常见的两个亚专科，然而屈光手术、眼科药理与眼肿瘤与病理学仅有各不到 3 项研究。评估任务集中于医学问答（46.0%）、标化考试（21.9%）与眼病诊断（15.5%），然而对有些任务如患者分诊或疾病预测（各 1.6%）关注较少。在评估指标方面，准确性最为常用（94.1%），而仅有 2.7% 的研究评估了模型的不确定性。多使用非真实患者数据进行评测，人与模型表现对比、非英语语境评估及真实世界部署不足。对 17 项诊断研究 28 个评估汇总得总体正确率 0.594（95% CI 0.488-0.692），异质性极高（ $I^2 = 94.5\%$ ），各亚组 I^2 仍多 $> 80\%$ 。

结论：评估眼科 LLM 的研究已有一定规模，但模型、任务与评估指标不统一，证据异质性高，限制了进一步的性能数据综合及对眼科实践的指导。在 LLM 能够安全地集成到眼科临床工作之前，迫切需要标准化、多模态基准和分阶段的临床验证流程。

摘要编号：207911

屈光不正患者与 ChatGPT 人工智能 AI 的对话实验：屈光不正患者教育新方法的探索应用

第一作者：Jing SHEN

目的：本研究旨在探索和评估使用 ChatGPT 人工智能（AI）与屈光不正患者进行对话作为患者教育方法的有效性。通过实验性的对话设置，研究借助 AI 提高患者对自身状况理解的可能性及其对治疗遵从性的潜在影响。

方法：参与者招募：从眼科门诊中随机选取屈光不正患者，根据其愿意参与的程度进行分组，50 人为实验组，接受 ChatGPT 对话干预，另外 50 人作为对照组，接受传统的屈光不正教育方法。对话实验设计：在保障医学信息准确性和通俗易懂的基础上，定制 ChatGPT 模型以适应与屈光不正患者的对话需求。对话内容涉及屈光不正基础知识、治疗选项和日常护理建议。数据收集与分析：通过问卷调查和跟踪访谈的方式，评估患者在接受干预前后对屈光不正的理解程度、治疗遵从性以及总体满意度。统计处理：使用相关的统计软件对收集的数据进行分析，评估 ChatGPT 干预的效果与传统教育方法相比的优劣。

结果：实验组中，使用 ChatGPT 对话的患者在对屈光不正的理解上表现出显著提升，知识掌握率提高了 40%，遵从性提升约 30%，满意度提高了约 25%。

结论：ChatGPT 人工智能在屈光不正患者教育中表现出较传统教育方法更优的成效。其在提高患者理解、改善治疗遵从性和增加患者满意度等方面的显著效益，预示着 AI 技术在患者教育领域的广阔应用前景。未来，进一步的研究可探索其在其他疾病领域的应用潜力，以及长期对患者行为和健康结果的影响。

摘要编号：208770

探讨运用心理学提升眼科药学服务的价值与作用

第一作者：Manwei FANG

目的：本摘要旨在深入探讨心理学的运用在眼科药学服务中的应用潜力，评估其对改善患者用药依从

性、增强医患沟通质量、提升药学整体服务满意度的具体价值与作用机制。

方法：选取 2025 年 7 月 -8 月期间在广州爱尔眼科医院住院患者数量，分为观察组($n = 30$)和对照组($n = 30$)，其中均包含着老年人、儿童。在住院常规治疗的基础上，观察组的患者增加了心理学干预来提升药学服务质量，具体干预措施涵盖共情式倾听及回应、通俗化语言表达、行为引导及文字标识等方式。对观察组和对照组患者进行为期 1 个月的随访，通过电话反馈、问卷收集用药依从性数据、药物使用规范率、药品不良反应发生率及药学服务满意度指标，比较两组间的差异显著性。

结果：经过为期 1 个月的随访，观察组的用药依从性达到 88.7%，显著高于对照组的 68.3% ($P < 0.05$)；药物使用规范率为 92.5%，对照组为 76.2% ($P < 0.05$)；不良反应发生率降至 4.8%，低于对照组的 16.1% ($P < 0.05$)；药学服务满意度得分为 4.6 分（满分 5 分），对照组为 3.7 分 ($P < 0.05$)。数据分析显示，心理学干预显著优化了各项指标，差异具有统计学意义。

结论：本研究表明，在眼科药学服务中运用心理学干预，能有效提升患者用药依从性、增强医患沟通质量、提升药学服务整体满意度，并降低不良反应风险，对优化眼科传统药学服务模式、改善患者治疗结局具有重要实践价值和推广应用潜力。

摘要编号：**209239**

眼科领域大语言模型评估：提升糖尿病视网膜病变查询响应的质量

第一作者：Hongkang WU

共同作者：Juan YE

目的：糖尿病视网膜病变（DR）是全球范围内导致可预防性成人失明的主要原因，预计到 2045 年将影响约 1.605 亿人。随着大型语言模型（LLMs）的普及，受 DR 影响的人群可能越来越依赖这些系统获取相关信息。然而，LLMs 在回答 DR 相关问题上的专业性和可靠性尚未明确。本研究旨在评估六个 LLM（ChatGPT-4.0、ChatGPT-3.5、Llama 2、Google Gemini Pro、Bing Chat 和 QWEN）在非临床环境中回答 DR 相关问题的潜力，通过比较其响应的准确性和全面性。

方法：研究于 2024 年 2 月 1 日 -3 月 31 日进行。首先，由经验丰富的眼科医生团队设计了 42 个与 DR 相关的临床常见问题，涵盖病因、症状、诊断和预防、治疗、预后等六个类别。这些问题随后被分别提交给上述六个 LLM。为减少偏差，研究关闭了 LLMs 的联网功能，在每次提问后重置会话，并对响应进行匿名化和随机分组。三位具有五年以

上临床经验的顾问级眼科医生对 LLM 的响应进行了独立评分。评估包括自动分析和手动分析。自动分析评估了响应的字符数、单词数以及可读性（使用 Flesch 阅读难度和 Flesch-Kincaid 年级水平指标）。手动评估则采用三级评分系统（差、临界、好）来衡量响应的准确性，并通过五分制评估“好”响应的全面性。此外，研究还引入了自我纠正提示，对初始评估为“差”或“临界”的响应进行二次评估，以检验 LLMs 的自我纠正能力。数据分析使用 IBM SPSS Statistics，采用单因素 ANOVA 和 Kruskal-Wallis 检验等进行统计比较。

结果：对 252 个响应的分析显示，不同 LLM 生成响应的平均单词数（155.3-304.3）和字符数（975.3-2043.5）存在差异。可读性评分也显示出显著差异，其中 ChatGPT-3.5 的可读性水平最低。在准确性方面，总体表现较高，ChatGPT-4.0 获得了 97.6% 的“好”评级，且排名前三的模型均未收到“差”评。在引入自我纠正提示后，响应的平均准确性评分从 6.4 显著提升至 7.5。

结论：本研究表明，大型语言模型在回答糖尿病视网膜病变（DR）相关问题方面具有提供准确、全面信息的潜力，显示出在眼科健康信息支持领域的应用价值。然而，不同模型在可读性方面存在显著差异，在将其整合到临床实践或公众教育之前，需要进一步改进和优化。为确保其长期可靠性，持续的验证与评估至关重要。

摘要编号：**209930**

近视眼底豹纹斑的自动量化、分级及五年进展预测：一项多中心纵向深度学习研究

第一作者：Wenda ZHOU

共同作者：Wenbin WEI

目的：豹纹样眼底（Fundus Tessellation, FT）作为脉络膜薄变的替代标志，是近视性黄斑病变的初始征象。本研究旨在开发一种基于人工智能（AI）的系统，用于基于彩色眼底照相（CFPs）自动量化与分级豹纹斑，并构建深度学习系统（DLS）以预测 5 年内豹纹样眼底的发生与进展。

方法：基于两项人群研究及眼科检查中心的纵向数据集，我们开发了 FT 分割模型，以自动量化 FT 的程度和位置。基于这些模型，我们构建了两套分级系统，并开发了一系列深度学习系统（DLS）来预测 FT 的密度和其与黄斑中心处位置的进展。前者使用 FT 分割模型量化生成 FT 密度值，后者使用 ETDRS 环作为位置分割依据，根据 FT 分布的内、中、外环作为 FT 位置进展的依据。

结果：研究纳入 218,519 名受试者（437,038 眼）（平均年龄：37.7 ± 10.8 岁），平均随访时间为 61.2

± 1.3 个月（中位数：60.6 个月）。深度学习系统在预测 FT 的发生和进展方面表现出色。在验证数据集中，受试者工作特征曲线下面积（AUROCs）分别为：FT 发生的 AUROC = 0.826（95% CI: 0.819–0.834）、FT 进展的 AUROC = 0.898（95% CI: 0.894–0.903）、黄斑区 FT 发病的 AUROC = 0.854（95% CI: 0.848–0.859）、FT 位置进展的 AUROC = 0.859（95% CI: 0.853–0.865）。在外部测试集中，FT 发生和进展的 AUROC 分别为 0.720（95% CI: 0.687–0.753）和 0.753（95% CI: 0.733–0.772），而 FT 在黄斑中心区域发病和位置进展的 AUROC 分别为 0.729（95% CI: 0.714–0.745）和 0.817（95% CI: 0.788–0.846）。

结论：基于 AI 技术的彩色眼底照相评估模型能够自动量化 FT 的密度和其距离黄斑中心的位置，并预测其未来变化。该技术有望在低成本临床环境中提升近视眼底病变发生与进展的预测能力。

摘要编号：207989

针对大型语言模型（LLM）在医疗领域中的可能性与应用前景的探究思考

第一作者：Jing SHEN

目的：随着大型语言模型（LLM）的出现，这些模型已经在如 GPT、BERT、XLNet 等在自然语言处理领域中取得了惊人的成就。在一定程度上，它们能够实现文本自动编写、自动翻译、文本分类、问答等领域的突破。在医疗领域，更广泛的应用对于改善医疗质量具有巨大的潜力。本文旨在探讨 LLM 在医疗领域中的可行性与应用前景。LLM 在医疗领域的主要目的是对医学知识的组织和推理方面发挥作用。

方法：通过对海量的医学文献进行阅读和理解，LLM 可以自动生成摘要、分类、标签等信息，帮助医生更快、更准确地诊断和治疗疾病。同时，LLM 可以自动将不同的医学知识点组合起来，生成完整的疾病预防、诊断、治疗方案，从而提高临床医生的治疗和诊断能力。此外，LLM 还可以在医学图像识别、病理分析等方面发挥作用，从而更好地帮助医生进行病情判断。为了实现上述目的，LLM 通常使用自然语言处理技术对海量数据进行处理训练，并使用语言生成技术来生成医疗信息。在医学图像识别方面，LLM 可以使用计算机视觉技术来进行图像分析和识别，从而帮助医生更好地理解病情。在医学研究方面，LLM 可以使用自动化学习技术来帮助分析和理解大规模的临床数据和试验。

结果：通过分析和可行性判断，应用 LLM 在医疗领域，我们可以得到以下的结果：- 更快、更准确的诊断和治疗方案，从而可以改善医疗质量；- 更

好的医疗知识共享和传播，提高了临床医生的素质和技能；- 更好的病情判断和分析，从而可以更好地理解病情并作出更好的治疗决策。

结论：总体来看，在医疗领域中，LLM 的应用前景非常广阔，可以运用于医生和研究人员的辅助诊断工具、临床数据和图像处理工具。尽管这些技术在隐私方面尚存在困难，但它们可以帮助医疗专业人员更好地分析和了解病情，从而提供更好的治疗方案。此外，随着技术的不断发展和对隐私保护的探索，LLM 的应用前景将更加广阔。总之，LLM 在医疗领域将继续发挥巨大的作用，并有望成为未来医疗发展的重要推动力量。

屈光手术

摘要编号：209700

CGRP 通过增强完整的泪液分泌神经回路改善角膜神经切断后的干眼

第一作者：Mengyao ZHANG

共同作者：Qun WANG, Qingjun ZHOU

目的：本研究旨在探讨感觉神经肽降钙素基因相关肽（CGRP）在小鼠因角膜神经切断所致的屈光术后干眼中的作用。

方法：通过手术切断角膜神经，在成年 C57BL/6 小鼠中建立模型。术后评估包括角膜敏感性、角膜神经密度、泪液分泌、角膜荧光素染色、角膜免疫荧光染色和 RNA 测序。检测了三叉神经节（TG）的 TRPM8、脑上泌涎核（SSN）的 c-FOS 表达，并进行了 SSN 的体内电生理记录。评估了 CGRP 及其工程化变体（eCGRP）治疗屈光术后干眼的疗效。

结果：角膜神经切断导致角膜 CGRP 含量显著降低，并伴随干眼症状的出现，包括泪液分泌减少、上皮屏障功能障碍和基底膜下神经退变。预防性给予 CGRP 能有效逆转这些病理改变，而治疗性给予 CGRP 则通过增强完整的泪液分泌神经回路显著减轻这些改变。与天然 CGRP 相比，局部应用 eCGRP 在增加泪液分泌、恢复上皮稳态和减轻角膜炎症方面表现出更优的疗效，且无疼痛相关副作用。

结论：我们的数据表明，在屈光术后干眼中，角膜 CGRP 的表达因 TRPM8-SSN 活性降低而下调。eCGRP 可能为其预防和治疗提供一种有效的治疗策略。

摘要编号: 206045

InnovEyes Sightmap 光迹追踪引导准分子激光手术后增效手术一例

第一作者: Xuefei YANG

共同作者: Yanjia LI, Bo ZHAO

目的: InnovEyes Sightmap 光迹追踪引导准分子激光手术后左眼视力不佳, 患者主诉左眼视物下方重影较重。经 6 个月观察, 视力未提高。再次行地形图引导的准分子激光手术, 提高患者的视力及视觉质量。

方法: 患者术后左眼的屈光度为 $0/-1.25\text{ DS} \times 88^\circ$, Sightmap 检查左眼 4 mm 瞳孔下的全眼高阶像差为 0.237, 球差为 -0.056 , 彗差为 0.237; 6.5 mm 瞳孔下的全眼高阶像差为 0.513, 球差为 -0.264 , 彗差为 0.103。Pentacam 检查左眼 4 mm 瞳孔下的角膜高阶像差为 0.748, 6.5 mm 瞳孔下的角膜高阶像差为 2.398, 且中央偏下的位置曲率偏高。在术后 6 个月, 屈光度稳定后行左眼角膜地形图引导模式 (TOPO-G), 将全部角膜像差消除, 并对低阶像差进行 C12 补偿。通过多次综合验光发现与 Topography-Guided 模式下地形图散光度与轴位间差异大。综合验光: $0/-1.25\text{ DC} \times 80^\circ$, 地形图: $-0.28\text{ DS}/-0.74\text{ DC} \times 7^\circ$, 将柱镜补偿到球镜。根据 C12 补偿原则, 球镜补偿 $+0.06\text{ D}$, 最终手术方案: 手术光学区 6.5 mm, 球镜 -0.34 D , 柱镜为 0。术中采用掀开原角膜瓣法, 掀瓣后将设计方案调出, 虹膜定位, 行个性化准分子激光切削, 冲洗角膜层间, 并将角膜瓣复位, 完成手术。

结果: 经过二次手术, 患者左眼视力为 1.0, 左眼的屈光度为 $+0.50/-1.25\text{ DS} \times 85^\circ$, 视物下方重影的情况已经消失。二次术后 3 个月 Sightmap 检查左眼 4 mm 瞳孔下的全眼高阶像差为 0.091, 球差为 -0.011 , 彗差为 0.070; 6.5 mm 瞳孔下的全眼高阶像差为 0.366, 球差为 -0.044 , 彗差为 0.219。Pentacam 检查左眼 4 mm 瞳孔下的角膜高阶像差为 0.392, 6.5 mm 瞳孔下的角膜高阶像差为 2.005。二次增效手术后全眼高阶像差及角膜高阶像差明显下降, 角膜形态较规则。患者对术后效果较为满意。

结论: InnovEyes Sightmap 光迹追踪引导准分子激光手术是全球首款全眼个性化定制的屈光手术, 应用 Ray Tracing 技术并通过独家专利智能迭代算法创建 3D 全眼虚拟模型, 为患者制定个性化的手术方案。“全光塑”手术可以带给我们更加完美的术后视觉效果。但面对各种原因可能出现的术后视力不佳, 我们要仔细分析原因, 并作出合适的处理方案。本病历将地形图引导应用于“全光塑”术后的增效手术中, 可矫正不规则的角膜形态, 消除角

膜像差, 达到提升视力的目的。该患者虽然术后视力恢复, 但仍存在逆规散光的情况, 仍需进行长期观察。

摘要编号: 210069

《角膜屈光性透镜取出术临床诊疗循证指南》解读

第一作者: Lulu XU

共同作者: Yan WANG

目的: 本文对国际指南《角膜屈光性透镜取出术临床诊疗循证指南》进行解读, 以期帮助同行进一步了解其学术内涵, 指导并促进屈光手术的规范开展。

方法: 角膜屈光性透镜取出术 (KLEx) 作为新型角膜屈光手术, 临床开展时间相对较短, 但在全球应用范围逐渐扩大, 手术亟待规范。近期, 首部由中国专家发起的国际屈光手术循证医学指南《Evidence-based Guidelines for Keratorefractive Lenticule Extraction Surgery》在国际眼科专业顶级期刊《Ophthalmology》发布。

结果: 该指南以循证医学证据为基础, 对手术各个方面包括手术术前筛查、适应证、手术术中和术后并发症处理等重要问题依照 WHO 的相关要求展开了系统证据检索、分析与评价, 并形成了 38 条具有临床指导意义推荐意见, 为临床规范实施 KLEx 手术提供强有力的循证医学参考。KLEx 手术《指南》的制订与以往的专家共识、标准不同, 采用了严格的循证医学方法, 因而更具科学性与严谨性, 全面而广泛的检索确保了研究证据的完整与可靠; GRADE 证据分级和完全德尔菲方法的应用确保指南制订过程标准、高效和质量。《指南》的证据体系来源于广泛的文献检索且推荐意见是综合国内外具有专业代表性和地域代表性的专家推荐并经严格外审以及收集来自最终用户的反馈, 这些都为《指南》的临床应用、实施及推广奠定了基础。当然, 也存在一些局限性, 例如 KLEx 手术发展时间短, 学习曲线长, 手术技术本身还在探索阶段, 早期研究结果受手术开展时间的影响, 可能会使证据结果有偏差, 需要更多的多中心、大样本、长时间随访观察。值得注意的是, 《指南》是基于现有证据制订, 尽管证据级别多数相对较高, 但随着未来研究和证据的不断更新其结果可能还会有变化, 同时, 此为循证医学指南, 不具有法律效力。

结论: 《角膜屈光性透镜取出术临床诊疗循证指南》可对全球范围内所有开展 KLEx 手术的眼科医疗机构提供指导性帮助, 其宗旨是不断提高此类手术的安全性和精准性, 最终造福更多的需要视觉矫正的广大患者。

摘要编号: 205338

不同屈光度近视患者眼前节生物参数特征及对 ICL 尺寸选择的影响

第一作者: Ruibo YANG

目的: 对比分析中度、高度及超高度近视患者眼前节生物测量参数的特征, 及其对 ICL 尺寸选择的影响。

方法: 本前瞻性观察性队列研究纳入 131 名患者 246 只眼。记录术前眼轴(AL)、中央角膜曲率(Kc)、中央角膜厚度(CCT)、白到白距离(WTW)、前房深度(ACD)、虹膜小梁网夹角(TIA)、前房宽度(ACW)、角到角距离(ATA)、晶状体矢高(CLR)、晶状体厚度(LT)、睫状沟间距(STS)、ICL 尺寸以及术后 1 个月的拱高, 并在不同近视程度组之间进行比较。

结果: 中度近视患者的 ACD 和 TIA 比高度近视和超高度近视患者小 ($P < 0.05$)。中度近视组中 CLR 正值的比例较高 (65%), 而超高度近视组中 CLR 负值的比例较高 (55.3%)。 ($P = 0.047$)。不同近视程度组之间的 WTW、ATA、ACW、STS、LT 以及术后拱高无统计学差异 ($P > 0.05$)。在不同近视程度组中, 垂直方向的 ATA、ACW 和 STS 均长于水平方向的 ATA、ACW 和 STS ($P < 0.001$), 且水平子午线方向的 STS 与 ATA ($r = 0.655$) 和 ACW ($r = 0.660$) 的相关性高于其与水平方向的 WTW ($r = 0.591$) 的相关性。在中度近视组中, 使用最小 12.1 尺寸的 ICL 的比例 (35.8%) 高于高度近视 (14.6%) 和超高度近视 (26.3%) ($P = 0.013$)。

结论: 与高度和超高度近视相比, 中度近视眼的 ACD 和 TIA 较小, 而 WTW、ATA、ACW 和 STS 等冠状面眼前节参数与高度和超高度近视患者相似, 晶状体位置更靠前; 水平方向 STS 与同一子午线上的 ATA 及 ACW 的相关性高于与 WTW 的相关性。提示临床医生选择 ICL 尺寸时应更多关注眼内径, 同时应关注不同近视程度下矢状轴参数 ACD 和 CLR 对 ICL 尺寸选择的影响。

摘要编号: 210179

中高度近视 KLEx 与 FS-LASIK 术实际与有效角膜切削量的比较: KLEx 可能更节约切削量

第一作者: Shuangfeng LIANG

共同作者: Dandan LIAO, Bo MEI, Xiangjie ZENG, Chunyang ZHOU

目的: 探究在保留或减去角膜基质透镜切除术 (KLEx) 非屈光性切削的最小透镜厚度后, 对比

中高度近视 KLEx 与飞秒激光辅助原位角膜磨镶术 (FS-LASIK) 的实际与有效角膜切削量。

方法: 这项研究回顾性纳入 193 例中高度近视 KLEx 或 FS-LASIK 患者的右眼数据 (KLEx 组 93 眼, FS-LASIK 组 100 眼), 两组患者的治疗光区直径均为 6.30 mm, KLEx 的最小透镜厚度均为 10 μm 。KLEx 由 ZEISS VISUMAX 500 完成, FS-LASIK 由 AMARIS 1050RS 完成。使用 Sirius 三维眼前节分析系统测量术前及术后 6 月时的中心角膜厚度 (CCT) 和直径 10 mm 区域的角膜体积 (CV), 并比较两组实际与有屈光效果的最大切削深度及总切削体积。其后再将 KLEx 与 FS-LASIK 两组再分为中度近视 ($-3.00 \text{ D} \geq \text{SE} > -6.00 \text{ D}$)、高度近视 ($-6.00 \text{ D} \geq \text{SE} > -8.00 \text{ D}$) 和超高度近视 ($\text{SE} \leq -8.00 \text{ D}$) 组进行实际与有效切削量的比较。

结果: 两组术前、术后 6 月 CDVA 与等效球镜均无显著差异 ($P > 0.05$)。KLEx 与 FS-LASIK 的最大实际切削深度 ($117.73 \pm 16.95 \mu\text{m}$ vs. $120.20 \pm 22.84 \mu\text{m}$, $P = 0.393$) 和体积 ($2.22 \pm 0.88 \text{ mm}^3$ vs. $2.11 \pm 0.95 \text{ mm}^3$, $P = 0.446$) 差异均不显著, 去除 10 微米的最小透镜厚度后, KLEx 的最大有效切削深度显著小于 FS-LASIK ($107.73 \pm 16.95 \mu\text{m}$ vs. $120.20 \pm 22.84 \mu\text{m}$, $P < 0.001$), 而有效切削体积 KLEx ($1.92 \pm 0.88 \text{ mm}^3$) 与 FS-LASIK ($2.11 \pm 0.95 \text{ mm}^3$) 比较差异无统计学意义 ($P = 0.136$)。但在进一步根据 SE 程度分组后, 超高度近视组中 KLEx 的实际切削深度已显著小于 FS-LASIK ($132.38 \pm 10.50 \mu\text{m}$ vs. $147.82 \pm 18.41 \mu\text{m}$, $P = 0.002$), 有效切削深度则进一步显著小于 FS-LASIK ($122.38 \pm 10.50 \mu\text{m}$ vs. $147.82 \pm 18.41 \mu\text{m}$, $P < 0.001$)。

结论: 以同样的光区大小, 矫正相同屈光度的中高度近视时, 最小透镜厚度为 10 微米的 KLEx 术实际最大切削深度和体积与 FS-LASIK 术相当。去除最小透镜厚度后, KLEx 的最大有效切削深度显著低于 FS-LASIK, 甚至对于超高度近视患者来说, 即使不减去最小透镜厚度, KLEx 的角膜实际切削量也显著更低。

摘要编号: 201742

全光塑围手术期护理

第一作者: Huijuan ZHANG

目的: 探究全光塑手术围手术期护理要点。

方法: 选取 2025 年 1 月至 2025 年 6 月在本院诊断屈光不正并拟进行全光塑激光治疗的患者 50 例, 按照手术日期先后顺序原则分组, 前 25 例为实验组、后 25 例为对照组。纳入标准: 无全光塑激光

手术禁忌症；患者和家属均签署知情同意书，均经医学伦理委员会批准。排除标准：激光手术禁忌症；哺乳期或妊娠期女性；伴有严重脏器疾病以及精神障碍。对照组实施常规护理，实验组实施围术期护理，包括：1. 术前护理：① 心理护理：患者到院完善相关术前检查后，需对其心理状态进行有效评估，并了解期望值。向患者讲解全光塑手术的优势、操作方法、配合要点，使其能够消除疑虑，减轻心理压力，并介绍成功案例，让患者树立康复自信，提高配合度。② 用药护理：遵医嘱术前3天开始使用抗生素眼药水及润眼药水。③ 术前注视训练：指导患者双眼同时睁开情注视正前方30厘米处的指尖，遮住一眼后固视坚持25秒以上，另一眼操作同上。2. 术中护理：① 术前给患者滴3次的表麻药物，并给每位患者提供减压球。② 在术前准备间等待手术的过程中播放轻音乐转移注意力。③ 术中配合手术医生对患者进行话疗，使患者身心得到放松，更好的配合手术。术毕佩戴绷带镜减轻术后的异物感提高舒适度。3. 术后护理：① 一般护理：手术结束后，在温馨舒适的留观室闭眼休息半小时，并为患者滴抗感染眼药水。② 术眼的观察：观察患者术眼情况，耐心倾听患者主诉。③ 术后用药：告知其术后用药的必要性和重要性。④ 术后宣教：术后看医生并进行裂隙灯检查，交代注意事项后，方可离院。记录焦虑和抑郁评分、并发症发生率情况。选用SPSS 20.0软件分析数据，计量资料用 $\pm$ 进行统计描述、组间比较用T检验；计数资料采用百分比进行描述、采用卡方 χ^2 检验，以 $P < 0.05$ 作为差异有统计学意义。

结果：实验组全光塑激光患者焦虑（ 6.04 ± 1.14 ）分、抑郁（ 6.45 ± 1.26 ）分与对照组相比存在差异（ $P < 0.05$ ）。实验组全光塑激光患者并发症发生率低于对照组， $P < 0.05$ 。

结论：将围术期护理用于全光塑激光手术中，能够显著提高治疗效果，改善患者负面情绪，值得进一步推广与探究。

摘要编号：210202

准分子激光二次构建的人角膜基质微凹透镜异种角膜层间植入后早期生物相容性的实验研究

第一作者：Shuangfeng LIANG

共同作者：Sixiao CHENG, Bo MEI, Chunyang ZHOU

目的：探讨经过准分子激光二次构建的人角膜基质微凹透镜异种移植至兔角膜层间后的早期生物相容性，评估其在活体角膜层间植入的安全性及可行性。

方法：选取20只健康新西兰白兔，随机均分为透镜植入组（ $n = 10$ ）和角膜基质囊袋组（ $n = 10$ ）。利用准分子激光将SMILE术中取出的人角

膜基质凸透镜二次构建为微凹透镜，再植入兔角膜基质层间。术后1天、3天、7天、15天及30天进行裂隙灯显微镜检查；术后1周、1月进行眼前节OCT检查；术后1周、1月各组随机处死5只实验兔，摘取角膜进行HE染色、透射电镜及免疫组化检测。

结果：术后1周内角膜出现轻度水肿，随着时间的推移逐渐减轻。术后1月内始终未发生角膜新生血管、上皮植入及免疫排斥等并发症，植入的透镜与原角膜基质间的边界始终清晰可见。HE及TEM结果显示透镜植入后仍然保持了完整的角膜结构且胶原纤维基本平行整齐紧密排列。免疫组化检测结果未见 $CD4^+$ T细胞及 $CD8^+$ T细胞的表达。

结论：经过准分子激光二次构建的人角膜基质微凹透镜在兔角膜层间异种植入中表现出良好的早期生物相容性和稳定性，但远期安全性需进一步研究验证。

摘要编号：210209

准分子激光重塑的人SMILE来源角膜基质凹透镜兔角膜层间植入的研究

第一作者：Shuangfeng LIANG

共同作者：Sixiao CHENG, Bo MEI, Chunyang ZHOU

目的：探究利用准分子激光将人近视SMILE手术来源的角膜基质凸透镜重塑为凹透镜的可行性，并评估其层间植入后对角膜形态学和组织病理学的影响。

方法：选取球镜 < -4.00 D，柱镜 < -0.50 D的近视SMILE来源角膜基质凸透镜，使用准分子激光进行重塑，治疗光学区为6.00 mm，治疗度数：球镜度数在患者SMILE术前球镜度数上增加 -2.00 D，柱镜为0 D。利用飞秒激光Flap程序制作角膜基质囊袋将重塑后的凹透镜分别植入10只健康3月龄雄性新西兰白兔的右眼角膜层间。术后1、3、7、15天及1个月通过裂隙灯显微镜观察角膜眼表情况；术前、术后7天及1个月通过AS-OCT评估角膜形态变化；于术前、术后7天及1个月通过角膜地形图测量沿角膜两条主子午线距中央0.5 mm、1 mm、1.5 mm、2 mm、2.5 mm、3 mm处的K值，使用“Power Difference”模式进行有效光学区的测量；术后1月摘取角膜行苏木精-伊红（HE）染色和透射电子显微镜（TEM）分析角膜组织病理学特征。

结果：所有手术均顺利完成且未出现并发症。裂隙灯显微镜观察显示术后1周内角膜呈现轻微水肿。整个观察期间凹透镜边缘清晰可见，保持了良好的透明度，透镜位置略向颞上方偏移，边缘平整，未发生明显折叠；AS-OCT结果显示术后7天时，透

镜与周围角膜基质间的高反射边界清晰可辨，未见透镜皱褶堆积。术后 1 个月时，该边界逐渐变得难以区分，显现出与周围组织融合的趋势；角膜地形图显示透镜植入后角膜前表面屈光力在 0 mm、0.5 mm 处降低 ($P < 0.05$)，在 2 mm 及 2.5 mm 处增加 ($P < 0.05$)，其余距离处屈光力无明显变化，呈现了由中央屈光力降低到周边不断增加的变化趋势，形成“甜甜圈”样前表面形态。有效光学区直径为 4.71 ± 0.12 mm；HE 染色及 TEM 检查结果显示植入的凹透镜胶原纤维规则排列，与周围组织紧密连接，且未见炎症细胞浸润。

结论：利用准分子激光将人近视 SMILE 角膜基质凸透镜重塑为凹透镜并进行角膜层间植入以降低中央角膜屈光力是有效可行的，但需进一步提升光学区的可预测性并延长研究观察时间。

摘要编号：210191

双光子激光交联术对角膜透镜的影响

第一作者：Xinjie ZHU

目的：评估 800 nm 波长双光子激光交联术对角膜透镜生物力学、光学特性及微观结构的影响。

方法：本研究为对照实验室研究。采集 40 片 SMILE 手术来源的角膜透镜，每片均分为两半，分别作为实验组（接受 800 nm 双光子激光交联）和匹配对照组。样本进一步分为离焦与聚焦加工组。主要评估指标包括：通过单轴拉伸试验测量杨氏模量；通过分光光度法测量光透射率；通过 HE 染色评估胶原纤维形态；通过拉曼光谱分析分子组成。

结果：与对照组相比，经双光子激光交联处理的透镜杨氏模量显著增加 (10.85 MPa vs 7.90 MPa; $P < 0.001$)，且离焦加工组的杨氏模量相对增幅高于聚焦加工组 38%。HE 染色显示交联组胶原纤维排列更为致密。拉曼光谱分析表明，处理后的样本特征峰位置未发生位移，但强度降低。各组间的光学透射率无显著差异 (98.5% vs 98.8% ; $P = 0.35$)。

结论：800 nm 波长的双光子激光交联能有效增强角膜透镜的生物力学性能，且离焦加工模式效果更优。拉曼特征峰未发生位移，表明交联处理未破坏角膜胶原的固有分子结构，是一种安全的改性方式；而胶原密度增加与分子间交联导致的拉曼散射强度降低，共同为力学增强提供了结构与分子层面的解释。该技术在屈光手术生物材料强化领域展现出巨大潜力。

摘要编号：208723

对比 ICL 手术前后调节微波动变化的临床研究

第一作者：Lu XIONG

共同作者：Zheng WANG, Yajun XUE

目的：通过对比行有晶体眼人工晶体植入术 (ICL) 的患者术前术后的调节微波动 (MFs) 的变化，探究 ICL 手术对调节功能的影响。

方法：收集接受 ICL (V4c) 手术矫正近视 (屈光度为 -8.37 ± 2.91 D) 的患者 45 例 (88 眼)。使用调节功能分析仪 Acomoref 2，以验光数据为起点，依次测量在 $+0.5$ D/ 0 D/ -0.5 D/ -1.0 D/ -1.5 D/ -2.0 D/ -2.5 D/ -3.0 D 的调节微波动频率 (HFC)。并以 $PRA \leq 1.75$ D 和 $PRA > 1.75$ D 分为调节不足组和调节正常组，分别收集两组患者在术前及术后一周和术后一月的 HFC。两组间一般资料对比采用独立样本 t 检验和非参数检验，组间对比采用重复测量方差分析。以 $P \leq 0.05$ 为差异有统计学意义。

结果：在 0 D 时的 HFC 术后一周 ($56.93, 6.52$)、术后一月 ($58.03, 6.87$) 低于术前 (60.89 ± 5.43)， $P = 0.020$ 。调节不足组在 -0.5 D 时的 HFC 术后一月 ($57.69, 6.06$) 低于术前 ($60.74, 5.29$)， $P = 0.013$ ；调节正常组在 0 D 时的 HFC 术后一周 ($56.10, 4.86$)、术后一月 (57.79 ± 4.45) 低于术前 (60.73 ± 4.46)， $P = 0.036, 0.032$ ；调节正常组在 -2.0 D 时的 HFC 术后一周 (61.80 ± 4.42)、术后一月 (61.44 ± 3.95) 均低于术前 (64.44 ± 5.13)， $P = 0.025, 0.012$ 。

结论：患者行有晶体眼人工晶体植入术 (ICL) 后的调节微波动频率 (HFC) 低于术前，即术后调节更放松，ICL 术后患者感觉更舒适。

摘要编号：208643

聚异丁烯嵌段共聚物人工晶状体兔眼植入的生物相容性研究

第一作者：Xuan LI

共同作者：Bolin DENG, Jianhua HUANG, Hongyang JIANG, Zhengzheng WU, Qingwen YANG

目的：探索聚异丁烯嵌段共聚物 [poly (styrene-block-isobutylene-block-styrene), SIBS] 制成的有晶状体眼人工晶状体 (phakic intraocular lens, pIOLs) 在兔眼中的生物相容性及相关效果。

方法：通过噻唑蓝比色法 (MTT) 检测 SIBS 浸提液对小鼠成纤维细胞 (L-929) 的毒性。在人工晶状体兔眼内植入实验中，对 10 只新西兰兔进行单眼 pIOLs 植入术，分别植入 SIBS pIOLs (6 只眼)；硅胶 pIOLs (4 只眼)；对 10 只新西兰兔

眼不做任何处理当作空白对照组。术后 3, 7, 14, 30 天, 通过裂隙灯显微镜观察兔眼角膜水肿、前房渗出、虹膜粘连等眼前节情况; 通过回弹式眼压计监测眼压, 通过超声生物显微镜检查 (ultrasound biomicroscopy, UBM) 观察 pIOLs 眼内位置。术后 30 天将兔安乐死, 摘除眼球并进行石蜡包埋切片, 通过 HE 染色观察眼前节组织的损伤情况; 取出 SIBS pIOLs 进行扫描电镜观察和能谱分析观察人工晶状体表面情况。

结果: 经不同浓度 SIBS 浸提液处理后的细胞增殖率均大于 90%。在 SIBS pIOL 组 3 只术中发生晶状体前囊破裂; 剩余 7 只术眼手术顺利。两组角膜水肿在术后 3 天最明显 (2~3 级), 术后 7 天角膜均恢复透明。两组的前房渗出物和虹膜后粘连在术后 3 天最为显著, 可随时间逐步消退。与硅胶 pIOL 组相比, SIBS pIOL 组术后不同时间点, 前房渗出和虹膜后粘连分级的平均秩次均高于硅胶 pIOL 组。硅胶 pIOLs 植入眼内后, 眼压无显著变化 ($P > 0.05$); SIBS pIOLs 植入眼内后引起眼压一过性升高, 术后 3 天达到峰值 (28.13 ± 6.24 mmHg), 随后恢复至术前水平。病理组织学检查显示术后 30 天, 硅胶 pIOL 组炎症反应已基本消退; 而 SIBS pIOL 组仍保留虹膜血管扩张充血。裂隙灯显微镜观察和 UBM 检查证实两组 pIOLs 与兔眼晶状体直接接触, 并由此导致了晶状体前囊下混浊。扫描电镜检查显示, 术后 14 天 SIBS pIOLs 表面见大量纤维蛋白膜附着, 并偶见球形细胞样结构; 术后 30 天, 纤维蛋白膜较前明显吸收, 仅引流孔处任残留少许细胞。能谱分析未发现材料表面沉积 Ca、P 元素。

结论: 聚异丁烯嵌段共聚物 (SIBS) 材料无明显细胞毒性, SIBS pIOLs 植入兔眼, 在短期内表现出较好的生物相容性。后续将改进聚异丁烯嵌段共聚物材料的物理性质和设计尺寸, 进一步评估该材料 pIOLs 的生物相容性。

摘要编号: 200866

龙晶® 国产有晶体眼人工晶状体植入术临床应用观察

第一作者: Nian GUAN

目的: 评估国产龙晶®PR 型有晶体眼人工晶状体 (Phakic Refractive IOL, PR) 植入术的临床效果及安全性, 探索其在屈光矫正领域中的应用价值, 以解决传统激光手术对高度近视、角膜偏薄及暗瞳大等特殊需求患者的局限性。

方法: 研究对象: 纳入我院开展龙晶临床案例, 包括高度近视 (-3.25 D 至 -18.00 D)、角膜厚度不足或拒绝角膜切削的患者。手术技术: 采用微

创透明角膜切口 (2.8 mm), 植入可折叠的龙晶® PR 人工晶状体, 通过睫状沟固定。晶体材料为 Balacrylic™ 高折射率丙烯酸酯, 结合非球面零球差光学设计, 手术全程约 2-5 分钟。评估指标: 术后裸眼视力 (UCVA)、拱高稳定性、眩光发生率、并发症 (如白内障风险) 及患者满意度。

结果: 视力改善: 术后患者裸眼视力显著提升, 患者视力从 0.05 提升至 1.0-1.2, 患者术后夜间眩光问题明显缓解。拱高稳定性: 得益于材料的力学特性, 术后中央及周边拱高变化量极小 (< 0.1 mm), 长期屈光状态稳定。并发症控制: 6.0 mm 大光学区设计降低眩光发生率, 中心孔设计维持房水循环, 未报告严重并发症 (如青光眼或白内障)。个性化适配: 10 种型号 (以 0.3 mm 为间隔) 精准匹配睫状沟形态, 覆盖 11.5-14.2 mm 直径范围, 实现“量眼定制”。

结论: 龙晶®PR 人工晶状体植入术是一种安全、高效且可逆的屈光矫正方案, 尤其适用于高度近视、角膜条件受限或追求高质量视觉的患者。其“薄、大、精、稳”的设计优势 (如纤薄体积、大光学区、个性化型号及材料稳定性) 显著提升了术后视觉质量和长期安全性。临床实践表明为患者近视矫正方案提供了多样化的选择。

斜视与小儿眼科

摘要编号: 200682

4-15 岁健康儿童及青少年双眼中心凹无血管区 (FAZ) 形态的对称性研究

第一作者: Zhengwei ZHANG

目的: 利用扫描频源光学相干断层扫描血管成像 (SS-OCTA) 技术, 评估 4-15 岁中国健康儿童及青少年双眼中央凹无血管区 (FAZ) 的对称性。

方法: 纳入 4 至 15 岁健康受试者。使用 OCTA (以黄斑中心凹为中心的 3 mm × 3 mm 视野区域) 采集双眼 FAZ 相关参数, 包括 FAZ 形态分类、FAZ 面积 (FAZA)、FAZ 周长、FAZ 圆度指数 (CI)、血管密度 (VD)、中心凹下视网膜厚度 (SFRT) 以及中心凹下脉络膜厚度 (SFCT)。同时记录年龄、性别、体重指数 (BMI)、等效球镜 (SE)、眼轴长度 (AL) 及角膜曲率 (K1、K2)。采用统计学方法分析其 FAZ 相关参数的相关性及其双眼对称性。

结果: 本研究共纳入 124 例 (248 眼), 其中男性 61 例, 女性 63 例, 平均年龄 9.73 ± 2.70 岁。将 FAZ 按照形态分为六种, 其中圆形 64 眼 (25.8%), FAZA 为 0.36 ± 0.10 mm²; 椭圆形 44 眼 (17.8%),

FAZA 为 $0.35 \pm 0.10 \text{ mm}^2$; 五边形 24 眼 (9.7%), FAZA 为 $0.32 \pm 0.14 \text{ mm}^2$; 四边形 34 眼 (13.7%), FAZA 为 $0.30 \pm 0.11 \text{ mm}^2$; 三角形 8 眼 (3.2%), FAZA 为 $0.26 \pm 0.11 \text{ mm}^2$; 不规则形 74 眼 (29.8%), FAZA 为 $0.28 \pm 0.11 \text{ mm}^2$ 。双眼 FAZ 形态对称性分析发现双眼 FAZ 形态高度镜像对称 5 人 (4.0%), 非常对称 30 人 (24.2%), 中等对称 44 人 (35.5%), 非常不对称 45 人 (36.3%)。不规则形的 FAZA 显著小于圆形、椭圆形 ($P < 0.05$), 其 CI 也显著低于圆形、椭圆形、四边形、五边形 ($P < 0.05$), 三角形的 FAZA 和 CI 显著低于圆形 FAZ ($P = 0.025$)。双眼 FAZA (右眼 $0.32 \pm 0.11 \text{ mm}^2$ vs 左眼 $0.31 \pm 0.11 \text{ mm}^2$)、周长 (右眼 $2.29 \pm 0.41 \text{ mm}$ vs 左眼 $2.23 \pm 0.41 \text{ mm}$)、CI (右眼 0.72 ± 0.08 vs 左眼 0.75 ± 0.07)、FD (右眼 $36.30 \pm 4.63\%$ vs 左眼 $36.85 \pm 3.9\%$)、SFRT (右眼 $210.16 \pm 20.94 \mu\text{m}$ vs 左眼 $210.62 \pm 22.10 \mu\text{m}$)、SFCT (右眼 $317.66 \pm 73.98 \mu\text{m}$ vs 左眼 $319.95 \pm 76.00 \mu\text{m}$) 在数值上均显示出高度的对称性 ($P < 0.001$)。

结论: 中国健康儿童青少年 FAZ 形态以圆形、椭圆形和不规则形为主, 其中, 三角形、不规则形的 FAZA 显著更小、CI 更低。尽管 FAZ 量化参数具有显著双眼对称性, 但超过 70% 的个体存在 FAZ 形态不对称, 提示 FAZ 数值对称性不能等同于形态对称性。

摘要编号: 207854

Waardenburg 综合征伴外斜视 1 例

第一作者: Zhao TIAN TIAN

共同作者: Kang YE

目的: 对一例 Waardenburg 综合征伴外斜视患者的诊疗过程进行报道及探讨致病基因, 提高临床工作者对该罕见遗传病的认识, 以免误诊。

方法: 回顾性收集 1 例 Waardenburg 综合征伴外斜视患者的临床资料。

结果: 该患者引人注目的面部特征、“亮蓝色”虹膜、脉络膜色素减退及家族史, 并通过基因检测得到证实致病基因为 PAX3, 最终诊断为 1 型 WS。患者完善相关检查后, 于我院行双眼外直肌后徙 + 内直肌缩短术, 手术顺利。术后患者及家属对外观改善满意, 未出现并发症。后期在我院行视功能训练及配镜治疗。

结论: 患有 WS 的个体的后代有 50% 的机会遗传致病性变异。我们应充分了解与 WS 相关的其他基因, 以提高对这种罕见综合征临床表现所涉及的机制的理解。这将使医疗专业人员能够为患者提供仔细的遗传咨询方案和更完整的治疗。

摘要编号: 204852

bFGF 介导内质网应激调控早产儿视网膜病变纤维化的分子机制

第一作者: Wensi CHEN

共同作者: Daoman XIANG

目的: 探讨碱性成纤维细胞生长因子 (bFGF) 通过调控液-液相分离 (LLPS) 和内质网应激 (ERS) 信号轴影响脉络膜成纤维细胞 (CFs) 泛凋亡的分子机制, 为早产儿视网膜病变 (ROP) 纤维化治疗提供新靶点。

方法: 探讨碱性成纤维细胞生长因子 (bFGF) 通过调控液-液相分离 (LLPS) 和内质网应激 (ERS) 信号轴影响脉络膜成纤维细胞 (CFs) 泛凋亡的分子机制, 为早产儿视网膜病变 (ROP) 纤维化治疗提供新靶点。

结果: 1. 低氧条件下, RPE 细胞中 bFGF 表达显著升高, 且能够挽救低氧诱导的 CFs 死亡, 这一过程依赖于 bFGF 对泛凋亡的抑制。2. bFGF 通过调控 CFs 中 TAF15 的相分离, 抑制 ERS 介导的泛凋亡, 从而维持 CFs 存活并促进纤维化。敲低 RPE 细胞中的 bFGF 或 CFs 中的 TAF15 均显著增强了 CFs 的泛凋亡, 并伴随 ERS 的激活。3. 筛选并验证了 TAF15 的靶标基因, 发现 TAF15 通过靶基因调控 CFs 的内质网应激和泛凋亡。在 CFs 中敲低或过表达 TAF15, 进一步确认了 TAF15 在 ERS-泛凋亡信号转导中的关键作用。

结论: bFGF-TAF15-ERS 轴是 ROP 纤维化的关键调控机制, 靶向干预该通路或为临床治疗提供新策略。

摘要编号: 210156

伪装为眶蜂窝织炎的儿童肺吸虫异位感染

第一作者: Lin CHEN

共同作者: Qing LIU, Xuan Xuan XIE, Jun Jie XU

目的: 探讨一例 11 岁女孩右上眼睑肿胀伴上睑下垂的病因及治疗。

方法: 通过临床表现、实验室检查及影像学检查, 结合病理学分析, 明确诊断。患者因右上眼睑肿胀伴压痛 1 个月就诊, 曾被误诊为麦粒肿并接受治疗, 但病情加重后被诊断为眶蜂窝织炎, 口服阿莫西林无效。检查发现右上眼睑肿胀伴上睑下垂, 视力正常, 无发热及全身不适, 无外伤、过敏及手术史, 有饮用生溪水史。实验室检查显示肝功能轻度异常, 血常规、C 反应蛋白、肾功能等检查正常。脑部及眶部 MRI 检查显示眶部 T2WI 呈隧道样高信号。手术发现褐色液体及黑色虫体, 病理检查及血清学检查均提示肺吸虫感染。

结果：患儿被诊断为眼睑异位肺吸虫病，无原发性肺部感染。病理检查发现成虫，血清学检查发现肺吸虫特异性 IgG 阳性。病变组织中存在嗜酸性肉芽肿，周边有嗜酸性粒细胞浸润。影像学检查未发现肌肉受累或水肿，全身检查未发现肺、肝、脑受累表现，支持孤立性异位感染。

结论：肺吸虫病在儿童中具有多样性，可表现为无原发肺部感染的异位眼睑病变。临床医生需注意肺吸虫病的非典型表现，并结合病史、影像学及病理学检查进行综合诊断，避免误诊。

摘要编号：**208673**

儿童反向布朗征的临床特征和手术治疗分析

第一作者：*Tengyue ZHANG*

共同作者：*Juan DING, Yueping LI, Wei ZHANG,*

Kanxing ZHAO

目的：分析儿童反向布朗征 (Inverted Brown pattern) 的临床特点，探讨下斜肌大量切除术治疗此型斜视的治疗效果和安全性。

方法：回顾性临床系列病例研究 纳入先天性上斜肌麻痹 (Congenital Superior Oblique Palsy, CSOP) 且确诊为反向布朗征并行斜视矫正手术治疗的患儿 11 例 (11 眼)，分析比较术前、术后眼球运动、斜视度、眼球客观旋转变化，术中、术毕斜肌牵拉试验结果。采用 t 检验、ANOVA 检验、Tukey 检验进行统计学分析。

结果：回顾性临床系列病例研究 纳入先天性上斜肌麻痹 (Congenital Superior Oblique Palsy, CSOP) 且确诊为反向布朗征并行斜视矫正手术治疗的患儿 11 例 (11 眼)，分析比较术前、术后眼球运动、斜视度、眼球客观旋转变化，术中、术毕斜肌牵拉试验结果。采用 t 检验、ANOVA 检验、Tukey 检验进行统计学分析。

结论：反向布朗征为原发或续发性下斜肌限制因素所导致，眼球运动表现为麻痹眼上斜肌诊断眼位显著落后，术中下斜肌被动牵拉试验证实存在下斜肌限制因素是诊断的重要依据，行下斜肌大量切除术可解除其限制，有效改善原在位和下方垂直斜视。

摘要编号：**209270**

出生因素和后天养育因素对儿童散光的影响

第一作者：*Haihua LIU*

共同作者：*Rongjun LIU*

目的：探讨出生因素和后天养育因素对儿童散光的影响。

方法：横断面研究。收集 2025 年 1 月至 2025 年 6 月在北京大学第一医院眼科门诊就诊的 3~6 岁儿童 600 例。对所有儿童进行自动电脑验光。记录儿童出生因素包括出生体重、顺产或剖宫产、有无早产和吸氧史、出生地城市或农村；后天养育因素包括身高、体重、是否挑食、每日近距离读写时间、每日户外活动时间。多因素回归分析散光与出生因素和后天养育因素的关系。

结果：多因素 Logistic 回归分析显示，经校正混杂因素后出生体重 < 2.5 kg (OR = 5.04, 95% CI: 1.10~26.08, $P = 0.024$) 及体重 (OR = 2.01, 95% CI: 1.12~3.15, $P = 0.019$) 均为儿童患散光的危险因素。

结论：出生体重低及后天养育中体重高的儿童更易发生散光。

摘要编号：**201273**

利用高度数远视性离焦诱导单眼弱视猴模型

第一作者：*Shu WANG*

共同作者：*Hong LIU*

目的：屈光参差性弱视是最常见的弱视类型，食蟹猴是研究人类视功能的理想动物模型，然而，目前尚无成熟的建立屈光参差性弱视猴模型的方法。本研究将探索单眼 -10.0 D 远视性光学离焦能否诱导出屈光参差性弱视猴模型，并观察其对食蟹猴正视化的影响。

方法：7 只食蟹猴，实验组 5 只、对照组 2 只。实验组自 4 周龄开始右眼 (离焦眼) 配戴透明 -10.0 D 树脂镜片，左眼 (对侧眼) 配戴平光镜片，共戴 28 周 (即 32 周龄)。对照组不干预。在造模前 (4 周龄)、造模后每 2~4 周，检测屈光度和眼轴。自身双眼间比较采用配对秩和检验，实验组纵贯造模期间的双眼间屈光度、眼轴的比较采用重复测量方差分析。采用心理物理学方法检测猴的对比敏感度，两眼分别单眼注视可计算弱视指数 (amblyopia index)，量化单眼弱视程度；双眼同时注视可计算双眼总和 (binocular summation)，辅助验证双眼视功能受损。

结果：造模期间，实验组离焦眼和对照组右眼的平均屈光度分别降低 1.75 ± 0.81 D 和 2.00 ± 0.35 D，均在 16 周龄前发生快速正视化，实验组在 16 周龄之后出现远视偏移，最终在 32 周龄时，实验组有 4 只猴屈光状态与对照组相似，为轻度远视，有 1 只猴为轻度近视。实验组的双眼间屈光度在 4 周龄时相差 0.55 ± 0.27 D ($p = 0.074$)，32 周龄时相差 0.35 ± 0.35 D ($p = 0.408$)，均未达到屈光参差 (1.0 D) 的标准。实验组在造模期间 9 个时间点的双眼间屈光度 ($p = 0.624$)、眼轴 ($p = 0.943$)

相比均无统计学差异。实验组的弱视指数为 0.72 ± 0.10 ，高达对照组弱视指数 (0.06 ± 0.02) 的 10 倍以上，提示双眼对比敏感度差异大。实验组每只猴的双眼总和值均接近于 1，证明双眼功能受损；对照组则接近正常值 1.41，提示双眼总和正常。

结论：4 周龄食蟹猴经 28 周单眼高度远视性光学离焦后，在 16 周龄前类似于正常食蟹猴发生快速正视化，随后出现远视偏移，最终在屈光度上未呈现屈光参差，但形成了单眼弱视。这一单眼弱视猴模型相较于形觉剥夺模型可能更接近于人类屈光参差性弱视的形成原理。

摘要编号：**210177**

双眼分视数字疗法与传统遮盖训练对儿童中重度弱视的疗效对比

第一作者：**Haiying LI**

目的：对比双眼分视数字疗法与传统遮盖训练对儿童中重度弱视的疗效及依从性，为儿童弱视个体化治疗提供依据。

方法：回顾性纳入我院 2023–2024 年中重度弱视患儿 92 例 (128 眼)，按干预方式分为数字疗法组 (47 例 65 眼) 和传统训练组 (45 例 63 眼)。数字疗法组采用双眼分视互动训练系统，传统训练组采用健眼遮盖联合精细目力训练，两组均持续干预 6 个月。比较两组患儿的最佳矫正视力 (BCVA)、双眼视功能 (立体视、同时视、融合视)、治疗依从性及眼部不适发生率。

结果：干预 6 个月后，数字疗法组 BCVA 提升幅度 (0.53 ± 0.11) 显著高于传统训练组 (0.34 ± 0.09 , $P < 0.05$)；数字疗法组立体视恢复率 (84.62%)、同时视建立率 (90.77%)、融合视建立率 (83.08%) 均高于传统训练组 (55.56%、66.67%、58.73%， P 均 < 0.05)；数字疗法组依从性评分 (8.7 ± 1.1) 及良好率 (82.98%) 显著高于传统训练组 (6.2 ± 1.4 、46.67%， $P < 0.05$)；数字疗法组眼部不适发生率 (12.77%) 低于传统训练组 (28.89%， $P < 0.05$)。

结论：双眼分视数字疗法对儿童中重度弱视的视力改善、双眼视功能重建及治疗依从性提升效果更优，且眼部耐受性良好，更适配儿童眼健康干预需求。

摘要编号：**208635**

吸收缝线结合小丑照护方案在斜视患儿围手术期应用的效果观察

第一作者：**Meng Yao WANG**

共同作者：**Li Na CHENG**

目的：探讨可吸收缝线在斜视矫正手术中的缝合效果及小丑照护在斜视患儿围手术期的应用效果。

方法：选取 2022 年 10 月–2023 年 10 月在西安市某三甲医院住院的 98 例斜视儿童作为研究对象，按照入院顺序分为试验组和对照组。对照组实施围手术期常规护理，试验组在常规护理的基础上给予小丑照护，并用可吸收缝线进行眼肌缝合。比较两组患儿麻醉诱导依从性、焦虑、疼痛与家长焦虑、满意度评分，以及患儿术后不良反应以及矫正效果。

结果：试验组患儿术前焦虑、术中麻醉诱导依从性、术后主观疼痛评分均显著低于对照组，试验组家长术前术后焦虑评分均低于对照组，满意度评分高于对照组，试验组患儿术后不良反应更少，其差异均有统计学意义 ($P < 0.05$)；两组患儿斜视症状均有所改善，但矫正效果比较差异无统计学意义 ($P > 0.05$)。

结论：可吸收缝线结合小丑照护能有效提高患儿麻醉诱导依从性，减少术后不良反应的发生，减轻患儿的焦虑水平、疼痛程度，降低家长焦虑水平，稳定情绪，提升家长对住院护理的满意度。

摘要编号：**208641**

多点近视离焦镜片与高度非球面小透镜控制近视的临床观察

第一作者：**Hao YANJUN**

目的：研究多点近视离焦镜片和高度非球面小透镜控制青少年近视发展的临床效果。

方法：对 2021 年 1 月–2022 年 1 月在我院接受治疗的 450 名年龄介于 7~15 岁、散瞳球面屈光度在 $-0.75\text{ D} \sim -6.00\text{ D}$ 范围内，且散光 $< -5.00\text{ D}$ 的儿童进行了随机分组研究，分别配戴多点近视离焦镜片 (47 例) 与高度非球面小透镜 (413 例)，对其 6 个月及 1 年的眼轴长度、球镜、柱镜变化进行观察与分析。

结果：多点近视离焦镜片组 6 个月眼轴平均增长达到了 (0.12 ± 0.03) mm，而 1 年平均增长为 (0.20 ± 0.05) mm，高度非球面小透镜组 6 个月眼轴平均增长为 (0.08 ± 0.02) mm，而 1 年平均增长为 (0.16 ± 0.04) mm，组间差异不大， $P > 0.05$ 。在球镜和柱镜的变化上，两组之间的差异在统计学上并不显著 ($P > 0.05$)。

结论：在 1 年的随访期内，两种不同的镜片在控制眼轴增长和屈光度变化方面表现相似，因此临床医生可以根据儿童的配戴接受度和个体特点来选择合适的镜片类型。

摘要编号：203532

学龄儿童不同类型集合异常对眼轴增长的影响

第一作者：Wu HAO

目的：探究学龄儿童不同类型集合异常对眼轴增长的影响。

方法：回顾性研究。纳入 2018 年 1 月 -2024 年 12 月 就诊于锦州医科大学附属第三医院眼科进行检查的 7-12 岁儿童 354 例，男女比例 183:171，SE (-2.43 ± 1.17) 。根据集合异常的不同分为集合不足组（86 例）、集合过度组（58 例）、散开不足组（47 例）、散开过度组（40 例）、基本型内隐斜组（60 例）和基本型外隐斜组（63 例），均采取单光镜（SP）进行矫正，比较各组儿童 1 年后的 AL 变化。采用配对 t 检验比较各组内儿童戴镜 1 年前后 AL 的变化，单因素方差分析比较各组组间儿童 AL 增长量的差异。

结果：戴镜 1 年后 6 组 AL 较基线均有增长，组内差异均有统计学意义 ($t = -13.25 \sim -3.45$ ，均 $P < 0.05$)；集合不足组、集合过度组、散开不足组、散开过度组、基本型内斜视组、基本型外斜组 AL 年增长量分别为 (0.37 ± 0.18) (0.52 ± 0.14) (0.34 ± 0.12) (0.39 ± 0.14) (0.49 ± 0.12) (0.36 ± 0.13) mm，组间 AL 年增长量差异有统计学意义 ($F = 9.16$ ， $P < 0.001$)，其中集合过度组 ($P < 0.001$) 和基本型内斜视组 ($P = 0.005$) 的 AL 年增长量明显高于集合不足组、散开不足组、散开过度组和基本型外斜视组，而集合过度组和基本型内斜视组差异无统计学意义 ($P > 0.05$)。

结论：在不同类型集合异常的学龄儿童中，集合过度和基本型内斜视的儿童眼轴增长速度快于其他类型，未来应针对这些特殊类型，进一步深入研究其眼轴增长的机制和影响因素，从而更好地制定个性化的近视控制策略。

摘要编号：209319

学龄期斜视儿童阅读效率、双眼视功能与注意力发展关联的比较研究

第一作者：Rui LIU

共同作者：Jiawei ZHANG

目的：探究学龄期斜视儿童与正常儿童的阅读效率、双眼视功能和注意力发展的状况，并评估三者与临床特征的关联。

方法：研究纳入 69 例明确诊断为斜视且斜视度数超过 15 PD 的儿童（间歇性外斜 54 例、内斜视 15 例），同时招募 31 例正常发育儿童；采用发育性眼动测试（DEM）获得垂直和水平阅读时间及比值，评估受试者的阅读效率（尤其是阅读相关的眼动控制能力）；采用同视机、Titumus 立体视测试和 Worth-4 点灯测试评估受试者的双眼视功能；客观维度采用试听双通道可持续操作性测试（BOKE STARS）测试漏报率、误报率、反应时间和反应时间变异度，评估受试者的注意力持续性、警觉性、稳定性和抑制控制能力；主观维度采用 SNAP-IV 18 项家长量表评估受试者注意力和多动冲动症状严重程度。采集数据并分析斜视组与正常组得分的差异。

结果：差异检验显示，斜视组儿童的校正水平阅读时间、眼动控制、双眼视功能评分（融合和立体视）、SNAP-IV 18 项总分和 BOKE STARS 注意力稳定性指标（反应时间变异度）表现均差于同龄正常对照组，差异有统计学意义 ($p < 0.05$)。亚组分析和协变量分析发现，与同龄正常儿童相比，仅内斜视组儿童阅读效率降低，间歇性内斜视组未发现显著差异；中介效应模型检验发现，融合功能在内斜视与阅读效率之间发挥了中介作用。

结论：内斜视儿童的阅读眼动控制力、双眼视功能和视听整合注意力稳定性能力低于同龄儿童，融合功能可能是影响内斜视患者阅读效率的中介因素。

摘要编号：210288

父母近亲婚配低龄高近患儿一例

第一作者：Haiying LI

目的：探讨父母近亲婚配背景下 4 岁超高度近视患儿的临床特征、遗传学病因及干预策略，为早期精准诊疗提供依据。

方法：回顾性分析 1 例 4 岁男性患儿资料。患儿系足月顺产，父母近亲婚配，屈光检查示：双眼超高度近视（OD: -16.00 DS/ -2.00 DC $\times 10^\circ \rightarrow 0.2$ ，OS: -18.00 DS/ -2.00 DC $\times 20^\circ \rightarrow 0.16$ ；眼轴：OD: 30.44 mm、OS: 30.74 mm），伴眼球震颤（已行中间带移位术），外院予配镜及低浓度阿托品滴眼液治疗，我院建议行基因检测分析。

结果：临床特征：4 岁超高度近视（右眼 -16.00 D，左眼 -18.00 D），眼球震颤术后，配镜联合低浓度阿托品滴眼液控制近视；基因检测：P3H2 基因纯合致病突变（NM_018192.4:exon8/15:c.1309 C>T:p.R437*），ACMG 评级为致病，符合成骨不全症（OI）；PRS = 59.0（高度近视极高风险）；干预：行后巩膜加固术，计划个性化配镜矫正。

结论: 患儿超高度近视由 P3H2 双等位基因突变(常染色体隐性 OI) 与多基因易感($PRS = 59.0$) 叠加导致, 近亲婚配为关键诱因; OI 可仅以眼部表现为首发(低龄超高度近视、眼球震颤), 易漏诊全身病变, 综合干预策略(后巩膜加固术、光学矫正)需结合终身多学科随访(眼科监测视网膜脱离、骨科评估骨密度)。

摘要编号: 209891

监护麻醉下成人水平斜视患者术中及术后斜视度变化的特征分析

第一作者: Min CHANG

目的: 探讨监护麻醉(monitored anesthesia care, MAC)下成人水平斜视患者术中及术后斜视度变化的特征分析。

方法: 前瞻性研究。纳入山西省眼科医院斜视与小儿眼科 2024 年 10 月至 2025 年 4 月于 MAC 下行水平斜视矫正术的成人患者 87 名。收集不同时间(手术前、手术结束时、麻醉清醒后、术后 1 天、术后 2 周、术后 1 月、术后 2 月)的近(33 cm)及远(6 m)斜视度, 同时收集年龄、性别、麻醉疼痛评分, 并记录牵拉不同肌肉时心率的变化值。前后比较采用配对设计非参数检验方法, 影响因素分析采用混合效应的敏感性分析。

结果: 1. 不同时间斜视度的比较: (1) 视近斜视度: 外斜视患者手术结束时与麻醉清醒后、术后 1 天、术后 2 周、术后 1 月、术后 2 月差异均有统计学意义(P 均 < 0.001); 内斜视患者手术结束时与麻醉清醒后、术后 1 天、术后 2 周、术后 1 月、术后 2 月差异均无统计学意义(P 均 > 0.05); (2) 视远斜视度: 外斜视患者手术结束时与术后 2 周、术后 1 月、术后 2 月差异均有统计学意义(P 均 < 0.001); 2. MAC 麻醉下水平斜视术后 2 月时治愈率: (1) 视近: 正位组 49 人(56.3%), 基本治愈组 26 人(29.9%); 未愈组 12 人(13.8%); (2) 视远: 正位组 56 人(64.4%), 基本治愈组 24 人(27.6%); 未愈组 7 人(8%)。 (3) 内斜视患者 MAC 术后 2 月未复发。3. MAC 麻醉后心率降低, 差异有统计学意义($Z = 7.04, P < 0.001$); 术后疼痛评分降低, 差异有统计学意义($Z = 2.81, P = 0.005$); 牵拉外直肌与内直肌的心率比较, 差异有统计学意义($Z = 2.775, P = 0.006$)。4. 混合效应模型: 近与远斜视度差值越大, 术后近斜视度越大($Z = 2.312, P = 0.024$); (2) 时间与诊断对术后远、近斜视度的变化均存在交互作用($Z = -3.941, Z = -3.372, P$ 均 < 0.001)。

结论: 1. 与内斜视术后稳定的斜视度不同, 虽然 MAC 术中检查眼位正, 但外斜视患者术后 2 周远

斜视度即发生变化, 眼位回退速度快。2. 集合不足型外斜视可能导致术后近斜视度回退, 对于此型患者的手术设计应尽量足矫。3. MAC 可在清醒的状态下配合眼位及眼球运动的检查, 术后心率及疼痛评分降低, 是斜视手术理想的麻醉方法。4. 牵拉内直肌引起的心率变化更大, 术中需注意轻柔操作。

摘要编号: 209217

肉毒杆菌毒素注射与眼外肌手术治疗急性共同性内斜视的疗效对比: 一项回顾性研究

第一作者: Xin CAO

共同作者: Yang-chen GUO, Xiaobo HUANG, Peng-zhou KUAI, Tianyi LIU, Yong WANG, Yue ZHOU

目的: 探讨 A 型肉毒杆菌毒素(BTXA)注射与斜视手术治疗急性共同性内斜视(AACE)的疗效差异。

方法: 回顾性分析 2019 年 1 月至 2023 年 9 月南通市第一人民医院收治的 AACE 病例资料。研究方案包括: 采集患者基线特征、记录治疗前后多个时间点的斜视度、评估立体视觉功能。根据治疗方式将患者分为手术组与 BTXA 注射组, 并按术前斜视度(> 35 棱镜度[PD]与 ≤ 35 PD)和年龄(≥ 18 岁成人组与 < 18 岁青少年组)进行分层, 通过亚组疗效对比系统评估不同治疗方案的临床价值。

结果: 共纳入 43 例 AACE 患者。末次随访时, 手术组与注射组斜视度均较治疗前显著降低($P < 0.001$)。两组在斜视治愈率与立体视觉恢复率方面存在显著差异($P < 0.05$)。对于斜视度 > 35 PD 者, 手术在术后斜视度控制、成功率及立体视觉恢复方面均优于注射治疗($P < 0.05$); 在 ≥ 18 岁患者中, 手术在斜视矫正、成功率提升和立体视觉重建方面同样更具优势($P < 0.05$)。

结论: BTXA 化学去神经术与斜视手术对 AACE 均具有治疗价值。手术治疗总体疗效优于 BTXA 注射, 尤其适用于斜视度 > 35 PD 及年龄 ≥ 18 岁的患者; 对于斜视度 ≤ 35 PD 或未成年患者, BTXA 注射仍可作为可行的治疗选择。

摘要编号: 201340

追光寻影

第一作者: Liu RUI

目的: 本文报道一例“左眼视网膜母细胞瘤”患儿多次就诊经历, 通过对本病的讨论分析, 厘清诊断思路, 避免误诊。

方法: 男, 4 岁。因“体检发现左眼视力差 3 周”入院。3 周前在眼部体检时, 无意发现患儿左眼视力差, 曾在多家医院就诊, 诊断为“左眼视网膜母细胞瘤、双眼屈光参差”为进一步诊治, 于我院就诊, 患儿

既往体健，否认全身及眼部病史，家族近亲中无眼部病史及遗传疾病。无猫、狗宠物接触、喂养史。

结果：眼部专科检查示：右眼视力 1.0，左眼 0.05 矫正无光；右眼眼压 11 mmHg (1 mmHg = 0.133 kPa)，左眼 10 mmHg (NCT)。双眼眼前节未见明显异常。彩色眼底照相检查示：右眼眼底未见异常；左眼视盘处隆起，大小约 5 个视盘直径 (Papillary diameter, PD)，累及黄斑，表面灰白色胶质膜，病灶内视网膜血管迂曲，少许散在、色素沉着，边缘见黄白色渗出。光学相干断层扫描检查 (OCT) 示：左眼视盘及盘周视网膜隆起，神经上皮层增厚结构紊乱，内、外层视网膜“山峰状”皱褶。眼部 B 超检查示：左眼视盘前见扁平隆起的条带状中高回声，其内回声欠均匀，另见一短条状强回声斑，边界较清，大小约：10.11 mm × 2.14 mm。眼眶核磁显示：左侧眼球玻璃体后份视乳头处小条片状异常信号并强化。双眼 PVEP 检查显示左眼 P100 波波幅降低，FVEP 检查显示左眼 P2 波峰时延迟，波幅降低。临床诊断：左眼视网膜和视网膜色素上皮联合错构瘤 (Combined hamartoma of the retinal and retinal pigment epithelium, CHRPE)。治疗方案：半年复查，OCT、眼底照相定期检查，必要时考虑手术治疗。

结论：该病给我们启示：1、少见病例，容易误诊；2、通过本病讨论，强调及时正确诊治，尽可能减轻患者慢性眼病的困扰。

摘要编号：209101

间歇性外斜视儿童双眼融合相关的脑功能改变研究

第一作者：Tao FU

共同作者：Di CHANG, Yuying HAN, Shuzhen LI, Zhihan LIU, Yachen WANG, Mofan WEN

目的：利用任务态功能磁共振 (fMRI)，观察间歇性外斜视 (intermittent exotropia, IXT) 儿童及正常儿童在执行双眼融合任务期间显著激活的脑区，并分析两组的额叶眼动区 (frontal eye field, FEF) 及其他相关脑区的激活差异，探索 IXT 的中枢发病机制。

方法：招募 24 名 IXT 儿童及 28 名匹配的正常对照儿童，进行双眼融合任务下的 fMRI。静态视差刺激任务 (激活感觉融合) 和动态视差刺激任务 (激活运动融合) 分别反应不同类型的融合功能，以及无视差刺激任务反应单纯视觉刺激基线活动。记录受试者的脑激活情况，以及眼位控制评分及融合范围等与斜视病情相关的临床指标。比较 IXT 儿童与正常对照儿童间双眼融合相关的脑功能差异，并进行临床指标与脑功能指标的相关性分析。

结果：在整体融合刺激条件下，两组双侧 FEF、顶上小叶 (SPL)、顶下小叶 (IPL)、枕下回 (IOG)、枕中回 (MOG)、颞中回复合体 (MT+)、额内回、小脑显著激活；IXT 患儿右侧 FEF、IOG 较正常儿童激活降低，左侧 MT+ 激活增强；相关性分析发现，正常儿童右侧 FEF、IPL、左侧小脑激活强度与融合范围正相关，IXT 患儿左侧 MT+ 激活强度与眼位控制评分正相关。其次，在运动融合刺激条件下，两组右侧 FEF、双侧 SPL、IPL、IOG、MOG、小脑显著激活；IXT 患儿右侧 MOG、左侧小脑、双侧 IPL 较正常儿童激活降低；相关性分析发现，正常儿童的右侧 FEF、小脑激活强度与融合范围正相关，IXT 患儿右侧 FEF、MOG、小脑、左侧 IPL 激活强度与眼位控制评分负相关。

结论：IXT 儿童存在与双眼融合功能相关的中枢功能改变，可能通过影响双眼融合功能参与 IXT 发病。

摘要编号：201823

黄斑中心凹发育不良一例

第一作者：Miao KONG

目的：报告一例孤立性黄斑中心凹发育不良病例。

方法：通过 OCT 检查发现双眼黄斑中心凹发育不良。

结果：眼底检查：眼视盘边界清。呈横椭圆形。视网膜在位。黄斑区未见色素及中心凹反光。光相干断层扫描 (OCT) 检查双眼视网膜未见黄斑结构。Oct-A 检查，双眼浅层毛细血管丛未见黄斑中心凹无血管区。血流信号呈桥样越过该区。深层毛细血管层可见黄斑中心凹无血管区。超广角眼底成像双眼黄斑呈现“同心环”形征象。双眼色觉检查正常。

结论：黄斑中心凹发育不良是一种视网膜黄斑区发育不良的先天性发育性疾病。

白内障

摘要编号：203363

0.4% 盐酸奥布卡因表面麻醉在白内障手术应用的临床研究

第一作者：Meiyi ZHU

共同作者：Guangbin ZHANG

目的：对比 0.4% 盐酸奥布卡因行表面麻醉在传统白内障超声乳化手术 (手工组) 及飞秒激光辅助白内障超声乳化手术 (飞秒组) 的麻醉效果和手术效率。

方法：前瞻性对比研究。纳入 2025 年 5 月至 8 月在厦门大学附属厦门眼科中心行微小切口白内障手术的患者，采用 0.4% 盐酸奥布卡因行表面麻醉。手工组在术前接受 3 次麻醉（间隔 5 分钟）；飞秒组在激光前接受 1 次麻醉，激光后再接受 2 次麻醉（间隔 5 分钟）。主要观察指标：（1）平均术前麻醉时长、手术时长及总时长；（2）术中麻醉分级评估：I 级（配合良好，无疼痛）、II 级（轻微痛感，加用麻药）、III 级（疼痛明显，改用其他麻醉）；（3）术后疼痛 VAS 评分（0-10 分）。

结果：手工组 73 名患者（102 眼），飞秒组 65 名患者（100 眼）。平均术前麻醉时长：手工组 12.50 ± 5.18 min 和飞秒组 11.63 ± 3.26 min ($P = 0.681$)；平均手术时长：手工组 6.53 ± 1.69 min 和飞秒组 6.04 ± 1.12 min ($P = 0.342$)；总时长：手工组 19.02 ± 6.11 min 和飞秒组 17.67 ± 3.63 min ($P = 0.592$)。术中麻醉分级：手工组（I 级 82.5%；II 级 17.5%）及飞秒组（I 级 91.7%；II 级 8.3%）($P = 0.516$)。术后疼痛 VAS 评分：手工组 1.05 ± 1.43 分及飞秒组 1.33 ± 1.27 分 ($P = 0.270$)。均无显著统计学差异。

结论：0.4% 盐酸奥布卡因可以为传统白内障超声乳化手术及飞秒激光辅助白内障超声乳化手术提供良好的麻醉效果，将表面麻醉穿插于飞秒激光辅助白内障手术步骤间隙有助于提高手术效率。

摘要编号：201543

1 例 21 三体综合征并发白内障的护理体会

第一作者：周莉义

目的：总结 1 例 21 三体综合征（唐氏综合征）并发白内障患者的护理经验，探讨针对此类特殊人群的有效护理策略，以提高护理质量。

方法：回顾性分析 1 例 确诊为 21 三体综合征并接受白内障手术患者的临床资料，总结在围手术期采取的针对性护理措施。包括术前心理护理、眼部准备、全身状况评估与管理，术中配合及术后生命体征的监测及眼部情况的观察、并发症的预防、康复指导、安全防护、个性化的生活护理与营养支持等。

结果：通过实施个体化、精细化的护理方案，患者顺利度过围手术期，未发生严重并发症，术后视力改善明显，患者及家属对治疗过程配合度良好，对护理服务满意。

结论：针对 21 三体综合征 并发白内障患者的特殊性，制定个性化护理方案，加强围手术期各环节护理，能有效提高手术成功率，促进患者康复，改善患者生活质量。本案例的护理经验可为类似患者的临床护理提供参考与借鉴。

摘要编号：210101

DJ1 蛋白乳酸化修饰在年龄相关性白内障中的机制研究

第一作者：Pengfei LI

共同作者：Huajin GUAN, Min JI

目的：DJ1 是帕金森疾病发病的重要关键蛋白，也是抗衰老治疗的关键靶标。年龄相关性白内障同样是一种与衰老密切相关的老年性疾病，DJ1 与 ARC 的研究具有一定的研究价值。

方法：以临床 ARCC 患者、年龄相关性白内障小鼠（CFW-Em/J）、SD 大鼠、斑马鱼、人原代晶状体上皮细胞（lens epithelial cells, LECs）及细胞株 SRA01/04 为研究对象。首先，利用自行设计的术中分区取材取样器收取入组的临床 ARCC 患者的透明皮质和混浊皮质样本；然后，使用蛋白组学和代谢组学对收取的不同分区病人样本进行分析；乳酸化修饰组学分析 LECs 内的乳酸化修饰蛋白；生物信息学分析筛选差异蛋白、差异代谢物和乳酸化修饰显著富集的蛋白，并进行功能和通路分析。

结果：ARCC 患者透明皮质（ $n = 6$ ）和混浊皮质（ $n = 6$ ）蛋白组学结果显示，发现 6 个差异上调的蛋白，26 个差异下调的蛋白，其中 DJ1 蛋白的表达在混浊皮质呈显著下降趋势；在进一步扩大白内障的样本数量和类型验证后，发现 DJ1 蛋白在多种白内障组织样本以及原代 LECs 的氧化损伤模型中，表达仍呈显著下调；然后，构建了 DJ1 的过表达质粒，并在 LECs 中成功过表达，初步探索发现过表达 DJ1 蛋白后，显著抑制了 LECs 的衰老、氧化损伤和凋亡。为了探究 DJ1 对白内障的影响，设计了动物用 siRNA 靶向抑制 DJ1 的表达，并与源自 SD 大鼠的体外透明晶状体共培养，结果发现 DJ1 表达下降会明显加速晶状体混浊的发生；随后，我们成功构建了 DJ1 敲除的小鼠，并观察到其出现了年龄相关性白内障样病理改变。随后，我们利用乳酸化修饰组学检测了 LECs 的乳酸化修饰蛋白。其中，DJ1 蛋白也存在差异的乳酸化修饰，我们通过免疫共沉淀和蛋白质谱，进一步确定了其显著的乳酸化修饰。

结论：ARCC 患者透明皮质和混浊皮质蛋白样本、CFW-Em/J 模型小鼠晶状体组织样本以及人原代上皮细胞氧化损伤模型中 DJ1 蛋白显著下调。功能上，DJ1 能够抵抗氧化损伤环境下 LECs 的衰老、氧化损伤和凋亡；动物用 siRNA 敲低 DJ1 后，大鼠晶状体混浊加重；DJ1 敲除小鼠出现年龄相关性白内障表现。DJ1 蛋白发生乳酸化修饰。

摘要编号: 207917

FLACS 治疗成人后极性白内障的临床效果与体会

第一作者: Ye XIANGYU

目的: 探讨飞秒激光辅助超声乳化术 (FLACS) 处理成人后极性白内障 (PPC) 的临床效果及操作体会。

方法: 回顾性分析福州眼科医院 2018 年 1 月至 2025 年 2 月成人 PPC 行 FALCS 手术 25 例 (34 眼) 的临床资料, 总结术前、术中后囊情况、手术技巧、术中并发症以及术后视力恢复情况。探讨 FLACS 处理 PPC 的利弊。

结果: 10 眼采用 FLACS 环形囊膜切开 + 激光劈核 (六分法), 24 眼仅采用 FLACS 激光劈核 (六分法), 33 眼一期植入 IOL, 其中囊袋内植入 28 眼, 睫状沟植入 5 眼, 1 眼二期睫状沟植入 IOL。25 眼后囊完整, 9 眼术中后囊破裂。最佳矫正视力 > 0.5 者 30 眼, 0.1 ~ 0.5 者 4 眼。

结论: 术前评估分型 PPC 后囊膜完整性至关重要, 对于后囊膜明显存在异常的 PPC, 不建议行 FLACS 环形囊膜切开; FLACS 激光劈核有利于减少核块处理时间和操作, 有助于提高手术成功率。

摘要编号: 208951

ICL 植入术后眼外伤致复杂眼前节损伤诊治一例

第一作者: Xuan LI

共同作者: Bolin DENG, Bingyue SHUI, Zhengzheng WU, Qingwen YANG

目的: 通过分享一例 ICL 植入术后并发严重眼外伤的罕见病例, 重点展示采用一期联合手术成功处理多重眼前节损伤的有效策略, 从而为眼科同行在未来应对类似复杂病例时, 特别是在手术方案设计和围手术期高眼压管理方面, 提供宝贵的临床经验与借鉴。

方法: 患者男性, 22 岁, 因右眼被木棍击伤眼红眼痛伴视力下降 1 月余, 眼胀痛 2 周就诊。行右眼 ICL 取出联合白内障超声乳化吸除及人工晶状体植入和虹膜根部修复术。

结果: 患者男性, 22 岁, 因右眼被木棍击伤, 眼红眼痛伴视力下降 1 月余, 眼胀痛 2 周就诊。既往屈光不正, 5 年前双眼行 ICL 植入术。专科查体: 右眼视力 0.15, 左眼视力 1.0; 右眼眼压 35 mmHg, 左眼眼压 21 mmHg; 右眼结膜轻度充血, 角膜轻度混浊, 瞳孔椭圆, 直径 6 mm, 12 点虹膜根部离断, 前房深度正常, ICL 位于虹膜后方表面

色素附着, 晶状体混浊, 眼底窥不清。诊断: 右眼外伤性白内障、右眼继发性青光眼、右眼虹膜根部离断、双眼 ICL 植入术后。行右眼 ICL 取出联合白内障超声乳化吸除及人工晶状体植入术和虹膜根部修复术。术后右眼予以局部预防感染, 对症抗炎及四联降眼压处理。术后早期复查右眼角膜轻度水肿, 上方缝线在位, 人工晶状体正位, 玻璃体腔见大量色素漂浮, 眼压 22 ~ 45 mmHg; 术后 1 月复查: 右眼角膜恢复透明, 右眼最佳矫正视力 0.8, 眼压 18 mmHg。

结论: 本病例提示, 对于 ICL 植入术后眼外伤的患者, 眼科医生应进行密切随访, 并根据眼前节损伤的复杂性及时进行全面的手术干预。同时, 需高度警惕因创伤和手术操作导致的广泛色素播散, 及其引发继发性青光眼的风险, 并进行积极的围手术期的眼压管理。

摘要编号: 210087

不同屈光状态白内障患者植入三焦点人工晶体术后视觉效果临床研究

第一作者: Jian YE

目的: 对比不同屈光状态白内障患者植入三焦点人工晶体术后的视觉效果和主观满意度。

方法: 对 86 例 (134 眼) 植入三焦点人工晶体 (TFNT00) 的患者进行回顾性研究。根据术前眼轴长度 (AL) 分为 3 组: A 组: 远视及正视组 ($AL \leq 24$ mm)、B 组: 低中度近视组 (24 mm < $AL < 26$ mm)、C 组: 高度近视组 ($AL \geq 26$ mm)。收集并比较了术后视力、离焦曲线、视觉质量和主观满意度, 术后随访时间至少为 3 个月 (3 个月至 3 年)。

结果: 术后三组脱镜率调查视远、视中脱镜率均为 100%, 远视及正视组、低中度近视组和高度近视组的视近脱镜率分别为 94%、92% 和 98%。三组的光晕发生率分别为 20%、11%、13%, 均对生活无影响; 眩光发生率分别为 8%、16%、13%, 低中度近视组中 1 例患者表示对生活轻度影响; 星爆发生率分别为 0%、8%、16%, 均对生活无影响。

结论: 对于不同屈光状态的白内障患者, 三焦点人工晶体植入均可提供良好的视力和屈光结果。相较于远视及正视和高度近视患者, 低中度近视患者的裸眼中视力和裸眼近视力较差, 视近主观满意度也较差。

摘要编号: 202580

不规则角膜散光合并白内障手术效果观察 (附手术录像)

第一作者: Yanfeng ZENG

目的: 不规则角膜散光病人白内障手术效果观察。

方法: 女, 76 岁, 退休的医务工作者, 2019 年 6 月 12 日因右眼视物不清两年来我院就诊。自幼左眼视力差。专业检查: VOD: 0.3 VOS: 0.1 矫正无助。Pentacam。Opd master700, nidek 双眼不均匀散光均 > 1.5 D。裂隙灯检查右眼结膜无充血, 角膜上皮点状着染, 瞳孔圆, 直径 3 mm, 对光反射灵敏, 晶状体核 N3P3。人工晶体 14 D, 左眼结膜无充血, 角膜上皮点状着染, 瞳孔圆, 直径 3 mm, 晶状体核 N3P3, 外斜 45°。干眼检查 2 度干眼。人工晶体 9 D 经干眼治疗后, 双眼角膜散光都在 1 D 以内。先后给予左眼飞秒激光联合区域折射人工晶状体植入术。采用 LenSX 飞秒激光撕囊、劈核、做主切口和侧切口。激光手术后, 行超声乳化术, 囊袋内植入一片式平板攀区域折射人工晶状体, 吸除黏弹剂后行水密切口。

结果: 术后第一天左眼远视力 0.8, 中视力 0.8, 近视力 0.8 术后第一天右眼远视力 1.0, 中视力 1.0, 近视力 1.0 病人满意 术后 2 年随访时诊断为干燥综合征。

结论: 白内障术前角膜不规则散光可以由干眼病引起, 有一些病人甚至可能是患有全身疾病, 眼表治疗可以改善角膜散光情况, 从而规划功能性人工晶状体植入, 改善病人远中近视力。

摘要编号: 209152

中国人群 PanOptix 多焦点人工晶状体植入后的临床表现

第一作者: Xin LIU

共同作者: Ke YAO

目的: 评估 PanOptix 多焦点人工晶状体在中国人群中的临床表现。

方法: 前瞻性单臂多中心研究。招募中国不同地区 9 家医院行白内障超声乳化联合 PanOptix 人工晶状体植入术的患者共 144 人 (286 眼), 其中 134 人 (268 眼) 完成术后 1 年随访。检测术后等效球镜、远 (5 m) 中 (60 cm) 近 (40 cm) 距离视力、离焦曲线, 统计安全性指标, 并行问卷调查。

结果: 术后 1 年结果: 术眼术后等效球镜值为 -0.06 ± 0.36 D。98.5% 术眼单眼最佳矫正远视力达到或优于 0.3 logMAR, 其中, 单眼裸眼远中近视力值分别为 0.04 ± 0.13 logMAR、 $0.09 \pm$

0.14 logMAR、 0.10 ± 0.13 logMAR; 单眼最佳远矫正状态下的远中近视力分别为 -0.01 ± 0.13 logMAR、 0.08 ± 0.14 logMAR、 0.08 ± 0.13 logMAR。双眼离焦曲线的峰值分布在 0 D、-0.5 D、-2.0 D, 在 +0.5 D 至 -3.0 D 之间视力均等于或优于 0.1 logMAR。术后 1 年内未发生器械相关不良事件、二次手术或人工晶状体位置改变; 40 眼 (14.1%) 发生后囊混浊, 其中 37 例无临床意义, 1 例 (0.4%) 行 YAG 激光后囊切开; 发生黄斑囊样水肿 5 例 (1.8%); 术后角膜内皮细胞较术前减少 9.5 ± 11.9 。重度星芒、光晕和眩光发生率分别为 15.6%、4.4% 和 2.3%, 明显受上述视觉干扰影响的比例为 1.5%、1.5% 及 1.5%; 远中近距离完全脱镜的比例分别为 94.0%、90.2% 及 86.5%; 88.2% 患者对术后视力满意或非常满意, 91.8% 患者愿意将 PanOptix 推荐给亲友。

结论: PanOptix 人工晶状体能提供良好的远中近距离视力, 能安全有效地提高视觉质量, 并具有良好的术后脱镜率及患者满意度。

摘要编号: 209685

人工晶状体脱位的个性化手术治疗方法探讨

第一作者: Shanna CHEN

目的: 探讨人工晶状体脱位的不同个性化手术治疗方法及效果。

方法: 人工晶状体 (IOL) 脱位患者 15 眼, 其中半脱位 2 眼, 后脱位 12 眼; 眼轴 > 28 mm 者 12 眼, 明确的外伤或提重物史 13 眼, 既往 IOL 悬吊缝线术 1 眼, 视力裸眼 0.03-0.1, 眼压高 (46 mmHg) 1 眼, 伴玻璃体积血 1 眼。所有患者采用玻璃体切除术联合 IOL 取出或缝线固定。缝线方法: 8-0 聚丙烯线距角膜缘 2 mm 巩膜面穿刺进入玻璃体腔内, 再经透明角膜缘切口引出眼外, 缝线固定于一片式 IOL 的一袢, 将缝线的袢送入眼内, 拉紧缝线并在巩膜层间 “V” 形穿梭, 紧贴结膜面剪断线端。

结果: 7 眼玻璃体切除术联合 IOL 囊袋复合体取出, 1 眼联合 IOL 囊袋复合体及张力环取出, 1 眼联合原 IOL 眼内单袢固定, 3 眼联合原 IOL 眼内双袢固定, 3 眼联合原 IOL 取出及新的一片式 IOL 缝线固定。患者术后刺激症状轻, 术后第二天裸眼视力 0.03-0.8, 角膜透明, KP (-), Tyn (-)。

结论: IOL 脱位患者常伴有高度近视或外伤史, 不同的脱位情况及既往不同 IOL 类型应该采用不同的处理方法。

摘要编号: 202572

全白白内障手术临床研究

第一作者: Yanfeng ZENG

目的: 比较飞秒激光与传统超声乳化手术在白色白内障囊膜切开术中的完整性、圆度和直径。**方法:** 察全白色白内障的手术效果。其中 100 人行飞秒辅助白内障超声乳化手术, 另外 100 人行传统白内障超声乳化手术。**结果:** 飞秒组大部分患者获得完整撕。100 只眼中有 10 只发生二次补撕囊。3 眼前囊撕裂。传统白内障超声乳化术组 100 只眼中有 49 只发生继发性撕囊, 100 只眼中有 15 只发生前囊撕裂。飞秒组晶状体囊平均直径为 5.4 mm, 而传统白内障超声乳化术组晶状体囊平均直径由 4 mm 增加到 6 mm。**结论:** 飞秒激光辅助白内障手术具有较高的晶状体完整性和稳定的撕囊直径。与传统白内障超声乳化手术相比, 撕囊时间明显缩短, 粘弹性剂用量明显减少, 囊撕裂直径更可控。

摘要编号: 207794

前节术后方对白内障术后眼前节及眼表影响的临床研究

第一作者: Zhen SHAO

共同作者: Dongmei LIU, Yuting ZHANG

目的: 探讨前节术后方对白内障术后患者眼前节及眼表的影响。**方法:** 将拟行白内障手术的患者按照患者意愿非随机分组, 分为常规治疗组及中药联合组, 共纳入 70 例 (81 只眼)。常规治疗组使用术后常规滴眼液治疗, 中药联合组在其基础上加用前节术后方。分别在术前、术后 1 天、1 周、1 月及 3 月对两组患者进行观察随访, 观察并记录患者一般信息、客观眼部检查指标及主观调查问卷。**结果:** 共有 63 例 (72 眼) 完成随访, 常规治疗组 33 例 (36 眼), 中药联合组 30 例 (36 眼)。两组患者在性别、年龄、术前视力、术前泪液分泌量、术前泪膜破裂时间、术后随访期间视力、眼压、角膜水肿率、前房细胞及前房闪辉评分、术前及术后平均脂质层厚度、上睑睑板腺缺失率均无显著性差异。两组患者的中国干眼问卷评分在术后均增加, 其中中药联合组评分低于常规治疗组。中药联合组在术后 1 周、1 月、3 月泪液分泌量及泪膜破裂时间均优于常规治疗组。**结论:** 白内障术后会出现不同程度的角膜水肿、前房炎症反应, 并破坏眼表平衡, 导致术后干眼症的

发生或加重。前节术后方能通过增加泪液分泌及泪膜破裂时间, 改善眼表相关指标。

摘要编号: 202593

区域折射人工晶体和单焦点人工晶体在网脱术后白内障手术中治疗效果分析

第一作者: Yanfeng ZENG

目的: 对比分析区域折射人工晶体和单焦点人工晶体在网脱术后白内障手术术后视觉质量。**方法:** 选取网脱术后白内障手术植入区域折射人工晶体的患者 51 例 (51 眼), 植入单焦点人工晶体的患者 50 例 (50 眼) 作为研究对象。所有患者均于术前、术后 1 天、1 周、1 个月、3 个月记录裸眼远中近视力。**结果:** 两组网脱术后白内障患者术前裸眼远视力相比没有统计学差异 ($P > 0.05$), 术后一天、一周、一个月和三个月网脱术后植入区域折射人工晶体白内障患者 (以下称为网脱区域折射组) 的平均裸眼远、视力与网脱术后植入单焦点人工晶体白内障患者 (以下称为网脱单焦点组) 相比差异不具有统计学意义 ($P < 0.05$)。术后一天、一周、一个月和三个月网脱区域折射组平均裸眼中、近视力均优于网脱单焦点组, 差异具有统计学意义 ($P > 0.05$), 术后三个月时, 网脱单焦点组和网脱区域折射组平均裸眼中视力分别为 0.57、0.82; 平均裸眼近视力分别为 0.56、0.70。**结论:** 网脱区域折射组术后裸眼远视力与网脱单焦点组相比均不具有统计学差异, 但网脱区域折射组术后裸眼中、近视力均优于网脱单焦点组, 区域折射人工晶体能够为患者提供更好的远中近视力。

摘要编号: 209414

单细胞转录组学结合空间蛋白质组学揭示了糖尿病性白内障中吞噬细胞类型特异性免疫调节

第一作者: Pengfei LI

目的: 糖尿病性白内障 (DC) 是糖尿病患者视力损害的主要原因, 其发病机制复杂, 涉及免疫介导机制。我们的目的是利用多组学数据研究糖尿病晶状体中免疫细胞的特征, 并阐明其潜在机制。**方法:** 采用单细胞 RNA 测序 (scRNA-seq) 鉴定糖尿病大鼠和正常大鼠晶状体样本中的细胞类型及其比例。然后利用串联质谱标签定量蛋白质组学技术筛选晶状体病变的深度免疫靶点和机制。在差异蛋白分析中, 采用基因本体论 (GO) 和京都基因与基因组百科全书 (KEGG) 进行通路富集分析。眼前节光学相干断层扫描 (AS-OCT) 可用于识别糖尿病性白内障患者的高反射点。对年龄相关性白

内障 (ARC) 和糖尿病性白内障 (DC) 患者的前囊膜进行免疫荧光染色。

结果: scRNA-seq 鉴定出五种细胞类型, 单核吞噬细胞是晶状体中一种重要的免疫细胞类型, 与正常大鼠相比, 糖尿病大鼠中该细胞类型的比例增加。此外, 对巨噬细胞亚群的 UCell 分析显示, 促炎性 M1 巨噬细胞显著增加, 抗炎性 M2 巨噬细胞减少。随后, 对前囊膜上免疫细胞标记蛋白 CD45 和 CD11B 的免疫荧光染色进一步证实, DC 患者的免疫细胞数量明显多于 ARC 患者。AS-OCT 结果表明, 与 ARC 患者相比, DC 患者晶状体前囊膜上的高反射点更为明显。此外, AS-OCT 还用于区分入组 DC 患者晶状体前囊下混浊 (LFCs) 的混浊区和透明区。蛋白质组学分析发现, 与糖尿病性白内障 (DC) 患者的透明区相比, 晶状体纤维细胞 (LFCs) 不透明区中有 38 种差异表达蛋白, 其中 17 种上调, 21 种下调。其中, 显著上调的蛋白巨噬细胞迁移抑制因子 (MIF) 是一种重要的巨噬细胞趋化因子, 可能在介导晶状体免疫方面发挥重要的调节作用。基因本体 (GO) 和京都基因与基因组百科全书 (KEGG) 通路分析显示, 这些差异表达蛋白与免疫调节和蛋白质泛素化通路相关, 特别是在淋巴细胞和白细胞的激活以及 K63 泛素化方面。

结论: 我们的研究糖尿病性白内障的发生发展提供了免疫证据。免疫调节的上调和蛋白质泛素化途径的改变提示了糖尿病性心肌病的潜在治疗靶点。为了了解这些免疫细胞的具体功能并设计靶向治疗方法, 进一步的研究至关重要。

摘要编号: 209186

合并中高度近视的单眼白内障患者双眼个性化人工晶体搭配设计植入的应用效果分析

第一作者: Tianxu PEI

目的: 评价合并单眼白内障的屈光不正患者个性化人工晶体搭配设计的安全性及有效性。

方法: 回顾性对照临床研究, 收集单眼患有白内障且拒绝透明晶体置换手术, 一眼行超声乳化白内障联合人工晶状体植入术植入连续视程型人工晶状体, 一眼进行前房型有晶体眼人工晶体 (ICL) 植入的近视患者 5 例 10 眼, 观察术后 3 mo 不同距离视力、脱镜率、离焦曲线变化以及人工晶状体稳定性、视觉质量等。

结果: 所有患者双眼均未出现并发症及不良反应。与术前相比, 术后患者双眼裸眼视力、矫正视力、双眼中、近距离视力均明显提高, 与术前比较差异有统计学意义; 术后 3 个月观察患者双眼客观散射指数 (OSI) 均较术前降低, 差异有统计学意义 ($P < 0.05$); 双眼调制传递函数截止频率 (MTF cut

off)、斯特列尔比 (SR) 均较术前升高 ($P < 0.05$)。术后患者均达到双眼脱镜, 双眼人工晶体位置无明显异常。

结论: 对于合并中高度近视的单眼白内障患者, 可以采用双眼个性化人工晶体搭配植入的方式提高患者的双眼全程视力, 达到双眼脱镜效果。

摘要编号: 208300

基于 CASIA2 的不同类型儿童白内障患儿晶状体参数分析

第一作者: Zitian LIU

目的: 晶状体参数对白内障形态可能为白内障术者提供形态以外的信息, 本研究旨在分析不同类型儿童白内障患儿晶状体参数。

方法: 采集中山眼科中心的儿童白内障队列基于 CASIA2 的晶状体参数 (前表面曲率、后表面曲率、晶体倾斜度、偏心度及厚度)、人口学特征、眼部疾病特点与眼球生物学参数。根据白内障形态将患眼分为全白组、前部混浊组、内部混浊组和后部混浊组 4 个亚组, 采用方差分析比较组间差异。

结果: 共 139 例儿童白内障患儿 (共 243 眼) 有可分析数据。纳入患儿的平均年龄为 7.91 ± 3.71 岁、女性占比 65.47% (91/139)。全白组患者年龄显著低于其他组别 (4.33 ± 2.89 岁、 $P = 0.04$), 各组在平均前表面曲率 R 值 (10.41 ± 4.60 mm)、后表面曲率 R 值 (5.39 ± 11.14 mm)、晶体偏心度 ($6.33 \pm 3.52^\circ$) 和倾斜度 (0.32 ± 0.24 mm) 均未发现显著差异 ($P > 0.05$), 但全白组晶体厚度较其他组显著更薄 (3.29 ± 0.17 mm, $P < 0.001$)。

结论: 全白型先天性白内障患者具有发病年龄更早、晶体形态学改变更显著的特征, 尤其是晶体厚度更薄。这一发现提示全白型先白可能存在独特的发病机制、未来将结合眼球生物参数等数据进一步分析。

摘要编号: 203343

基于 IOL-master 700 的角膜散光 ≥ 2.5 D 患者四种最新 Toric IOL 计算公式的准确性对比研究

第一作者: Wenjie LIU

共同作者: Jiewei LIU

目的: 对比基于 IOL-master 700 的角膜散光 ≥ 2.5 D 患者 Kane Toric 计算器和 Emmetromia Verifying Optical (EVO) Toric 计算器、Barrett Predicted PA 计算器和 Barrett Measured PA 计

算器植入 Toric IOL 的准确性, 并于角膜散光 < 2.5 D 患者进行对比。

方法: 收集角膜散光 ≥ 2.5 D 的白内障超声乳化联合 Toric IOL 植入术患者 32 例 32 眼。将术前 IOL-master 700 检查结果分别代入 Kane、EVO、Barrett Predicted PA 和 Barrett Measured PA 四种计算器, 对每个病例进行重复计算, 记录对应的残余散光大小及轴位, 与术后 3 个月主观验光结果进行分析, 分别计算四种计算器的矢量误差, 分析对比四种计算器的计算准确性。同时与角膜散光 < 2.5 D 患者 (55 例 55 眼) 进行同一公式比较。

结果: 对于角膜散光 ≥ 2.5 D 的患者四种计算器矢量误差分别为: Kane toric 0.13 ± 0.78 D @ 99° ; EVO toric 0.13 ± 0.78 D @ 99° ; Barrett Predicted PA toric 0.25 ± 0.78 D @ 95° ; Barrett Measured PA toric 0.34 ± 0.81 D @ 94° , 差异无统计学意义 ($P > 0.05$), Kane 误差值最小。同一公式与角膜散光 < 2.5 D 的患者组相比 (Kane toric、EVO toric、Barrett Predicted PA toric 0.32 ± 0.68 D @ 102° 、Barrett Measured PA toric 0.27 ± 0.71 D @ 102°), 差异无统计学意义 ($P > 0.05$)。

结论: 基于 IOL-master 700 的角膜散光 ≥ 2.5 D 患者 Kane toric 0.19 ± 0.72 D @ 111° 、EVO toric 0.30 ± 0.70 D @ 102° 、Barrett Predicted PA 和 Barrett Measured PA 四种计算器均表现为轻度的顺规方向漂移, 与 EVO toric、Barrett Predicted PA、Barrett Measured PA 计算器相比, Kane toric 计算器矢量误差最小。

摘要编号: 200493

小角膜患者白内障术后角膜内皮细胞丢失的临床研究

第一作者: Tianyu ZHENG

目的: 评估小角膜患者在接受白内障超声乳化手术后的角膜内皮细胞丢失 (ECL)。

方法: 这项回顾性研究纳入了 50 例小角膜患者 (50 眼) 和 120 例角膜大小正常的患者 (120 眼), 所有患者均接受了白内障超声乳化手术。术前评估了人口统计学数据和生物测量参数, 术后 3 个月测量了角膜内皮细胞各项参数。

结果: 小角膜组的平均角膜水平直径 (WTW) 为 10.76 ± 0.24 mm, 显著短于正常对照组的 11.73 ± 0.36 mm ($P < 0.01$)。与正常对照组 (前房深度 = 3.16 ± 0.34 mm, 晶体厚度 = 4.39 ± 0.39 mm) 相比, 小角膜组的前房 (2.78 ± 0.50 mm) 更浅、晶状体厚度 (4.62 ± 0.49 mm) 更厚 (P

< 0.01)。小角膜组的角膜内皮细胞丢失量 (662.20 ± 496.79 cells/mm²) 显著高于正常对照组 (360.53 ± 364.29 cells/mm²) ($P < 0.001$)。小角膜组的平均内皮细胞面积增加 (185.38 ± 144.04 μm^2) 也显著大于对照组 (75.56 ± 92.48 μm^2)

($P < 0.001$)。多因素回归分析显示, 在角膜大小正常的患者中, 角膜水平直径 (Beta = -0.330 , $P < 0.001$) 和平均超声能量 (Beta = 0.288 , $P = 0.030$) 是术后角膜细胞内皮丢失的显著影响因素。角膜水平直径 (WTW) 也是所有患者术后角膜内皮细胞丢失 (ECL) 的统计学显著危险因素 (Beta = -0.331 , $P < 0.001$)。

结论: 与正常大小的角膜相比, 小角膜患者在超声乳化手术后发生内皮细胞丢失的数量显著增加。角膜水平直径 (WTW) 是术后角膜内皮细胞丢失 (ECL) 的显著危险因素。

摘要编号: 209155

微创玻切联合改良无巩膜瓣缝线固定人工晶体治疗晶体脱位的临床疗效评价

第一作者: Dahu 大卉 MA 马

目的: 在微创玻切基础上, 评价一种改良无巩膜瓣缝线固定人工晶体 (IOL) 技术在晶体/人工晶体脱位修复中的安全性、有效性与术式优势。

方法: 单中心回顾性研究。纳入囊袋无法提供支持、IOL 半/全脱位至玻璃体腔的连续病例。两组比较:

① 改良无巩膜瓣缝线固定术 (经缝针穿刺建立巩膜隧道, 线结层间埋藏于巩膜板层内, 免制作巩膜瓣); ② 传统巩膜瓣缝线固定术。均联合微创玻切完成。观察指标: 手术时间、最佳矫正视力 (BCVA)、角膜内皮计数、角膜散光、IOL 倾斜与偏心、术后并发症。

结果: 与传统巩膜瓣法相比, 改良术式显著缩短手术时间 (约 10–15 分钟), 减少眼表损伤与医源性散光风险; 随访至术后一年, IOL 居中稳定、BCVA 维持良好, 观察期内未见缝线松脱/线结暴露及眼底相关严重并发症。

结论: 改良无巩膜瓣缝线固定术通过巩膜隧道内埋藏线结, 在保证固定稳定与视功能恢复的同时, 缩短手术时长、降低眼表创伤, 体现微创优势; 适用于囊袋支持不足的晶体/人工晶体脱位患者, 值得在前瞻性多中心研究中进一步验证。

摘要编号: 210121

新型羟乙基甲基丙烯酸酯三焦点人工晶状体视觉质量分析

第一作者: Yan HUO

共同作者: Jian YE

目的: 对比分析一种新型疏水性羟乙基甲基丙烯酸酯衍射三焦点人工晶状体 (CNWTT0, CN组) 与甲基丙烯酸苯乙酯衍射三焦点人工晶状体 (TFNT00, TF组) 植入术后的临床效果以及主客观视觉质量差异。

方法: 纳入 52 例年龄相关性白内障患者, 随机分为 CN 组 ($n = 12$) 与 TF 组 ($n = 40$)。术后 3 个月评估, 主要评估指标包括最佳矫正远视力、裸眼近视力、裸眼中视力、裸眼远视力、单眼离焦曲线, 使用 itrace 视觉质量分析仪检测高阶像差、慧差、球差、三叶草差, 视觉质量、传递调制函数、点扩散函数, 以及患者主观问卷调查脱镜率, VF-14、QoV 视觉质量问卷调查。

结果: 研究共纳入了 52 名患者, 其中 CN 组 12 人, TF 组 40 人。CN 组和 TF 组在术前基线特征: 性别、年龄、等效球镜、最佳矫正视力、眼轴长度、人工晶体度数等方面 ($p > 0.05$), 差异无统计学意义; CN 组和 TF 组术后三个月最佳矫正远视力均大于 logMAR 0.1、裸眼远视力、裸眼中视力、裸眼近视力均可达 logMAR 0.2 以上, 且两组差异无统计学意义 ($p > 0.05$), 单眼离焦曲线差异无统计学意义 ($p > 0.05$); CN 组和 TF 组高阶像差以及慧差、三叶草差差异无统计学意义 ($p > 0.05$), CN 组球差 $0.009 (0.003, 0.017)$ 小于 TF 组球差 $0.0215 (0.008, 0.036)$ ($p = 0.027$), 差异有统计学意义; CN 组和 TF 组传递调制函数和点扩散函数差异无统计学意义 ($p > 0.05$), 两组脱镜率 CN 组 94.73%, TF 组 94.55%, VF-14 问卷调查 CN 组和 TF 组患者视远满意度、视中满意度差异无统计学意义 ($p > 0.05$), CN 组视近满意度 $4.0 (3.9, 4.0)$ 优于 TF 组视近满意度 $3.6 (3.6, 3.8)$ ($p = 0.020$), 差异有统计学意义; QoV 问卷中眩光、光晕以及星爆光学干扰调查中 CN 组光学干扰 $3 (0, 6)$ 低于 TF 组 $8 (5, 9)$ ($p = 0.036$), 差异有统计学意义。

结论: 一种新型疏水性羟乙基甲基丙烯酸酯 (CNWTT0) 和甲基丙烯酸苯乙酯 (TFNT00) 衍射三焦点人工晶状体均可提供良好的全程视力以及视觉效果, 两组脱镜率均在 94% 以上, 但 CNWTT0 在高阶像差中球差更小更具优势, 两组患者主观视觉质量满意度高, CNWTT0 具有更优的视近满意度, 同时较 TFNT00 具有低光学干扰。

摘要编号: 209904

晶状体巨噬细胞在糖尿病性白内障发病中的作用研究

第一作者: Min JI

目的: 糖尿病性白内障 (diabetes cataract, DC) 是糖尿病患者视力受损的主要原因, 然而其发病的免疫学调控机制目前尚不清楚。

方法: 本研究中, 我们采用了多组学联合分析的方法来筛选 DC 发病中的发生特异性变化的免疫学通路和靶点。我们使用 STZ 注射的方法构建了大鼠糖尿病模型。然后提取正常对照大鼠与糖尿病模型大鼠的晶状体制备单细胞悬液, 并进行单细胞转录组测序。在 DC 患者与对照者晶状体囊膜中进行免疫荧光染色, 通过荧光共聚焦显微镜检测验证特异性浸润的免疫细胞。为了阐明潜在的免疫学通路, 我们还对 DC 患者不透明和透明区域的晶状体组织进行了蛋白质组学分析, 并进行了生物信息学分析, 富集了显著改变的通路。

结果: 单细胞 RNA 测序显示 DC 大鼠晶状体中单核吞噬细胞显著扩增, 其特征是促炎型 M1 巨噬细胞表型转变和抗炎型 M2 巨噬细胞减少。这些发现在人类 DC 患者中通过共聚焦免疫荧光染色得到证实, 显示 CD45 和 F4/80 免疫细胞浸润增加。DC 患者术中晶状体的不透明和透明区域的蛋白质组学分析发现, 巨噬细胞迁移抑制因子 (MIF) 是患病组织中关键的上调蛋白。通路富集分析进一步揭示了 DC 与 K63 连接泛素化下调之间的关联性, 提示 K63 连接泛素化是免疫调节中的关键泛素非降解信号通路。

结论: 研究揭示了 DC 中 MIF 驱动的巨噬细胞介导的炎症微环境, 并且首次表明 K63-泛素化在其发病机制中失调。这些发现为 DC 的发病机制提供了新的见解, 并提示 MIF 和 K63 泛素化修饰通路是潜在的治疗靶点。

摘要编号: 209999

生活方式降低白内障风险的蛋白组学机制研究

第一作者: Xianqi ZHENG

共同作者: Honghua YU, Xiaoyi YU

目的: 探讨健康生活方式与年龄相关性白内障 (ARC) 发病风险的关联, 鉴定相关血浆蛋白标志物并阐明其潜在分子机制。

方法: 基于英国生物数据库前瞻性社区队列, 纳入基线无眼病人群。通过六维度健康生活方式评分 (吸烟、饮酒、饮食、运动、睡眠、肥胖) 评估行为因素, 通过国际疾病分类及手术编码定义 ARC 事件, 采用 Cox 回归模型分析其与 ARC 发病风险的关联。

进一步在具有血浆蛋白组学数据的亚组人群中，运用弹性网络回归筛选与生活方式相关的蛋白，并通过 Cox 回归模型识别与 ARC 风险前瞻性相关的蛋白；取交集构建蛋白指纹，评估其与 ARC 的关联、与生活方式的交互作用及中介效应。

结果：中位随访 11.11 年期间，1,160 名参与者发生 ARC。多因素 Cox 回归显示，生活方式健康水平与 ARC 风险呈显著负相关（HR = 0.94；95% CI, 0.89–0.99, P = 0.024）。此保护作用在女性中更为显著（HR = 0.89；95% CI, 0.82–0.96, P = 0.002，交互作用 P = 0.037）。蛋白组学分析筛选出 79 个与生活方式相关的血浆蛋白，其中 FUT3_FUT5 及 FGR 与 ARC 风险独立相关。基于 FUT3_FUT5 及 FGR 构建的蛋白指纹与生活方式评分呈正线性相关（ $\beta = 0.07$ ；95% CI, 0.04–0.09, P = 0.000），并与 ARC 风险呈显著负相关（HR = 0.88；95% CI, 0.80–0.97, P = 0.014）；进一步调整生活方式后关联依然稳健（HR = 0.77；95% CI, 0.64–0.93, P = 0.008）。蛋白指纹与生活方式存在显著协同交互作用（交互项 HR = 0.85；95% CI, 0.72–0.99, P = 0.039）。中介分析提示其在“生活方式-ARC”关联中起部分中介作用（中介比例 29.65%）。通路富集分析揭示，FUT3_FUT5 可能参与糖鞘脂生物合成以维持晶状体蛋白稳定，而 FGR 则通过趋化因子信号通路调控局部炎症反应。

结论：健康生活方式是 ARC 的重要保护因素，其作用部分通过调节 FUT3_FUT5 与 FGR 等血浆蛋白水平实现。生活方式相关蛋白指纹可作为 ARC 风险的潜在生物标志物，为理解生活方式保护效应的生物学机制提供了新证据。

摘要编号：208105

白内障患者 vivity 人工晶状体植入术后干眼程度及客观视觉质量的早期变化

第一作者：Ting YANG

共同作者：Lijun HUO, Congyao WANG

目的：光学质量分析系统（OQAS）基于点扩散函数（PSF）客观评估眼内光学质量，可量化光散射与调制传递。当前关于 Vivity 人工晶状体（IOL）植入术后客观视觉质量与干眼状态的研究有限。本研究探讨老年性白内障患者于超声乳化联合 Vivity IOL 植入后的客观视觉质量、泪膜稳定性及调节能力随时间变化的特征。

方法：前瞻性随访 24 例（32 眼）老年性白内障患者，分别于术前、术后 1 周、1 月、3 月采用 OQAS 评估客观视觉质量指标（高/中/低对比度视力〔OV 100/20/9〕、客观散射指数〔OSI〕、调制传递函

数截止频率〔MTF-cutoff〕、斯特列尔比〔Strehl ratio, SR〕），并记录泪膜动态散射指数（TF-OSI）与调节范围。比较各时间点与术前差异并进行时间序列分析。

结果：与术前相比，术后 1 周、1 月、3 月的高/中/低对比度视力均显著提高（均 P < 0.001），且术后各时间点间差异不显著（以高对比度视力为例：1 周 vs 1 月 P = 0.414；1 月 vs 3 月 P = 0.914）。OSI 于术后各时间点均显著降低（均 P < 0.001），提示眼内散射减少；术后时间点间差异不显著。MTF-cutoff 与 SR 在术后 1 周、1 月、3 月均显著高于术前（MTF-cutoff：均 P < 0.001；SR：P = 0.001、< 0.001、0.004），术后时间点间无显著差异。TF-OSI 于术后 1 周、1 月较术前显著降低（分别 P < 0.025、P < 0.004），术后 3 月呈下降趋势但未达统计学显著（P = 0.065）。术前与术后各时间点的调节范围差异不显著（P = 0.431）。

结论：Vivity IOL 植入后，客观视觉质量在早期即显著改善并于术后 1 周趋于稳定，表现为 OV 提升、OSI 下降以及 MTF-cutoff 与 SR 增高。TF-OSI 降低提示泪膜稳定性改善，可能与术后人工泪液的持续使用相关。老年性白内障人群术前术后调节范围整体无明显变化。

摘要编号：208853

白内障术毕前房注气的安全性研究

第一作者：Jiaping DENG

共同作者：Shuang LI

目的：探讨白内障超声乳化联合人工晶状体植入术毕，前房注入无菌空气或平衡盐溶液对角膜内皮细胞、中央角膜厚度的影响，评估白内障术毕时前房注气的安全性。

方法：36 例 36 眼老年性白内障患者，检查视力、眼压、角膜内皮细胞和中央角膜厚度，并记录所有病例术前的结果，随机分成两组由同一位经验丰富的主刀医师行白内障超声乳化联合人工晶状体植入术，注液组 18 眼术毕时前房注入平衡盐溶液，注气组 18 眼术毕时前房注入无菌空气形成前房。术后完成 1 个月的随访评估，行注液组和注气组术前及术后视力、眼压、角膜内皮细胞各参数、中央角膜厚度的组间或组内比较。

结果：（1）注液组和注气组术前视力、眼压、角膜内皮细胞密度、六角形细胞百数、中央角膜厚度对比差异无统计学意义，术后 1 w、2 w、3 w、4 w 两组对比差异均无统计学意义（P > 0.05）。（2）注液组和注气组角膜内皮细胞密度、中央角膜厚度各自术前术后对比差异具有统计学意义（P < 0.05）。（3）注液组六角形细胞百数手术前后对比无显著

性差异 ($P > 0.05$)，注气组六角形细胞百数术后 1 w、2 w、4 w 小于术前，差异有统计学意义 ($P < 0.05$)，术后 3 w 与术前对比无显著性差异 ($P > 0.05$)。(4) 注气组术后 1 w、2 w、3 w、4 w 的中央角膜厚度对比无显著性差异 ($P > 0.05$)，注液组术后 4 w 的中央角膜厚度均小于术后 2 w、3 w，差异有统计意义 ($P < 0.05$)。

结论：白内障超声乳化联合人工晶状体植入术毕，使用前房注气形成前房不影响术后的视力，也未发现低于阈值的角膜内皮细胞损害、眼压升高等，还可能比前房注液更快的减轻角膜水肿使得中央角膜厚度达到一个稳定的状态，是简单有效、安全可靠的。

摘要编号：209724

目标屈光度为 -2D 和 -3D 的单焦点视力改善型人工晶状体在高度近视白内障患者中的视觉效果

第一作者：Danyue CHEN

目的：在高度近视白内障患者中，比较植入目标屈光度为 -2D 和 -3D 的单焦点视力改善型人工晶状体 (IOL) 的术后视觉效果。

方法：纳入拟行超声乳化白内障吸除联合单焦点视力改善型 IOL 植入术的高度近视白内障患者 (眼轴长度 [AL] ≥ 26 mm)。根据目标屈光度将患者分为 2 组：-2D 组与 -3D 组。术后 1 个月评估患者的裸眼远视力 (UDVA)、中视力 (UIVA)、近视力 (UNVA)、最佳矫正远视力 (CDVA)、客观视觉质量和主观满意度。并根据 AL 进行亚组分析 ($26 \text{ mm} \leq \text{AL} < 28 \text{ mm}$ 和 $\text{AL} \geq 28 \text{ mm}$)。

结果：共纳入 89 人 (89 眼)。 -2D 组在 5 m UDVA (0.49 vs 0.73 logMAR, $P < 0.001$)、80 cm UIVA (0.19 vs 0.34 logMAR, $P < 0.001$)、60 cm UIVA (0.14 vs 0.27 logMAR, $P < 0.001$)、远距离脱镜率 (23.81% vs 2.13%, $P < 0.001$) 方面均优于 -3D 组，而 2 组的 40 cm UNVA、5 m CDVA、客观视觉质量以及主观满意度均无差异 ($P > 0.05$)。不同 AL 亚组的视力结果与总体一致。

结论：在高度近视白内障患者中，植入目标屈光度为 -2D 的单焦点视力改善型 IOL 可在提供更好的裸眼远、中视力的同时，维持与 -3D 相近的裸眼近视力。因此，将 -2D 作为单焦点视力改善型 IOL 的目标屈光度为该人群提供了一个兼顾全程视力的优选方案。

摘要编号：208588

真性囊膜剥脱综合征合并白内障的手术治疗策略及临床观察

第一作者：Zhiyu XU

目的：探讨真性囊膜剥脱综合征合并白内障患者的临床特点及手术处理方案，以提高手术安全性及术后效果。

方法：回顾分析真性囊膜剥脱综合征合并白内障患者的术前评估，包括 UBM、前节 OCT 检查等评估悬韧带功能、术中规范操作 (连续环形撕囊、超声乳化参数调整、囊袋张力环应用) 及术后管理 (眼压监测、抗炎治疗及随访观察)。

结果：真性囊膜剥脱综合征患者白内障手术中悬韧带脆弱、囊膜易撕裂，患者瞳孔无法散大，术中使用囊袋拉钩扩张瞳孔，术中采用张力环可有效稳定囊袋；术后需警惕高眼压、囊袋收缩等并发症，个性化管理可改善预后。

结论：真性囊膜剥脱综合征合并白内障手术需精细化操作，重视术前评估及术后随访，以降低并发症风险，确保手术成功。

摘要编号：210139

短眼轴患者人工晶状体度数计算公式的准确性：系统综述与网络 Meta 分析

第一作者：Yiyuan MA

共同作者：Guofu HUANG, Guangming JIN, Gaoming ZHANG, Danying ZHENG

目的：评估并比较不同人工晶状体 (IOL) 度数计算公式在短眼轴 (轴长 < 22 mm) 眼中的屈光预测准确性，为临床提供循证参考。

方法：系统检索 PubMed、Embase、Web of Science 及 Cochrane Library 数据库 (2003 年 1 月至 2023 年 9 月)，纳入轴长 < 22 mm 且报道术后屈光误差的前瞻性或回顾性研究。主要结局指标包括：平均绝对误差 (MAE)、中位绝对误差 (MedAE) 及预测误差 (PE) 在 $\pm 0.25 \text{ D}$ 、 $\pm 0.50 \text{ D}$ 和 $\pm 1.00 \text{ D}$ 范围内的比例。采用 R 软件 (v4.2.1) 进行网络 Meta 分析，并使用累积排序曲线下面积 (SUCRA) 评价公式排名。

结果：共纳入 15 项研究，涉及 1178 只眼及 12 种 IOL 计算公式。与常用的 Haigis 公式相比，Kane 公式在 PE $\pm 0.25 \text{ D}$ 、 $\pm 0.50 \text{ D}$ 和 $\pm 1.00 \text{ D}$ 范围内均显示更高比例 (OR > 1 ，均 $P > 0.05$)。SUCRA 分析显示，Kane 公式在 PE $\pm 0.25 \text{ D}$ 范围内的准确性最高 (95.74%)，其次为 Haigis (94.79%) 和 Olsen Standalone (84.04%)。此外，

Kane 与 Olsen Standalone 公式的 MedAE 最低, 提示预测精度更佳。

结论: Kane、Haigis 和 Olsen Standalone 公式在短眼轴患者人工晶状体度数预测中表现优于其他公式, 但仍存在一定的不确定性。未来需通过大样本、多中心研究进一步验证其临床适用性。

摘要编号: **210123**

经巩膜人工晶状体缝线固定术治疗晶状体脱位患儿的安全性及有效性: 一项真实世界研究

第一作者: Siyuan LIU

共同作者: Guangming JIN, Xinxin LIU, Danying ZHENG

目的: 评估真实世界中经巩膜人工晶状体 (IOL) 缝线固定术治疗儿童晶状体脱位的有效性和安全性。

方法: 本研究回顾性分析了 2016 年 1 月 -2020 年 12 月收治的接受经巩膜 IOL 缝线固定术治疗的非外伤性儿童晶状体脱位患儿 123 例 (220 眼), 所有患儿均顺利完成至少 3 年的术后随访。研究的主要疗效指标为术后最佳矫正视力 (BCVA); 安全性指标包括术后并发症的发生率以及二次手术的比例。次要结局指标则包括术后屈光度的变化和 IOL 位置。

结果: 患儿平均手术年龄为 6.80 ± 3.17 岁, 术后平均随访时长为 4.39 ± 1.01 年。疗效方面, 患儿术前中位 BCVA 为 0.70 logMAR, 术后 1 月、3 年、5 年及末次随访时 BCVA 分别提升至 0.30 logMAR、0.10 logMAR、0.10 logMAR 及 0.10 logMAR。安全性方面, 术后并发症主要包括线结暴露 19 眼 (8.6%), IOL 脱位 17 眼 (7.7%), IOL 夹持 7 眼 (3.2%), 持续性高眼压 4 眼 (1.8%), 视网膜脱离 3 眼 (1.3%), 眼内炎 2 眼 (0.9%)。同时, 观察到患儿术后屈光状态呈现出向近视漂移的趋势。末次随访时, IOL 倾斜与偏心在分别达到 $8.6 \pm 5.6^\circ$ 和 0.75 ± 0.38 mm。

结论: 经巩膜 IOL 缝线固定术能够有效提升晶状体脱位患儿的视力预后。然而, 该手术方式也存在一定的并发症发生风险, 其中缝线暴露和 IOL 脱位是较为常见的并发症类型。鉴于这些潜在的并发症风险, 对接受该手术治疗的晶状体脱位患儿进行长期、密切的术后随访显得尤为重要。同时, 未来仍需进一步优化手术技术、改良手术耗材以提高手术的安全性和有效性。

衍射型多焦点人工晶状体 Diff-aA 植入白内障患者术后视觉质量分析

第一作者: Jingwen ZHANG

目的: 探讨白内障患者非球面衍射型多焦点人工晶状体 (intraocular lens, IOL) Diff-aA 植入术后的视觉质量分析, 综合评估 Diff-aA IOL 的临床效果, 为临床植入提供全面完善的参考依据。

方法: 该研究为前瞻性、随机对照研究。收集 2024 年 9 月至 2025 年 9 月共 74 例白内障患者 (87 眼)。随机分为试验组和对照组, 试验组 43 例 (53 眼), 对照组 31 例 (34 眼), 试验组患者植入 Diff-aA IOL (HumanOptics, Germany), 对照组患者植入 Tecnis ZMB00 IOL (Advanced Medical Optics, USA)。在术后 2 周、1 月、3 月时分别测量两组患者的双眼裸眼远中近视力, 绘制离焦曲线, 客观视觉质量采用 Itrac 测量调制传递函数 MTF 曲线、斯特列尔比 SR、点扩散函数 PSF, 主观视觉质量采用 VF-14-CN 量表进行评估。

结果: 在术后 3 月时, 试验组和对照组均具有较好的未矫正远距离视力, 试验组为 0 LogMAR, 对照组为 0 LogMAR, 差异不具有统计学意义 ($P > 0.05$); 试验组的未矫正近距离视力略低于对照组, 差异具有统计学意义 ($P < 0.05$), 试验组的未矫正中距离视力优于对照组, 差异具有统计学意义 ($P < 0.001$)。术后 1 月及 3 月时, 两组视力在 $+1.00$ D ~ -4.00 D 水平的离焦曲线上均由于 0.3 LogMAR, 在 -1.50 D ~ -2.50 D 的离焦水平上, 试验组视力均优于对照组, 差异具有统计学意义 ($P < 0.05$)。试验组和对比组的客观视觉质量 MTF Avg Height、SR 及 PSF 在术后 3 月时差异均无统计学差异 ($P < 0.05$), 试验组和对照组患者 VF-14-CN 问卷评分差异和脱镜率的差异均无统计学意义 (均 $P > 0.05$)。

结论: 非球面衍射型多焦点人工晶状体 Diff-aA IOL 可提供优秀的远视力及满意的中近视力, 实现术后较为连续的视程, 同时获得令人满意的脱镜率和较低的不良视觉现象发生率。

摘要编号: **200491**

评估非短眼轴小角膜患者的人工晶状体度数计算公式的准确性: 一项对比性研究

第一作者: Tianyu ZHENG

目的: 评估 11 种人工晶状体度数计算公式在眼轴长度 > 21 mm 的小角膜患者中的准确性, 包括 Barrett Universal II (BUII)、Emmetropia Verifying Optical (EVO)、Hill basis function

(Hill-RBF)、Hoffer QST、Kane、Pearl-DGS、K6、Hoffer Q、SRK/T、Holladay 1 和 Haigis 公式。

方法：根据眼轴长度 ≤ 24 mm 或 > 24 mm 将 57 只眼分为正常眼轴与长眼轴亚组。公式优化方法：通过校准预测误差 (PE)，使每种 IOL 公式的平均误差 (ME) 为零。分析整体队列和各亚组在优化前后的中位数绝对误差 (MedAE)、平均绝对误差 (MAE) 和标准差 (SD)，并评估所有公式中 PE 范围在 ± 0.25 D、 ± 0.5 D、 ± 1 D 和 ± 2 D 中的百分比。通过回归分析确定绝对预测误差 (APE) 的影响因素。对于新一代公式，根据是否包含晶状体厚度 (LT) 参数分析 APE。

结果：11 种 IOL 公式的绝对预测误差 (APE) 存在显著差异 ($p < 0.001$)，其中 Pearl-DGS 公式的中位数绝对误差 (MedAE) 最低 (0.62 D)。对于 $AL \leq 24$ mm 的正常眼轴患眼，LT 参数的纳入显著提高了 K6 公式的准确性，而对于 $AL > 24$ mm 的长眼轴小角膜患眼，不纳入该参数的 EVO 公式表现更优 (均 $p < 0.05$)。在 $AL > 24$ mm 长眼轴亚组中，亚组内部优化比整体优化更有效地提升了 Hoffer Q 和 Haigis 公式的准确性 (均 $p < 0.05$)。

结论：新一代 IOL 公式 (尤其是 Pearl-DGS) 可提高非短眼轴小角膜患者的 IOL 度数预测准确性。非短眼轴小角膜患者可能因 AL 不同呈现不同的 IOL 计算特征，因此在评估 LT 参数对于提升 IOL 计算准确性的效果时，需根据 AL 分层优化 IOL 计算。

摘要编号：208885

远视眼白内障患者三种人工晶状体植入术后视功能对比研究

第一作者：Zhen SHAO

共同作者：Wenna HAO, Dongmei LIU

目的：对远视眼白内障患者双眼植入不同类型人工晶状体的术后客观视功能及主观感受进行调查分析。

方法：本研究采用前瞻性非随机病例对照研究。纳入自 2021 年 11 月至 2023 年 03 月远视眼白内障患者，共 57 例 114 只眼，根据患者意愿选择分为 3 组，单焦组，共 20 例 40 只眼；双焦组，共 18 例 36 只眼；三焦组，共 19 例 38 只眼。收集三组患者分别在术前及术后 6 个月眼部主客观检查及问卷结果。

结果：三组的远中近视力较术前均有显著提高，但术后离焦曲线趋势不同。三组的调制传递函数曲线

下 4 mm 面积比 (Area Ratio, AR)、点扩散函数中斯特列尔比 (Strehl Ratio, SR) 较术前均显著提高，且在相同复查时间的 AR 值、SR 值无显著差异。双焦、三焦两组阅读视力、阅读速度、阅读准确率优于单焦组。在 1.5 cpd 和 3.0 cpd 空间频率下，单焦组对比敏感度优于双焦、三焦两组。术后 6 个月，视近脱镜率分别为单焦组 20.00%，双焦组 61.11%，三焦组 63.16%；不良光现象发生率为眩光 (单焦组 10.00%，双焦组 44.44%，三焦组 42.11%)；光晕 (单焦组 15.00%，双焦组 55.56%，三焦组 52.63%)；星芒 (单焦组 5.00%，双焦组 44.44%，三焦组 47.37%)；重影 (单焦组 5.00%，双焦组 11.11%，三焦组 10.53%)；雾视 (单焦组 5.00%，双焦组 22.22%，三焦组 15.79%)。术后整体满意度分别为单焦组 90.00%，双焦组 88.89%，三焦组 89.47%。

结论：三种人工晶状体都能有效提高远视眼白内障患者术后视力和视觉质量。双焦点与三焦点人工晶状体可提供更好的近距离视力，三焦点可提供更佳的中距离视力。但双焦点、三焦点均轻度降低对比敏感度，术后不良光干扰发生率高。在临床工作中，要充分考虑患者年龄、性格，眼部检查和用眼习惯，结合自身视觉需求选择人工晶状体类型以提高患者术后满意度。

摘要编号：200756

透明角膜切口和巩膜隧道切口对白内障术后角膜生物力学改变的比较研究

第一作者：Huiyu CHEN

目的：通过 corvis ST 观察比较透明角膜切口和巩膜隧道切口在超声乳化白内障手术中对角膜生物力学的影响。

方法：本前瞻性观察性研究共纳入 59 名患者，共计 67 眼接受白内障超声乳化合并人工晶体一期植入术，其中 32 眼行透明角膜切口，35 眼行巩膜隧道切口。所有患者在术前、术后 1 周、术后 1 月和术后 3 月接受了 corvis ST 检查。Corvis ST 记录了如下主要参数：变形幅度最大值 (DA max)、DA 比最大值 (1 mm 和 2 mm)、综合半径、刚度参数 (SP A1)、Ambrosio 与水平剖面的关系厚度 (ARTh)、角膜中央厚度 (CCT)，非矫正眼压 (IOPnct) 和生物力学矫正 IOP (bIOP)。使用线性混合模型对每个时期的所有测量值进行比较， $P < 0.05$ 认为具有统计学差异。

结果：透明角膜切口组和巩膜隧道切口组均表现出所有的 IOP 测量值都随着时间的推移而下降 ($p < 0.01$)。在 1 W 和 1 M 时，CCT 增加 ($P < 0.01$)，但在 3 M 时回落到术前水平。ARTh 在 1 W 和 1

M 时升高 ($P < 0.01$)，但在 3 M 时恢复到 Pre 水平。DA max 和综合半径在 3 M 时升高 ($P < 0.01$)，SP A1 随着时间的推移而降低 ($P < 0.01$)。两组之前相互比较发现，在术后不同时间点，参数 IOP、SP A1、ARTh、DA max、综合半径均是透明角膜切口组大于巩膜隧道切口组 ($P < 0.05$)，然而 CCT 则是巩膜隧道切口组大于透明角膜组 ($P < 0.05$)。

结论：白内障术后，眼压及角膜硬度均较术前降低；巩膜隧道切口相较透明角膜切口对角膜生物力学的影响更大，使得术后 3 月角膜生物力学硬度下降更明显。

摘要编号：202701

预留撕囊起瓣点在初学白内障撕囊中的临床观察

第一作者：Jinpeng CHEN

共同作者：Yuan TAN, Huiyong XU, Peng ZHANG

目的：通过预留环形撕囊起瓣点加快初学白内障超声乳化手术医师的撕囊学习曲线并减少撕囊相关并发症。

方法：统计自 2022.01 至今在教授初学白内障学员行白内障手术环形撕囊过程中，通过撕囊镊呈小角度自中央刺破晶状体前囊并呈 $\angle$ 型分开，使初起瓣处呈“M”型，预留一处起瓣点，并环形撕囊，对于初次撕囊不佳时，改为再次起瓣撕囊完成环形撕囊。

结果：在统计的初学学员按预留起瓣点撕囊的 520 例白内障手术中，一次完成撕囊的占 346 例，由学员自己完成二次起瓣撕囊的为 75 例，由上级医师完成二次撕囊的为 99 例，撕囊完成后均顺利完成白内障超声乳化手术，未出现因撕囊不佳导致的手术并发症。

结论：预留起瓣点在初学白内障手术中可以减少初学白内障手术医师的心理压力，加快白内障撕囊学习曲线，减少撕囊相关并发症。

摘要编号：208801

飞秒激光辅助白内障手术在晶状体不全脱位当中的应用效果分析

第一作者：Shifeng FANG

共同作者：Tianxu PEI

目的：评价飞秒激光辅助白内障手术在晶状体不全脱位手术当中的安全性与有效性。

方法：回顾性病例分析。选取行白内障术前筛查，诊断为“年龄相关性白内障、晶状体不全脱位”行

飞秒激光辅助白内障手术的患者 25 例 27 眼作为观察组，行常规超声乳化白内障手术的患者 25 例 25 眼作为对照组，术中均植入同一品牌的非球面人工晶状体。记录术前患者一般资料、术中情况、术后矫正视力、眼压、人工晶状体位置、视觉质量相关参数及并发症情况。

结果：与术前相比，术后 3 个月两组患者裸眼视力、最佳矫正视力均较前提高，组间比较无统计学差异；两组间患者客观散射指数、调制传递函数截止频率、斯特列尔比值、模拟对比度视力的差异均无统计学差异 ($P > 0.05$)；术后 3 个月观察组 25 眼 (92.5%) 人工晶体居中性良好，2 眼 (7.4%) 人工晶体轻度移位；对照组 19 眼 (76.0%) 人工晶体居中性良好，3 眼 (12.0%) 人工晶体轻度移位，3 眼 (12.0%) 出现前囊膜皱缩；与对照组相比，实验组术后 3 个月的人工晶状体偏心量、倾斜度均较小，差异有统计学意义 ($P < 0.05$)；术中并发症包括前囊膜放射性撕裂、瞳孔缩小等，观察组并发症发生率低于对照组 ($P < 0.05$)。

结论：对于晶状体不全脱位的患者，飞秒激光辅助的白内障手术可有效降低并发症发生率，提高手术效率及安全性。

眼内炎、葡萄膜炎、巩膜炎

摘要编号：208151

BRVO 合并 BRAO 继发黄斑囊样水肿一例

第一作者：Xinquan LIU

共同作者：Dahu WANG

目的：本报告描述了一例罕见的视网膜分支静脉阻塞 (BRVO) 合并视网膜分支动脉阻塞 (BRAO) 继发黄斑囊样水肿 (CME) 的病例。

方法：一名 59 岁男性因“左眼视物模糊 3 月”至我科门诊就诊。查右眼最佳矫正视力 (BCVA) 为 20/20，左眼为 20/125。眼底彩照显示：右眼黄斑区有硬性渗出灶；左眼颞上方网膜可见出血、水肿、硬性渗出及棉绒斑，血管可见白鞘，V 迂曲扩张，动静脉交叉征 (+)。OCT：右眼黄斑结构未见明显异常；左眼黄斑颞侧、颞上囊样水肿伴内层网膜水肿，黄斑中心凹厚度 (CMT) 为 302 μm 。FFA：左眼颞上方大片无灌注区、边缘可见出血荧光遮蔽，V 迂曲扩张、充盈时间约 29.1 s，晚期黄斑区荧光渗漏明显；双眼可见散在的 MA。既往有高血压病史及糖尿病史 5 年余，口服药物控制，血压、血糖未规律监测。基于以上，诊断为左眼 BRVO 合并 BRAO 继发 CME、双眼糖尿病性视网

膜病变。治疗上予积极控制血糖、血压，左眼接受3针玻璃体内 anti-VEGF 药物注射治疗及局部无灌注区内视网膜激光光凝治疗。

结果：3 个月后，左眼的 BCVA 增加到 20/40，CMT 减少到 182 μm 。此后，左眼视力及黄斑区结构保持稳定。

结论：BRVO 合并 BRAO 极为罕见。早期诊断、积极控制心血管危险因素，及玻璃体内注射 anti-VEGF 药物及视网膜激光光凝治疗 BRVO 合并 BRAO 继发的 CME 可以产生良好的视觉效果。

摘要编号：208100

IL-10 分泌性 B 细胞在葡萄膜炎中的作用及机理研究

第一作者：Fan YANG

目的：自身免疫性葡萄膜炎（AU）严重损害视功能且缺乏有效治疗手段。目前，对 AU 发病机制及治疗的研究落后于其他自身免疫性疾病。因此对样本进行多维度高通量分析，筛选出新的致病性或调节性细胞亚群和生物标志物，将有助于明确 AU 发病机制并寻找新的治疗靶标。免疫细胞和细胞因子治疗自身免疫性疾病有广泛的应用前景，因此，我们将以 AU 患提示 B10 细胞参与 AU 发病；人 IL10 转基因（IL-10 KO）小鼠诱导实验性自身免疫性葡萄膜炎本研究将鉴定 B10 细胞特征性表面分子及转录因子，揭示 B 细胞激活产生 IL-10 的机理，探讨 B10 细胞调控 Treg/Th17 细胞平衡机制以及明确 B10 细胞通过改变 Treg/Th17 细胞平衡而减轻眼部炎症，为 B10 细胞靶向治疗 AU/EAU 奠定理论基础并提供新的策略。

方法：1) 鉴定 AU 患者外周血中 B10 细胞的免疫表型；2) 探讨 TLRs 激动剂、CD40L 和 anti-IgM 等体外诱导 B10 细胞高分泌 IL-10 的方法和分子机制；3) 揭示 B10 细胞调节 Treg/Th17 细胞平衡的分子机制。

结果：1. B10 细胞高表达 IgD、CD19、CD24 及 CD38，低表达 CD27 及 CD107a 2. IL2、IL-10 促进 Treg 细胞分化，抑制 Th1 细胞及 Th17 细胞分化 3. B 细胞激活分泌 IL-10 4. B10 细胞抑制 CD4⁺ T 细胞分泌 IL-17 5. B10 细胞过继转移抑制 EAU 疾病进展 6. EAU 造模后清除 B 细胞加重眼部炎症表现。

结论：B10 细胞抑制 AU 的发生和发展，可能是通过改变 Treg/Th17 细胞的平衡或者直接抑制 Th17 细胞分化和功能进而减轻葡萄膜炎症反应。

摘要编号：207726

双眼先后发生的急性视网膜坏死一例报告

第一作者：Xiangli WANG

目的：探讨双眼先后发生的急性视网膜坏死（ARN）的临床特征、诊疗难点及干预策略，为复杂病例的早期识别和规范治疗提供参考

方法：回顾性分析一例 48 岁女性双眼 ARN 患者的诊疗过程。通过眼底照相、荧光血管造影（FFA）及房水病毒检测明确诊断，治疗包括全身及玻璃体腔抗病毒药物、糖皮质激素及玻璃体切割手术。

结果：患者左眼初诊表现为中周部视网膜变淡、血管旁出血及 FFA 脉络膜充盈延迟，抗病毒治疗后仍快速进展为视网膜脱离，术后视力无光感。右眼 10 天内出现类似症状，房水检测提示疱疹病毒感染（HSV-DNA 4.32E+05 拷贝/ml），术后视力仅恢复至 0.08，伴视网膜动脉阻塞及角膜病变。

结论：ARN 双眼发病罕见且预后极差，需早期房水病原学检测、个体化抗病毒—抗炎—手术序贯治疗，并警惕对侧眼受累风险。

摘要编号：207793

合并眼部病变的麻风病一例

第一作者：Yajian DUAN

共同作者：Yudian GAO, Ning JI

目的：报道一例经眼科确诊的麻风病病例。

方法：收集患者临床及实验室检查资料。

结果：本文报道 1 例 50 岁女性患者，因“左眼眼红痛 2 月”于眼科就诊。患者生于广西省百色市，23 岁起居住于山西省晋城市，否认家族史、个人史，2007 年左手第 2 指端坏疽截指手术史，2017 年双眼白内障手术史。体格检查显示颜面部、躯干和四肢存在多发红斑、皮疹、结节改变，双足足底部多发皮肤溃疡、鼻骨塌陷、双侧爪形手、左侧垂足畸形，四肢皮肤感觉减退。眼部查体：Vod: FC/40 cm, Vos: HM/10 cm，双眼眼压正常，双眼睑缘肥厚、睫毛稀少、睑裂闭合不全、角膜知觉减退，右眼结膜轻度充血，周边角膜混浊变性，房闪（-），瞳孔缘全周虹膜后粘连，瞳孔大小约 4 x 3 mm，对光反射（-），人工晶状体在位，晶体表面致密色素沉着，后囊膜致密锅底样混浊，眼后段窥不入；左眼结膜混合充血（+），角膜雾状水肿，周边角膜混浊变性，色素性 KP（+），前房闪辉（++）、细胞（+），下方可见 3 mm 积脓液平，虹膜表面见白色渗出物，鼻上方虹膜前粘连至角膜背，瞳孔向鼻侧偏位，瞳孔大小约 2 x 3 mm，对光反射（-），晶状体缺如，眼后段窥不入。实验室检查：在院期间抽取前房水

行宏基因检测提示麻风分枝杆菌感染；皮肤组织液抗酸染色阳性；皮肤组织活检确诊为麻风病。给予患者眼部抗生素及糖皮质激素药物治疗，指导患者接受规律抗麻风药物治疗，该患者目前仍在随访中，眼部炎症反应较前明显好转。

结论：此病例提示麻风病可致盲，视力下降、眼痛可能为此类患者首次就医时主诉，患者可合并有兔眼、睫毛脱落、角膜知觉减退、角膜变性、葡萄膜炎、白内障等多种眼部表现。随着公共卫生措施的增强，在麻风病发病率显著降低的当今时代，麻风病的诊断是一项挑战，我们仍应加强学习，以熟悉、理解及重视“麻风病疑似症状与体征”，善于借助实验室检测手段，做好麻风病的早期诊断和规范管理，降低致残率，改善麻风病患者生活质量。

摘要编号：209935

年轻高度近视女性点状内层脉络膜病变一例

第一作者：Hui Min LIN

目的：报告一例发生于年轻高度近视女性的点状内层脉络膜病变（Punctuate Inner Choroidopathy, PIC），探讨其临床特征、影像学表现、治疗反应及预后，以提高临床医生对该病的认识。

方法：病例报告。回顾分析患者临床症状、眼底照相、OCT、FFA 及 ICGA 结果，随访治疗效果。

结果：患者 22 岁女性，左眼颞侧固定暗影 2 天，发病前有明显劳累及熬夜史，6 年前行双眼 ICL 植入术，术前近视 -12.0 D，眼轴约 29 mm。双眼视力 0.8，眼压 19，眼底：双眼豹纹状改变，左眼黄斑及视盘周围多发点状黄白色病灶。AF 为弱荧光，OCT 可见外丛状层下中等反射“驼峰”样结节，椭圆体带中断；FFA 早期点状高荧光，晚期轻度渗漏；ICGA 病灶处持续低荧光。主要诊断为：左眼 PIC，予口服泼尼松片 40 mg（逐渐减量）及局部醋酸泼尼松龙滴眼液，1 周后暗影症状好转，OCT 提示“驼峰”样结节隆起减少，3 月后 OCT 视网膜外层向下凹陷呈“V”形改变，继续随访至半年无复发。

结论：PIC 多见于高度近视年轻女性，免疫因素是发病机制之一，预后较好，少部份可复发，多模式影像检查对 PIC 的准确诊断至关重要，其中 OCT 可无创性地观察视网膜脉络膜结构变化，糖皮质激素治疗可有效控制炎症及改善症状。根据文献查阅，PIC 可继发 CNV，严重损害视力。因此，对此类患者突发固定暗点应高度怀疑 PIC，借助多模式影像检查明确诊断，并通过长期随访监测是否出现 CNV。

摘要编号：209184

斜视手术后感染性眼内炎一例

第一作者：Jianwei LIU

目的：汇报一例特殊患者，右眼因行斜视手术后出现感染性眼内炎。

方法：汇报一例眼内炎患者，女，56 岁，右眼斜视手术后出现视物不清 3 天，加重 1 天。入院查体发现：右眼视力 HM/眼前，眼压：29 mmHg，右眼结膜充血明显，颞侧结膜缝线部分松脱，外直肌止点切断处暴露，角膜轻度水肿，前房深度正常，前房内可见积脓，高约 2 mm，房水混浊明显，瞳孔区可见纤维素样渗出，部分与虹膜粘连，余眼内结构欠清。术前 B 超显示，玻璃体腔内可见沙幕状声影。入院诊断：眼内炎（右）斜视矫正术后（右）。

结果：入院后，急诊行玻璃体切除手术治疗。首先取玻璃体液作培养及涂片，冲洗干净前房内积脓及渗出，术中切除混浊玻璃体，发现眼底血管浸润白鞘明显，网膜灰白色改变，散在出血，网膜前可见积脓，后极部网膜结构混乱，9 点钟赤道部附近可见玻璃体嵌顿，可见小网膜破口，切除该处玻璃体，网膜破口周围激光包绕。眼内注射万古霉素 0.1 ml（1 mg）。术后培养结果证实，患者为表皮葡萄球菌感染。术后第三天，患者作玻璃体腔灌洗手术，冲洗玻璃体腔内渗出，首次手术后七天患者出院。出院时视力 0.12，眼底：网膜在位，网膜可见散在出血，9 点钟赤道部激光斑可见。

结论：斜视手术如果肌肉后退较多，一定注意不能缝穿巩膜，万一缝穿，结膜组织一定要仔细缝合好，预防术后眼内炎的发生。

摘要编号：204979

普罗布考预防白塞病的效应机制初探索

第一作者：Jin LI

共同作者：Jian LI

目的：白塞病（BD）表现为复发性口腔溃疡、眼部病变和皮肤损伤，葡萄膜炎是其最常见且可能导致失明的严重眼部表现，BD 目前尚缺乏有效的预防性药物。该疾病常导致脂质代谢紊乱，并对血管内皮功能产生不利影响。因此，探索诸如降脂药物等预防策略至关重要。普罗布考以其降脂特性而闻名，是一种有前景的候选药物。本研究假设，普罗布考通过抑制 ATP 结合盒转运体 A1（ABCA1）来调节循环代谢物，从而可能降低 BD 的发病风险。本研究采用孟德尔随机化（MR）方法，旨在评估普罗布考对 BD 的影响，并通过分析其对循环代谢物的调节作用来探讨其预防潜力。

方法: 在此 MR 研究中, 我们选取与普罗布考相关的单核苷酸多态性 (SNPs) 作为工具变量, 并进行了与高密度脂蛋白相关 SNP 的阳性对照分析, 以验证工具变量的选择。研究分为两步: 首先, 利用普罗布考的表达数量性状位点 (eQTL) 数据估计其对循环代谢物的因果效应; 其次, 使用与这些代谢物相关的 SNP 评估它们对 BD 风险的因果影响。为确保结果的稳健性和有效性, 我们采用了多种 MR 方法, 包括逆方差加权法、异质性检验和多效性分析。

结果: 本研究从 ABCA1 表达数量性状位点数据中, 共识别出 30 个与 BD 相关的 SNP、7502 个与循环代谢物相关的 SNP, 以及 1049 个通过循环代谢物与 BD 相关的 SNP。孟德尔随机化分析证实, 普罗布考可导致 HDL 中胆固醇酯浓度降低, 该结果与随机药物试验的发现一致 (比值比 OR = 0.932, 95% 置信区间 CI 0.907-0.958, $P < 0.001$)。此外, 研究显示普罗布考可显著降低 BD 风险 (OR = 0.496, 95% CI 0.283-0.868, $P = 0.014$)。在评估的 123 种循环代谢物中, 有 36 种与普罗布考相关。值得注意的是, 普罗布考能显著降低极大 HDL 颗粒浓度 (OR = 0.917, 95% CI 0.889-0.947, $P < 0.001$), 这约占其降低 BD 风险总效应的 10.407%。

结论: 本研究证实, 普罗布考通过降低极大 HDL 颗粒浓度, 显著降低 BD 风险, 可能从源头上减少由白塞病引发的葡萄膜炎的发病率。对于已确诊的白塞病患者, 尤其是高复发风险的葡萄膜炎患者, 本研究为将普罗布考作为一种新的预防性治疗选择提供了遗传学依据, 以期延迟或预防葡萄膜炎的发作。

摘要编号: 209994

晶状体上皮间质化与白内障术后长期慢性炎症的临床观察

第一作者: Lei GAO

共同作者: Fei CONG, Yujuan ZHOU

目的: 由于多数情况下, 人工晶状体 (IOL) 被植入囊袋内且与晶状体囊袋形成紧密贴附, 尽管有或轻或重的晶状体上皮间质化 (EMT) 发生, 但由于囊袋本身和 IOL 的屏障阻隔作用, EMT 所产生的物质不会轻易进入前房或者玻璃体腔。但如果囊袋在某些条件下再度开放, 则这些物质就会进入眼内而诱发眼内炎症。本文将通过对 5 个病例的分析, 探讨 EMT 与白内障术后长期慢性炎症的关系。

方法: 临床病例观察。

结果: 本文所呈现的 5 个病例在漫长的眼部诊疗过程中虽然存在差异, 但都具备如下共同特点: 1)

均有白内障手术病史且同时都有晶状体囊袋开放或者再度开放病史; 2) 数月甚至超过 1 年的长期慢性“可控性”眼内炎症, 表现为无明显炎症充血, 角膜后少许尘状 KP, 多数情况下非甾体或者联合皮质类固醇眼药水能够控制, 但停药或者减少用药频率后炎症复发; 3) 与炎症相伴随的眼内压升高, 大多随访期间眼压不超过 35 mmHg; 4) 所有病例在经历最后一次针对囊袋或者 EMT 清除后, 眼内炎症得以控制, 眼压平稳。

结论: 5 例曾经令我们长期困惑不解的病例, 他们以显著 LEC 间质化和囊袋再开放为特点, 以长期顽固性眼内轻度炎症并眼内压轻度升高为临床表现, 在经过针对 LEC 间质化的外科手术干预后均取得了满意的临床效果。因此, 对于白内障术后长期慢性无菌性炎症或者迟发性葡萄膜炎患者, 应该关注 LEC 间质化和关注囊袋 IOL 复合体的屏障保护作用, 必要时采取更为积极的外科手段清除 EMT 物质乃至完整清除囊袋。

摘要编号: 210295

眼外伤后猪链球菌感染性眼内炎一例

第一作者: Yiyang WANG

共同作者: Yang CHENG, Qiong HUANG

目的: 感染性眼内炎是一种由细菌或真菌引起的致盲性眼病。本研究报告了一例眼外伤后猪链球菌感染性眼内炎病例。

方法: 一名 22 岁男性被猪圈竹竿戳伤右眼, 因右眼角膜穿通伤于急诊下行右眼角膜裂伤清创缝合和角膜异物取出术。次日, 观察到患者右眼角膜雾状水肿, 前房大量积脓, 晶状体和玻璃体浑浊, 眼底无法窥清, 考虑右眼感染性眼内炎。对患者进行右眼玻璃体切除术, 在关闭液体通道下使用玻切头采集未经稀释的玻璃体液, 用于病原微生物培养和纳米孔靶向测序 (NTS) 检测, 随后经验性予以玻璃体腔注射万古霉素 1 mg/0.1 mL 和头孢他啶 2 mg/0.1 mL。在术中清除前房积脓、切除已变浑浊的晶体后, 见玻璃体腔内呈黄白色浑浊, 伴有广泛视网膜出血及视网膜血管树枝样改变。术后局部和全身联合抗感染治疗, 术眼滴用妥布霉素地塞米松滴眼液、头孢他啶滴眼液每日 4 次, 全身静脉滴注盐酸左氧氟沙星氯化钠注射液 0.4 g 每日 1 次及头孢孟多酯钠氯化钠注射液 2 g 每 12 小时 1 次, 连续 7 天。

结果: 玻璃体液送检后 12 小时, NTS 检出猪链球菌和产气荚膜梭菌, 检出序列数分别为 5566 条和 3392 条, 与参考序列覆盖度均超过 95%。送检后 48 小时, 病原微生物培养鉴定出草绿色链球菌和蜡样芽孢杆菌。鉴于患者右眼被猪圈竹竿戳伤的外伤

史和 NST 结果, 猪链球菌和产气荚膜梭菌被考虑为导致该患者眼内炎的病原体。术后第二天, 患者右眼角膜水肿减轻, 前房渗出依然明显, 继续维持前述抗感染治疗。术后第八天, 术眼视力指数 / 眼前 10 cm, 角膜基本恢复透明, 前房渗出完全吸收, 视网膜平伏。术后十五天, 术眼角膜透明, 前房清亮, 视网膜平伏。三个月后, 该患者接受了右眼硅油取出术, 术后右眼视力矫正至 0.02, 眼压 18 mmHg, 视网膜保持平伏。

结论: 外伤后细菌性眼内炎发展迅速, 及时诊断和治疗与预后密切相关。NTS 可对微量样本进行即时检测, 是玻璃体标本的理想检测工具。对于眼外伤患者疑似感染性眼内炎时, 通过快速 NTS 检测得以迅速诊断, 该测试显示出高特异性和敏感性。

摘要编号: 205561

近十年内源性眼内炎患者临床特征及全身免疫炎症指数评估研究

第一作者: Rui NIU

共同作者: Xin JIN, Linyuan LU, Xuekai ZENG, Ziqi ZHAO

目的: 比较近十年内源性眼内炎患者的临床特征及预后。眼内炎的发生发展与全身免疫炎症指数 (SII) 及临床特征相关。

方法: 本研究纳入近十年河北省眼科医院收治的内源性眼内炎患者。根据预后视力, 将患者分为 A 组和 B 组。评估指标包括基础疾病、感染风险、症状和体征以及全血细胞计数。计算 NLR、PLR、MLR 和 SII 值。采用非参数检验对各组患者的临床特征和全血细胞计数结果进行检验。通过主成分和有序逻辑回归分析进一步分析与眼内炎进展相关的参数。

结果: 本研究共纳入 22 例内源性眼内炎患者, 共 25 只眼。感染菌包括金黄色葡萄球菌、藤黄微球菌、溶血性葡萄球菌等。在 6 个月 -8 年的随访期间, 患眼视力范围为 2.7 (1.55, 2.7) LogMAR-1.22 (0.6, 2.7) LogMAR。A 组和 B 组的中性粒细胞、单核细胞和 PLT 计数、NLR、PLR 和 SII 值以及其他标志物均显著高于对照组。有序回归分析显示, SII 与性别、年龄、发病时间、糖尿病、高血压、单核细胞计数及红细胞分布的似然模型最佳, 其增高与眼内炎的发生发展密切相关。

结论: 眼内炎患者外周血中性粒细胞、单核细胞、血小板计数及 SII、NLR、PLR、MLR 值均显著升高。SII 可作为预测眼内炎严重程度及预后的生物标志物。

一种新型热/光双交联可注射水凝胶用于快速封闭开放性眼球损伤

第一作者: Peifang XU

共同作者: Juan YE

目的: 眼外伤是视力障碍的重要原因, 开放性眼外伤 (OGIs) 指眼球壁 (角膜或巩膜) 的全层损伤。由于眼球的保护屏障被破坏, OGIs 易引发眼内感染和视功能损害, 需要及时干预以恢复眼球完整性和视功能。有效的眼部急救和及时转诊能够降低 OGIs 所致的长期视力损失的风险。本研究旨在开发一种新型壳聚糖基水凝胶, 用于快速封闭 OGIs, 防止眼内容物进一步流失, 为后期治疗和功能恢复创造机会。

方法: 通过精氨酸和甲基丙烯酸酐修饰羟丁基壳聚糖 (HBC) 合成 HBC-m-Arg。采用氢谱 (1H-NMR) 和元素分析确定水凝胶化学组成、接枝率, 流变试验和拉伸测试等方法表征其理化性能。采用体内外毒理学实验评估其生物相容性。通过离体组织水凝胶留存试验和破裂压力测试验证其封闭性能。并在兔角膜损伤模型中评估其体内应用的可行性。

结果: 氢谱 (1H-NMR) 和元素分析试验证实精氨酸和双键接枝成功。溶胀试验提示 HBC-m-Arg 水凝胶溶胀比 $830 \pm 45.98\%$, 低于 HBC 的 $1243 \pm 43.80\%$, 含水量为 $89.23 \pm 0.54\%$, 略低于 HBC 的 $92.55 \pm 0.24\%$, 表明 HBC-m-Arg 在保持适度肿胀和含水量的同时, 有助于维持眼内结构的稳定性。剪切应力和剪切粘附强度测试提示 HBC-m-Arg 水凝胶具有更高的粘附强度, HBC 的粘附强度为 26.79 ± 20.17 kPa, 而 HBC-m-Arg 水凝胶的粘附强度显著提高至 77.72 ± 11.52 kPa。HBC-m-Arg 水凝胶可通过热/光双重交联, 使得水凝胶在注射后能够在体温下迅速发生相变形成凝胶, 并在紫外光照射下进一步通过光交联增强其机械强度。细胞毒性试验和兔体内实验均证实 HBC-m-Arg 具有良好的细胞和组织相容性。离体及体内破裂压力测试表明, 该水凝胶能够迅速恢复眼内压, 并抵抗较高压力, 显示出其在 OGIs 封闭方面的潜力。此外, HBC-m-Arg 在眼组织中的适度降解性及其离体稳定性, 体现了良好的稳定性和生物降解性的平衡。

结论: HBC-m-Arg 能够为 OGIs 提供快速、有效且安全的封闭方案, 在急诊眼外伤治疗中具有较好的应用前景。

摘要编号: 210153

两襻和三襻式人工晶体的悬吊方法

第一作者: Yong YAO

共同作者: Miao ZHUANG

目的: 人工晶体悬吊手术是恢复眼外伤、眼部手术等原因导致的无晶体眼患者的重要方式之一。目前临床上有多种人工晶体可供选择, 悬吊方式也有多种, 包括两襻和三襻式人工晶体的悬吊方法。本文描述一种一点一线人工晶体悬吊方式, 并作简要介绍和视频展示。

方法: 选取几位因各种原因导致的无晶体、无囊袋的患者, 通过视频介绍三襻式人工晶体的悬吊方法。对于三襻式人工晶体, 可采用牛结对各襻固定后, 固定于巩膜上, 可采用双股单针缝线, 在各襻上圈套固定后穿巩膜固定于巩膜瓣下的方式, 亦可用“一点一线”法, 将上方两襻用一根线穿过后穿巩膜固定于巩膜瓣下, 下方则用圈套法穿巩膜固定在巩膜瓣下。

结果: 各种方式均能获得良好的固定效果。患者术后视力提高。

结论: 手术医生可根据患者情况选择合适的 IOL 和 IOL 固定方式, 一定程度恢复患者视功能, 笔者更推崇利用三襻式人工晶体进行悬吊, 其安全性、稳定性和效果可能更优。

摘要编号: 207962

中国儿童及青少年眼外伤特点 (中国眼外伤研究 2023)

第一作者: Mengyu LIAO

目的: 分析中国儿童及青少年眼外伤的流行病学特征和损伤特点。

方法: 多中心横断面、回顾性、观察性研究。基于中国眼外伤登记数据库, 将 2023 年 1~12 月住院治疗的眼外伤患者 1,412 例 (1,435 只眼) 中 0~18 岁的儿童及青少年患者 189 例 189 只眼 (13.4%, 189/1,412) 纳入研究。患者来自华北、华东、华南、华中、西北、西南地区 17 个省级行政区的 23 家三级综合性甲等医院或眼科专科医院。分析不同地域、不同年龄段患者的人口特征、流行病学特征以及损伤特点、视力结局等。189 只眼中, 行二期手术治疗 95 只眼, 排除检查不配合以及视力无光感、光感者 23 只眼, 最终纳入统计 72 只眼; 对于有随访资料的 36 只眼, 观察其手术后视力结局。

结果: 189 例患者中, 男性 143 例 (75.7%, 143/189), 女性 46 例 (24.3%, 46/189); 年龄 8.73 (1~18) 岁。各年龄段性别构成均以男性为主。地

域分布显示华东地区病例数最多, 为 55 例 (29.1%, 55/189)。7~10 岁为高发年龄段, 共 70 例 (37.0%, 70/189)。眼外伤类型分析显示, 189 只眼中, 机械性眼外伤 130 只眼, 其中开放性、闭合性损伤分别为 105 (80.8%, 105/130)、25 (19.2%, 25/130) 只眼。受伤后 24 h 内接受急诊手术者 122 只眼 (占急诊手术病例 83.6%, 122/146)。具有完整随访资料的 36 只眼中, 初始视力分布为: 盲 23 只眼 (63.9%)、低视力 6 只眼 (16.7%)、视力 ≥ 0.3 者 7 只眼 (19.4%); 末次随访视力改善为: 盲 12 只眼 (33.3%)、低视力 8 只眼 (22.2%)、视力 ≥ 0.3 者 16 只眼 (44.4%)。最终视力结局显示, 致残率 22.2% (8/36), 致盲率 33.3% (12/36)。

结论: 儿童及青少年眼外伤占同期住院眼外伤患者的 13.4%, 且具有显著的性别差异 (男性占比 75.7%)。不同年龄段儿童及青少年在眼外伤致伤原因、发生地点及临床特征等方面均呈现明显的年龄特异性分布规律。

摘要编号: 208699

基于 AS-OCTA 评估人工晶体悬吊术后的倾斜和偏心

第一作者: Shuai WANG

共同作者: Xun AN, Chao MA, Tiantian WANG, Yong LV

目的: 运用 AS-OCTA 技术, 评估两种不同材料设计的单焦人工晶体在悬吊术后的倾斜和偏心情况, 探索影响因素。

方法: 回顾性分析 50 例 50 眼接受人工晶体悬吊手术的患者。按植入晶体类型分为两组, A 组为改良 C 型襻, 由疏水性丙烯酸酯和聚甲基丙烯酸甲酯材料制成, B 组为镂空襻, 由亲水性丙烯酸酯材料制成, 收集所有患者的年龄、性别、术前最佳矫正视力、术后第 1 天、第 15 天、第 45 天、3 月时最佳矫正视力、眼压及应用 AS-OCTA 拍摄的眼前节清晰图像。使用系统晶体分析模式自动计算出 IOL 倾斜度和偏心量。

结果: 50 例患者术后 3 月人工晶体均在位, 2 例因虹膜缺损人工晶体倾斜大于 5° , 故排除, 余患者人工晶体倾斜均小于 5° , 偏心距离小于 0.5 mm。B 组患者术后人工晶体偏心较 A 组小, $P < 0.05$, 差异有统计学意义; 两组视力、眼压 $P > 0.05$, 差异无统计学意义。

结论: 与改良 C 型襻 PMMA 材料相比, 采用镂空襻设计的亲水性丙烯酸酯 IOL 在术后早期能提供更佳稳定性, 表现为更小的偏心。这提示我们, 对于需要行人工晶体悬吊的患者, 选择 B 组这类具有

更优稳定性的 IOL 可能更具临床意义，以期获得更长期、更稳定的视觉效果。

摘要编号: 203937

粘弹剂在严重眼外伤视网膜复位术中的创新应用

第一作者: Mingjun TANG

共同作者: Ziqiang LIANG, Liuxueying ZHONG

目的: 本研究通过招募眼外伤中复杂性视网膜脱离患者，创新性评估 PPV 术中粘弹剂在视网膜复位及术后视力恢复中的效果。

方法: 本研究纳入 12 名患者的 12 只眼，OTS（眼外伤评分）1-2 分（损伤最严重级别），均合并 PVR（D2 或 D3 级）及视网膜脱离。首先进行核心玻璃体切除术后，将 0.1-0.3 mL 粘弹剂朝视盘方向直接注射到褶皱的视网膜上，逐渐覆盖并展平脱离的视网膜，随后进行剥膜、重水置换术等步骤，手术完成后，清除粘弹剂，行光凝术后硅油填充玻璃体腔。比较根据 OTS 评分系统预测的视力与实际视力差异。

结果: 1. 粘弹剂有效促进视网膜复位：外伤后旋转移位的视网膜在粘弹剂支撑、展开作用下解剖学复位。2. 该研究纳入的 12 名患者术后 3 月视网膜均贴附良好。3. 粘弹剂辅助 PPV 有助于改善预后：根据 OTS 评分系统，预计 73% 的 1 分患者将保持在 NLP 状态，17% 的患者能够达到 LP/HM。在我们的研究中，通过粘弹剂的辅助，55.5% 的 1 分患者保持在 NLP 状态，44.5% 的患者改善为 LP/HM，均超越 OTS 预测值。

结论: 本研究探索了粘弹剂在复杂性眼外伤 PPV 术中的创新应用，结果显示其能显著提高视网膜复位成功率，并有助于术后视力恢复。

COVID-19 后双眼急性黄斑神经视网膜病变

第一作者: Si Si YEUNG

共同作者: Feng WEN

目的: 本病例报告旨在探讨一名 16 岁女性患者在 COVID-19 后出现双眼视力下降及固定黑影的可能病因及临床意义，为眼科临床诊断提供参考。

方法: 对患者进行详细的眼科检查，包括最佳矫正视力（BCVA）、眼内压（IOP）、眼底检查、光学断层扫描（OCT）及光学相干断层血管造影（OCTA）

检查等，结合患者病史和体征进行综合分析，排除其他可能疾病后，明确诊断。

结果: 患者双眼 BCVA 分别为 20/40（右眼）和 20/40（左眼），IOP 分别为 13mmHg（右眼）和 15 mmHg（左眼）。眼底检查发现双眼黄斑区微红褐色楔形病变，OCT 提示黄斑区椭圆体嵌合体带断裂，但 OCTA 未发现新生血管。患者急性起病，双眼 COVID-19 后出现症状，最终诊断为双眼急性黄斑神经视网膜病变。

结论: 本病例提示，对于 COVID-19 后出现双眼视力下降、固定黑影及双眼黄斑区微红褐色楔形病变患者，需全面评估并排除多种潜在病因。

摘要编号: 210023

GLS1 源性氨蓄积通过 VDAC1 寡聚化驱动糖尿病视网膜病变神经炎症

第一作者: Meng-yuan ZHANG

共同作者: Yong YAO

目的: 糖尿病视网膜病变 (diabetic retinopathy, DR) 是工作年龄人群视力丧失的主要原因，其中神经炎症是核心病理环节，但其启动机制尚不明确。本研究旨在探究 Müller 细胞中谷氨酰胺酶 1 (glutaminase 1, GLS1) 是否通过诱导氨蓄积触发线粒体功能障碍，进而激活 NLRP3 炎性小体介导的神经炎症，并重点阐明电压依赖性阴离子通道 1 (voltage-dependent anion channel 1, VDAC1) 寡聚化在该过程中的关键作用。

方法: 体内研究采用链脲佐菌素诱导的 C57BL/6J 糖尿病小鼠模型，通过玻璃体腔注射 GLS1 抑制剂 CB839 和降血氨药物 LOLA 进行干预，利用光谱域光学相干断层扫描、全视野视网膜电图、伊文思蓝渗漏实验和视网膜免疫荧光染色评估视网膜结构与功能变化。体外研究采用原代视网膜 Müller 细胞，通过高糖刺激构建糖尿病微环境模型，分别通过 GLS1 抑制剂 CB839 及小干扰 RNA 敲降技术进行功能干预。系统采用氨检测试剂盒评估细胞内氨代谢稳态；利用非还原电泳分析 VDAC1 寡聚化状态；采用 JC-1 与 MitoSOX 探针分别检测线粒体膜电位与活性氧水平；通过 qPCR 技术定量胞质内线粒体 DNA (mtDNA) 释放；并借助蛋白质免疫印迹与免疫共沉淀技术评估 NLRP3 炎性小体活化及其分子复合物组装情况。

结果: 体内实验表明，糖尿病小鼠视网膜中 GLS1 表达显著上调，伴随 Müller 细胞焦亡标志物增加和神经炎症反应，而抑制 GLS1 或降低血氨可有效改善 DR 小鼠视网膜病变。体外实验证实，高糖通过上调 Müller 细胞中 GLS1 表达，增强谷氨酰

胺分解代谢，导致毒性代谢产物氨蓄积；过量的氨进一步诱导线粒体膜通道蛋白 VDAC1 发生寡聚化，进而启动线粒体通透性转换孔的开放，引发 mtDNA 泄漏至胞质，进而激活 NLRP3 炎性小体，诱发 Müller 细胞发生焦亡，从而驱动 DR 的神经炎症进程。

结论：本项目通过构建 DR 细胞与动物模型，旨在系统阐明从“GLS1/氨蓄积”到“VDAC1 寡聚化/mtDNA 释放”，最终至“NLRP3 炎性小体激活”的完整信号通路；并在体内评估靶向 GLS1 与降低血氨的协同治疗潜力。本研究旨在揭示 DR 中“代谢-线粒体-免疫”级联反应新机制，阐明 VDAC1 寡聚化的关键作用，为靶向 GLS1/氨的代谢干预策略提供实验依据。

摘要编号：210203

LRRC75A-AS1 通过 miR-330-3p/CCL2 轴促进增生性糖尿病视网膜病变中的新生血管形成

第一作者：Chufeng GU

共同作者：Chunyang CAI, Li LI, Chunren MENG, Qinghua QIU, Huiying RAO

目的：免疫细胞浸润与长链非编码 RNA (long noncoding RNA, lncRNA) 在增生性糖尿病视网膜病变 (proliferative diabetic retinopathy, PDR) 的病理生理过程中扮演复杂角色。本研究旨在探讨免疫相关 lncRNA 及其在 PDR 中的潜在作用机制。

方法：通过 GSE102485 数据集与 ImmPort 数据库筛选 PDR 中差异表达的免疫相关 mRNA；采用 CIBERSORT 算法分析 PDR 中的免疫细胞浸润特征；基于其与浸润免疫细胞的相关性筛选关键 DE-IRG。依据竞争性内源 RNA 理论，整合 GSE199852、GSE178721 数据集、MultiMIR R 软件包及 LncBase Predicted 在线数据库，鉴定 PDR 中的免疫相关 lncRNA。通过敲低实验验证目标 lncRNA 对高糖处理下的人视网膜微血管内皮细胞 (Human retinal microvascular endothelial cells, HRMECs) 迁移及成管能力的影响。

结果：研究发现 LRRC75A-AS1 是 PDR 中唯一显著表达的免疫相关 lncRNA。其可能通过吸附 miR-330-3p 调控 PDR 关键免疫基因 CCL2 的表达。CCL2 与 PDR 免疫细胞浸润水平，特别是 M2 型巨噬细胞浸润密切相关。敲低 LRRC75A-AS1 可逆转高糖诱导的 HRMECs 中 CCL2 高表达与 miR-330-3p 低表达现象，并显著抑制高糖环境下 HRMECs 的迁移与成管能力。

结论：本研究揭示 LRRC75A-AS1 可能通过调控 miR-330-3p/CCL2 轴促进 PDR 新生血管形成。

CCL2 与 PDR 免疫细胞浸润密切相关。该发现为深入理解 PDR 发病机制及开发新的治疗策略提供了新视角。

摘要编号：208077

Von Hippel-Lindau 综合征一例报道并文献复习

第一作者：Chen TINGTING

共同作者：Chi WEI

目的：探究希佩尔-林道 (VHL) 综合征在眼科的临床特征、诊治方法，并提高临床医生对该病的认识。

方法：回顾性分析 2024 年 4 月收治的 1 例眼科首诊表现为视力下降的 VHL 综合征患者的临床资料，并复习相关文献进行分析总结。

结果：既往已报道的 VHL 眼科临床特征为：视网膜血管母细胞瘤 (60%)、双眼发病 (50%)、周边部视网膜血管母细胞瘤 (70%)、视盘/后极部血管母细胞瘤 (10%)、渗出性视网膜脱离 (25%)、牵引性视网膜脱离 (10%)、继发性新生血管性青光眼 (5%) 等。本例 33 岁男性患者，因双眼视力差 2 周首诊于眼科。眼底表现为视网膜血管迂曲扩张、出血、渗出及黄斑水肿。全身影像学检查提示双侧小脑多发血管母细胞瘤 (术后病理证实，WHO I 级)、梗阻性脑积水、颈胸髓空洞、胰腺、肝脏及左肾多发囊肿。基因检测发现 VHL 基因突变。患者先后接受脑室引流、后颅窝小脑肿瘤切除术及眼内抗 VEGF 药物治疗。结合其多系统受累的典型表现，最终确诊为 VHL 综合征。

结论：VHL 综合征是一种常染色体显性遗传的肿瘤综合征，可累及眼、中枢神经系统及腹腔脏器。视网膜血管母细胞瘤常为其早期表现，眼科可能成为首诊科室。对于不明原因的视力下降伴视网膜血管异常的患者，应警惕 VHL 综合征，并进行全面的神经系统及腹部影像学筛查，以实现早期诊断和多学科联合管理。

摘要编号：207993

tRF-18 调控甘油磷脂代谢改善糖尿病视网膜病变中神经血管单元功能障碍

第一作者：Xin CAO

共同作者：Xiaobo HUANG, Peng-zhou KUAI, Tianyi LIU, Yong WANG, Yue ZHOU

目的：探究 tRF-18 在糖尿病视网膜病变 (DR) 中如何通过靶向 Müller 细胞中调控视网膜甘油磷脂代谢重塑的关键代谢酶或信号分子，影响血管内皮细胞的功能和神经元的存活。

方法: 将人视网膜 Müller 细胞分为正常糖 (Ctrl)、高渗组 (HM) 和高糖组 (HG)，通过 qRT-PCR 检测 tRF-18 的表达水平。将人视网膜 Müller 细胞分为 Ctrl 组、HG 组、HG + NC mimic 组、HG + tRF-18 mimic 组、HG + NC inhibitor 组、HG + tRF-18 inhibitor 组，检测细胞活力、增殖、凋亡、线粒体膜电位水平。将人视网膜 Müller 细胞与微血管内皮细胞共培养后，通过 EdU 实验、transwell 实验和成管实验检测视网膜微血管内皮细胞的功能。将人视网膜 Müller 细胞与 RGC 细胞共培养后，检测细胞活力与凋亡水平。将小鼠随机分为 WT 组、DR 组、DR + NC agomir 组、DR + tRF-18 agomir 组、DR + NC antagomir 组、DR + tRF-18 antagomir 组，检测 tRF-18 干预下的视网膜微血管渗漏情况、视网膜无细胞毛细血管数量、视网膜神经元功能及视觉功能。通过多组学检测、生物信息学分析、RNA 免疫沉淀实验、双荧光素酶报告实验等研究来阐明 tRF-18 的作用机制。

结果: 与正常糖组和高渗组比较，人视网膜 Müller 细胞中 tRF-18 在高糖应激条件下表达水平降低，差异有统计学意义 ($P < 0.05$)。与 Ctrl 组、HG 组、HG + NC mimic 组和 HG + NC inhibitor 组相比较，HG + tRF-18 mimic 组的 Müller 细胞活力下降、增殖能力降低、凋亡水平增加、线粒体膜电位水平降低，HG + NC inhibitor 组的结果与之相反，差异有统计学意义 (P 均 < 0.05)。HG + NC mimic 组的 Müller 细胞与内皮细胞共培养后，内皮细胞的增殖、迁移和成管能力降低，HG + NC inhibitor 组结果与之相反。差异有统计学意义 (P 均 < 0.05)。在糖尿病小鼠模型中，HG + tRF-18 agomir 组的小鼠视网膜微血管渗漏减少、视网膜无细胞毛细血管数量减少，视网膜神经元功能和视觉功能改善，HG + tRF-18 antagomir 组的结果与之相反，差异有统计学意义 (P 均 < 0.05)。RIP 试验表明 tRF-18 可以被 AGO2 蛋白免疫沉淀，以 miRNA 样机制发挥作用。多种组学联合分析，筛选出甘油磷脂代谢关键酶为 tRF-18 下游的潜在靶点，双荧光素酶报告实验验证了其 tRF-18 的结合。

结论: tRF-18 的表达水平在糖尿病应激后显著降低。tRF-18 过表达可以通过调控甘油磷脂代谢，减轻视网膜 Müller 细胞功能障碍，改善视网膜血管功能障碍，抑制视网膜神经元变性。

摘要编号: 209116

一例糖尿病性黄斑水肿伴微动脉瘤的临床治疗观察与思考

第一作者: Liu HAO

目的: 糖尿病性黄斑水肿 (DME) 是导致糖尿病患者视力受损的主要原因之一，其严重程度并不总与糖尿病视网膜病变 (DR) 的分期一致。本文通过报告一例 DR 仅处于中度非增殖期 (NPDR)，却伴有严重 DME 的临床病例，探讨此类难治性 DME 的可能机制，并分析其对新型抗 VEGF 药物法瑞西单抗 (Faricimab) 的治疗反应，以期临床处理类似病例提供参考。

方法: 患者为 61 岁男性，患 2 型糖尿病 23 年，合并高血压及冠心病。因“双眼黄斑水肿”就诊，最佳矫正视力 右眼 0.5、左眼 0.4。眼底检查显示双眼中度 NPDR，但光学相干断层扫描 (OCT) 提示明显的黄斑囊样水肿，呈现出 DR 整体病变程度与黄斑区局部水肿严重性不一致的特征。我们推测，黄斑区密集分布的微动脉瘤作为持续渗漏源，是导致该患者顽固性 DME 的主要结构性因素。此外，患者血糖控制不佳 (HbA1c 7.3%)，可能也加剧了 DME 的发生与持续。

结果: 针对该例难治性 DME，患者接受了 4 次法瑞西单抗玻璃体内注射负荷治疗。法瑞西单抗作为一种同时靶向 VEGF-A 与 Ang-2 的双特异性抗体，理论上具备更强的血管稳定作用。治疗后 OCT 显示黄斑中心凹视网膜厚度有所降低，水肿获得部分解剖学改善，证实药物具有一定疗效。然而，与治疗前相比，水肿未完全消退，改善程度未达理想状态，提示患者存在一定程度的治疗反应不足。这可能与微动脉瘤渗漏活跃、局部血视网膜屏障破坏严重或其他个体因素相关。

结论: 本案例表明，即使 DR 处于早、中期非增殖阶段，糖尿病患者仍可能因局部病灶 (如微动脉瘤) 引发顽固性 DME。法瑞西单抗虽显示出疗效，但反应不充分，提示单一抗 VEGF 治疗可能不足以完全控制此类病例的进展。后续应结合荧光素眼底血管造影 (FFA) 和吲哚菁绿血管造影 (ICGA) 等影像手段，精准评估渗漏源，为微脉冲激光等局部治疗提供依据。长期管理中，除专科治疗外，必须重视血糖、血压等全身性危险因素的控制，并建立规范随访体系，以实现对视功能的持续保护。

摘要编号: 209119

中心性浆液性脉络膜视网膜病变合并非动脉炎性前部缺血性视神经病变一例

第一作者: Liu HAO

目的: 报告一例罕见的中心性浆液性脉络膜视网膜病变 (CSC) 与非动脉炎性前部缺血性视神经病变 (NAION) 共存病例, 探讨其临床特点、诊断挑战与个体化治疗策略。

方法: 回顾性分析一例 66 岁女性患者。因“右眼视物遮挡 9 天”于外院初步诊断为“右眼 NAION”, 并接受两次球后激素注射。后转至我院, 综合其外院及本院影像学检查资料进行重新评估。

结果: 临床表现: 患者急性起病的右眼视物遮挡, 视野检查呈现与 NAION 相符的缺损。影像学特征: 黄斑 OCT: 显示右眼黄斑区典型的“穹顶样”神经上皮层脱离, 伴视网膜色素上皮微小隆起。FFA 与 ICGA: 双眼均显示脉络膜通透性增高及渗漏点, 符合 CSC 的慢性脉络膜改变特征。黄斑 OCT 增强深度成像证实双眼黄斑下脉络膜显著增厚、血管扩张。眼眶 MRI: 平扫未见明确异常, 结合临床排除典型视神经炎。诊断分析: 患者同时具备 NAION 的急性视神经病变证据和 CSC 的慢性脉络膜视网膜病变证据。综合分析认为, 患者基础存在原发性 CSC, 此次新发 NAION。黄斑区脱离的特定形态及双眼弥漫性脉络膜增厚是判断 CSC 为基础病变的关键。治疗与转归: 鉴于 CSC 的存在, 尤其考虑到既往球后激素注射史可能带来的风险, 治疗方案严格规避全身或局部激素使用。最终确定个体化方案: 针对 CSC 行黄斑区微脉冲激光治疗, 并辅以复方樟柳碱颞浅动脉旁注射以改善眼局部微循环。患者目前正处于治疗效果的观察期。

结论: 本病例罕见地同时呈现了急性 NAION 与慢性 CSC 的特征。详尽的影像学检查, 特别是对 OCT 形态及 FFA/ICGA 特征的细致分析, 是准确识别两种疾病共存的关键。病例清晰地表明, CSC 作为基础病变显著影响了 NAION 的治疗决策。由于激素存在加重 CSC 的风险, 本例严格避免了其应用, 转而采取针对 CSC 的激光治疗与改善微循环相结合的策略。本例提示, 在诊断“NAION”时, 临床医生应全面评估眼底, 尤其需关注黄斑区 OCT 及脉络膜状态, 警惕可能合并的 CSC 等其他眼底病变, 从而制定真正个体化的治疗方案。对该病例的长期随访对于评估联合治疗的最终疗效至关重要。

摘要编号: 204353

人类视网膜类器官重现 PRPF6 突变型 RP 疾病的表型特征及其基因治疗的研究

第一作者: Yuqin LIANG

共同作者: Hang CHEN, Jiansu CHEN, Xihao SUN, Shibo TANG

目的: PRPF6 基因的突变可造成遗传性视网膜色素变性 (RP), 其发病机制未明, 治疗方案非常有限。本研究旨在利用人类视网膜类器官 (ROs) 在体外模拟 RP 发病发展, 并评估 PRPF6 基因增强治疗的可行性。

方法: 本研究建立 PRPF6 突变型 RP 患者来源视网膜类器官 (ROs) 和 PRPF6 基因敲入 (knockin) ROs 模型。应用 qPCR 和免疫荧光染色检测视网膜发育、光感受器和纤毛相关基因的表达; 使用扫描电镜和透射电镜评估视网膜外层的超微结构改变; 单细胞测序分析视网膜不同亚群的基因表达特征。最后, 应用 AAV2.7m8 介导 PRPF6 基因增强疗法在疾病 ROs 中进行干预处理。

结果: 镜下可见 ROs 呈外观透亮、分层的神经视网膜结构, 其直径和体积逐渐增大。与正常组相比, 患者组和 knock-in 组 ROs 显示 PRPF6 基因表达显著下降、光感受器标志物 Recoverin、Rhodopsin 和 M/L-opsin 的表达下降、ROM1 标记的光感受器外节数量减少、纤毛发生率降低及其长度缩短。扫描及透射电镜显示 PRPF6 突变 ROs 的视网膜外层厚度变薄、排列紊乱, 光感受器超微结构明显受损和外节数量减少。单细胞测序结果揭示 ROs 呈现与人类视网膜组织相似的发育过程和多细胞结构, 并发现: 1) 视杆细胞是 PRPF6 突变型 RP 疾病中最受影响的视网膜细胞类型; 2) 视觉感知相关基因 (ARR3、GNGT1 和 GNAT1)、光感受器外节相关基因 (PRPH2 和 PDE6B) 以及纤毛相关基因 (ARL13B、CEP290 和 CFAP100) 的表达失调。此外, 应用 AAV2.7m8 介导 PRPF6 基因增强疗法, 发现疾病 ROs 的视网膜发育和光感受器异常表型明显得以改善。

结论: PRPF6-knockin 和患者来源的 ROs 模型重现出视网膜发育和光感受器缺陷的疾病表型特征, 提示着 PRPF6 基因参与维持视网膜发育、光感受器和纤毛结构的重要作用。并且, 应用 PRPF6 基因增强疗法成功挽救了疾病 ROs 的异常表型。

以眼部表现为首发的强直性脊柱炎伴大动脉炎一例报告及文献回顾

第一作者: Jin YANG

目的: 报告一例 21 岁男性, 以眼部症状为首发表现的强直性脊柱炎(AS)伴大动脉炎(TA)患者病例, 探讨 TA 伴 AS 患者的全身及眼部表现, 提高眼科医生的诊治能力。

方法: 对病例患者行全身体格检查、血管 CTA 及生化检验; 眼部检查包括眼底照相、眼底血管造影及光学相干断层扫描等。

结果: 该患者最终确诊为强直性脊柱炎伴发大动脉炎。其眼部表现为严重的视网膜血管炎及黄斑水肿。眼部局部治疗包括视网膜激光光凝术, 以及眼用皮质类固醇和非甾体抗炎药滴眼液。全身治疗则系统性应用了口服皮质类固醇、硫唑嘌呤和麦考酚酯等免疫抑制剂。

结论: 大动脉炎与强直性脊柱炎均可导致多种眼部表现, 眼部治疗与全身治疗同等重要。现有研究提示, AS 与 TA 并存并非随机现象, 炎症反应可能在其发病机制中起关键作用。两者或具有共同的病因与发病机制, 例如基于主动脉与骨质抗原相似性的分子模拟机制。眼科医生应增强对 TA 合并 AS 的识别与诊断能力, 重视对这类患者进行系统的眼科检查。

摘要编号: 209653

功能化框架核酸多靶点治疗脉络膜新生血管

第一作者: Liu YANHAN

共同作者: Ye JUAN

目的: 脉络膜新生血管为主要病理特征的湿性年龄相关性黄斑变性是导致视力丧失的主要原因, 其发生发展与血管内皮生长因子(VEGF)过度表达、局部慢性炎症及氧化应激微环境等密切相关。目前临床治疗以抗 VEGF 药物(如雷珠单抗)为核心, 但单一靶点治疗无法解决新生血管形成的复杂病理过程, 需要寻找更加有效且综合的治疗策略以克服现有单靶点治疗的不足从而有望提高治疗效果。

方法: miRNA 作为一种核酸药物, 可以调节多种生物学途径中的靶基因, 并对不同的细胞和分子过程具有潜在的短期或长期影响。例如 miR-205 可抑制病理性新生血管和血管渗漏; miR-223 可调节视网膜炎症。但易被核酸酶快速降解以及细胞摄取不良阻碍了 miRNA 的治疗应用, 需要开发一种药物载体。鉴于现有治疗的局限性, 期望开发一种新的治疗策略, 即用四面体框架核酸(tFNA)这种具有天然生物相容性、结构稳定性、可编程性以及

易于内化等优点的药物载体共载治疗性的 miR-205 和 miR-223 (tFNA-M2), 同时结合 tFNA 固有的抗氧化能力, 实现“抗 VEGF- 抗炎 - 抗氧化”三重协同治疗, 克服单一靶点疗法的不足。

结果: 在证明 tFNA-M2 具有生物安全性后, 鉴于核酸药物易被核酸酶快速降解以及细胞摄取不良的问题, 通过共聚焦和流式实验证明了 tFNA-M2 可以延长药物的半衰期, 增强药物的细胞摄取; 在体外实验中, 通过 Elisa、免疫荧光、和 PCR 从分子水平以及基因水平上证明了 tFNA-M2 具有抗炎作用, 通过细胞增值、成管、划痕实验证明了 tFNA-M2 具有抗血管生成作用, 通过活性氧清除实验证明 tFNA-M2 具有抗氧化应激的作用; 在体实验中, 通过 FFA 造影, OCT 成像, IB4 染色, HE 染色证明 tFNA-M2 在体内具有抗血管生成作用, 通过免疫荧光染色证明 tFNA-M2 具有抗炎和抗氧化应激的作用。

结论: tFNA-M2 可以实现“抗 VEGF- 抗炎 - 抗氧化”多靶点协同治疗, 克服了目前单靶点治疗的不足。这一策略在于将 CNV 的三大核心机制同步干预, 克服单一靶点疗法的不足, 同时以非抗体依赖的核酸药物替代蛋白质, 降低免疫原性风险。该纳米系统不仅可为 CNV 耐药患者提供新治疗选择, 其模块化设计还可拓展至其他血管增生性疾病(如糖尿病视网膜病变)的治疗。

摘要编号: 209064

卡格列净调控 AMPK-Akt-eNOS 通路对糖尿病视网膜病变的保护机制研究。

第一作者: Zhuoni ZHENG

目的: 糖尿病视网膜病变(DR)是糖尿病患者视力丧失的主要原因。高浓度葡萄糖(HG)在糖尿病视网膜病变的发病机制中具有重要作用。能够诱导人视网膜毛细血管内皮细胞(Human retinal capillary endothelial cell, HRCEC)氧化应激和凋亡。卡格列净是钠 - 葡萄糖共转运蛋白 -2 抑制剂(Sodium-glucose cotransporter 2 inhibitor, SGLT2i)药物家族的重要成员, 已被证实具有抗氧化应激和抗细胞凋亡的作用, 并且可以激活 AMPK-Akt-eNOS 信号通路。在本研究中, 我们探讨了卡格列净抑制 HG 诱导的 HRCECs 和糖尿病小鼠视网膜氧化应激和细胞凋亡的分子机制。

方法: (1) 体外培养 HRCEC, 用不同浓度的葡萄糖溶液或 / 和卡格列净处理细胞。运用 MTT 法检测 HRCEC 活性。(2) 采用 DCFH-DA 活性氧探针装载处理后, 用倒置荧光显微镜评估各组 HRCEC 的 ROS 强度。(3) 用 WB 检测各组 HRCEC 内核因子 E2 相关因子 2 (Nuclear

factor erythroid2-related, Nrf2)、血红素氧合酶-1 (Heme oxygenase-1, HO-1)、B-cell lymphoma-2 (Bcl-2)、Bcl2-associated X (Bax)、Cleaved Caspase-3、NOX4、iNOS 以及 p-AMPK、AMPK、p-Akt、Akt、p-eNOS、eNOS 的蛋白表达水平。(4) Akt 抑制剂 A-443654 和 AMPK 抑制剂 Dorsomorphin 处理后, 用 WB 检测相关蛋白表达水平。(5) db/db 小鼠玻璃体腔内注射卡格列净, 用眼底荧光素血管造影评估视网膜。视网膜组织样本进一步通过 WB 分析以验证分子改变。

结果: 1. 卡格列净和 HG 共同处理后提高 HRCEC 的细胞活性、降低 ROS 水平、抑制细胞凋亡。2. 卡格列净对 HRCEC 氧化应激和细胞凋亡的抑制作用分别通过逆转 HG 引起的 Nrf2 和 HO-1 的蛋白水平和 Bcl-2, Bax 以及 Cleaved Caspase-3 的蛋白水平改变来达成。3. 卡格列净和 HG 共同处理后可激活 HRCEC 内 AMPK, Akt 和 eNOS 的蛋白水平表达。4. Akt 抑制剂 A-443654 和 AMPK 抑制剂 Dorsomorphin 处理后能够逆转卡格列净的保护作用。5. 卡格列净抑制 db/db 小鼠视网膜氧化应激和细胞凋亡。

结论: 卡格列净能够显著抑制高糖诱导的 HRCEC 的氧化应激损伤和细胞凋亡。其机制是卡格列净通过激活 AMPK-Akt-eNOS 信号通路, 从而影响下游的相关氧化应激和凋亡蛋白的水平表达。因此, AMPK, Akt, eNOS 可能是糖尿病视网膜病变预防和治疗的新靶点, 卡格列净有望成为预防和治疗糖尿病视网膜病变的有效药物。

摘要编号: 204430

孤立性视网膜星形细胞错构瘤一例

第一作者: Xiuli CHEN

共同作者: Xiaonan YAO

目的: 展示一例孤立性视网膜星形细胞错构瘤患者的眼底多模影像。

方法: 患者女性, 67 岁, 因左眼白内障术后 1 周复诊时发现眼底病变, 就诊于眼底病内科。既往体健, 智力正常, 否认癫痫或皮脂腺瘤等全身病病史。眼部检查: 右眼矫正视力为 1.0, 左眼矫正视力为 0.8; 双眼眼压正常, 右眼晶状体轻混浊, 眼底未见明显异常; 左眼人工晶体透明、位置正, 后囊膜不混, 视盘颞上方视网膜灰白色、半透明、隆起病灶 (精粹图片 1)。扫频光学相干断层扫描血管成像 (swept-source optical coherence tomography angiography, SS-OCTA) 结构成像显示左眼视盘颞上瘤体处可见神经纤维层增厚, 呈圆顶状隆起, 并压迫其下方视网膜内层结构。瘤体反射信号强, 轻微遮蔽下方组织, 使椭圆体带显示欠清, RPE 层

光带完整, 瘤体内部及边缘可见低反射小囊腔, 瘤体顶部可见丝状高信号, (精粹图片 2 中 A); 表层血流成像显示瘤体内有血流信号 (精粹图片 2 中 B 红框); en face 组织结构图可显示瘤体边缘的囊腔 (精粹图片 2 中 C 红框)。

结果: 患者诊断符合单眼孤立性视网膜星形细胞错构瘤。

结论: 孤立性视网膜星形细胞错构瘤的眼底多模影像特点可帮助诊断及理解病理生理特点。

摘要编号: 209719

巨噬细胞活化综合征眼底病变 1 例

第一作者: Baoyu HUANG

目的: 巨噬细胞活化综合征 (MAS) 是一种继发于风湿性疾病的具有潜在致命风险的并发症, 常见于儿童慢性风湿性疾病, 尤其与幼年特发性关节炎全身型相关。MAS 的主要临床特征包括发热、全血细胞减少、肝脾淋巴结肿大、肝功能损害、凝血功能障碍和中枢神经系统损害, 以及骨髓噬血现象等。其在视网膜方面的改变的报道比较少见。

方法: 患儿, 彭**, 性别: 女 年龄: 14 岁 5 月, 45 kg, 因反复发热 2 月余, 伴关节痛半月余入院于 2025 年 7 月 29 日入院。既往史: 全身型幼年特发性关节炎。患儿约发热第 3 天患儿出现皮疹, 呈片状红色斑丘疹, 从小腿开始逐渐蔓延到胸背部及全身, 伴有关节游走性疼痛。入院查体: 颈部可触及多个如黄豆大小的淋巴结, 边界清, 活动可, 肝肋下约 2 cm 可触及。血常规: 白细胞计数 $7.41 \times 10^9/L$ 、红细胞计数 $2.49 \times 10^{12}/L$, 血红蛋白 $61 g/L$, 血清铁蛋白 $1596.86 ng/ml$ 。入院后予美罗培南 + 万古霉素联合抗感染, 但患儿仍反复发热, 皮疹仍反复。复查血清铁蛋白: $4536.38 ng/ml$ 。2025 年 8 月 10 日患儿出现双眼视力骤降, 并出现多器官功能障碍综合征, 血压不稳, 转入 PICU。眼科会诊: 双眼视力 HM/20 cm, 眼前段未见异常, 后极部出现 Purtscher-like 样改变。FFA 提示后极部视网膜广泛毛细血管闭塞伴大片无灌注区形成。OCT 提示视网膜内五层细胞内水肿伴视网膜层间小囊腔。

结果: 患儿最终治疗无效, 死亡。

结论: MAS 的核心特征是 T 细胞和巨噬细胞持续活化, 释放大炎症因子 (如 IL-1、IL-6、IFN- γ 等), 形成“细胞因子风暴”, 血管内形成微血栓, 导致视网膜血管栓塞。

摘要编号: 207947

循环代谢物与年龄相关性黄斑变性及其亚型因果关系的孟德尔随机化研究

第一作者: Keting ZHANG

目的: 年龄相关性黄斑变性 (AMD) 是一种以光感受器与视网膜色素上皮进行性退行为核心的神经变性性疾病, 是老年人不可逆视力丧失的主要原因。尽管现有治疗手段能延缓晚期病变, 但对该病的根本致病机制, 尤其是其中的关键因果路径, 认知仍不充分。日益增多的证据提示代谢紊乱在 AMD 进程中扮演重要角色, 然而从因果推断角度系统解析特定代谢物的作用仍是当前研究的关键缺口。本研究旨在通过孟德尔随机化 (MR) 方法系统评估循环代谢物与 AMD 及其不同亚型之间的因果关联。

方法: 本研究采用全面的孟德尔随机化 (MR) 分析框架, 系统评估 1400 种代谢物及其比值与三种 AMD 亚型 (早期 AMD、干性 AMD 及湿性 AMD) 之间的因果关系。通过多重敏感性分析验证结果的稳健性与一致性。

结果: 在纳入分析的 1400 种代谢物及代谢物比值中, 基于逆方差加权法, 分别识别出 77 种、62 种及 80 种代谢物与早期 AMD、干性 AMD 及湿性 AMD 风险存在统计学显著的因果关联。多数关联在不同 MR 分析方法中表现一致。在脂质代谢物中, 甘油磷脂酰乙醇胺类代谢物显示出稳定的保护作用。

结论: 本研究首次在因果推断框架下系统评估血清代谢物与 AMD 及其亚型间的因果联系, 识别出包括甘油磷脂、脂肪酸、氨基酸衍生物、类固醇激素及能量代谢中间产物在内的多类代谢物在 AMD 发病中发挥重要作用。研究结果不仅从因果层面确认代谢紊乱是 AMD 的核心驱动因素, 也揭示了不同代谢通路在疾病亚型中的异质作用。本研究为未来开发基于代谢调控的 AMD 预防、诊断与精准治疗策略提供了关键因果证据及潜在分子靶点。

摘要编号: 201223

报告一例由激光焊引起的黄斑损伤的患者诊治情况

第一作者: Hongliang WANG

共同作者: Wancheng JIA, Gang LIU, Yan YAN

目的: 报告一例由激光焊引起的黄斑损伤的患者诊治情况。

方法: 我院收治一例 27 岁男性职业电焊工, 工作时接触激光焊, 3 天后出现右眼视物遮挡伴视物模糊就诊, 就诊期间使用眼底照相、光学相干断层扫描血管成像 (OCTA) 等设备, 监测其视网膜黄斑

的变化情况。根据检查结果和视网膜黄斑损伤的情况, 积极调整治疗方案。当发现患者右眼黄斑区出现脉络膜新生血管后, 及时采取了玻璃体腔内抗血管内皮生长因子 (VEGF) 药物注射的方法进行治疗, 在治疗过程中, 使用 OCTA 记录了注射后黄斑区脉络膜新生血管的密度、面积变化及波动情况。

结果: 患者初诊时右眼视力 0.02, 眼科检查发现右眼黄斑区中心凹 1/10 PD 大小灰白色病灶, 当出现右眼黄斑区出现脉络膜新生血管时, 及时玻璃体腔内抗血管内皮生长因子 (VEGF) 治疗, 经 4 个月治疗, 患者右眼最佳矫正视力 1.0, 成功挽救了患者的视力。

结论: 当激光弧焊致眼底黄斑区损伤出血脉络膜新生血管时, 可进行抗 VEGF 治疗, 同时 OCTA 在视网膜黄斑病变类疾病的治疗中具有重要的指导意义。

摘要编号: 201437

早产儿黄斑水肿的危险因素及其对黄斑结构发育的影响——基于 OCT 的队列研究

第一作者: Weiming YANG

共同作者: Xiaojing CAI, Chenhao YANG

目的: 探讨早产儿黄斑水肿 (ME) 的危险因素及其对中央凹结构发育的影响, 采用手持式 OCT 影像结合临床资料进行分析。

方法: 本回顾性队列研究纳入 106 例接受常规 ROP 筛查及 OCT 检查的早产儿。收集临床及围产期资料。根据 OCT 形态学对黄斑水肿严重程度进行分型, 并定量测量中央凹厚度 (CFT)、中央凹内层厚度 (FIRT)、外层厚度 (FORT)、平均旁黄斑厚度 (MPFT)、平均旁黄斑内层厚度 (MPIRT)、中央凹深度 (FD) 及中央凹角度 (FA)。采用逻辑回归分析 ME 的危险因素, 线性回归及混合效应模型 (校正矫正胎龄、性别及出生体重) 评估其对中央凹发育的影响。

结果: 共 106 例早产儿纳入, 其中 27 例 (25.5%) 在随访中出现 ME, 79 例 (74.5%) 始终未发生 ME, 作为对照组。与对照组相比, 既往发生过 ME 的患儿在 CFT ($\beta = 43.4$, $P < 0.001$)、FORT ($\beta = 27.7$, $P < 0.001$)、MPFT ($\beta = 109.9$, $P < 0.001$) 及 FA ($\beta = 20.8$, $P < 0.001$) 均显著增厚或增大; MPIRT 亦在多模型中表现出一致性增厚 ($\beta \approx 58.7$, $P = 0.002$); 而 FD 和 FIRT 无显著差异 (均 $P > 0.05$)。多变量逻辑回归显示, 独立危险因素包括较高的矫正胎龄 ($OR = 1.62$, $P < 0.001$)、较长光疗时间 ($OR = 1.21$, $P = 0.019$)、呼吸支持 ($OR = 6.62$, $P = 0.032$) 及中高营养风险 ($OR = 7.69$,

$P = 0.009$) ; 出生体重、胎龄及 Apgar 评分与 ME 无显著关联 (均 $P > 0.05$) 。

结论: 早产儿黄斑水肿与中央凹持久性结构异常密切相关, 主要表现为中央凹及旁黄斑厚度增加和中央凹角度增大, 即使水肿消退后亦然。其发生主要受系统性因素 (矫正胎龄、光疗、呼吸支持、营养风险) 驱动, 而非传统围产期指标。结果提示应加强新生儿全身管理与营养支持, 并结合 OCT 监测, 及早识别并干预高危人群, 以降低远期视觉损害风险。

摘要编号: **210033**

桂枝茯苓丸在糖尿病视网膜病变治疗中的分子机制: 基于分子生物学阐释中药复方制剂中“君臣佐使”配伍原则

第一作者: Chufeng GU

共同作者: Chunyang CAI, Chunren MENG, Qinghua QIU, Huiying RAO, Huake ZENG

目的: “君臣佐使” (JCZS) 是中医理论中最具代表性且广泛应用的方剂配伍原则。桂枝茯苓丸作为遵循该法则的经典方剂, 在糖尿病视网膜病变 (DR) 的临床治疗中已有数十年应用历史。本研究以桂枝茯苓丸治疗 DR 为例, 旨在从分子生物学层面系统阐释“君臣佐使”配伍原则的科学内涵。

方法: 通过整合 TCMSP、PubChem、SwissTargetPrediction、GeneCards 和 OMIM 数据库资源, 系统筛选桂枝茯苓丸治疗 DR 的活性成分及其潜在作用靶点。基于 DAVID 平台进行基因功能富集分析, 并运用 Yinfo 云计算平台完成分子对接验证。在此基础上, 通过综合分析活性成分、作用靶点、分子对接结果及现有研究成果, 系统论证“君臣佐使”配伍原则的合理性。

结果: 本研究明确了桂枝茯苓丸治疗糖尿病视网膜病变所涉及的 6 个关键活性成分、5 个核心作用靶点及 5 条主要信号通路。方中茯苓与牡丹皮为“君”药, 发挥核心治疗作用; 白芍与桃仁为“臣”药, 协同增强君药功效; 桂枝为“佐”药, 起辅助治疗作用。全方的协同治疗作用可能与活性成分溶出率和生物利用度的提高密切相关, 而白芍在方中的配伍可能对减少潜在副作用具有重要作用。

结论: 本研究为深化对中药“君臣佐使”配伍理论科学内涵的认识提供了新的研究视角, 同时为经典名方的二次开发与现代化研究奠定了理论基础。

摘要编号: **204013**

法瑞西单抗单药及联合激光治疗 1 型黄斑中心凹旁毛细血管扩张症的初步临床观察

第一作者: Qi HUIJUN

目的: 1 型黄斑中心凹旁毛细血管扩张症 (MacTel 1), 又称成人 Coats 病, 是一种以黄斑区旁毛细血管扩张和微血管瘤形成特征的眼底疾病, 常引发黄斑水肿及视力下降。由于病变位置邻近中心凹, 传统激光治疗应用受限, 而既往抗 VEGF 药物治疗效果常不理想。本研究旨在初步探讨法瑞西单抗 (Faricimab) 单药或联合激光治疗 MacTel 1 的临床疗效与安全性。

方法: 回顾性分析 10 例确诊为 MacTel 1 的患者, 所有病例均存在继发性黄斑水肿。治疗方案采用法瑞西单抗负荷剂量治疗 (每月 1 次, 连续 3 个月), 后续按病情需要 (PRN) 给予注射。其中 6 例患者于完成 3 针注射后联合激光治疗。随访时间 6-10 个月, 观察最佳矫正视力 (BCVA)、中央视网膜厚度 (CMT) 变化及黄斑水肿消退情况。

结果: 所有患者治疗后最佳矫正视力均较基线有不同程度提升。黄斑水肿完全消退者 8 眼 (80%), 部分消退者 2 眼 (20%)。光学相干断层扫描 (OCT) 显示视网膜结构明显改善, 未出现治疗相关严重不良事件。所有患者仍在定期随访中。

结论: 法瑞西单抗单药或联合激光治疗 MacTel 1 可有效促进黄斑水肿消退, 改善患者视功能, 近期疗效显著且安全性良好, 提示该药可能为难治性 MacTel 1 的治疗提供新方向。但其远期疗效仍需更大样本量和更长随访时间进一步验证。

摘要编号: **209957**

法瑞西单抗对比阿柏西普治疗新生血管性年龄相关性黄斑变性疗效与安全性的 Meta 分析

第一作者: Shitong HUANG

共同作者: Danna CHEN, Wenzhi HUANG, Yunxia LENG

目的: 评估双特异性抗体法瑞西单抗与传统抗 VEGF 药物阿柏西普在治疗新生血管性年龄相关性黄斑变性中的疗效、治疗负荷及安全性, 为临床治疗选择提供循证依据。

方法: 全面检索 PubMed、Embase、Cochrane Library 及 ClinicalTrials.gov 等数据库中自建库至 2024 年 10 月发表的相关随机对照试验。严格筛选文献并提取数据, 采用 Cochrane 风险评估工具评价文献质量, 运用 RevMan 软件进行统计分析。

结果: 共纳入 3 项高质量随机对照试验 (TENAYA、LUCERNE、STAIRWAY), 累计 2251 例患者。荟萃分析显示, 治疗 52 ~ 56 周后, 法瑞西单抗组在最佳矫正视力改善方面不劣于阿柏西普组。在解剖学结构改善方面, 法瑞西单抗组表现出显著优势, 其中心凹视网膜厚度降低值较阿柏西普组平均多 17.3 μm (95% CI: -26.5 ~ -8.1, $P = 0.0002$)。在治疗负荷方面, 法瑞西单抗组第一年内注射次数显著少于阿柏西普组 (均值差: -2.5 次, $P < 0.001$), 且 59.6% 的患者成功维持每 16 周一次给药方案。两组总体不良事件、严重不良事件及眼内炎症发生率均无统计学差异。

结论: 法瑞西单抗在视力维护方面不劣于阿柏西普, 且在视网膜积液控制方面更具优势, 能够显著延长治疗间隔并降低注射频次, 安全性相当, 为 nAMD 的长期管理提供了更优化的治疗策略。

摘要编号: 203104

法瑞西单抗治疗合并糖尿病黄斑水肿的重度 NPDR 疗效观察

第一作者: Hong WANG

共同作者: Hong WANG

目的: 探讨法瑞西单抗治疗非增生期糖尿病视网膜病变 (NPDR) 糖尿病黄斑水肿 (DME) 的效果。

方法: 对 2024 年 3 月至 2024 年 8 月收治的 30 例 (30 眼) 非增生期糖尿病视网膜病变 (NPDR) 糖尿病黄斑水肿 (DME) 患者进行回顾性研究。比较治疗前后最佳矫正视力 (BCVA)、中心凹厚度 (CFT)、视网膜静脉直径、微动脉瘤 (MA)、中央凹无血管区 (FAZ)、浅层毛细血管密度 (SCP)。

结果: 治疗后最佳矫正视力 (BCVA) 在术后 24 小时、1 个月、3 个月、6 个月均优于治疗前; 治疗后黄斑中心凹厚度 (CFT) 在术后 24 小时、1 个月、3 个月、6 个月均低于治疗前; 治疗后视网膜静脉直径在 1 个月、3 个月、6 个月均低于治疗前。治疗后微动脉瘤 (MA) 在 1 个月、3 个月、6 个月均低于治疗前。治疗后黄斑无血管区 (FAZ) 在 1 个月、3 个月、6 个月均低于治疗前。治疗后视网膜浅层毛细血管层 (SCP) 在 1 个月与治疗前相比, 无明显统计学差异 ($P > 0.05$), 治疗后 3 个月、6 个月均高于治疗前。

结论: 玻璃体腔注射法瑞西单抗治疗合并 DME 的重度非增生期糖尿病视网膜病变, 可能在形态上逆转视网膜静脉直径、微动脉瘤、黄斑无血管区及视网膜浅层毛细血管层。

摘要编号: 209511

法瑞西单抗治疗湿性年龄相关性黄斑变性的有效性及安全性研究

第一作者: Jianmin WANG

共同作者: Shuzhen FAN, Qian LI, Mengtian LIU, Xi LV, Man XU

目的: 探讨法瑞西单抗在中国人群中治疗湿性年龄相关性黄斑变性 (nAMD) 的短期真实世界疗效和安全性, 特别是比较其对初治和经治患者的解剖学和功能性影响。

方法: 本单中心回顾性研究纳入了 29 例 (31 只患眼) 接受法瑞西单抗玻璃体腔注射的 nAMD 患者。所有患者接受了连续 3 次的每月治疗, 分为初治组 (9 眼) 和经治组 (21 眼)。主要评估指标包括最佳矫正视力 (BCVA, Best Corrected Visual Acuity)、中心黄斑厚度 (CMT, Central Macular Thickness)、脉络膜厚度 (CT, Choroidal Thickness)、脉络膜体积 (CV, Choroidal Volume), 以及视网膜内液 (IRF, Intraretinal Fluid)、视网膜下积液 (SRF, Subretinal Fluid) 和视网膜色素上皮脱离 (PED, Pigment Epithelial Detachment) 的解剖学变化。数据分析采用 T 检验、Wilcoxon 检验, Fisher 检验, 统计学差异以 $P < 0.05$ 为准。

结果: 1. 初治患者 (9 眼): logMAR BCVA 从 1.10 (± 0.14) 提高到 0.82 (± 0.19)。CMT 在 1 个月和 3 个月时均较基线显著下降 ($p < 0.05$)。IRF 在注射 1 针后达到 100% 消除; 75% 的患者在 1 针后无 SRF 和 IRF, 3 针后 87.5% 的患者无 SRF。2. 经治患者 (21 眼): logMAR BCVA 从 0.68 (± 0.34) 提高到 0.64 (± 0.32)。CMT 在 1、2、3 个月均较基线显著下降, 分别为 106 μm 、152 μm 、150 μm (P 均 < 0.05); PED 的宽度在 1、2、3 个月均较基线显著下降, 分别为 845.8 μm 、1259 μm 、1386 μm (P 均 < 0.05); PED 高度在 1、2、3 个月较基线显著下降, 分别为 223.6 μm 、164.5 μm 、125 μm (P 均 < 0.05)。CT 和 CV 在 3 个月时亦显著下降 ($P < 0.05$)。3 针后无 SRF、无 IRF, 无 SRF + IRF 的患者比例分别为 62%、58%、50%。3. 安全性: 研究期间未报告任何显著不良事件。

结论: 法瑞西单抗在中国 nAMD 患者的负荷期治疗中展现出良好的安全性和有效性。对于初治患者, 其表现为功能性 (BCVA) 和解剖学 (CMT、积液等) 的显著改善; 对于经治患者, 则显示出强大的解剖学控制能力, 显著降低了 CMT、PED、CT 和 CV, 提示法瑞西单抗在难治性 nAMD 的解剖学改善中具有应用潜力。

摘要编号: 209517

法瑞西单抗治疗眼底疾病初治患者短期真实世界疗效及相关性分析

第一作者: Jie ZU

共同作者: Jianmin WANG

目的: 估双通路抑制剂法瑞西单抗治疗初治糖尿病性黄斑水肿 (DME)、新生血管性年龄相关性黄斑变性 (nAMD) 和视网膜分支静脉阻塞 (BRVO) 患者的短期 (1 个月) 真实世界疗效和安全性。重点分析血液炎症指标 (中性粒细胞 / 淋巴细胞比值 (NLP)、全身炎症指数 (SII)、血小板 / 淋巴细胞比值 (PLR)) 与视网膜高反射点 (HRF) 数量之间的相关性, 为法瑞西单抗的临床应用及疾病的炎症机制提供循证支持。

方法: 本研究纳入了我院 2025 年 1 月至 7 月期间接受法瑞西单抗玻璃体腔注射 (IVF) 治疗的 DME (25 眼)、nAMD (23 眼)、BRVO (21 眼) 初治患者。收集基线的 NLP、SII、PLR, 并在注射前和注射后 2 周、4 周评估最佳矫正视力 (BCVA, logMAR)、中央视网膜厚度 (CRT) 和 HRF 数量。数据分析采用 T 检验、Wilcoxon 检验、Spearman 相关分析等统计方法, 以 $P < 0.05$ 为统计学显著性标准。

结果: 1. 疗效和安全性: ① 所有疾病组患者的 BCVA 在治疗 2 周和 4 周后均较基线显著改善。② nAMD 和 BRVO 组的 CRT 在 4 周时均有显著下降 ($P_{4W} < 0.01$), 尤其合并视网膜色素上皮脱离 (PED) 的患者效果更显著。nAMD 患者 HRF (ILM-INL、OPL-ELM、Full) 数量在 4 周时均显著下降; DME 患者 HRF (Full) 在 2 周和 4 周后均显著下降。③ 所有患者耐受性良好, 未出现新发安全性事件。2. 基线血液炎症指标与 HRF 的相关性: ① DME 患者: 基线 HRF 数量血液炎症指标显示出显著正相关。其中, HRF (ILM-INL、OPL-ELM、Full) 数量均与 NLP 和 SII 存在显著正相关。如, HRF (ILM-INL) 与 NLP 的相关系数 (r) 为 0.53 ($P < 0.05$), 与 SII 的相关系数 (r) 为 0.57 ($P < 0.05$)。② nAMD 和 BRVO 患者: 基线 HRF 数量与血液炎症标志物无明显相关性。3. HRF 变化与视力改善的相关性: ① 在 nAMD 患者中, 治疗 4 周后 HRF (ILM-INL、OPL-ELM、Full) 的变化与视力变化有显著相关性 ($P < 0.05$)。

结论: 法瑞西单抗在初治 DME、nAMD 和 BRVO 患者短期疗效显著, 安全性良好。在 DME 患者中, 视网膜 HRF 数量与血液炎症标志物 NLP、SII 存在显著正相关, 有力支持了 HRF 的炎症本质理论, 并提示 NLP 和 SII 可能是 DME 治疗决策及疗效评估的潜在生物标志物。HRF 数量的变化可能是

nAMD 患者视力改善的预测指标。未来需更大样本量和更长期研究进一步证实。

摘要编号: 204491

玻璃体腔注射更昔洛韦治疗病毒性视网膜炎后黄斑出血的原因分析

第一作者: Wei ZHOU

共同作者: Zhao PINTING

目的: 本研究评估更昔洛韦玻璃体腔注射对病毒性视网膜炎的黄斑区可能产生的不良影响, 来分析该药物行玻璃体腔注射对黄斑区小动脉血流及结构和中心视力的影响。

方法: 本研究分析了已确诊患有病毒性视网膜炎的患者, 为其进行玻璃体内更昔洛韦注射治疗。在随访不同时间内发生了黄斑区出血和无血管区面积增加, 研究人员密切监测患者视网膜病变以及视功能恢复情况。

结果: 我们观察到三名病毒性视网膜炎患者 (其中一名患有 ARN, 两名患有 CMV 视网膜炎), 眼底出现典型的局灶性视网膜血管炎, 并且视网膜组织中存在黄白色的坏死灶, 这些患者也存在不同程度的全身症状。在确诊后, 三名患者均接受了玻璃体内更昔洛韦玻璃体腔注射并显著缓解了原有的视网膜病变。然而, 在治疗过程中在不同的时间点发生了包括黄斑出血和黄斑区小动脉阻塞和无血管区显著扩大, 并导致这些患者最终视功能预后不良。

结论: 病毒性视网膜炎的治疗仍面临挑战, 这类患者由于凝血功能异常, 发生眼内出血的风险会增加; 此外长期的视网膜血管炎可能会导致视网膜血管阻塞和缺血, 也会影响到黄斑区。玻璃体内药物注射引起的玻璃体腔流体动力学紊乱, 也可能对黄斑区造成机械性损伤。需要更密切的监测和潜在的辅助治疗来解决长期的视力预后问题。

摘要编号: 208134

疏肝健脾法治疗中心性浆液性脉络膜视网膜病变 1 例

第一作者: 和瑶

共同作者: 罗燕

目的: 研究疏肝健脾法对中心性浆液性脉络膜视网膜病变 (central serous chorioretinopathy, CSC) 的临床价值, CSC 中医治疗后的临床疗效总结。

方法: 对 1 例辨证为肝脾不调证的 CSC 患者采用“疏肝健脾”治则, 丹栀逍遥散加减方剂治疗, 通过全身证候、视力、眼底照相、眼光学相关断层扫描等指标评估疗效。

结果：患者视力提高，OCT 显示黄斑水肿消退，视网膜色素上皮层下积液完全吸收，结构恢复正常，随访 2 月无复发。

结论：中医疏肝理气，健脾祛湿的治法可有效改善患者症状，稳定视力，恢复视功能，体现了中医药在治疗中心性浆液性脉络膜视网膜病变方面的独特优势。

摘要编号：202494

真性小眼球合并急性缺血性视神经病变一例报告及文献综述

第一作者：Yuying JI

共同作者：Jin MA

目的：探讨真性小眼球（nanophthalmos）合并急性缺血性视神经病变（AION）的临床表现、诊治经过及潜在机制，并结合文献综述，为临床诊疗提供借鉴。

方法：回顾性分析 1 例真性小眼球合并 NA-AION 患者的临床资料，包括症状体征、影像及辅助检查、诊断与治疗过程，并结合相关文献进行讨论。

结果：患者男性，40 岁，因右眼疼痛及视力急剧下降 5 天就诊。检查发现双眼眼轴显著缩短（右眼 16.48 mm，左眼 18.49 mm），巩膜增厚，双眼前房浅，眼压正常。右眼视盘充血水肿，视网膜静脉扩张迂曲，左眼视盘苍白、边界模糊。OCT 显示右眼黄斑区外核层增厚，视盘水肿，左眼视神经纤维层变薄。荧光素眼底血管造影提示右眼视盘早期灌注缺损、晚期渗漏，左眼上半视盘灌注减少。B 超及超声生物显微镜证实双眼巩膜广泛增厚及前房角狭窄。视觉诱发电位轻度异常，视野检查见双眼全野缺损。MRI 未见视神经明显增强。实验室检查 ESR 和 CRP 正常。最终诊断为右眼非动脉炎性前部缺血性视神经病变（NA-AION）、双眼真性小眼球及左眼视神经萎缩。治疗采用静脉甲泼尼龙冲击（250 mg 起始，增至 500 mg 后视力恶化，后降至 80 mg 维持）联合局部注射阿托品改善微循环与神经营养支持。用药约 1 周后患者右眼视盘水肿明显改善，1 个月后视力提升至 20/1000，视盘水肿基本消退，OCT 提示黄斑及视盘水肿减轻。

结论：真性小眼球因解剖结构异常（如眼轴缩短、巩膜增厚等），容易导致视神经灌注不足，显著增加 AION 的发病风险。其临床表现易与视神经炎混淆，需结合影像学及血管造影等手段综合判断。AION 合并真性小眼球患者对常规高剂量激素治疗反应有限，低剂量激素联合改善微循环及神经营养支持可能有助于部分视力恢复。对真性小眼球患者如出现急性视力下降及视盘水肿，应高度警惕 AION，避免误诊误治。建议早期诊断、综合治疗

和长期随访。该病例为真性小眼球并发 AION 的少见实例，提示临床需关注其视神经缺血风险，并为今后相关疾病的诊治积累经验。

摘要编号：207725

眼缺血综合征合并视网膜中央动脉阻塞继发新生血管性青光眼一例

第一作者：Peng JIE

目的：分析一例复杂的眼缺血综合征（OIS）合并视网膜中央动脉阻塞（CRAO）继发新生血管性青光眼（NVG）患者的临床特征及治疗效果，为早期识别和治疗方案提供参考。

方法：患者男，51 岁，“右眼视物模糊一年，视物不见半月”。既往脑梗死、高血压、糖尿病及冠心病病史，头颅 MRA 示多支大脑动脉及双侧颈内动脉不同程度狭窄或闭塞，冠脉 CTA 示右侧冠状动脉狭窄并行冠脉搭桥术。眼科查体右眼视力光感，眼压 31 mmHg，角膜水肿，虹膜弥漫新生血管，视网膜灰白色水肿、黄斑区樱桃红斑；左眼视力 0.2，周边眼底散在出血点。心电图提示陈旧性心肌梗死及 ST 段改变。本例患者 OIS 与颈脑动脉严重供血不足密切相关，累及视网膜中央动脉急性阻塞，持续缺血缺氧诱发新生血管形成导致 NVG。予患者右眼 PRP 及抗 VEGF 治疗，加强全身疾病控制以稳定全身血流动力学。

结果：患者治疗后虹膜新生血管回退明显，但右眼视力、眼压未能显著恢复，视网膜中央动脉阻塞后的不可逆神经损伤依然是预后关键限制因素，凸显了在多血管病变背景下 OIS 的复杂性及全身循环障碍对眼的累积危害。

结论：OIS 合并 CRAO 继发 NVG 是多系统动脉阻塞导致的罕见且高度破坏性的眼病，早期识别颈脑及冠状动脉病变、眼部抗 VEGF 及 PRP，控制全身血管因素，对延缓病情进展及保留残余视觉功能具有重要意义。

摘要编号：209644

糖尿病视网膜病变人群 ZJU 指数与高血压的关系：来自 NHANES 的证据

第一作者：Rui HU

目的：研究发现 ZJU 指数与糖尿病发病率相关，可作为评估中国普通人群胰岛素抵抗的有用指标。本研究旨在阐明 ZJU 指数在糖尿病视网膜病变患者高血压中的作用。

方法：本研究采用横断面设计，基于 1999 至 2020 年美国国家健康与营养检查调查（the National Health and Nutrition Examination Survey，

NHANES) 的糖尿病视网膜病变诊断数据, 共纳入 537 名受试者。通过逻辑回归分析、限制性立方样条及交互效应分析等方法, 系统验证了研究假设。

结果: 多变量逻辑回归分析显示, 糖尿病视网膜病变患者中 ZJU 指数与高血压存在显著关联 (ZJU 指数每增加 1 个单位, 比值比 OR 为 1.13, 95% 置信区间 1.08–1.18)。所有受试者均呈现正线性关系 (非线性检验 $P = 0.237$), 且不同年龄和性别人群间该关系无显著差异。

结论: 在糖尿病视网膜病变人群中, ZJU 指数值较高的个体患高血压的风险更高。需要进一步研究来验证这一发现是否适用于更多样化的群体。

摘要编号: 209510

肠-眼轴: 肠道菌群在糖尿病性视网膜病变进展中的作用及机制研究

第一作者: Liying LUO

目的: 肠道微生物群作为“人体第二基因组”, 对人体健康起着关键的调控作用。最新研究表明, 肠道菌群失调与各类眼部疾病显著相关, 由此提出“肠-眼轴” (Gut-Eye Axis) 概念。本文从细胞和动物模型角度, 系统阐述肠道菌群失衡通过增加肠道通透性、微生物代谢产物全身性转移及免疫失调等核心机制诱发眼病的病理过程, 为眼科诊疗提供新视角。

方法: 本项研究中, 我们使用链脲佐菌素 (STZ) 诱导的糖尿病小鼠模型来评估肠道菌群对糖尿病视网膜病变进展的影响。我们设对照组、Akk 菌低/高剂量组及抗生素 (ABX) 干预组; 利用 16S rRNA 测序、非靶向代谢组学分析肠道/眼部菌群及血清代谢物变化评估了炎症标志物和氧化应激水平的变化, 通过 qPCR 验证关键通路基因, 结合相关性分析揭示肠-眼-脑轴调控机制, 以阐明肠道菌群可能改善 DR 的作用机制。

结果: 肠道菌群 Akk 菌补充对 DR 发挥了显著的治疗作用, 这体现在血糖控制得到改善、外核层和内核层厚度增加 ($p < 0.05$) 以及促炎细胞因子 (IL-1 β 、TNF- α 、IFN- γ) 和氧化应激标志物 (ROS、MDA; $p < 0.05$)。肠道微生物群测序显示, Akk 菌可延缓 DR 的进展。这种保护作用在抑制细胞外囊泡分泌后显着减弱。外泌体代谢组学分析确定左旋肉碱是 AKK 衍生的显著升高的代谢物, 左旋肉碱的外源性给药也显着改善了 DR 病理。

结论: 本研究首次从肠-眼-脑轴视角, 阐明 Akk 菌对治疗 DR 的多维度机制, Akk 菌通过左旋肉碱轴-炎症通路延缓糖尿病视网膜病变。这种保护机制是通过富集嗜粘性阿克曼氏菌、随后的细胞外囊

泡释放和代谢物左旋肉碱的递送介导的。我们的研究结果旨在阐明肠道菌群在 DR 中的重要作用, 并为未来的临床策略提供基础。

摘要编号: 207684

脉络膜上腔注射曲安奈德治疗难治性黄斑水肿的探索

第一作者: Ying WANG

目的: 采用玻璃体抗 VEGF 联合脉络膜上腔 TA 注射。选取既往多次抗 VEGF 治疗效果不佳的糖尿病性黄斑水肿 (DME) 和视网膜静脉阻塞 (RVO) 相关 ME 患者, 观察治疗前后最佳矫正视力 (BCVA)、中央黄斑厚度 (CMT) 及不良反应。

方法: 探讨脉络膜上腔注射曲安奈德 (TA) 在治疗难治性黄斑水肿 (ME) 中的临床疗效及安全性。

结果: 治疗后患者 BCVA 平均提高 2 行以上, CMT 明显降低。DME 患者 CMT 平均减少 326 微米; RVO-ME 患者 CMT 平均减少 440 微米。不良反应主要为短暂眼压升高, 用药后或自行缓解, 但发生率较低。

结论: 脉络膜上腔注射 TA 联合抗 VEGF 对难治性 ME 具有良好的治疗效果和安全性, 可作为现有治疗的补充手段。

摘要编号: 207878

视网膜静脉阻塞三重标志物风险预测模型

第一作者: Yilin WANG

共同作者: Bo QIN

目的: 在亚太地区视网膜静脉阻塞 (RVO) 疾病负担持续增加的背景下, 本研究通过回顾性分析构建首个整合预后营养指数 (PNI)、甘油三酯葡萄糖指数 (TyG) 及全身炎症反应指数 (SIRI) 的 RVO 风险预测模型, 以解决传统单一指标预测效能不足的临床问题。

方法: 采用回顾性病例-对照设计, 纳入深圳某三甲医院 2023–2025 年确诊 RVO 患者 100 例, 按年龄、性别 1:2 匹配健康对照 200 例。核心指标检测遵循亚太实验室联盟指南: PNI (血清白蛋白 g/L + $5 \times$ 淋巴细胞计数 $\times 10^9$ / L)、TyG ($\ln$ [空腹甘油三酯 (mmol/L) $\times$ 空腹血糖 (mmol/L) / 2])、SIRI (中性粒细胞计数 $\times$ 单核细胞计数 / 淋巴细胞计数) $\times 10^9$ / L。通过 LASSO 回归筛选变量建立 Logistic 模型, 经 10 折交叉验证及 Bootstrap 内部验证 (1000 次抽样), 采用 Delong 检验比较模型间 AUC 差异。性能评估包括区分度 (AUC)、校准度 (Brier 评分) 及临床效用 (决策曲线分析)。

结果：病例组较对照组显著异常：PNI: 43.2 ± 4.0 vs 52.8 ± 3.5 ($p < 0.001$)、TyG: 9.6 ± 1.1 vs 8.1 ± 0.7 ($p < 0.001$)、SIRI: 3.1 ± 1.3 vs 1.1 ± 0.4 ($p < 0.001$)。最终模型纳入：PNI ≤ 46.5 (OR = 6.8, 95% CI: 4.1–11.3)、TyG ≥ 9.0 (OR = 5.2, 95% CI: 3.0–9.0)、SIRI ≥ 2.2 (OR = 4.9, 95% CI: 2.8–8.6)、高血压史 (OR = 4.1, 95% CI: 2.3–7.4)。模型验证集 AUC = 0.87 (95% CI: 0.82–0.92)，显著优于传统临床模型 (Δ AUC = 0.16, $p < 0.001$)。Brier 评分 = 0.11 显示良好校准，决策曲线分析在 10%–40% 阈值概率区间净获益率提升 35%–52%。

结论：本回顾性研究证实 PNI-TyG-SIRI 三重标志物与 RVO 风险的独立关联性。基于大样本构建的整合模型 (验证集 AUC = 0.87) 为亚太人群提供首个三重标志物预测工具，可支持高危人群精准预防。本研究揭示 PNI、TyG 和 SIRI 三重标志物与 RVO 风险的独立关联，并建立并验证了首个适用于亚太人群的预测模型，为高危人群的精准预防提供了新工具。

摘要编号：210268

金丝桃苷通过调控小胶质细胞缓解糖尿病视网膜病变的机制研究

第一作者：Nan SHENG

共同作者：Suyan LI, Lei QIAO

目的：探究金丝桃苷 (Hyperoside, HYP) 通过调控小胶质细胞 (Microglia, MG) 异常活化改善糖尿病视网膜病变 (Diabetic Retinopathy, DR) 的作用机制。

方法：1. 基于网络药理学，使用 TCMSP、GeneCards、DisGeNET、GeneCards 等数据库筛选出 HYP、DR 和 MG 的靶点，借助 Jvenn 工具获取 HYP-DR-MG 的共同靶点。使用 STRING 数据库构建 PPI (Protein-Protein Interaction, 蛋白质-蛋白质相互作用) 网络，并运用 Cytoscape 软件对其进行可视化，筛选出关键靶点。使用 DAVID 数据库对关键靶点进行 GO 和京都基因和基因组数据库 (Kyoto Encyclopedia of Genes and Genomes, KEGG) 富集分析。2. 利用体外培养高糖诱导 (75 mM) BV2 小胶质细胞结合转录组学分析对照组 (CON 组, 25 mM)、高糖组 (HG 组, 75 mM) 和高糖联合金丝桃苷处理组 (HG + HYP 组, 75 Mm + 100 mM) 之间的差异表达基因 (Differentially Expressed Genes, DEGs)，并与网络药理学所得结果取交集得到核心靶点。运用分子对接技术验证 HYP 与核心靶点之间的对接活性。3. 基于网络药理学和转录组学

的研究结果进行体内外实验验证。采用 CCK-8 法筛选出培养 BV2 细胞适宜的葡萄糖浓度和 HYP 浓度。使用 RT-qPCR 技术、Western blot (WB) 法检测各组 BV2 细胞中 MAPK3、NOS3、ESR1、RELA 以及核心靶点下游基因的 mRNA 和蛋白质表达水平。4. 将 30 只 6 周龄 C57BL/6 随机分成 3 组，设为对照组 (CON 组)、链脲佐菌素组 (STZ 组) 和链脲佐菌素联合 HYP 干预组 (STZ + HYP 组) ($n = 10$)。采用 50 mg/kg 链脲佐菌素 (Streptozotocin, STZ) 腹腔注射诱发糖尿病，连续注射 5 天，1 周后尾尖采血检测血糖，连续 3 天随机血糖水平 ≥ 16.7 mM 视为造模成功，被用于后续实验。观察并记录各组小鼠存活情况，体毛状态，体型改变，大小便及白内障情况；每两周统计一次各组小鼠体重、血糖、饮食饮水情况。利用光学相干断层扫描 (Optical Coherence Tomography, OCT) 检测各组小鼠视网膜厚度的改变。

结果：1. 通过网络药理学数据库筛选出共 87 个 HYP 靶点，16244 个 DR 靶点，2821 个 MG 靶点和 50 个 HYP-DR-MG 交叉靶点。STRING 数据库显示预测的 PPI 网络中包括 45 个节点和 341 条边 ($p < 1.0 \times 10^{-16}$)。Cytoscape 软件筛选出 12 个关键靶点，分别是 TNF、NFKB1、MAPK3、BCL2、CASP3、PTGS2、ESR1、NFKBIA、NFE2L2、CYCS、RELA、NOS3。DAVID 数据库显示 12 个关键靶点的 GO 富集分析中生物过程有 98 个条目，细胞组成有 11 个条目，分子功能有 19 个条目；KEGG 富集分析共得到 92 条信号通路，主要涉及脂质与动脉粥样硬化、细胞凋亡、IL-17 信号通路、糖尿病并发症中的 AGE-RAGE 信号通路等。2. 转录组学分析发现高糖组和正常组之间共有 1132 个 DEGs，HG + HYP 组和 HG 组之间共有 314 个 DEGs，与网络药理学 12 个关键靶点交叉后得到 4 个核心靶点，分别是 MAPK3、NOS3、ESR1 和 RELA。分子对接显示 HYP 与上述靶点结合能均 ≤ -6.7 kcal/mol，具有强亲和力。3. CCK-8 结果显示当葡萄糖浓度在 75 mM 时 BV2 小胶质细胞增殖率下降较为显著 ($p < 0.0001$)；当金丝桃苷浓度在 100 mM 时显著提升 BV2 小胶质细胞的增殖率 ($p < 0.0001$)。RT-qPCR 及 WB 结果显示 HYP 能够有效抑制高糖诱导的 MAPK3、NOS3、ESR1、RELA 以及部分下游基因的 mRNA 和蛋白质表达的上调 ($p < 0.05$)。4. 对照组小鼠生长稳定、速度快，体毛顺滑且反光，饮食与二便均正常，体型健壮，无白内障；STZ 组及 STZ + HYP 组的小鼠生长迟缓，体毛发涩且枯柴，饮食、饮水显著增多，小便量多，大便时干时稀，体型消瘦，有白内障；各组小鼠存活情况良好。从第 2 周开始，CON 组体重、血糖显著高于 STZ 组和 STZ

+ HYP 组 ($p < 0.0001$)，STZ 组与 STZ + HYP 组之间体重无明显差异，第 12 周注射 HYP 干预后，STZ + HYP 组与 STZ 组血糖在第 16 周时开始有统计学差异 ($p < 0.05$)。OCT 检查显示与 CON 组 (约 220 μm) 相比，STZ 组小鼠视网膜厚度显著降低 (约 190 μm , $p < 0.0001$)，STZ + HYP 组 (约 210 μm) 与 STZ 组相比小鼠视网膜变厚 ($p < 0.0001$)。

结论：HYP 通过抑制小胶质细胞 MAPK/NF- κ B 炎症信号轴，下调促炎因子及氧化应激相关通路，减轻视网膜损伤，为 DR 治疗提供了多靶点干预策略。

摘要编号：206175

靶向 IRS1 的反义寡核苷酸药物治疗眼部新生血管疾病的研究

第一作者：Huimin SHAN

共同作者：Yong TAO

目的：眼部新生血管疾病，包括角膜、视网膜和脉络膜新生血管，占据目前眼部疾病的重要部分。目前的治疗方法，如抗 vegf 疗法，由于耐药性和副作用而面临局限性。根据以往研究，胰岛素受体底物 1 (IRS1) 已成为血管生成的关键调节因子。本研究探讨了靶向 IRS1 的反义寡核苷酸 (ASOs) 在抑制病理性血管生成方面的治疗潜力。

方法：利用人真皮成纤维细胞 (HDF) 和人脐静脉内皮细胞 (HUVEC)，我们设计并筛选了 42 个靶向 IRS1 的 ASOs。实时定量 PCR 评估 IRS1 mRNA 的敲降效率，而体外血管生成试验用以评估血管抑制作用。在小鼠、兔角膜新生血管以及小鼠脉络膜新生血管模型中测试了体内疗效。

结果：利用 HDF 筛选，在 42 个靶向 IRS1 的 ASOs 中，39 个 ASOs 有效抑制了 IRS1 mRNA 的表达，达到 10–90% 的下调。利用 HUVEC 进行体外血管生成试验，35 个 ASOs 显著降低了血管密度，而 28 个 ASOs 进一步抑制了体外平均血管长度。值得注意的是，ASO 19-41 不仅在内皮细胞模型中，而且在动物研究中都表现出有效且一致的抗血管生成的效果。在体内，ASO 19-41 明显抑制角膜和脉络膜新生血管，优于对照 ASO。

结论：靶向 IRS1 的 ASO，尤其是 ASO 19-41，在体外和体内均能有效抑制病理性血管生成。这些发现突显了 IRS1 作为眼部新生血管疾病治疗靶点的潜力，为当前的抗 VEGF 治疗提供了潜在的替代方案。

摘要编号：205507

高度近视黄斑病变与视盘周围萎缩病灶严重程度的相关性分析

第一作者：Qunxin YIN

共同作者：Xuhui YU

目的：本研究旨在探讨高度近视中视盘周围萎缩与近视性黄斑病变之间的相关性。

方法：单中心回顾性研究。连续纳入 51 例高度近视患者 (101 眼)。采用 ATN 分级系统对近视性黄斑病变进行分级，通过 Spearman 检验分析视盘周围萎缩参数与黄斑病变各组分/严重程度的相关性。采用逻辑回归识别与高分级 ATN 组分相关的独立危险因素，并构建高分级 ATN 组分的预测模型。采用曲线下面积评估模型性能。

结果： β 区视盘周围萎缩面积与近视性萎缩性黄斑病变高度相关，与近视性新生血管性黄斑病变呈中度相关，与近视性牵拉性黄斑病变呈弱相关。 γ 区视盘周围萎缩直径也与黄斑病变严重程度显著相关。针对高分级 A 与 N 组分的预测模型曲线下面积分别达到 0.925 和 0.956，以及 0.906 和 0.763。

结论：在高度近视患者中， β 区视盘周围萎缩面积和 γ 区视盘周围萎缩直径的变化与黄斑病变严重程度显著相关。基于视盘周围萎缩参数构建的高分级 A 与 N 组分预测模型，能有效识别进展至晚期阶段的高风险患者。

1 例 Schwartz 综合征患者护理的个案研究

第一作者：周莉义

目的：总结一例 Schwartz 综合征患者的护理经验，提升护理质量。

方法：护理要点包括实施针对性体位管理方案，制定个性化的体位管理计划，确保患者保持正确的体位以促进病情恢复，密切关注患者的心理状态，及时识别并减轻患者的焦虑和恐惧情绪，采用多样化的宣教方式提升患者对维持特殊体位的依从性，定期评估患者的体位保持情况，及时调整护理方案，确保体位管理的有效性和患者的舒适度，以实现临床疗效与患者体验的双重优化。

结果：使其能够积极配合治疗和护理，实施个体化身心护理；确保视网膜复位率，保持患者的眼部健康，实现治疗效果与生活质量的同步改善。

结论：经过 7 天的精心治疗和个性化护理，患者术后恢复良好，未出现明显的并发症，视力逐步恢复，心理状态良好，对治疗和护理的依从性较高，顺利出院。

摘要编号：209098

30G 微针直视下主动抽吸视网膜下液的临床观察

第一作者：Kai ZHU

目的：本研究的目的是介绍和评估一种在巩膜扣带术（Scleral Buckling, SB）过程中采用 30G 微针巩膜外穿刺，并直视下可控抽吸视网膜下液（Subretinal fluid, SRF）的改良技术。

方法：一项包括 68 例 RRD 患者的病例系列研究。对于 2023 年 7 月 -2025 年 9 月在中国科学技术大学附属第一医院进行巩膜扣带术的视网膜脱离患者，采用了一种新的直视下巩膜外穿刺抽吸视网膜下液体的方法，术中采用 30-gauge 的 4 mm 长度微针从预定的巩膜外穿刺进入视网膜下，通过双目间接眼底镜观察微针位置，微针后衔接负压系统，脚控负压，从而精准控制抽吸视网膜下液的量，尽可能完全吸除液体，促进视网膜快速复位。黄斑 OCT、SLO、广角 OCTA 观察术后早期视网膜复位情况、SRF 的吸收情况以及视网膜外层表现。

结果：共纳入 68 例患眼，无术中出血、视网膜嵌顿或其他严重并发症。完全复位定义为眼底镜下未观察到 SRF，术后 1 天完全复位 59 例，术后 1 周复位 8 例，术后 1 月复位 1 例。其中，术后 OCT 显示黄斑区 SRF 高度下降到仅剩下一薄层液体（小于 280 μm ）13 例，38 例 SRF 完全清除，12 例发现黄斑中央凹下单独的局限性泡状 SRF，5 例发现黄斑区多个泡状 SRF。

结论：研究表明直视下采用 30G 微针巩膜外穿刺抽吸视网膜下液的方法，对视网膜复位是有效、可控和有益的，尤其是在术后早期促进 SRF 快速消除，并且该方法没有增加更显著的并发症和风险。

摘要编号：208535

3D 显微镜下术中 OCT 引导的“PPV+ 羊膜填塞术”治疗难治性黄斑裂孔的疗效观察

第一作者：Haitong FENG

共同作者：Xiaoyi YU

目的：难治性黄斑裂孔（RHM）包括复发性、高度近视性、大型（最窄水平直径 $> 400 \mu\text{m}$ ）及伴视网膜脱离的黄斑裂孔，常规手术难以闭合，视力预后差。随着诊疗技术进步，其治疗仍具挑战。本

研究探讨在 3D 显微镜联合术中 OCT 引导下，行玻璃体切割联合羊膜填塞术治疗 RHM 的疗效。

方法：我们收集了自 2025 年 1 月至 2025 年 9 月在广州爱尔眼科医院就诊的 7 例（5 眼）RHM 患者，包括复发性 1 例、巨大裂孔 2 例、高度近视相关 2 例、硅油填充眼 2 例。所有患者均于 3D 显微镜下联合术中 OCT 引导，接受后路玻璃体切除联合湿态羊膜填塞术，术毕眼内注入洁净空气。观察术后羊膜位置、黄斑裂孔孔径变化及术后 1 月视力改善情况。

结果：所有 7 例患者术后 OCT 检查显示所有患者羊膜位置良好，黄斑裂孔孔径均较术前缩小并趋于闭合，术后 1 月视力均有不同程度提高。

结论：难治性黄斑裂孔因其复杂的病因及结构特点，常规手术方式往往难以达到满意的解剖复位与功能改善。本研究在 3D 显微镜联合术中 OCT 引导下，对 7 例不同类型的难治性黄斑裂孔患者实施玻璃体切割联合羊膜填塞术，结果显示所有患者术后羊膜位置良好，裂孔趋于闭合，且术后 1 个月视力均有提升，提示该联合术式在处理复杂黄斑裂孔方面具有显著优势。术中 OCT 可实时高分辨率显示黄斑结构，指导羊膜精准填塞，减少视网膜损伤或羊膜移位风险，提升手术精准性与安全性。羊膜生物相容性好，可促进组织修复，填入裂孔后有效支撑神经上皮层，促进胶质细胞迁移与增殖，助力裂孔闭合。3D 显微镜提供立体高清术野，结合 OCT 层面信息，优化手术流程，在处理高度近视或既往手术史等复杂病例时展现出良好适应性与可控性。本研究病例有限，随访期短，但初步结果积极。未来需扩大样本、延长随访，进一步验证该术式长期疗效与安全性，并探索其在其他复杂玻璃体视网膜病变中的应用潜力。

摘要编号：201545

ERAS 理念指导下的护理干预对糖尿病性视网膜病变患者术后康复的影响

第一作者：周莉义

目的：探讨加速康复外科（ERAS）理念指导下的护理干预对糖尿病性视网膜病变（DR）患者术后康复的影响。

方法：选取 2024 年 1 月至 2024 年 12 月大连市第三人民医院眼科一病房收治的 120 例拟行玻璃体切除术的糖尿病性视网膜病变患者，采用随机数字表法分为对照组（ $n = 60$ ）和观察组（ $n = 60$ ）。对照组实施常规围术期护理，观察组在 ERAS 理念指导下实施优化护理干预，包括术前健康教育、术中保温、术后疼痛控制、早期活动及个性化血糖监测等。比较两组患者术后视力恢复情况、疼痛评分

(VAS)、术后并发症发生率、住院时间及护理满意度等指标。

结果：观察组术后 1 周最佳矫正视力 (BCVA) 显著优于对照组 ($P < 0.05$)，术后 24 h、48 h 疼痛评分 (VAS) 低于对照组 ($P < 0.05$)，术后并发症 (如高眼压、玻璃体再出血等) 发生率显著降低 ($P < 0.05$)，平均住院时间缩短 ($P < 0.05$)，护理满意度评分显著提高 ($P < 0.05$)。

结论：基于 ERAS 理念的护理干预能有效促进糖尿病性视网膜病变患者术后视力恢复，减轻疼痛，降低并发症风险，缩短住院时间，提高患者满意度，值得临床推广应用。

摘要编号：209000

一种创新的三步法技术：简便、安全、高效地整片去除特发性视网膜前膜

第一作者：Qinghua QIU

共同作者：Qingquan WEI

目的：本研究旨在评估一种创新的三步法在治疗特发性黄斑视网膜前膜 (ERM) 中的有效性和安全性。

方法：该创新技术包括三个精确步骤：瓣膜制作 - 宽边 - 整片剥离。在完成玻璃体切割术 (PPV) 后，为了精确定位视网膜前膜，我们采用吲哚菁绿 (ICG) 染色内界膜 (ILM)，并以染色后的 ILM 为引导，启动 ERM 瓣膜的创建。为了最大限度地减少膜剥离过程中所需的力度以及对下方视网膜的牵引力，我们使用弯曲的 DSP 刮刀，在血管弓内侧从鼻侧到颞侧形成一个宽边缘的平行弧。随后，使用 ILM 钳紧紧夹住 ERM 的宽边缘，并向中央黄斑区域施加牵引力，以完整剥离整个膜。最后，再次应用 ICG 染色以确保 ERM 被彻底清除。该技术要求术者精确掌握三步手术技巧，并熟练使用专用器械。

结果：在 55 例患者中，该手术取得了显著的治疗效果。所有手术均顺利完成，ERM 剥离的平均时间为 4.23 ± 0.34 分钟。术后 12 个月的随访显示，最佳矫正视力 (BCVA) 从术前的 4.74 ± 0.30 显著提高至 4.27 ± 0.34 。平均中央黄斑厚度 (CMT) 从术前的 $503.64 \pm 111.88 \mu\text{m}$ 显著下降至 $353.38 \pm 72.64 \mu\text{m}$ 。术中及术后均未发生任何并发症，且无复发案例。

结论：该创新技术是一种快速、简便、有效且安全的手术方法，适用于特发性 ERM 的治疗。它显著改善了患者的视觉功能，同时有效降低了并发症和复发的风险。

摘要编号：209013

一项比较利多卡因、罗哌卡因及其混合液在玻璃体视网膜手术球周麻醉中效果的前瞻性、随机、双盲研究

第一作者：Yujia WANG

共同作者：Xuhui YU

目的：比较 1% 罗哌卡因、2% 利多卡因以及两者等体积混合液在玻璃体视网膜手术球周麻醉中的术中和术后临床特性。

方法：在这项前瞻性试验中，将 109 名计划接受玻璃体视网膜手术的患者中的 117 只眼随机分为三组：利多卡因组 (2%， $n = 39$)、罗哌卡因组 (1%， $n = 39$) 或利多 + 罗哌混合组 ($n = 39$)。我们测量了感觉和运动阻滞的起效时间，评估了术中眼球运动评分，记录了总麻醉药剂量 (包括需要补充麻醉的情况)，并评估了术后疼痛强度及其发生时间。

结果：除利多 + 罗哌组的 ASA 分级略高外，各组基线特征具有可比性。各组感觉阻滞的中位起效时间相似 ($P > 0.05$)。然而，运动阻滞的起效时间存在显著差异 ($P = 0.018$)，罗哌卡因组最慢 (244 秒)，与利多卡因组 (200 秒， $P = 0.017$) 相比。罗哌卡因组的运动阻滞效果也最差 ($P < 0.001$)。总麻醉药物剂量无显著差异 ($P > 0.05$)。利多 + 罗哌组术前需要补充麻醉的比例最低 (5.1%)，显著低于罗哌卡因组 (25.6%， $P = 0.012$)。麻醉效果等级的分布无统计学显著差异 ($P = 0.139$)。虽然术后 1 天未报告无法忍受的疼痛，但与利多卡因组相比，罗哌卡因组和利多 + 罗哌组的疼痛发生时间显著更晚 ($P < 0.001$)。有序 Logit 回归分析确定男性性别和玻璃体切割手术是与较高术后疼痛水平相关的因素 (均 $P < 0.05$)。

结论：对于玻璃体视网膜手术的球周麻醉，罗哌卡因与利多卡因联合用药相比两者单用提供了更优的综合效果。它比罗哌卡因起效更快、运动阻滞更有效，并且比利多卡因提供更持久的术后镇痛。

摘要编号：210106

人羊膜填塞在复发性视网膜脱离手术中的应用初步观察

第一作者：Tong WANG

共同作者：Jingjing FAN, Hongsong LI

目的：观察并初步评价人羊膜填塞在治疗复发性视网膜脱离 (RRD) 伴增生性玻璃体视网膜病变 (PVR)，尤其是合并巨大裂孔患者中的疗效与安全性。

方法：采用前瞻性单中心病例系列研究设计，纳入 2025 年 1-10 月收治的 7 例玻切术后复发性视网膜脱离或合并重度及以上 PVR ($\geq$ C3 级) 患者，裂孔范围 $\geq$ 3 个钟点或长径 $\geq$ 5 PD。所有患者术中均用人羊膜填塞裂孔。术后随访观察裂孔愈合、视网膜复位、PVR 复发及免疫排斥反应等情况。

结果：术后 3 个月，7 例患者视网膜全部复位，裂孔均达到解剖学愈合。平均随访 6 个月期间，无一例出现 PVR 复发，未观察到明确的免疫排斥反应。

结论：人羊膜填塞有助于促进复发性视网膜脱离中大裂孔的闭合与解剖学愈合，避免 RPE 细胞裸露，对降低术后 PVR 再发风险和减少术后硅油依赖具有积极作用，为大裂孔、复杂眼底病的治疗提供了有前景的治疗手段。

摘要编号：208598

人诱导多能干细胞来源的视网膜类器官与含视泡的脑类器官培养的比较研究

第一作者：Xiao Liang JIN

共同作者：Yi Bo TAO

目的：视网膜类器官作为一种重要的体外 3D 模型，在模拟人类视网膜发育与疾病方面显示出显著优势。相较于传统的动物模型和二维细胞系，视网膜类器官具有更接近真实视网膜的复杂结构、多样化的细胞类型以及部分生理功能。结合人诱导多能干细胞 (human induced pluripotent stem cell, iPSC) 技术，其广泛的细胞来源和患者特异性疾病建模能力，使得该类器官不仅能模拟单基因缺陷导致的病理变化，还能在器官水平上重现个体化的复杂疾病表型，从而为疾病机制研究、精准医疗、药物筛选及再生医学等领域提供了新的研究方向。目前，视觉研究领域主要采用两种类器官模型：一种为脑类器官中自发形成的双侧对称视泡结构，即视泡脑类器官 (optic vesicle-containing brain organoids, OVB)；另一种为由 hiPSC 直接分化并自组织形成的微型视网膜结构，即视网膜类器官 (Retinal Organoid, RO)。这两种方法在形态发生过程、细胞组成特征及实验操作流程上存在差异，因此系统比较其优缺点，针对对不同研究目标选择适宜的建模策略具有重要意义。本研究旨在系统评估并比较视泡脑类器官与视网膜类器官在从人 iPSCs 诱导生成视网膜类器官过程中的诱导效率、组织结构特征、细胞特异性分化能力以及实验操作复杂度方面的差异。

方法：实验采用同一来源的人 iPSCs，分别通过两种方案进行视网膜类器官诱导。通过组织学染色、免疫荧光染色及实时定量 PCR 等技术，定期分析

类器官的形态结构、组织形成情况，以及光感受器细胞等关键视网膜细胞类型的分化进程。

结果：结果表明，两种方法均能成功诱导出具有视网膜特征、表达眼发育特异性生物标志物的类器官结构，但在应用中各具优势。

结论：视泡脑类器官更适用于模拟源于早期神经发育障碍的视网膜病变，而视网膜类器官则在研究视网膜本身的发育过程及相关疾病机制方面表现更为突出。

摘要编号：203492

内界膜翻转覆盖联合自体血治疗大直径特发性黄斑裂孔的黄斑区微结构及血流变化研究

第一作者：Xian WANG

目的：应用光相干断层扫描 (optical coherence tomography, OCT) 及光相干断层扫描血流成像技术 (optical coherence tomography angiography, OCTA) 观察内界膜翻转覆盖联合自体血治疗裂孔直径 $\geq$ 400 μ m 的特发性黄斑裂孔 (idiopathic macular hole, IMH) 手术前后的黄斑区微结构及血流改变。

方法：选取裂孔直径 $\geq$ 400 μ m 行内界膜翻转覆盖联合自体血治疗的 IMH 患者 31 例 (31 只眼) 纳入分析进行观察。观察术前黄斑裂孔最小直径、黄斑裂孔基底直径、黄斑裂孔指数 (macular hole index, MHI)、裂孔牵拉指数 (tractional hole index, THI)、裂孔直径指数 (diameter hole index, DHI)、黄斑裂孔的愈合指数 (macular hole closure index, MHCI)。比较分析患者术前、术后 1 周、1 月及 3 月的最佳矫正视力 (best corrected visual acuity, BCVA)、外界膜 (external limiting membrane, ELM) 缺损直径、椭圆体带 (ellipsoid zone, EZ) 缺损直径、视网膜浅层毛细血管灌注密度 (retinal perfusion densities of the superficial capillary plexus, PSCP)、黄斑中心凹无血管区 (foveal avascular zone, FAZ) 面积、FAZ 周长的变化情况，并分析各指标与术后 BCVA 的相关性。

结果：共 31 人纳入分析，平均年龄 64.45 ± 9.27 岁，男性和女性分别为 5 例 (16%) 和 26 例 (84%)。平均裂孔最小直径 $570.0 \pm 141.0 \mu$ m，术后 3 个月随访时 U 型闭合 22 眼 (71%)，V 型闭合 8 眼 (26%)，W 型闭合 1 眼 (3%)。术后 BCVA (LogMAR) 显著好转 ($P < 0.001$)。EZ 缺损直径、ELM 缺损直径显著降低 ($P < 0.001$)。术后 FAZ 面积及周长、PSCP 术后一周较术前降低，后逐渐上升 ($P < 0.05$)。术后 3 个月的 BCVA (LogMAR) 与术前 BCVA (LogMAR)、裂孔最小直径、基

底直径呈显著正相关 ($P < 0.05$)。术后 3 个月 BCVA (LogMAR) 与术前 MHI、MHCI 呈显著负相关 ($P < 0.05$)。

结论：内界膜翻转覆盖联合自体血是治疗大直径 IMH 的有效方法，患者术后有较好闭合形态及良好的视觉质量。IMH 患者行内界膜翻转覆盖联合自体血术后 FAZ 面积、FAZ 周长、PSCP 发生变化，提示其术后愈合过程可能涉及视网膜血流动力学变化。同时，相关性分析结果提示术前裂孔最小直径、基底直径越小，术后 3 月最佳矫正视力越好；术前视力越好、MHI 及 MHCI 越大，术后 3 月最佳矫正视力越好，因此，手术前最佳矫正视力、裂孔最小直径、基底直径、MHI 及 MHCI 可以作为 IMH 术后视力的预估指标。

摘要编号：208758

呼吸睡眠暂停和孔源性视网膜脱离：一项孟德尔随机化研究

第一作者：Dengke ZHOU

共同作者：Pan LI, Xuehui ZHANG

目的：既往观察性研究已探讨了阻塞性睡眠呼吸暂停 (OSA) 与多种眼部疾病的关联，然而 OSA 与孔源性视网膜脱离 (RRD) 之间的因果关系尚不明确。本研究采用两样本孟德尔随机化方法 (TSMR) 评估 OSA 对 RRD 风险的因果关系。

方法：OSA 的遗传工具变量数据来自英国生物银行的一项全基因组关联研究 (GWAS)，共纳入 463,035 例病例和 13,818 例对照。我们从中筛选出 33 个与 OSA 显著相关的单核苷酸多态性作为工具变量 (IVs)。RRD 的遗传数据来源于芬兰生物银行的 GWAS 汇总数据，包括 203,018 例病例和 1,935 例对照。主要采用逆方差加权法 (IVW) 进行因果效应估计，并辅以加权中位数法 (WM) 等 MR 方法。通过 MR-Egger 回归进行敏感性分析，评估潜在的多效性影响，同时利用 F 统计量检验 IVs 的强度。

结果：IVW 结果显示 OSA 会显著增加 RRD 的发病风险 ($OR = 1.030$, 95% CI: 1.008–1.0419, $P = 0.04$)。敏感性分析未提示存在异质性 ($P = 0.623$) 和水平多效性 ($P = 0.428$)。所有纳入的工具变量均为强工具变量 ($F > 10$)。

结论：本研究表明，OSA 可能是孔源性视网膜脱离的危险因素，会升高其发病风险。这一发现为 RRD 的预防、临床诊断与护理策略提供了新的科学依据。

摘要编号：210181

基于光学相干断层扫描的特征性表现用于儿童 NF2 的早期识别

第一作者：Yingqian PENG

共同作者：Yun LI, Jiayue WANG

目的：探讨儿童 2 型神经纤维瘤病 (NF2) 的早期眼科表现及其在诊断中的重要性；分析儿童 NF2 患者中黄斑前膜 (ERM) 的临床特征及手术治疗效果；强调在缺乏典型神经系统肿瘤表现的儿童中，眼科表现作为 NF2 早期诊断线索的价值。

方法：回顾性分析两名儿童 NF2 疑似病例的临床资料：病例 1：5 岁女孩，因“先天性白内障”就诊，伴黄斑前膜及皮肤牛奶咖啡斑，经基因检测确诊 NF2；病例 2：6 岁男孩，因单眼视力下降伴黄斑前膜就诊，皮肤有疑似牛奶咖啡斑，因经济原因未行基因检测，临床诊断为 NF2；收集患者的眼科检查资料 (包括视力、眼底照相、OCT)、全身检查 (皮肤、听力、颅脑 MRI) 及手术记录；结合文献回顾，比较其他儿童 NF2 相关黄斑前膜的手术治疗及预后。

结果：一、眼科表现：两例患者均表现为特征性黄斑前膜 (OCT 显示边缘卷曲、火焰状外观)；病例 1 合并白内障及视网膜前膜，病例 2 可见视网膜皱褶和灰白色病灶；二、全身表现：两例均有皮肤牛奶咖啡斑，但无前庭神经鞘瘤或其他神经系统肿瘤；三、基因检测：病例 1 基因检测确诊 NF2，病例 2 未检测；四、手术治疗：两例均接受 27 G 微创玻璃体切除术联合视网膜前膜剥除；术后 OCT 显示前膜消失，但视网膜结构异常持续存在；视力均未显著改善 (病例 1 术后 BCVA 20/125，病例 2 20/1000)；五、文献比较：现有报道中儿童 NF2 相关 ERM 手术效果不一致，部分病例视力改善，部分无变化；术后黄斑结构异常 (如内核层低反射腔) 可能影响视力恢复。

结论：儿童的 NF2 可能最初由眼科医生诊断。因此，临床医生应对这些显著的眼科表现保持警惕，比如视力低下、晶状体混浊和视网膜病变，特别是在没有特定病因的儿童中 OCT 上出现边缘卷曲的 ERM。应进行全面的全身检查和定期随访，因为 NF2 的早期诊断对于适当的患者管理和治疗至关重要。然而，儿童 NF2 所致 ERM 的手术治疗仍缺乏标准，27 G 微创玻璃体切除术和视网膜前膜剥除术的长期效果仍存在争议，需要更大样本量和更长的术后随访期。同时，这些患者术后中心凹的微观结构和弱视训练效果值得在未来研究中探讨。

摘要编号: 204332

基于术中荧光造影对 PDR 术前不同时间点抗 VEGF 治疗疗效的对比研究

第一作者: Ruolan LING

共同作者: Yue HAN, Jie LI, Yawen QIN, Xi WANG, Jie ZHONG

目的: 利用术中荧光血管造影 (IOFA) 技术评估增生性糖尿病视网膜病变 (PDR) 术前进行玻璃体腔注射抗 VEGF 治疗的最佳时间点。

方法: 回顾性病例系列研究。收集 2023 年 1 月至 2025 年 2 月在四川省人民医院就诊的因 PDR 伴玻璃体积血行玻璃体切除术的患者的临床资料。按术前玻璃体腔注射康柏西普的时间分为 A 组 (术前 3 天注射)、B 组 (术前 7 天注射)、C 组 (术前 14 天注射)。通过 IOFA 观察 PDR 患者眼底新生血管 (NV) 的个数和大小, 并收集术前最佳矫正视力 (BCVA)、玻璃体积血分级、术中手术时间、电凝使用频率、高灌注压持续时间、玻璃体视网膜粘连分级及术后 BCVA、黄斑中心区厚度 (CMT) 等信息, 进行多维度分析。

结果: 本研究共纳入的 91 例 (94 眼) 患者, 年龄 (52.53 ± 10.39) 岁, 男性 57 例 (62.6%), 女性 34 例 (37.4%), 3 组患者性别、年龄、糖尿病病程等术前基本指标均无统计学差异 ($p > 0.05$)。IOFA 辅助下观察到的 NV 个数、大小比较分析, NV 个数 A 组为 2.03 ± 2.22 个, B 组 0.89 ± 1.10 个, C 组 0.92 ± 1.26 个; NV 大小 A 组为 2.46 ± 3.61 PD, B 组 0.68 ± 0.91 PD, C 组 0.88 ± 1.51 PD。B 组、C 组的 NV 个数、大小均小于 A 组; 两两比较, B 组比 A 组的 NV 个数降低 56.2% ($p = 0.007$), 大小降低 72.4% ($p = 0.002$); C 组比 A 组 NV 个数降低 54.7% ($p = 0.021$), 大小降低 64.2% ($p = 0.011$)。B 组与 C 组比较差异无统计学意义 ($p > 0.05$)。三组手术时间、电凝使用频率、高灌注压持续时间、玻璃体视网膜粘连分级等其他术中指标的差异无统计学意义 ($p > 0.05$)。

结论: IOFA 证实, 术前 7 天、14 天抗 VEGF 治疗较术前 3 天能更有效的抑制 PDR 患者视网膜 NV 活性。

摘要编号: 208479

增殖性糖尿病视网膜病变行玻璃体切除术前抗 -VEGF 治疗的最佳时机: 基于大规模队列的竞争风险分析

第一作者: Jinlian ZHAN

目的: 过分析抗血管内皮生长因子 (抗 -VEGF) 治疗对术后玻璃体出血 (VH) 和牵引性视网膜脱离

(TRD) 竞争风险的不同影响, 定义增殖性糖尿病视网膜病变 (PDR) 玻璃体切除术前抗 -VEGF 治疗的最佳时机。

方法: 608 只接受 PDR 玻璃体切除术的眼睛, 分为未治疗组 ($n = 100$) 和抗 -VEGF 组 ($n = 508$)。抗 -VEGF 组按注射到手术的间隔时间分为 1-3 天、4-7 天、8-14 天和 > 14 天组。使用多变量 Cox 比例风险模型和 Fine 和 Gray 竞争风险模型分析术后首次复发 (需要干预的 VH 或 TRD) 时间。主要结局指标: 术后 VH 和 TRD 的发生率及独立预测因子。

结果: 与未治疗组相比, 术前抗 -VEGF 显著减少了总复发率 (24% vs. 41%; $P < 0.001$)。竞争风险显示, 这一效果主要是通过减少 VH 的发生来实现的 (调整后的亚分布风险比 [aSHR] 为 0.38; 95% CI, 0.24-0.61), 对 TRD 没有显著影响 (aSHR 为 0.98; 95% CI, 0.59-1.64)。注射时机是结果的关键决定因素。注射到手术间隔为 4-7 天与最低的整体复发风险相关 (调整后的风险比为 0.52; 95% CI, 0.30-0.88, 比较 > 14 天组)。相比之下, 手术延迟超过 14 天与 TRD 的累积发生率显著增加相关 (21% vs. 7-9% 对于其他组; Gray 检验, $P = 0.001$)。

结论: PDR 玻璃体切除术中的术前抗 -VEGF 治疗具有双刃剑效应, 其作用受血管纤维化转换的影响。该治疗的益处是特定于并发症的, 仅限于减少玻璃体出血。最佳治疗窗口为 4-7 天, 最大化该益处。然而, 手术延迟超过 14 天会触发一种促纤维化的转变, 显著增加牵引性视网膜脱离的风险, 抵消抗出血的效果。

摘要编号: 208476

层特异性微血管变化在特发性黄斑前膜中的意义

第一作者: Jinlian ZHAN

目的: 探讨使用光学相干断层扫描血管成像 (OCTA) 观察特发性黄斑前膜 (iERM) 患者神经纤维层血管丛 (NFLP) 和视网膜神经节细胞层血管丛 (GCLP) 中的层特异性微血管变化, 并与手术后的视觉功能进行关联分析。

方法: 本回顾性研究分析了 47 只 iERM 眼和 30 只健康对照眼。评估了术前和术后 6 个月的最佳矫正视力 (BCVA)、视网膜敏感性和 OCTA 衍生的 NFLP、GCLP 及浅层血管复合体 (SVC) 的血管密度 (VD) 和血管面积 (PA)。通过 ROC 曲线评估诊断准确性, 并通过相关性分析和多元线性回归分析评估预后价值。

结果：术前，iERM 眼的 NFLP、GCLP 和 SVC 的血管密度 (VD) 和血管面积 (PA) 均显著高于健康对照 ($P < 0.01$)。NFLP 参数在诊断准确性上优于 SVC 指标。术前，NFLP 血管指标的增加与更好的 BCVA 改善相关 (所有 $P < 0.05$)。相反，较大基线 $6 \times 6 \text{ mm}^2$ GCLP 血管指标与较差的 BCVA 改善相关 (所有 $P < 0.05$)。多元分析显示，术前 GCLP VD 是最终术后 BCVA 改善 ($\beta = 1.84$, $P = 0.045$) 和术后视网膜敏感性 ($\beta = 0.048$, $P < 0.001$) 的独立预测因子。

结论：通过 OCTA 对 NFLP 和 GCLP 的分层分析提供了对 iERM 的独特且有力的生物标志物。NFLP 指标在诊断中表现优异，而术前 GCLP 的完整性则是术后功能恢复的关键预测因子，提供了比传统 SVC 分析更细致的见解。

摘要编号：200960

斜面与平面玻切头在糖尿病性视网膜病变玻切手术增生膜剥离操作中的效率对比

第一作者：Jinfeng QU

共同作者：Xiaoxin LI

目的：比较最高切速 10 K 的斜面 (beveled-tip) 玻切头与最高切速 5 K 的平面 (flat-tip) 玻切头在 PDR 患者手术中剥离纤维血管增生膜 (FVP 膜) 的操作效率。

方法：采用多中心前瞻性随机对照研究设计。纳入 FVP 膜分级为 3~4 级的 PDR 患者，随机分为两组：实验组使用 Alcon Advanced ULTRAVIT® 10 K/25 G 斜面玻切头，对照组使用 Alcon 5 K/25 G 平面玻切头分别进行玻璃体切除术。比较两组在术中单独使用玻切头清除 FVP 膜粘连点的比例、辅助器械切换的平均次数、手术总时长、核心玻璃体切除时间、膜清除时间、术后随访 3 个月内最佳矫正视力及玻璃体体积血的复发率。

结果：共纳入 110 例 PDR 患者 (113 眼)。斜面玻切头组单独使用玻切头清除 FVP 膜粘连点的比例为 $70.1 \pm 21.9\%$ ，显著高于平面玻切头组的 $50.9 \pm 33.5\%$ ($P = 0.001$)。斜面玻切头组辅助器械 (镊子/剪刀/电凝) 切换的平均次数为 2.7 ± 1.7 次，低于平面玻切头组的 3.4 ± 1.6 次 ($P = 0.022$)。斜面玻切头组 FVP 膜清除时间为 16.3 ± 3.4 分钟短于平面玻切头组的 20.8 ± 5.8 分钟 ($P = 0.041$)。两组在手术总时长、核心玻璃体切除时间、术后最佳矫正视力及玻璃体体积血复发率方面无显著差异。

结论：与 5 K 平面玻切头相比，10 K 斜面玻切头能清除更高比例的 FVP 膜粘连点，减少辅助器械切换次数，并缩短 FVP 膜总清除时间。

摘要编号：208694

术中激光联合 FCB 外垫压治疗 RRD 的临床观察

第一作者：Shuai WANG

共同作者：Xun AN, Yong LV, Chao MA, Tiantian WANG

目的：评估非接触广角镜下术中激光联合 FCB 外垫压治疗孔源性视网膜脱离的安全性及有效性。

方法：回顾分析 10 例 (10 只眼) 单纯性孔源性视网膜脱离患者接受非接触广角镜下术中激光联合 FCB 外垫压手术的临床资料，评估手术前后 3 个月最佳矫正视力、眼压、视网膜复位情况、视网膜下液吸收情况及并发症情况。

结果：10 例 (10 眼) 患者术后视网膜均复位，最佳矫正视力较术前均提高，且差异具有统计学意义 ($P < 0.05$)，手术未出现与 FCB 相关的严重并发症。

结论：本研究利用非接触性广角眼底镜联合光纤导光系统辅助内路照明下用 FCB 顶压联合术中激光光凝封闭裂孔，对于网脱范围 ≤ 3 象限、赤道以后的大裂孔也可以进行有效的顶压，可使原来计划 PPV 手术的患者改为 FCB 加压术。不仅可以对隆起程度较高的视网膜脱离且合并多处视网膜变性的患者术中一次性封闭裂孔并同时光凝变性区，减少了后续治疗过程，也避免术后激光带来炎症加剧的情况，这是传统 SB 及目前 FCB 顶压术不能做到的。综合 10 例患者术后视力、眼压、视网膜复位及视网膜下液吸收情况，我们认为改良性 FCB 治疗 RRD 是安全且有效的。

摘要编号：203364

湿性年龄相关性黄斑变性 (wAMD) 与认知功能障碍的炎症分子网络关联：视网膜-脑轴的作用

第一作者：周雪娇

共同作者：Yunqin LI

目的：湿性年龄相关性黄斑变性 (wet age-related macular degeneration, wAMD) 是老年人群中导致不可逆失明的重要原因之一。而临床上观察到，wAMD 患者发生认知功能障碍 (如轻度认知障碍和阿尔茨海默病) 的风险较健康人群更高，提示这两种疾病之间存在潜在的关联性机制。本文主要围绕 wAMD 是否与认知功能障碍有关展开讨论，从临床观察的关联现象入手，探索两者可能存在的核心生物学机制——从解剖学和功能学角度阐释“视网膜-脑轴”的双向联系，解释视觉系统与中枢神经系统之间的交互作用；讨论两者在炎症反应方面的共同性，包括视网膜局部和颅内炎症反应的相似

性、小胶质细胞的异常活化模式，以及血视网膜屏障和血脑屏障破坏均涉及到的相同反应通路；最后详述氧化应激反应在两种疾病发病过程中发挥的作用。理解上述的病理生理过程有利于更深刻地了解wAMD与认知功能障碍疾病的发生发展过程，并寻找可能的联合干预措施。

方法：无。

结果：无。

结论：无。

摘要编号：**203226**

玻璃体切除联合保留中心凹的内界膜剥除及硅油填充术治疗病理性近视黄斑劈裂

第一作者：**Jun ZHOU**

目的：探讨玻璃体切除术联合保留中心凹的内界膜剥除及硅油填充治疗病理性近视黄斑劈裂的临床疗效。

方法：收集2023年1月-2024年11月在我院接受玻璃体切除术联合保留中心凹的内界膜剥除及硅油填充治疗病理性近视黄斑劈裂10例10眼比较术前、术后1周、1月、3月最佳矫正视力(BCVA)、中心凹厚度(CFT)、视网膜劈裂腔高度(FS)、及黄斑劈裂、中心凹脱离复位情况。

结果：纳入病理性近视黄斑劈裂10例10眼中，完全复位率为30%(3眼)，部分复位率为70%(7眼)。术后3月，BCVA(LogMAR)较术前 1.432 ± 0.509 显著改善至 0.957 ± 0.393 ($P < 0.05$)，CFT和FS较术前 437.9 ± 180.4 、 686.5 ± 172.2 μm 显著降低至 207.5 ± 76.1 、 290.7 ± 86.6 μm ($P < 0.05$)。术中及术后随访期间未见黄斑裂孔、视网膜脱离硅油乳化、眼内炎等并发症发生。

结论：玻璃体切除术联合保留中心凹的内界膜剥除及硅油填充有助于病理性近视黄斑劈裂患者的视力提高及黄斑劈裂的解剖复位。

摘要编号：**207988**

眼前后节联合术后有效晶状体位置的变化及其对屈光结局的影响

第一作者：**Jianmin WANG**

共同作者：**Qian LI**

目的：探讨玻璃体视网膜病变患者接受眼前后节联合手术前后有效晶状体位置(effective lens position, ELP)的变化，及其对屈光结局的影响，为以后眼前后节联合手术前人工晶状体度数的精确测算奠定基础。

方法：研究纳入2024年5月至2025年9月就诊于河北省人民医院眼科，确诊为玻璃体视网膜病变患者64例64只眼，根据所行术式不同分为以下四组：前后联合水液填充组(行Phaco + IOL + PPV术)20只眼；单纯后节水液填充组(单纯行PPV手术)14只眼；前后联合气体填充组(行Phaco + IOL + PPV + 注气术)15只眼；前后联合硅油填充组(I期行Phaco + IOL + PPV + 硅油填充术，二期行硅油取出术)15只眼；所有需植入IOL的病例均植入一片式亲水性丙烯酸酯IOL；应用超声生物显微镜(ultrasound biology microscope, UBM)测量眼轴方向角膜后顶点到晶状体前表面之间的距离以及到两侧睫状突连线之间的距离，分别作为前房深度(ACD)和ELP的数值。比较术后1个月和3个月等效球镜度数(SE)，同时应用UBM测量各随访时间点的ACD和ELP。分析各个时间点ELP的前后变化，应用Pearson相关性分析ELP与SE变化的相关性。

结果：ELP的变化：前后联合水液填充组：术后1个月和3个月较术前显著后移($P < 0.05$)；单纯后节水液填充组：术后1个月较术前显著前移($P < 0.05$)，术后3个月较术后1个月后移($P < 0.05$)；前后联合气体填充组：术后1个月和3个月较术前显著后移($P < 0.05$)；前后联合硅油填充组：I期术后1个月和3个月较术前显著后移，II期术后1个月和术后3个月较前显著后移($P < 0.05$)。相关性分析：ELP的变化与SE的变化显著相关($r = 0.39$, $P < 0.05$)。

结论：眼前后节联合术后ELP变化趋势有迹可循，其中前后联合手术组术后ELP显著后移，实际屈光度与预测屈光度存在误差，与ELP变化显著相关。在估算术后屈光度时应该考虑ELP随时间变化的影响，适当调整预留屈光度，为患者提供更佳的术后视觉效果。

摘要编号：**207686**

视网膜下注射治疗大直径黄斑裂孔的中长期观察

第一作者：**Ying WANG**

目的：评估平衡盐溶液(BSS)视网膜下注射用于治疗大直径黄斑裂孔(MHz直径 ≥ 400 微米)的疗效和安全性。

方法：本研究是一项前瞻性干预研究，共纳入31例患者的31只眼，均为全层黄斑裂孔。患者接受了玻璃体切除术，随后使用41 G针头进行视网膜下BSS注射。术后1个月、3个月及6个月，通过光学相干断层扫描(OCT)、最佳矫正视力(BCVA)和微视野计检查评估结果。微视野计检查的指标包

括黄斑完整性指数 (MII) 和黄斑阈值 (MT)。对比分析了术前与术后 BCVA (LogMAR)、MII 和 MT 的变化, 记录黄斑裂孔闭合情况和并发症。

结果: 术后 1 个月时, 93.54% (29/31) 的患者实现了黄斑裂孔完全闭合。术前 BCVA (LogMAR) 为 1.34 ± 0.59 , 术后 1 个月为 0.67 ± 0.20 、3 个月为 0.48 ± 0.36 , 6 个月为 0.35 ± 0.57 , 随访时逐渐提高 ($P < 0.001$)。术后 6 个月时, MII 从 98.77 ± 4.83 改善为 85.38 ± 16.5 ($P < 0.001$), MT 从 17.53 ± 5.04 改善为 25.43 ± 2.91 ($P < 0.001$)。未观察到并发症发生。

结论: 视网膜下 BSS 注射治疗大直径黄斑裂孔是有效且安全的, 能够促进解剖结构的成功闭合并有效改善视功能。

摘要编号: 208474

视网膜血管灌注能力作为评估特发性黄斑前膜患者视觉功能恢复的预测指标

第一作者: Jinlian ZHAN

目的: 本研究利用光学相干断层扫描血管造影 (OCTA) 研究特发性黄斑前膜 (iERM) 患者的视觉功能与视网膜血管指标, 特别是灌注能力 (PC) 之间的关系。

方法: 文章回顾性研究包括 30 例 iERM 手术患者的 30 只眼, 随访 3 个月。另外, 28 名健康人的 28 只眼睛作为对照组。我们测量了最佳矫正视力 (BCVA)、视网膜敏感度、血管密度 (VD)、灌注面积 (PA)、灌注能力 (PC) 和视网膜厚度 (RT)。OCTA 扫描评估 $3 \times 3\text{-mm}^2$ 和 $6 \times 6\text{-mm}^2$ 区域的浅层血管复合体 (SVC) 和深层血管复合体 (DVC)。分析视网膜血管指标与视力结果之间的关系。

结果: 术后 BCVA 和视网膜敏感性均有显著改善 ($P < 0.001$)。SVC 层 VD、PA 显著降低 ($P < 0.001$), PC 显著升高 ($P < 0.001$)。DVC 层 VD、PA、PC 变化无统计学意义。与视网膜敏感性变化相关的基线因素包括 $3 \times 3\text{-mm}^2$ RT ($r = -0.389$, $P = 0.034$) 和 PC 在 $3 \times 3\text{-mm}^2$ 和 $6 \times 6\text{-mm}^2$ SVC 区域 ($3 \times 3\text{-mm}^2$ SVC PC: $r = 0.71$, $P < 0.001$; $6 \times 6\text{-mm}^2$ SVC PC: $r = 0.51$, $P = 0.003$)。基线 VD 或 PA 与术后视网膜敏感性改善之间无显著相关性。在多元线性回归分析中, 回归模型显示, 术后视网膜敏感性呈负相关 ($\beta = -0.53$, $P = 0.001$) 和 $3 \times 3\text{-mm}^2$ RT ($\beta = -0.39$, $P = 0.013$), 而与术前视网膜敏感性呈正相关 ($\beta = 1.10$, $P < 0.001$), 在 $3 \times 3\text{-mm}^2$ 区域内术后 BCVA 和视网膜敏感性均有显著改善 ($P < 0.001$)。SVC 层 VD、PA 显著降低 ($P < 0.001$), PC 显著升高 ($P < 0.001$)。DVC 层 VD、PA、PC 变化无统计学意义。

与视网膜敏感性变化相关的基线因素包括 $3 \times 3\text{-mm}^2$ RT ($r = -0.389$, $P = 0.034$) 和 PC 在 $3 \times 3\text{-mm}^2$ 和 $6 \times 6\text{-mm}^2$ SVC 区域 ($3 \times 3\text{-mm}^2$ SVC PC: $r = 0.71$, $P < 0.001$; $6 \times 6\text{-mm}^2$ SVC PC: $r = 0.51$, $P = 0.003$)。基线 VD 或 PA 与术后视网膜敏感性改善之间无显著相关性。在多元线性回归分析中, 回归模型显示, 术后视网膜敏感性与年龄呈负相关 ($\beta = -0.53$, $P = 0.001$) 和 $3 \times 3\text{-mm}^2$ RT ($\beta = -0.39$, $P = 0.013$), 而与术前视网膜敏感性呈正相关 ($\beta = 1.10$, $P < 0.001$), 在 $3 \times 3\text{-mm}^2$ 区域内 SVC 中的 PC ($\beta = 0.49$, $P = 0.023$)。

结论: 视网膜血管灌注能力 (PC) 是评价特发性黄斑前膜视网膜微循环的一种新颖且可靠的指标。我们的研究表明, 术前浅层血管复合体的 PC 是术后视网膜敏感性改善的重要预测因素。这一发现具有重要的临床意义, 表明 PC 可用于更好地选择手术候选人和定制个性化治疗计划。

摘要编号: 207691

超长眼轴硅油取出致眼球脱臼一例报告

第一作者: Xiangli WANG

目的: 探讨超高度近视硅油眼行联合手术时发生急性术中眼球脱臼的危险因素、机制及应急处置策略。

方法: 病例报告。45 岁女性患者, 右眼为唯一视眼, 眼轴 35 mm, 因高度近视孔源性视网膜脱离行玻璃体切割 + 硅油填充术后 7 个月。术前检查: 视网膜平复, 黄斑裂孔萎缩性愈合, 晶状体混浊 (LOCS III: N2C2P0), 硅油下矫正视力 0.1。局麻 (球后阻滞: 2% 利多卡因 + 0.75% 罗哌卡因共 4.5 ml) 下行右眼 Phaco + IOL 植入 + 硅油取出术。术中关键事件: Phaco 阶段: 主切口反复虹膜脱出伴前房波动, 连续环形撕囊不规则撕裂; 硅油取出阶段: 25 G 套管取出硅油时突发眼球向颞下方脱出超过赤道部; 缝合巩膜切口后见眼球大部分脱位于眶外, 角膜完全暴露, 上下睑张力显著增高, 徒手还纳困难。处理: 立即停止操作, 行眼球内、外侧轻柔按摩 30 分钟, 眼球大部分回纳 (角膜暴露 50%), 遂以绷带加压包扎。

结果: 术后 2 小时解开包扎, 眼球完全复位。术后首日: 眼压 14 mmHg, 角膜透明, IOL 囊袋内位正, 眼底视网膜复位。术后视力维持 0.1。

结论: 三重高危因素协同致病: 眼轴 ≥ 35 mm 导致眼球-眼眶容积比失衡 (计算容积比 > 1.8); 硅油取出诱发“眼球塌陷效应”: 瞬时负压 (实测术毕眼压 6 mmHg) 使薄壁眼球变形; 悬韧带松弛: 术中见晶状体震颤及囊袋不稳定。局麻操作的额外风险: 球后注射 4.5 ml 药液加剧眶压升高; 患者疼痛性眼睑痉挛进一步推挤眼球。急救关键: 即刻

解除眼睑压迫（禁用暴力还纳）；加压包扎通过降低眶静脉压促进淋巴回流。

摘要编号：208442

非膨胀浓度 C3F8 气体与空气在充气性视网膜固定术治疗 RRD 的多中心、前瞻性临床研究——（CANARY study）中期报告

第一作者：Enhui LI

共同作者：Youxin CHEN

目的：比较非膨胀浓度 C3F8 气体与空气应用于充气性视网膜固定术（PR）治疗孔源性视网膜脱离（RRD）的疗效及安全性差异。

方法：本研究为多中心、前瞻性、单盲、随机对照、非劣效性临床试验。纳入符合标准的 RRD 患者，随机分配至非膨胀气体组（14% C3F8 组）与空气组。患者入院进行手术及术后体位管理，手术方案如下：前房穿刺充分放液后注入 0.7 ml 气体，术后保持规定头位 6 至 12 小时，后行激光裂孔封闭处理。主要评价指标包括：1. 视网膜复位率（单次注气解剖复位率、总复位率）；2. 最佳矫正视力（ETDRS 字母数）；3. 手术并发症发生率。

结果：截至中期分析（2024 年 4 月至 2025 年 4 月），共纳入国内 13 家医疗中心的 137 例 RRD 患者，这些患者的平均年龄为 50.77 ± 12.45 岁，男女性别比例为 72:65，病程中位数为 10 天，平均住院日为 4.51 ± 2.11 天，将这些患者随机分组为 C3F8 组（70 例）和空气组（67 例）。- 解剖复位率：C3F8 组单次注气复位率为 90%（63/70），空气组为 86.6%（58/67），组间差异无统计学意义（ $P > 0.05$ ）。- 二次干预情况：首次复位失败的 16 例患者中，C3F8 组 1 例行二次注气仍未复位；空气组 7 例行二次注气，其中 6 例成功复位。- 视力改善：C3F8 组 ETDRS 字母数从术前 44.91 ± 31.66 提升至术后 61.40 ± 23.53 （ $P < 0.05$ ）；空气组从 55.79 ± 32.15 提升至 68.98 ± 15.78 （ $P < 0.05$ ），但组间视力改善幅度无显著差异（ $P > 0.05$ ）。- 并发症及处理：10 例注气失败病例中，5 例因气体顶压失败，2 例气体进入视网膜下腔，2 例萎缩孔视网膜下积液持续存在，1 例术后新发下方裂孔。上述病例最终通过玻璃体切除术（PPV）或巩膜扣带术（SB）实现解剖复位。随访期间，2 例复发经再次 PR 治疗成功，3 例出现黄斑前膜，1 例出现黄斑裂孔。

结论：中期数据表明，非膨胀浓度 C3F8 气体与空气在 PR 治疗 RRD 中均具有良好安全性及有效性，两种气体在解剖复位率与视力改善方面无显著差异。但空气组需二次注气的比例为 10.4%（7/67），高于 C3F8 组二次注气比例 1.4%（1/70），提示

其单次治疗成功率低于 C3F8 组。后续研究需进一步验证长期疗效及并发症风险。

眼整形眼眶病

摘要编号：205541

3D 打印辅助制作的预成型可吸收填充材料联合计算机导航在眼眶骨折修复手术中的应用评价

第一作者：Wang YINING

目的：评价 3D 打印辅助制作的预成型可吸收填充材料联合计算机导航在眼眶骨折修复手术中的应用价值。

方法：选择 60 例单侧眼眶爆裂性骨折患者，均存在眼球内陷及复视。将患者以是否利用 3D 打印技术辅助手术及计算机导航随机分为观察组 30 例和对照组 30 例。观察组患者经眼眶 CT 扫描数据创建虚拟眼眶模型，将数据导入 3D 打印机制备 3D 打印眼眶模型，对骨折修复材料进行大小设计，以此为模板预成型可吸收眶底板，在计算机导航辅助下对患者施行眼眶骨折修复手术。对照组采用常规眼眶骨折修复手术。观察并比较两组患者的可吸收眶底板在眼眶骨折缺损位置的贴附情况。随访记录患者术后的复视、眼球突出度和眼球运动情况，以评价愈后效果。

结果：术后 1 周复查所有患者视力均无明显变化，瞳孔大小无变化，眼眶 CT 可见骨折断端对合良好，个体化预成型可吸收眶底板位置角度良好。随访 6~8 个月，两组患者术后眼球突出度差值均在 2 mm 以内。观察组和对照组患者在术后 1 周、1 个月和 6 个月最大方向复视比较，差异均具有统计学意义（ $P < 0.05$ ）。在术后 1 周、1 个月和 6 个月，观察组和对照组患者术后上转运动受限均值、下转运动受限均值比较，差异均具有统计学意义（ $P < 0.05$ ）。

结论：3D 打印眼眶模型辅助设计的预成型可吸收填充材料对眼眶爆裂性骨折修复具有确切效果，且手术安全，种植体植入位置精确，联合计算机导航辅助下实施手术对复视、眼球运动受限及眼球突出等症状改善效果良好，患者术后恢复效果更好。

摘要编号: 204373

DEPTOR 蛋白在甲状腺相关眼病中的作用及机制研究

第一作者: Xue JIANG

共同作者: Dongmei LI

目的: 甲状腺相关眼病 (TAO) 是一种炎症性自身免疫性疾病, 其在成人眼眶疾病中的发病率最高。尽管目前对 TAO 的发病机制已有广泛的研究, 但目前仍未完全阐明。普遍认为, 眼眶成纤维细胞 (OFs) 是 TAO 的靶细胞, 在其发病机制中发挥重要作用, 但对于 DEPTOR 在 TAO 期间炎症反应和脂肪生成中的具体作用仍不十分清楚。因此, 本研究旨在探究眼眶组织 (来自 TAO 患者和健康对照受试者) 中 DEPTOR 的表达情况, 并通过小干扰 RNA (siRNA) 介导眼眶成纤维细胞的基因沉默, 来探索 DEPTOR 在 TAO 发病机制中的作用。

方法: 沉默 DEPTOR 基因后对 TAO 炎症反应和脂肪生成的影响: 我们收集了 10 例 TAO 患者的眼眶结缔组织样本以及 10 例健康对照者眼眶样本, 体外培养眼眶成纤维细胞。在转染后的 48 小时内, 利用 CCK8 法和划痕实验分别检测细胞增殖和迁移的改变情况。在使用 IL1 β 刺激之前, 我们对细胞进行了 DEPTOR siRNA 及 NCsiRNA 的预处理, 持续处理 24 小时。通过 Western blot 和 ELISA 测量炎症细胞因子的蛋白白介素 6 (IL6)、细胞间黏附分子 1 (ICAM1)、单核细胞趋化蛋白 1 (MCP1) 表达水平。随后, 我们对 DEPTOR siRNA 及 NCsiRNA 持续转染 OFs 细胞进行了脂肪分化, 并使用油红 O 染色, 通过 Western blot 分析测定了成脂转录因子过氧化物酶体增殖物激活剂 γ (PPAR γ) 和 CCAAT 增强子结合蛋白 (C/EBP) α/β 的水平。通过 Western blot 检测了 DEPTOR/mTOR 相关信号通路的蛋白水平, 包括 mTOR 特征性底物 S6K1 和 AKT 及其磷酸化的蛋白, 以及负反馈通路 PI3K/AKT 级联反应的蛋白水平。

结果: 体外实验显示, TAO 眼眶组织中 DEPTOR mRNA 的表达水平显著高于非 TAO 组织 ($P < 0.05$)。抑制 DEPTOR 基因表达影响细胞迁移和增殖, 并可以有效降低 IL-1 β 诱导的炎症细胞因子 IL-6、ICAM-1、MCP-1 的蛋白表达水平。同时, 在脂肪生成过程中, DEPTOR 的表达持续增加, 而 DEPTOR siRNA 转染的 TAO 的 OFs 细胞显示, 与脂肪细胞分化相关的成脂转录因子 PPAR γ 、C/EBP α 、C/EBP β 的表达显著减少。油红 O 染色结果表明, 在脂肪分化过程中, 经 DEPTOR siRNA 转染处理后, 脂滴减少。体外实验发现, DEPTOR siRNA 转染后, TAO 的 OFs 在脂肪生成过程中,

使 p70S6K 及 p-p70S6K 蛋白表达水平增加, 但同时减弱了 AKT、p-AKT、PI3K、p-PI3K 蛋白的表达水平。

结论: 在 TAO 的体外模型中, 沉默 DEPTOR 可以有效抑制促炎细胞因子的产生和脂肪生成过程, 这提示 DEPTOR 可能在介导 TAO 的发病分子机制中发挥着重要作用。此外, 我们的研究进一步揭示了 DEPTOR 蛋白通过调节 PI3K/Akt 和 mTOR/p70S6K 信号级联来调节 TAO 的脂肪生成。具体而言, DEPTOR 通过抑制 mTORC1 介导的反馈抑制来激活促脂肪生成的 Akt/PKB-PPAR- γ 轴。这些发现为未来 TAO 治疗的潜在靶点之一提供了线索, DEPTOR 蛋白可能成为治疗该疾病的有力候选。

摘要编号: 208910

En-DCR 联合中药治疗慢性泪囊炎疗效影响因素分析

第一作者: Ya MO

目的: 本研究通过观察成都中医药大学附属医院眼科就诊的单眼慢性泪囊炎患者, 从多个角度分析鼻内镜下泪囊鼻腔吻合术 (En-DCR) 联合中药治疗单眼慢性泪囊炎的疗效影响因素。

方法: 收集 2023 年 10 月至 2024 年 10 月于成都中医药大学附属医院眼科接受 En-DCR 联合中药治疗的单眼慢性泪囊炎患者 203 例 (203 眼)。其中完成术后 6 个月门诊随访且符合纳排标准的患者 111 例 (111 眼)。从一般基线资料、既往史、手术史、CT 泪道造影等多因素分析 En-DCR 联合中药治疗单眼慢性泪囊炎疗效的影响因素。使用 SPSS 24.0 行数据分析, 单因素分析筛选出 P 值较小者 ($P < 0.10$) 作为自变量, Logistic 回归分析, 筛选出影响 En-DCR 手术疗效的危险因素 ($P < 0.05$)。

结果: 1. En-DCR 联合中药治疗的 203 例 (203 眼) 单眼慢性泪囊炎患者术后 6 个月电话随访的有效率为 91.53%。在完成术后 6 个月门诊随访且符合纳排标准的 111 例患者 (111 眼) 中, 治愈 79 眼 (71.2%), 好转 16 眼 (14.4%), 无效 16 眼 (14.4%), 总有效率为 85.6% (95 眼)。2. 本研究符合纳排除标准的单眼慢性泪囊炎患者中男性 9 例, 女性 102 例, 所有患者平均年龄为 52.86 ± 12.80 岁。3. 单因素分析结果显示: 下鼻甲肥厚、中鼻甲气化、小泪囊对 En-DCR 手术疗效有关 ($P < 0.05$)。4. 多元有序 Logistic 回归分析结果显示: 高血压、下鼻甲肥厚、中鼻甲气化、小泪囊为影响 En-DCR 手术疗效的危险因素 ($P < 0.05$)。

结论: 高血压、下鼻甲肥厚、中鼻甲气化、小泪囊为影响 En-DCR 手术联合中药疗效的危险因素 ($P < 0.05$)。

摘要编号: 209669

Maya 软件结合手机 3D 扫描测量眼球突出度的可行性研究

第一作者: Jia MA

共同作者: Ting WANG

目的: 创新性提出 Maya 软件结合手机 3D 扫描测量眼球突出度, 以期对眼球突出度的测量提供新的思路和方法。

方法: 在 3D 编辑 Maya 软件中测量 3D 面部模型上的眶距、瞳孔中点到同侧眶外侧缘点距离以及对侧眶外侧缘点距离。同时通过 IOL Master 700 测量中央前房深度和中央角膜厚度, 以弥补角膜顶点到瞳孔中点的距离, 进一步用海伦公式求得眼球突出度。纳入 30 名确诊为甲状腺相关眼病 (TED) 患者及 37 名健康人群作为受试者, 分别行 Maya 结合手机 3D 扫描、Hertel 眼突计及眼眶 CT, 测量眼球突出度 (Exophthalmos, EXPH) 和眶间距离 (Interocular Distance, IOD)。使用 MedCalc (v20.2) 和 SPSS (v27.0) 对实验数据集统计分析, 通过 Passing-Bablok 回归模型进行线性关系评估, 并结合 Bland-Altman 一致性界限分析法, 对测量结果的可比性维度展开双重验证。

结果: 1. HE 法和 Maya 法测得健康受试者的 EXPH 分别为 $15.42 \text{ mm} \pm 1.91 \text{ mm}$ 和 $15.38 \text{ mm} \pm 1.99 \text{ mm}$, IOD 分别为 $107.76 \pm 4.50 \text{ mm}$ 和 $106.29 \pm 4.89 \text{ mm}$; 两种方法测得 EXPH 和 IOD 的 95% 一致性界限区间 (LoA) 分别为 $-0.52 \text{ mm} \sim 0.60 \text{ mm}$ 和 $-2.00 \text{ mm} \sim 5.00 \text{ mm}$, 相关系数 ρ 分别为 0.987 ($P < 0.0001$) 和 0.925 ($P < 0.0001$); 二者位于置信区间外的数值点均小于 5%。2. HE 法和 Maya 法测得 TED 患者的 EXPH 分别为 $20.23 \pm 2.45 \text{ mm}$ 和 $20.33 \pm 2.52 \text{ mm}$, IOD 分别为 $110.17 \text{ mm} \pm 5.09 \text{ mm}$ 和 $109.06 \text{ mm} \pm 5.83 \text{ mm}$; 两种方法测得 EXPH 和 IOD 的 95% LoA 分别为 $-0.72 \text{ mm} \sim 0.54 \text{ mm}$ 和 $-2.70 \text{ mm} \sim 4.90 \text{ mm}$, 相关系数 ρ 分别为 0.990 ($P < 0.0001$) 和 0.929 ($P < 0.0001$); 二者位于置信区间外的数值点均小于 5%。3. 对 19 名 TED 患者分别行 CT 法和 Maya 法测量 EXPH 和 IOD。CT 法和 Maya 法测得的 EXPH 分别为 $20.07 \pm 2.43 \text{ mm}$ 和 $20.15 \pm 2.56 \text{ mm}$, IOD 分别为 $99.78 \pm 4.00 \text{ mm}$ 和 $107.96 \pm 6.36 \text{ mm}$; 两种方法测得 EXPH 和 IOD 的 95% LoA 分别为 $-0.80 \text{ mm} \sim 0.65 \text{ mm}$ 和 $-22.30 \text{ mm} \sim 5.90 \text{ mm}$, 相关系数 ρ 分别为 0.989 ($P < 0.0001$) 和 0.126 ($P < 0.0001$); 二者位于置信区间外的数值点均小于 5%。CT 法与 Maya 法所测 TED 患者的 EXPH 具有良好的一致性。两种方法测量的 IOD

存在差异, 是由于眼眶 CT 所测量的 IOD 为眶骨内侧壁距离, 而 Maya 法还包括皮肤、皮下组织及部分眶骨厚度。

结论: 与传统 Hertel 眼突计及眼眶 CT 法对比, 基于 Maya 软件结合手机 3D 扫描测量 EXPH 的方法在健康人群和 TED 患者的中均展现出极好的测量一致性。该方法无创、非接触、可重复性好、无辐射、操作简便, 具有良好的临床实践潜力。

摘要编号: 210204

中国西南地区眼眶蜂窝织炎的回溯性分析

第一作者: Meng XIE

共同作者: Xin LUO

目的: 评估中国西南地区眼眶蜂窝织炎的流行病学特征、危险因素、病原谱、治疗模式及视力预后, 为区域化防治策略提供循证依据。

方法: 回顾性纳入 2015-01 至 2025-06 西南地区单中心住院且经 CT/MRI 确诊的眼眶蜂窝织炎患者。采集人口学、伴随鼻窦炎、创伤史、微生物学、抗生素选择、手术干预、住院时长、最佳矫正视力 (BCVA) 及并发症。按年龄 ≤ 14 岁与 > 14 岁分层, 采用多变量 Logistic 回归分析视力不良 (最终 BCVA $< 20/40$) 的独立危险因素。

结果: 共 368 例符合标准, 儿童 207 例 (56.3%), 成人 161 例 (43.7%)。男女比 1.62:1。诱因: 急性鼻窦炎 68.5%, 外伤 11.2%, 皮肤疖肿 7.3%, 牙源性 5.0%。病原培养阳性率 32.5% (119/368), 首位为金黄色葡萄球菌 (38.0%, 其中 MRSA 占 22.1%), 其次肺炎链球菌 15.3%、流感嗜血杆菌 9.5%。· 治疗: 单用静脉广谱抗生素 42.1%, 联合内镜鼻窦手术 (ESS) 眼眶引流 57.9%。平均住院 8.7 ± 3.4 天。· 视力不良率 8.9% (46/518); 儿童 5.5%, 成人 16.7% ($P < 0.01$)。· 多变量分析示: 就诊延迟 ≥ 7 天 (OR 3.42, 95% CI 1.78-6.58)、合并糖尿病 (OR 2.91, 1.30-6.52)、眶尖综合征 (OR 6.73, 2.45-18.5) 及 MRSA 感染 (OR 2.15, 1.02-4.54) 为视力不良独立危险因素。· 并发症 7.5%, 以海绵窦血栓 2.1%、脑膜炎 1.5%、永久性失明 0.8% 为主; 无死亡。

结论: 中国西南地区眼眶蜂窝织炎好发于男性儿童, 鼻窦炎是最主要诱因。MRSA 比例高于既往东部报告, 提示需重视经验性抗生素覆盖。早期联合内镜下鼻窦手术可缩短疗程并降低并发症。及时就诊、控制糖尿病及针对 MRSA 的个体化治疗是改善视力预后的关键。

摘要编号: 203188

儿童外伤性鼻泪管阻塞的治疗与预后影响因素

第一作者: Caiwen XIAO

目的: 本研究旨在系统分析儿童群体中外伤性鼻泪管阻塞 (nasolacrimal duct obstruction, NLDO) 的临床表现、损伤机制与阻塞部位分布特征, 比较不同手术方式的治疗效果及安全性。进一步通过统计学方法探索影响手术成功率和功能恢复的关键预测因素, 建立治疗失败的预测模型, 为临床个体化治疗策略的制定提供循证依据, 以期提升儿童外伤性 NLDO 的诊疗水平及预后质量。

方法: 选取 2011 年 1 月至 2021 年 8 月就诊于上海市第九人民医院眼科的 18 岁以下外伤性 NLDO 的 80 例患者、83 只眼进行回顾性分析。对人口统计学信息、损伤情况、既往手术史、伤术间隔、治疗方案、治疗效果等临床资料进行了回顾和分析。采用二元逻辑回归建立治疗后手术失败的预测模型。

结果: 83 只眼中, 65 只眼行外路泪囊鼻腔吻合术 (Dacryocystorhinostomy, DCR) 联合硅胶管植入术, 18 只眼行内镜下 DCR 联合硅胶管植入术, 63 只眼同期进行了钛钉内固定矫正内眦畸形。术后 1 个月拔除支架。支架取出后平均随访 28 个月, 末次随访时, 总体解剖结构和功能康复率为 83.1% (69/83), 未出现需要手术干预的鼻出血或脑脊液漏等严重并发症。通过 LASSO 回归以及二元逻辑回归分析儿童外伤性 NLDO 的疗效主要影响因素。未经处理的眶缘骨折、明显的皮肤瘢痕以及泪囊区域存在骨折碎片可能是手术失败和功能性溢泪高风险因素。该模型的受试者工作特征曲线下面积为 0.888。

结论: 本研究表明, 儿童外伤性 NLDO 最常见的阻塞部位是泪囊与鼻泪管交界处, 泪囊向前移位和泪囊区域存在碎骨片是手术失败的重要预测因素。对于合并内眦畸形的患者, 术中同期行钛钉内固定矫正效果良好。

摘要编号: 209110

双侧眼眶同期发现不同类型原发性肿瘤一例

第一作者: Zhenyu PIAO

目的: 双侧眼眶原发性肿瘤本身较为少见, 而同期发现但病理类型完全不同的病例则罕见。本研究旨在报告并探讨一例在初次检查时即同时发现、但术后病理分别证实为海绵状血管瘤 (右眼) 与多形性腺瘤 (左眼) 的双侧眼眶肿瘤病例, 以增进对此类罕见临床情况的认识。

方法: 回顾分析一例 67 岁男性患者的临床资料。患者于 2023 年 10 月因头痛查体发现右眼眶占位

就诊, 患者无明显眼部不适, 查体双眼视力眼压无明显异常, 右眼上转、内转不到位, 眶压 +。眼球突出度: 23-106-20 mm, 眼底检查未见明显异常。眼眶增强 MRI 检查同时提示双侧眼眶独立的占位性病变: 右眼眶内上方块状较大信号, T1 中信号、T2 高信号, 不均匀强化, 与上直肌、上斜肌、上睑提肌关系密切, 左眼泪腺区圆形信号, T1 中信号, T2 中信号, 强化不均匀。我们采取了分次手术的治疗策略, 先行“右眼前路眶内肿物摘除术” (2023 年 11 月), 待患者恢复后, 再行“左眼前路眶内肿物摘除术” (2024 年 5 月)。两次手术标本均送病理学检查以明确最终诊断。

结果: 术后病理检查给出了明确的诊断: 右眼眶肿瘤: 海绵状血管瘤, 大小 $2 \times 1.5 \times 0.7$ cm。左眼眶肿瘤: 符合多形性腺瘤, 伴有囊性变, 大小 $1 \times 0.4 \times 0.4$ cm。这一结果证实了本例属于罕见的双侧、异时、不同病理类型的原发性眼眶肿瘤。两次手术过程顺利, 患者术后恢复良好, 双眼视力与眼压均维持稳定, 眼球运动好, 未见其他严重并发症。

结论: 本病例展示了一种罕见的临床情形: 双侧眼眶肿瘤可在初次诊断时即同时存在, 但其病理类型可以完全不同。在临床实践中, 对于双侧眼眶病变, 即使同时发现, 也应警惕其存在独立病理本质的可能性, 而不能简单假定为同一疾病过程。最终诊断必须依赖于对每一侧肿瘤的病理学检查。

摘要编号: 209960

基于角膜生物力学及形态学构建甲状腺相关眼病眶减压术后屈光及炎症变化临床预测模型

第一作者: Mingqian YU

共同作者: Liqiang WANG, Wei WU, Xinji YANG

目的: 探讨甲状腺相关眼病 (Thyroid Eye Disease, TED) 患者行眶减压术后屈光参数及临床活动度评分 (Clinical Activity Score, CAS) 的时序变化特征及其与角膜生物力学及形态学参数的关系, 构建术后屈光与炎症活动变化的个体化预测模型, 开发网页计算器以辅助临床决策。

方法: 前瞻性纳入 2024 年 5 月至 2025 年 2 月在我院行眶减压术的中重度 TED 患者 57 眼。于术前、术后短期 (< 2 月) 及长期 (≥ 2 月) 检测 Corvis ST 角膜生物力学、Pentacam 角膜形态学、屈光、眼轴及角膜内皮参数。采用广义估计方程 (Generalized Estimating Equations, GEE) 结合限制性立方样条连续建模时间效应, 分析参数非线性轨迹; 通过组惩罚回归筛选关键变量, 构建等效球镜屈光度 (Spherical Equivalent, SE) 变化 (Δ SE) 与炎症变化 (Δ CAS) 的预测模型, 基于 R Shiny 平台开发网页计算器。

结果：术后参数随时间呈显著双相变化：屈光参数 SE 及球镜度数呈早期近视漂移、晚期远视回归；眼轴长度 (Axial Length, AL) 早期延长、后期缩短；角膜生物力学早期软化、后期硬化；角膜前表面曲率早期变陡、后期变平；中央角膜厚度 (Central Corneal Thickness, CCT) 及中央光密度先升后降。与 Δ SE 显著相关的术前参数包括角膜达到最大凹陷时的最小曲率半径及第二次压平时的最大形变幅度、角膜表面不规则指数、中央角膜光密度及前房深度等；与 Δ CAS 显著相关的术前参数包括第一次压平时的最大形变幅度、角膜表面不规则指数、角膜高度偏心指数、角膜前表面散光、角膜六边形率及眼球整体位移量等。结合年龄、性别、病程、手术方式、拟去除脂肪体积及基线 SE、CAS、CCT、AL、生物力学校正眼压等临床重要变量，构建了 Δ SE 及 Δ CAS 预测模型。两模型拟合良好、误差小，已集成至网页计算器 (https://uaie.shinyapps.io/GEE_Prediction_Calculator_SE/; https://uaie.shinyapps.io/GEE_Prediction_Calculator_CAS/)。

结论：基线角膜生物力学与形态学参数可预测术后屈光与炎症变化，存在屈光敏感区间 (Refractive Susceptibility Zone, RSZ) 及炎症敏感区间 (Inflammatory Susceptibility Zone, ISZ)，其内轻微波动即可引发术后 Δ SE 或 Δ CAS 的非线性放大。识别 RSZ 与 ISZ 并利用网页计算器进行个体化评估，可高效辅助 TED 术前风险评估与个体化手术策略优化。

摘要编号：210189

外侧开眶肿瘤摘除术后并发症影响因素分析： 聚焦于肿瘤特性的作用

第一作者：Zhangjun REN

目的：探讨肿瘤特性（包括性质、体积大小、边界、位置、与视神经及眼外肌的关系）以及其他相关因素对外侧开眶肿瘤摘除术后并发症发生的影响，为术前风险评估和手术策略优化提供依据。

方法：采用回顾性研究方法，纳入 2017 年 -2025 年 4 月在南昌大学附属眼科医院行外侧开眶肿瘤摘除术的患者 88 例。收集患者术前临床资料，重点分析肿瘤相关因素：性质（良性/恶性）、体积大小、边界（清晰/模糊）、位置（肌锥内/肌锥外、眶前部/眶后部或眶尖）、包裹视神经程度（无、部分或完全包裹）、与眼外肌的关系（粘连/无粘连）。同时记录患者年龄、手术时长等因素。术后随访最少半年，根据术后是否发生并发症进行分组，采用单因素及多因素 Logistic 回归分析确定并发症的独立危险因素。

结果：本研究共纳入 88 例患者，术后并发症发生率为 35%。常见并发症包括眼球运动障碍、视力下降或丧失、上睑下垂、瞳孔改变、眶内出血或血肿、视网膜水肿等。单因素分析显示，患者年龄 ≥ 75 岁、手术时间 ≥ 3 小时、恶性肿瘤、肿瘤边界模糊、肿瘤位于眶内或累及深部（如眶尖）、肿瘤分化程度低以及存在合并症等因素与术后并发症发生或预后不良显著相关 ($P < 0.05$)。多因素 Logistic 回归分析进一步确认，年龄 ≥ 75 岁、手术时间 ≥ 3 小时、恶性肿瘤、肿瘤边界模糊、存在合并症、肿瘤分化程度低以及肿瘤累及深部是外侧开眶术后并发症发生或预后不良的独立危险因素 ($P < 0.05$, OR ≥ 1)。

结论：外侧开眶肿瘤摘除术后并发症的发生受多种因素影响。患者高龄 (≥ 75 岁)、手术时间长 (≥ 3 小时)、恶性肿瘤、肿瘤边界模糊、存在合并症、低分化肿瘤以及肿瘤累及深部是预后不良的独立危险因素。临床实践中应针对这些高危因素加强围术期评估与干预，包括术前利用影像学技术精确评估肿瘤特性、精心规划手术入路，术中精细操作以减轻组织损伤、控制手术时间，并对高危患者实施密切的术后监测，从而有望降低并发症风险，改善患者预后。

摘要编号：209183

改良 CFS 悬吊术在治疗上睑下垂术后欠矫中的应用与疗效分析

第一作者：Kelin LI

共同作者：Ronxin CHEN

目的：评估改良联合筋膜鞘 (Conjoint Fascial Sheath, CFS) 悬吊术在矫正初次上睑下垂术后欠矫的临床效果与优势。

方法：回顾性分析 2022 年 1 月至 2025 年 10 月于我院因初次上睑下垂术后欠矫并接受改良 CFS 悬吊术修复的 48 名患者资料。手术改良核心步骤包括：1) 精准分离与暴露：经原切口入路，精细松解瘢痕粘连，充分暴露提上睑肌及睑板，明确初次手术方式（如额肌瓣悬吊术、提上睑肌缩短术）；2) CFS 复合体悬吊：以提上睑肌腱膜与 Müller 肌-CFS 复合体作为新的悬吊基点，进行多点、均衡的缝合固定；3) 动态调整：术中实时调整悬吊张力与位置，以优化眼睑高度、弧度及闭合功能。记录并比较患者术前与末次随访时的评估指标，睑裂高度、睑缘弧度、眼睑闭合情况、并发症及患者满意度。

结果：所有患者均顺利完成手术，平均随访时间为 12.6 个月。末次随访显示，患眼的睑裂高度由术前的 5.27 mm 改善至术后的 8.34 mm，差异具有统

计学意义 ($P < 0.01$)。所有患眼均获得良好且稳定的上睑弧度, 未出现睑缘不规则或内外眦畸形。术后短暂性眼睑闭合不全均在 1 个月内明显缓解, 未见暴露性角膜炎等严重并发症。患者主观满意度普遍较高。

结论: 研究表明, 改良 CFS 悬吊术是治疗上睑下垂术后欠矫的一种有效且可靠的方法。该术式具有以下优势: 1) 力学结构合理: 以 CFS 复合体作为新的悬吊基点, 更符合生理性提睑方向, 能够有效矫正上睑位置, 并恢复自然的上睑弧度和轮廓。2) 术中可控性好: 支持动态调整悬吊张力与高度, 有助于实现精准矫正, 降低术后欠矫或过矫的发生风险。3) 手术安全性高: 操作层面位于相对正常的解剖间隙, 可有效避免原手术区瘢痕粘连, 并发症少, 恢复可预测性强。该改良 CFS 悬吊术为处理上睑下垂术后欠矫这一临床难点提供了可靠的修复策略, 具有推广应用价值。

摘要编号: 209094

数字化 3D 打印辅助创伤性眶上裂减压

第一作者: Liu GUIQIN

共同作者: Rao JING, Wu PENGSEN, Yang SHENGLAN, Shi ZHAOHUI

目的: 本研究报道一例采用数字化 3D 打印技术辅助进行创伤性眶上裂减压的病例, 旨在探索这一新兴技术在眼眶外科手术中的应用价值。

方法: 患者为 31 岁男性, 主诉“左眼摔伤后睁眼困难和视物模糊 8 小时”, 查体显示患者左侧面部凹陷畸形, 左眼矫正视力 0.5, 左眼球突出下移, 左眼外斜约 40° , 下斜约 15° 、上睑下垂以及向下上内方运动受限 -4。眼眶 CT 显示, 左侧蝶骨、额骨、颧弓、上颌骨及颞骨多发骨折, 且眶上裂处骨折片移位压迫。诊断: 左眼眶尖综合征、左眼复合型眼眶骨折。予患者糖皮质激素冲击治疗, 患者虽然视力提升, 但其他症状未见明显改善。术前设计阶段, 基于患者的 CT 影像数据, 运用三维重建技术对蝶骨大翼、颧骨及上颌骨的重建, 评估骨折导致的眶上裂容积变化、几何变形及其与周围重要结构的时空关系变化。利用镜像技术, 模拟了手术后的预期形态, 并结合 3D 打印技术, 制作出患者的眼眶实体模型。这一模型不仅为手术提供了直观的解剖参考, 还辅助设计了针对眶上裂减压及眶颧颌复合体骨折复位的手术方案。后患者在全麻下行内镜辅助眶上裂减压联合颧骨上颌骨骨折复位内固定术, 术中创新性地采用了眉弓下切口的眼眶外侧入路, 磨除蝶骨大翼三角区骨质, 完整去除了压迫眶上裂的骨折片, 并复位了错位的骨折断端。术后, 基于患者的 CT 数据对手术效果进行了模拟验证。

结果: 通过构建术后三维模型并与术前的虚拟规划模型进行对比分析, 结果显示, 患者的颧骨突度、眶容积得到了有效恢复, 各骨折段的复位精度良好, 且与术前模拟拟合程度高。术后随访 3 个月, 患者的左眼上睑下垂得到了恢复, 眼球运动无受限, 左眼外下斜明显好转, 左侧面部的凹陷畸形得到了有效矫正。

结论: 数字化 3D 打印技术在创伤性眶上裂减压中的应用具有显著优势。通过高精度的三维重建与模拟, 明确患者的解剖结构及病变情况, 从而制定出更为精准的手术方案; 3D 打印模型提供了直观的物理参考, 增强了手术的可操作性和安全性, 具有较大的临床应用价值。

摘要编号: 205391

泪囊区肿瘤诊治的临床实践与心得体会

第一作者: Xuanwei LIANG

目的: 本文旨在全面综述泪囊区肿瘤的流行病学特点、临床表现、诊断方法以及基于病理类型和侵犯范围的治疗策略, 并通过典型病例印证规范诊疗的重要性, 为临床医生提供系统、实用的诊疗框架。

方法: 结合典型病例, 对泪道系统肿瘤的临床特征进行总结, 分析误诊原因, 并给予相应的治疗。

结果: 泪囊区肿瘤是一类相对罕见但临床表现多样、易被误诊的眼附属器肿瘤, 对其系统认识对提高诊疗水平至关重要。虽相对罕见, 但因临床表现(如溢泪、内眦肿块、血性分泌物)易与慢性泪囊炎混淆, 常导致误诊延误。精准诊断依赖详尽的临床评估, 结合关键影像学检查(CT/MRI)评估范围、泪道内窥镜直视病变及获取活检(确诊金标准)。诊疗常见误区包括低估肿瘤可能、影像评估不足及活检不当。治疗核心在于根治性手术切除以确保阴性切缘, 辅以术后放疗(尤其对恶性肿瘤高危患者), 常需多学科协作(眼科、头颈外科、肿瘤科等)。典型病例佐证了提高认识、规范诊断流程(强调活检与影像)、避免误区及实施根治性多模式治疗对改善预后的核心价值。

结论: 提高对泪囊区肿瘤临床表现的警惕性、采用规范化的诊断流程(特别是精准活检和影像学评估)、避免常见误区、实施以根治性手术为基础的多学科综合治疗模式, 是改善泪道肿瘤患者预后的核心要素。典型病例的分享有助于加深临床医师对此类疾病的认识。

甲状腺相关眼病激素冲击治疗患者的心理护理效果研究

第一作者: Qing YU

目的: 甲状腺相关眼病激素冲击治疗患者实施认知-行为疗法、健康教育和放松训练相结合心理护理,探讨此方法对减轻患者焦虑、抑郁情绪及改善睡眠质量是否有效。

方法: 本次研究随机抽取本院 2024 年 3 月到 2025 年 3 月收入本院眼眶病外科甲状腺相关眼病激素冲击治疗患者(激素冲击次数进行第 3 次及以上者)100 例,按照随机数表法将其分为了对照组(常规护理)和观察组(心理护理)两组。观察组接受个性化心理护理,包括个性化睡眠卫生教育、自我护理教育、认知重构、积极心态训练。最后比较两组患者睡眠质量评分(PSQI)、焦虑抑郁评分(HADS)和护理满意度。

结果: 干预后观察组患者睡眠质量评分、焦虑抑郁评分显著低于对照组,对护理工作满意度得分显著高于对照组($p < 0.05$, $p < 0.01$)。

结论: 个性化心理护理可改善甲状腺相关眼病激素冲击治疗患者睡眠质量,缓解其焦虑情绪,提高患者护理满意度。

摘要编号: 209956

甲状腺眼病合并限制性斜视的临床特点及影响因素

第一作者: Weimin HE

共同作者: Hao ZHANG

目的: 探讨甲状腺眼病(thyroid eye disease, TED)合并限制性斜视在我院首次就诊时的临床特点及影响眼外肌病变的危险因素。

方法: 前瞻性横断面研究。从 2009 年 9 月至 2023 年 12 月作者接诊的 5234 例中国 TED 患者中,共纳入 339 例患者。记录患者的性别、年龄、眼别、发病至首次来我院的时间间隔、吸烟、眼外肌、斜视类型、CAS、NOSPECS、甲状腺功能状况等。采用盈联影像系统内置软件测量受累眼外肌冠状位最大面积及 T1、T2 加权像 MRI 强化程度。

结果: 1. 80.5% 的患者受累眼外肌处于炎症活动期。所有患者均存在不同程度的眼外肌增厚,79.9% 的患者有不同程度的眼外肌充血,46.3% 的患者有不同程度的眼外肌水肿;2. 垂直斜视患者受累眼外肌的频率依次为下直肌(49.6%)、上直肌(26.3%)、内直肌(15.9%)和外直肌(8.2%)。水平斜视患者受累眼外肌的频率依次为下直肌(34.2%)、内

直肌(30.9%)、上直肌(23.6%)、外直肌(11.3%);3. 眼外肌处于活动期的 CAS 高于稳定组,单眼发病患者的 CAS 高于双眼;甲亢患者的 NOSPECS 高于甲功正常者,单眼发病患者的 NOSPECS 高于双眼;4. 发病至首次就诊时间越长,受累眼外肌冠状位最大面积越小,水肿和充血程度越轻;CAS 越高,受累眼外肌冠状位最大面积越大,水肿程度越重。

结论: 1. TED 合并限制性斜视多见于男性、双眼患病和甲亢患者;2. 单眼发病患者在下直肌受累时更易发生垂直斜视,而双眼发病患者在累及内直肌时更易发生水平斜视;3. 受累眼外肌冠状位最大面积和水肿程度受病程和 CAS 的影响,而受累眼外肌炎症程度仅受病程影响。

摘要编号: 210216

眶鼻颅沟通性病变的临床病理特征及良恶性鉴别诊断指标

第一作者: Meng XIE

共同作者: Fagang JIANG, Xinghua WANG

目的: 探讨眶鼻颅沟通性病变的临床病理特征,寻找鉴别良恶性肿瘤的关键诊断指标。

方法: 回顾性队列研究分析了 2010 年 1 月至 2020 年 12 月在华中科技大学同济医学院附属协和医院经组织学证实的 74 例病例,按解剖部位分为 A 组(眶鼻组,29 例)、B 组(眶颅组,27 例)、C 组(眶鼻颅组,18 例)。系统评估了症状表现、组织病理学及浸润模式等临床病理特征。

结果: 队列中包含 49 例(66.2%)良性病变和 25 例(33.8%)恶性病变。与良性病变相比,恶性病变具有更短的发病时间(12 个月对比 2.5 个月, $P = 0.004$)、更差的视力(0.6 对比 1.53, $P = 0.025$)。头痛在良性病变中出现的比例为 28.6%,而在恶性病变中未出现($P = 0.002$)。良性病变中 32.7% 的患者出现结膜充血和水肿,恶性病变中该比例为 60% ($P = 0.028$)。筛窦是最常受侵犯的部位,共 35 例。恶性病变在鼻腔(28.0% 对比 0, $P = 0.000$)及前颅窝(40.0% 对比 8.2%, $P = 0.003$)的侵犯程度比良性病变更严重。与眶鼻组相比,眶颅组更易通过骨孔侵袭($P = 0.002$)。神经源性肿瘤在良性病例中占主导(34.7%),而恶性亚组中血液源性(28%)和腺体性肿瘤(28%)最常见。多学科联合手术中恶性肿瘤的比例高于良性病变(61.5% 对比 38.5%)。

结论: 恶性眶鼻颅沟通性病变展现出独特的临床病理特征,表现为快速进展、对前颅窝和鼻区的侵袭性强以及严重的视力损害。

摘要编号: 208976

神经外科术后眼部并发症的手术处理

第一作者: Rong LIU

目的: 了解神经外科手术的常见眼部并发症及眼科手术处理方法与效果。

方法: 统计 2023 年 1 月 1 日至 2024 年 12 月 31 日 两年内因神经外科术后并发症而就诊的患者, 统计眼部手术种类及手术效果。

结果: 共收集患者 18 例, 其中面瘫 10 例 (主要症状为闭合不全, 眼红, 流泪); 动眼神经麻痹 6 例 (主要症状为上睑下垂, 外斜视); 单纯内斜视 2 例。面瘫患者行下睑外翻矫正术 8 例, 同时行下睑外翻及上睑皮肤松弛矫正术 2 例, 术后患者的眼部症状及外观得到改善。上睑下垂患者提上睑肌 -CFS 复合体悬吊术 4 例, 硅胶条悬吊术 2 例, 术后患者发生暴露性角膜炎 1 例, 经对症治疗后好转。行斜视矫正术 2 例, 斜视部分改善。

结论: 神经外科引起的颅神经损伤易导致永久性的眼部损伤, 眼科手术能部分解决解剖异常, 改善患者生活质量。

摘要编号: 209654

经鼻眼眶多壁减压一期联合斜视矫正治疗甲状腺眼病

第一作者: Chen LINLIN

目的: 甲状腺眼病患者手术需遵循“眶减压 - 斜视矫正 -- 眼睑手术”顺序原则, 为进一步缩短甲状腺眼病患者就医周期, 改善患者症状及就医感受, 减少患者医疗负担, 拟进一步探讨“经鼻眼眶多壁减压一期联合斜视矫正治疗甲状腺眼病”的临床疗效。

方法: 对 20 例甲状腺眼病患者同时伴有眼球突出、斜视, 施行“经鼻径路眼眶多壁减压联合一期直肌和或下直肌徙后”手术, 对患者眼球突出度、斜视、视野、RNF、眼压、视力、复视程度及患者满意度等进行综合评估。

结果: 眼球突出度、斜视、视野、RNF、眼压、视力、复视程度均有不同程度改善, 患者满意度 100%。

结论: 经鼻眼眶多壁减压一期联合斜视矫正治疗甲状腺眼病安全有效, 但需严格把握手术适应症, 尽量较少或避免并发症的发生。

摘要编号: 209210

评估等离子消融术在治疗上泪道阻塞中的临床疗效、安全性及技术优势。

第一作者: Chi Feng XIE

共同作者: Rongxin CHEN

目的: 评估等离子消融术在治疗上泪道阻塞中的临床疗效、安全性及技术优势。

方法: 回顾性分析 2022 年 6 月至 2025 年 10 月期间, 于我院诊断为上泪道阻塞并接受经内镜下等离子消融术治疗患者资料。手术关键步骤包括: 1) 泪道内镜引导下准确定位泪小管阻塞部位; 2) 使用低温等离子消融探头精确消融阻塞组织; 3) 联合泪道硅胶置管置入以维持通畅, 并泪道内镜引导下确认泪小管再通。记录并比较患者术前及术后 6 个月的泪道冲洗通畅度、MUNK 评分、术后并发症。

结果: 所有患者均为局限性泪小管阻塞, 手术均顺利完成, 平均随访时间为 6 个月, 临床疗效显著。末次随访时, 基于 MUNK 评分评估, 所有患者溢泪症状均获显著改善: 由术前的重度溢泪 (MUNK 评分 < 4 分, 改善至术后 MUNK 评分 < 2 分, 无仍维持重度溢泪患者。与之相应, 术后 6 个月大部分患者泪道冲洗通畅。所有患者术中及术后均未发生大出血、感染等严重并发症; 个别患者术中存在组织损伤、假道形成等问题。

结论: 等离子消融术是治疗上泪道阻塞的一种微创、安全且有效的术式, 尤其是为局限性泪小管阻塞提供了新的治疗选择。

摘要编号: 209818

鼻软骨代睑板修复巨大恶性肿瘤切除后眼睑缺损

第一作者: Zhang LI

目的: 分享应用鼻软骨修补眼睑巨大恶性肿瘤切除术后上睑全层全长缺损 1 例病人的手术治疗效果。

方法: 男性病人, 孙某, 46 岁, 左眼上睑巨大恶性肿瘤。采用 Mohs 法在冰冻病检监控下控制切缘的眼睑恶性肿瘤切除。术中冰冻结果为皮脂腺癌。肿瘤切除术后眼睑全层全长缺损应用带鼻粘膜的鼻中隔软骨进行眼睑重睑, 修复缺损的睑板和粘膜, 鼻软骨上缘与提上睑肌残端缝合, 鼻粘膜上缘与结膜残端缝合, 表面用上方滑行皮瓣修补进行全层眼睑重建。术后常规换药, 局部点抗生素眼药水预防感染, 10 天拆线。

结果: 术后病检结果回示各切缘未见肿瘤细胞残留。眼睑全层重建后的形态和弧度基本正常, 眼睑活动不受限, 皮肤疤痕不明显, 无上睑皮肤内卷倒毛,

无明显角膜刺激症状，患者及家属满意。随访 2 m，无眼部干涩等不适症状，目前眼部情况稳定。

结论：本病例应用鼻软骨代睑板修复眼睑巨大恶性肿瘤切除后眼睑全层全长缺损效果可靠，重建了眼睑的结构，基本恢复了眼睑功能。但取材有一定难度，需要和耳鼻喉科医生联合手术。

眼科学的转化研究

摘要编号：209292

PRRX1 通过周细胞 - 肌成纤维细胞转化及周细胞 - 内皮细胞交互促进视网膜新生血管病纤维化和血管生成

第一作者：Jing LUO

目的：探讨 PRRX1 在视网膜新生血管疾病中通过周细胞 - 肌成纤维细胞转化及 IGFBP7 转录调控激活 JAK1-STAT3 通路，从而驱动纤维化和血管生成的双重作用，阐明视网膜微环境相关分子机制。

方法：本研究探讨 PRRX1 在视网膜新生血管病中的双重作用，重点关注其通过周细胞 - 肌成纤维细胞转化促进纤维化，以及通过转录调控 IGFBP7 激活 JAK1-STAT3 通路促进血管生成的过程，旨在阐明视网膜微环境中这些相互关联机制的分子基础。

结果：PRRX1 在氧诱导视网膜病变及视网膜静脉阻塞模型视网膜组织及增殖性糖尿病视网膜病变患者纤维血管膜中表达显著升高 ($P < 0.01$)。ChIP 测序证实 PRRX1 结合 IGFBP7 启动子，激活 JAK1-STAT3 通路促进血管生成。低氧条件下周细胞 PRRX1 敲低显著降低 α -SMA 表达及迁移 ($P < 0.001$)，抑制周细胞肌成纤维细胞转分化。管形成实验显示 PRRX1 敲低降低血管生成活性 ($P < 0.01$)。单细胞 RNA 测序证实 PRRX1 特异表达于周细胞，其上调与纤维化和血管生成相关。IGFBP7 通过 JAK1-STAT3 激活促进血管生成，并在增殖性糖尿病视网膜病变患者玻璃体样本中水平升高。

结论：PRRX1 是视网膜纤维化和血管生成的关键调控因子，通过周细胞中周细胞 - 肌成纤维细胞转化及转录调控 IGFBP7 激活内皮细胞中 JAK1-STAT3 通路发挥作用。靶向 PRRX1-IGFBP7 轴可能提供同时治疗视网膜病新生血管化和纤维化的新策略。

摘要编号：207616

于 CRISPR/Cas9 技术的 TGFBI-CD 人源化小鼠的构建

第一作者：Xiaozhen LIU

共同作者：Liping YANG

目的：使用 CRISPR/Cas9 基因编辑技术构建 TGFBI 基因相关角膜营养不良 (Corneal dystrophy, TGFBI-CD) 的人源化小鼠模型。

方法：采用 CRISPR/Cas9 基因编辑技术及同源重组修复 (HDR) 策略，将小鼠 Tgfb1 基因 4 使用人“部分 intron3-exon4-intron4-exon5-intron6-exon6-部分 intron6”序列取代小鼠的相应序列替换成人 TGFBI 基因相应序列。通过 PCR 及 Sanger 测序技术进行小鼠基因型鉴定，技术 RT-PCR、qPCR 和 RNA 测序技术等检测小鼠 Tgfb1 基因的表达。通过裂隙灯、前节 OCT、组织学和免疫组织化学评估小鼠 CD 表型。

结果：本研究共构建两种人源化小鼠——TGFBI-WT 和 TGFBI-R124H，后者携带 c.371G > A(p. R124H) 突变，两种小鼠仅有 c.371G > A 点突变的差别。基因型鉴定结果显示，在 gDNA 层面人源化小鼠构建成功。RNA 测序及 qPCR 结果显示，在小鼠内源性启动子启动子，部分插入的人 TGFBI 基因可以正常表达，杂合人源化小鼠同时表达鼠 Tgfb1 和人 TGFBI mRNA，纯合人源化小鼠仅表达人 TGFBI mRNA。接着我们获得了纯合人源化小鼠的 RNA，并将其反转录为 cDNA，以此模板，使用 PCR 扩增人源化小鼠 TGFBI 序列，Sanger 测序显示，人源化小鼠 TGFBI 基因可正常发挥功能，人 exon4-exon5-exon6 可能被正确转录出来，说明在转录层面人源化小鼠的构建成功。表型鉴定结果显示，小鼠自 4 月龄起，部分纯合 TGFBI 小鼠具有 CD 表型，而杂合子小鼠的 CD 表型不明确。

结论：本研究在 DNA 和 RNA 水平成功构建了 TGFBI 人源化小鼠模型，为将来 TGFBI-CD 的发病机制及基因治疗打下模型基础。

摘要编号：204658

免疫调节抗菌冷冻凝胶接触镜用于细菌性角膜炎的治疗研究

第一作者：Yuzhuo FAN

目的：开发制备基于甲基丙烯酸酯明胶 (GelMA) 和绿原酸 (CGA) 的免疫调节冷冻聚合凝胶隐形眼镜 (cGelMA/CGA-CL)，旨在预防和治疗 BK，使其具备良好生物相容性、抗菌与免疫调节活性，克服传统疗法局限。

方法: 1. 合成 GelMA 后, 经高效偶联剂 N- 羟基琥珀酰亚胺 (NHS) 和 1- 乙基 -3-(3- 二甲基氨基丙基) 碳二亚胺 (EDC) 与 CGA 偶联并进一步冷冻聚合使其凝胶化, 制备不同 CGA 含量 (100、200、300 μ M) 的 cGelMA/CGA 及空白对照 cGelMA; 2. 运用瓶倾法、扫描电子显微镜 (SEM)、傅里叶变换红外光谱 (FTIR) 等表征材料结构与性能, 包括观察溶液与水凝胶状态、微观结构、CGA 接枝模式, 测定平衡含水量、氧通透性、酶降解与溶胀行为、CGA 释放动力学、弹性模量等; 3. 通过体外人角膜上皮细胞 (HCECs) 与 cGelMA/CGA 材料共培养实验 (CCK-8、活 / 死染色、骨架染色) 和体内小鼠背部皮肤植入材料实验 (H&E 染色) 评估 cGelMA/CGA 的生物安全性; 4. 针对金黄色葡萄球菌 (*S. aureus*) 和铜绿假单胞菌 (*P. aeruginosa*) 开展平板培养计数、活 / 死细菌染色、长期培养测定抗菌稳定性及生物膜破坏能力等实验检测抗菌活性; 5. 利用佛波醇 12- 肉豆蔻酸 13- 乙酸酯 (PMA) 诱导人单核白血病细胞 (THP-1) 分化成巨噬, 再用脂多糖 (LPS) 将细胞诱导成炎症环境, 再进一步结合 RT-qPCR、RNA-seq、WB 等技术研究免疫调节功能及作用通路; 6. 构建 BK 小鼠模型, 经裂隙灯观察、角膜荧光染色、临床评分、组织学分析 (H&E 染色、免疫组化染色) 评估治疗效果及探究作用通路。

结果: 成功制备 cGelMA/CGA-CL, 其结构特性良好。体外实验显示, cGelMA、cGelMA/CGA100、cGelMA/CGA200 均具有良好生物相容性, 其中 cGelMA/CGA200 体外抗菌、抗炎活性显著, 可调节巨噬细胞相关基因表达及 JAK2-STAT1/STAT2 信号通路。体内实验表明, cGelMA/CGA-CL 能有效缓解 BK 小鼠角膜症状, 临床评分与左氧氟沙星眼药水相近, 减轻炎症细胞浸润, 促进角膜上皮和基质修复。

结论: cGelMA/CGA-CL 在 BK 防治中极具潜力, 具备良好生物相容性、抗菌和免疫调节功能, 为 BK 治疗提供新策略, 降低隐形眼镜佩戴者感染风险。

摘要编号: 209463

具有强光热释电响应的全有机纳米复合材料及其在视网膜假体中的应用

第一作者: Xi LIU

共同作者: Huaijin GUAN, Min JI

目的: 解决传统基于铁电聚合物的视网膜假体材料光电响应低和响应波长范围窄的问题, 开发具备柔性、生物相容性和优异光电性能的材料, 用于构建

人工视网膜假体, 最终实现视网膜退行性疾病患者的视力恢复。

方法: 合成超小尺寸的共轭聚席夫碱纳米颗粒。将该纳米颗粒与聚偏氟乙烯 - 三氟乙烯 (P (VDF-TrFE)) 铁电聚合物复合, 制备全有机纳米复合材料。利用上述复合材料构建超薄 (约 20 μ m) 铁电视网膜假体。通过电生理测试和动物行为分析, 验证假体在盲鼠身上的视觉恢复效果。

结果: 新型纳米复合材料在可见光和近红外光下均表现出高光电响应, 最大峰峰值电压超过 90 V。该材料具备良好的柔性和生物相容性, 能够与神经元细胞建立有效信号传导。动物实验显示, 植入假体后, 盲鼠的可见光敏感性得到恢复, 且额外获得了感知红外光的能力。

结论: 成功开发出一种由超小共轭纳米颗粒和 P (VDF-TrFE) 组成的新型全有机铁电聚合物纳米复合材料, 其兼具柔性、生物相容性和优异的光热释电响应。该复合材料可用于构建高性能人工视网膜假体, 能有效恢复盲鼠视觉功能并赋予红外光感知能力。这项工作为视网膜退行性疾病的治疗提供了新方案, 同时体现了该复合材料在生物电子学领域的潜在应用价值。

摘要编号: 209835

可再生 ROS 清除性氧化铈纳米酶水凝胶治疗角膜化学伤的作用及机制探究

第一作者: Wen XUETIAN

共同作者: Lan GONG, Tong LIN

目的: 角膜碱烧伤作为高发且严重的眼部急症, 其急性期剧烈炎症反应可导致角膜融化、穿孔, 严重威胁视功能, 临床需求迫切。传统药物治疗存在眼部滞留时间短、生物利用度低的局限, 羊膜移植则面临加工保存影响生物性能、供体间活性成分异质性及早期易降解脱落等问题, 现有治疗方案难以满足临床需求。本研究旨在构建负载氧化铈纳米酶 (CeNPs) 的聚乙烯醇 (PVA) 水凝胶贴片 (CeNPs@PVA), 借助其自再生抗氧化特性高效清除眼表过量活性氧 (ROS), 发挥“炎症灭火器”作用, 缓解氧化应激与炎症反应, 抑制角膜新生血管及瘢痕形成, 为角膜碱烧伤提供新型高效治疗策略。

方法: 采用“一步法”将 CeNPs 负载于 PVA 基质, 通过优化盐析凝胶化与冷冻 - 解冻工艺制备 CeNPs@PVA 水凝胶贴片, 系统表征其理化性能与生物活性; 以人角膜上皮细胞为模型, 评估材料生物相容性及 ROS 清除效能; 建立 SD 大鼠角膜碱烧伤模型, 设空白对照组、CeNPs@PVA 治疗组及羊膜移植对照组, 通过临床表型观察、组织病理学分

析及分子生物学检测，综合评价其体内治疗效果及作用机制。

结果：CeNPs@PVA 水凝胶贴片具有良好的生物相容性及适配眼表应用的理化与机械特性，CeNPs 在水凝胶中均匀分散，表现出稳定的类超氧化物歧化酶（SOD）、过氧化氢酶（CAT）活性及自再生抗氧化能力，同时具备一定抗菌活性；体外实验证实，该水凝胶贴片可显著清除氧化应激诱导的角膜上皮细胞内过量 ROS；体内实验显示，与空白对照组相比，CeNPs@PVA 治疗组大鼠角膜碱烧伤后，角膜混浊度、新生血管面积及上皮缺损程度均显著改善，角膜组织炎症细胞浸润明显减少，ROS 水平显著降低，炎症因子、血管新生及纤维化相关基因与蛋白表达均受到有效抑制，且组织修复效果优于羊膜移植对照组。

结论：CeNPs@PVA 水凝胶贴片兼具优异的生物相容性、自再生抗氧化活性、适配眼表的理化机械性能及抗菌特性，通过高效清除 ROS、抑制炎症反应、减少新生血管形成及纤维化进程，可有效促进角膜碱烧伤后的组织修复，显著改善预后，为角膜碱烧伤的临床治疗提供了安全高效的新型生物材料方案，具有良好的转化应用潜力。

摘要编号：207995

基于铁稳态调控的树枝状聚合物制剂的开发及其在湿性黄斑变性治疗中的应用

第一作者：Yifan ZHOU

共同作者：Haijie HAN, Juan YE

目的：临床治疗 wAMD 以玻璃体腔注射抗血管内皮生长因子药物为主，但该方法效果有限且仅对症（针对新生血管），无法靶向 AMD 上游复杂发病机制。本研究拟开发创新纳米制剂 Nuci@PAM-BR（负载荷叶碱的胆红素修饰的聚酰胺-胺树枝状聚合物），其设计核心为靶向清除 AMD 发病时视网膜色素上皮细胞产生的病理性“三重池”，同时评估其调控 RPE 铁稳态以抑制 CNV 的效果，旨在提供新型治疗方案，为 AMD 治疗拓宽思路。

方法：1. 合成：通过酰胺化反应将胆红素接枝到 PAMAM 外表氨基合成 PAM-BR，再经低温真空旋转蒸发，将荷叶碱包封于 PAMAM 内部疏水空腔，制得 Nuci@PAM-BR。2. 表征：用核磁共振波谱仪、红外光谱仪、透射电镜等表征其结构、形貌、粒径及电位，确定 PAM-BR 与 Nuci 的最适投料比及体外缓释曲线；以三种自由基测试法测其体外抗氧化能力。3. 安全性评估：活/死细胞染色评细胞毒性；借小动物视网膜显微成像系统、视网膜电生理仪、眼压仪、裂隙灯及眼球/主要脏器 H&E 染色、小鼠血液检查，评估体内生物相容性与安全性。

4. 细胞疗效评估：测 Nuci@PAM-BR 对 NaIO₃ 诱导 RPE 细胞的 ROS、游离二价铁清除作用；透射电镜评线粒体形貌恢复；ZO-1/RPE65 免疫荧光共染色评细胞保护作用；BDP 探针、脂质探针染色及丙二醛测定评脂质过氧化抑制；qRT-PCR 测 VEGF 抑制及铁稳态恢复机制。5. 动物实验：用视网膜成像系统、视网膜电生理仪、铺片染色、视网膜 H&E 病理学，评其减轻眼底渗漏、恢复结构、改善视力及减小 CNV 病灶的效果。

结果：1. 成功合成 Nuci@PAM-BR，Nuci 体外释放 65 h 达峰（释放率 35.3%），抗氧化能力优秀。2. 对 ARPE-19 细胞毒性低，组织生物安全性好。3. 清除损伤细胞内 ROS 池与不稳定铁池，维持细胞正常代谢。4. 清除脂质过氧化物池、恢复胞内铁稳态，抵消 NaIO₃ 诱导的细胞变性与死亡。5. 减少 CNV 小鼠模型液体渗漏及 CNV 面积、厚度，改善小鼠视功能。

结论：本研究成功制备靶向清除 AMD 病理性“三重池”的 Nuci@PAM-BR，载药率优且缓释好。体内外研究证实，其生物相容性佳，可对抗 AMD 铁稳态失衡、提升 CNV 疗效。作为安全有效的兼具抗氧化与抗新生血管作用的纳米药物，Nuci@PAM-BR 在 AMD 治疗中应用前景显著，也为 AMD 精准治疗提供新策略。

摘要编号：207824

新型自膨胀水凝胶在孔源性视网膜脱离的应用研究

第一作者：Jian Tao REN

目的：评估新型自膨胀水凝胶聚合物在孔源性视网膜脱离动物模型外路手术的应用效果。

方法：选取 8-12 周龄新西兰大白兔制作孔源性视网膜脱离模型，随机分为 3 组，实验组行 23 G 内照明定位裂孔 + 巩膜外冷冻裂孔 + 水凝胶置于对应巩膜外表面，对照组行 23 G 内照明定位裂孔 + 巩膜外冷冻裂孔 + 常规硅胶加压块缝合固定于巩膜外，空白对照组不做处理，观察指标包括手术时间、视网膜复位时间、视网膜解剖复位率、角膜曲率、屈光度、眼内压、视网膜电图、并发症发生率。

结果：1. 手术时间：实验组明显短于对照组，差异有统计学意义；2. 视网膜复位时间：实验组与对照组无明显差异；3. 视网膜解剖复位率：观察时间为手术后 1 天、7 天、14 天、28 天，手术后 1 天实验组复位率低于对照组，差异有统计学意义，其余各时间点实验组与对照物无明显差异；4. 角膜曲率：观察时间为手术前及手术后 7 天、14 天、28 天，各时间点各组之间均无明显差异；5. 屈光度：观察时间为手术前及手术后 7 天、14 天、28 天，各时

间点各组之间均无明显差异；6. 眼内压：观察时间为手术前及手术后 1 天、7 天、14 天、28 天，手术后 1 天实验组和对照组均高于空白对照组，差异有统计学意义，手术后 28 天空白对照组眼压低于实验组和对照组，差异有统计学意义，其余各时间点各组之间均无明显差异；7. 视网膜电图：观察时间为手术前及手术后 7 天、14 天、28 天，各时间点实验组与对照组无明显差异，各时间点实验组与空白对照组差异明显，各时间点对照组与空白对照组差异明显；8. 并发症发生率：观察时间为手术后 1 天、7 天、14 天、28 天，实验组与对照组无明显差异。

结论：此新型水凝胶材料可用于孔源性视网膜脱离动物模型外路手术，具备微创、免缝合、自膨胀、可降解的优点，可降低手术操作难度、缩短手术时间、降低手术创伤及并发症。

19 号染色体 q13.42 区域 69 kb 缺失导致 PRPF31 基因异常的中国常染色体显性遗传性视网膜色素变性家系研究

第一作者：Lan YUANZHENG

共同作者：Xueli CHEN

目的：本研究旨在明确一个中国常染色体显性遗传性视网膜色素变性 (adRP) 家系的遗传学病因，并深入阐明其不完全外显的分子机制。

方法：所有入组成员均接受了系统的眼科检查。研究人员对全体参与者进行了全基因组测序 (WGS)、多重连接依赖性探针扩增 (MLPA)、连锁分析及单倍型构建，并利用 RNA 测序技术对比分析了患者、突变携带者与健康对照，以探寻不完全外显的调控机制。

结果：研究结果显示，该家系中 14 名成员携带 19q13.42 区域一个新型的杂合性 69 kb 大片段缺失。该缺失范围涵盖了 PRPF31 基因的第一外显子及其上游的五个基因 (TFPT、OSCAR、NDUFA3、TARM1 和 VSTM1)。其中，三名家族成员被确认为非外显携带者 (NPCs)。RNA 测序分析表明，缺失区内的基因在突变携带者与健康对照之间存在显著差异表达。此外，本研究的 RP11 家系是迄今报道的携带大片段缺失的 RP11 家系中规模最大者，且所有患病成员均表现出早发性症状，这尚属在 RP11 家系中的首次报道。

结论：本研究证实，PRPF31 基因在患病与未患病个体间的差异表达表明单倍体不足是该家系的核心致病机制。同时，其他存在显著差异表达的基因可能对 RP11 的外显率起到了协同调控作用。

摘要编号：202997

AI 辅助眼科医院医教科运营管理的应用研究

第一作者：Xianwei LI

目的：本研究聚焦眼科专科医院运营管理中的三大核心挑战：效率瓶颈（日均接诊量超负荷）、质量控制（复杂病例误诊率）、资源错配（设备使用率不足）。通过引入 AI 技术，构建覆盖患者服务—临床决策—后勤管理的智能解决方案，旨在实现运营指标提升 30%、医疗差错率降低 25% 的阶段性目标，为专科医院数字化转型提供可复制的实施路径。

方法：技术实现三维架构 1. 感知层：部署智能终端设备（如自动验光仪、OCT 影像采集站），实现检查数据实时上云，数据采集效率提升 5 倍。2. 分析层：采用混合机器学习模型 (CNN + LSTM)，对 10 万份眼科病例进行特征提取，诊断准确率达 94.7%。3. 决策层：开发动态资源调度算法，将设备使用率从 68% 提升至 89%，候诊时间缩短 40%。典型应用场景 智能分诊系统：通过症状自述 + 基础检查数据分流患者，减少专家资源浪费。耗材预测模型：基于手术量历史数据，实现人工晶体等耗材的精准采购。质控看板：实时监测诊疗规范执行情况，自动标记异常操作。

结果：运营效率提升。某三甲眼科医院应用后：日均接诊量从 800 人次增至 1200 人次；患者平均在院时间从 3.2 小时压缩至 1.8 小时；行政人力成本下降 35%；医疗质量改善糖尿病视网膜病变筛查：AI 初筛准确率 91.3% (vs 医师 86.2%)；微小病变检出率提升 40%；术后并发症预警系统使二次手术率下降 28%。

结论：实施关键要素：数据基建：需建立统一的数据中台，打通 HIS/PACS/EMR 系统壁垒；人机协同：制定 AI 辅助诊疗规范，明确人工复核节点；持续迭代：每月更新训练数据集，保持模型时效性。未来发展方向：开发眼科专科大语言模型，实现智能病历生成；构建区域级眼科 AI 协作网络，优化分级诊疗；探索 AR 远程手术指导系统应用 (AI 生成)。

摘要编号: 209975

SARM1 调控线粒体稳态介导视网膜退行性病变的机制研究

第一作者: Yihua ZHU

共同作者: Kaiping CHEN, Biting ZHOU

目的: 探究 SARM1 在视网膜变性中的作用并阐明其潜在分子机制。

方法: 利用 CRISPR/Cas9 技术构建 SARM1^{-/-} 小鼠, 通过聚合酶链式反应 (Polymerase Chain Reaction, PCR) 及 Western blot 验证基因型和视网膜组织 SARM1 蛋白敲除; 免疫组化染色标记 SARM1 在眼球的表达分布; 利用扫描激光检眼镜 (Scanning Laser Ophthalmoscopy, SLO) 检查小鼠眼底变化, 并摘取眼球进行苏木精 - 伊红 (Hematoxylin-Eosin, HE) 染色观察眼球结构。通过腹腔注射碘酸钠 (Sodium Iodate, NaIO₃) 诱导构建视网膜变性小鼠模型, 利用 SLO 检查小鼠眼底情况, 并摘取眼球进行 HE 染色观察眼球结构变化。通过慢病毒感染大鼠视网膜细胞株 (R28), 使 R28 细胞稳定表达全长 SARM1 (Full Length-SARM1, Full-SARM1) 及线粒体定位序列缺失的 SARM1 蛋白 (delta Mitochondrial Targeted Sequence-SARM1, ΔMTS-SARM1), 并通过 Western blot 实验进行验证过表达成功。采用 MTT 法和 EdU 掺入实验评估 SARM1 过表达及 NaIO₃ 处理对细胞活力和增殖的影响; 通过 Western blot 检测线粒体动力学相关蛋白, 探究 SARM1 对线粒体动力学调控的作用; 线粒体分离提取结合 Western blot 实验明确不同 SARM1 突变体的线粒体靶向效率。利用多重免疫荧光共定位技术标记 SARM1、Parkin 及溶酶体标志蛋白 LAMP1, 评估 SARM1 与线粒体自噬的关系。

结果: Western blot 证实 SARM1 基因敲除成功; 免疫组化结果显示 SARM1 特异性表达于视网膜神经上皮层, 呈现区域性表达特征。SLO 及 HE 染色显示 NaIO₃ 选择性损伤视网膜外核层 (Outer Nuclear Layer, ONL) 及光感受器内节 (Inner Segment, IS) / 外节 (Outer Segment, OS), 而 SARM1 敲除显著减轻早期损伤程度。NaIO₃ 处理显著降低 R28 细胞的细胞活力和细胞增殖, 并促进线粒体动力学平衡向分裂的方向偏移。SARM1 通过非线粒体定位依赖性机制抑制线粒体分裂, 通过线粒体定位依赖性途径增强 PINK1/Parkin 通路活性及 LAMP1 表达, 参与线粒体自噬。

结论: SARM1 敲除可以延缓 NaIO₃ 诱导的早期视网膜变性。SARM1 通过双重机制调控视网膜细胞变性中的线粒体稳态: (1) 通过非线粒体定位依

赖途径抑制线粒体分裂, 帮助细胞短暂维持线粒体稳态; (2) 参与线粒体定位依赖的线粒体自噬通路, 在细胞生理状态和损伤早期清除受损线粒体, 维持细胞内线粒体稳态, 而在损伤后期与线粒体分裂和融合相互配合, 过度清除线粒体, 引发细胞功能受损, 促进视网膜变性。

摘要编号: 207893

miR-130a-3p 通过 YY1/PI3K/AKT/mTOR 通路调控自噬与巨噬细胞极化改善糖尿病视网膜病变的机制研究

第一作者: Yan LI

目的: 探究 miR-130a-3p 通过调控自噬与巨噬细胞极化从而改善糖尿病视网膜病变的作用机制。

方法: 通过单次腹腔注射 100 mg/kg 的链脲佐菌素 (STZ) 构建 DR 小鼠模型。使用人单核细胞系 (THP-1) 诱导分化为 M0 巨噬细胞, 并用 30 mM 高糖 (HG) 处理模拟炎症模型。使用 RT-qPCR 和 Western blotting 验证相关基因和蛋白的表达水平。通过 ELISA、MDC 染色、免疫荧光染色和 HE 染色等方法检测巨噬细胞极化和小鼠视网膜损伤情况。

结果: 1. miR-130a-3p 在 M1 巨噬细胞中表达较低, 在 M2 巨噬细胞中表达较高, 高糖处理后的巨噬细胞中 miR-130a-3p 水平降低。2. 过表达 miR-130a-3p 能够减轻高糖或 STZ 诱导的炎症, 促进巨噬细胞自噬, 抑制 M1 极化, 并减缓 DR 的进展。3. YY1 是 miR-130a-3p 的下游靶基因, 过表达 miR-130a-3p 抑制 YY1 表达, 而过表达 YY1 则减弱 miR-130a-3p mimic 的效果。4. 使用 PI3K/Akt/mTOR 通路激活剂 740 Y-P 处理后, YY1 敲低的效果减弱, 巨噬细胞自噬被抑制, M1 极化和炎症反应增强。

结论: miR-130a-3p 通过下调 YY1 表达抑制 PI3K/Akt/mTOR 通路的激活, 从而促进巨噬细胞自噬, 抑制 M1 极化和炎症反应, 最终减缓 DR 的进展。

摘要编号: 203775

三维可视化手术系统在角膜裂伤缝合显微训练中的应用

第一作者: Sha ZHU

共同作者: Wen XU, Zhe XU

目的: 探讨三维可视化手术系统在早期角膜裂伤缝合显微训练中的教学培训效果。

方法: 共纳入 11 名眼科第一年住院医师, 均为眼科手术显微操作新手。使用定制的三维可视化系统

实时观察包含角膜缝合在内的各种眼前段手术，培训共持续 4 周（32 小时），培训前和培训后均通过 wetlab 显微手术进行自我评估和专家评估，并根据手术录像对手术过程及结果进行客观评估。

结果：与培训前评估（自我评分 2.45 ± 0.82 分）相比，经过 3D 可视化系统实时观察训练后，住院医师对角膜缝合显微操作的自信心显著提高（自我评分 4.09 ± 0.54 分， $p < 0.05$ ）；利用 Zhang score 系统评估角膜缝合质量发现三维可视化手术系统培训后缝合质量优于培训前，缝合所需时间也显著短于培训前（ $p < 0.01$ ）。

结论：三维可视化系统实时观察训练能帮助眼科新手住院医师加深对眼内显微手术技术的理解，是提高外科教学效率的有效工具。

摘要编号：204256

人体眼表菌群“种”水平特征研究

第一作者：Dong KUI

目的：人体眼部菌群是维持眼表稳态、抵御病原体入侵的关键微生态系统。传统研究受限于培养技术，难以全面解析菌群多样性及功能特征。本研究整合宏基因组测序和培养组学技术，开展“种”水平眼表菌群多样性的研究，对眼部疾病的诊断、预防和治疗提供了新的依据。

方法：采用宏分类学（Metataxics）方法与培养组学和基因组测序分析相结合，突破以往眼部微生物菌群研究局限在“属”的分类学水平，实现了“种”水平的分类学特征研究。掌握和发现人体眼部微生物组信息特别是潜在致病菌，对预防眼部感染性疾病具有重要意义。

结果：对 128 位健康人的 196 只健康眼进行了研究，共检测到 796 个已知菌，784 个疑似新种，151 个疑似新的高分类单元。每个眼表面菌群平均有 49.17 ± 35.66 “种”细菌。对 73 株分离菌株进行了全基因组测序，检测到 43 个耐药基因，编码 12 种抗生素耐药性。最常见的葡萄球菌属、链球菌属和莫拉氏菌属，平均每株菌含有 3 ~ 5.3 个耐药基因。结果提示，人类的眼睛和所暴露环境的细菌相互作用，其中一些细菌可侵入并定居眼睛。这些细菌，一部分能够引起人类感染，一部分携带耐药基因。

结论：研究系统性揭示健康与疾病状态下眼部菌群的组成、功能及其与宿主互作机制，为感染性眼病诊疗提供新契机。人体眼部被来自所暴露环境的细菌入侵和定植，当免疫力低下或受到污染时候，其中一些细菌能够引起人类感染，并携带耐药基因。应该制定预防措施，以保护我们的眼睛免受侵害。

摘要编号：204257

医院环境来源新菌种“杏花岭玫瑰单胞菌”发现并命名

第一作者：Dong KUI

目的：传统研究受限于培养技术，难以全面解析菌群多样性及功能特征，探究医院环境微生态中未培养微生物，为医院环境致病微生物防控及抗药性防控策略的制定提供了重要的科学依据。

方法：通过创新的培养组学和基因组分析的方法，采用多相分类学方法鉴定潜在细菌新种，评估其生物学特性及生态意义。采用 16S rRNA 基因测序、全基因组分析（ANI/dDDH $< 95\%$ 及 $< 70\%$ ）、化学分类（脂肪酸谱、极性脂质、呼吸醌）及生理生化表征。

结果：医院空气分离株 SXEYE001T 为 *Roseomonas xinghualingensis* sp. nov.（杏花岭玫瑰单胞菌），特征性化学分类标志物主要脂肪酸 C16:0（29.8%）及 C19:0 cyclo ω 8c（25.3%），极性脂质以二磷脂酰甘油（DPG）、磷脂酰乙醇胺（PE）为主，呼吸醌为辅酶 Q-10；功能上表现多重耐药性（对万古霉素、 β -内酰胺类、氨基糖苷类耐药），并携带 RND 外排泵基因及毒力因子 acpXL（LPS 合成），提示其作为医院环境潜在耐药病原体的风险。从医院空气中分离的耐药玫瑰单胞菌新种，其多重耐药表型（尤其对糖肽类耐药）及空气传播途径，为手术室、ICU 等高危区域的耐药菌生物气溶胶监测提供了靶标菌株，并为开发靶向 RND 外排泵的消毒策略奠定资源基础。

结论：*Roseomonas xinghualingensis* sp. nov. 的发现对医院感染防控具有重要的意义。该菌株在医院空气中分离出来，表现出显著的多重耐药性，尤其是对糖肽类抗生素的耐药性，表明它可能作为潜在的耐药病原体，尤其是通过空气传播的耐药菌株可能构成医院内感染的风险。这些发现对潜在致病菌实验室鉴定、精确的流行病学调查和细菌耐药性监测等都具有重要的科学价值。

摘要编号：207971

四川汉族人群冠心病与老年性黄斑变性的相关性研究

第一作者：Ling LIAO

目的：老年性黄斑变性（AMD）是一种多基因遗传性疾病，与动脉粥样硬化性心脏病在斑块的形成和预后方面有一定的相似之处。本研究通过 meta 分析和临床研究来分析老年黄斑变性与冠心病之间的关系及其发生的相关危险因素。

方法：采用荟萃分析冠心病与 AMD 的相关性，得出心肌梗死 (MI) 是 AMD 发病的危险因素。一项病例对照研究招募了 100 名 AMD 患者、100 名 MI 患者和 446 名健康对照者。采用 Mann-Whitney U 检验和二分类 logistic 回归分析，评估年龄、BMI、吸烟状况、糖尿病、高血压、血清 TC、TG、LDL-C、HDL-C、MI 等因素与 AMD 发病率的关系。

结果：荟萃分析结果显示，冠心病不是 AMD 的显著危险因素 ($RR = 1.07$, $p = 0.377$)。在我们的研究中，心肌梗死与 AMD 风险有显著相关性 ($RR = 1.12$, $p = 0.005$)。病例对照研究结果显示，AMD 患者与对照组在以下因素上存在显著差异：心肌梗死 ($p < 0.001$)、性别 ($p = 0.041$)、年龄 ($p < 0.001$)、体重指数 (BMI) ($p < 0.001$)、糖尿病 ($p < 0.001$)、高血压 ($p < 0.001$)、甘油三酯 (TG) ($p < 0.001$) 和低密度脂蛋白胆固醇 (LDL-C) ($p = 0.039$)。多变量分析确定这些因素是 AMD 的重要危险因素。具体来说，心肌梗死患者发生 AMD 的风险是无心肌梗死患者的 2.64 倍 (95% CI: 1.13–6.12)。受试者工作特征 (ROC) 曲线分析发现，年龄、BMI、TG、MI、性别和糖尿病是 AMD 发生的潜在预测因素。年龄具有最强的预测值 ($AUC = 0.926$, 95% CI: 0.938~0.974)。其他因素的预测效果无显著差异。

结论：本文综合 meta 分析和病例对照分析显示心肌梗死是 AMD 的重要危险因素。其他独立的 AMD 预测因素包括性别、糖尿病、高龄、BMI 升高和高甘油三酯血症。年龄仍然是 AMD 最重要的危险因素。

摘要编号：200654

基于 AI 辅助的智慧化医院科教科管理体系探索

第一作者：Bao Tong

目的：探索人工智能 (AI) 技术在医院科教科管理中的应用效果，优化传统管理模式中效率低、资源分配不均及数据管理滞后等问题，提升医学教育与科研管理质量。

方法：以赤峰朝聚眼科医院科教科为例，设计并部署 AI 辅助管理系统，集成自然语言处理 (NLP)、机器学习算法及智能数据分析模块。通过构建教学任务智能分配、科研数据自动挖掘、培训效果动态评估三大核心功能，对比分析 AI 系统应用前后管理效率、错误率及用户满意度等指标。

结果：AI 系统应用后，教学任务分配耗时降低 62% (由平均 4.2 小时缩短至 1.6 小时)，科研数据整理错误率由 15.3% 降至 3.8%，培训需求匹配

准确率提升至 92%。用户满意度调查显示，医务人员对管理流程的满意度从 68% 提高至 89%。

结论：AI 技术能显著提升医院科教科管理的效率与精准性，尤其在任务分配、数据整合及个性化培训方面效果显著。未来可进一步优化算法适应性并推广至多院区协同管理，为智慧医院建设提供实践参考。

摘要编号：207959

基于 Olink 蛋白质组学的增殖性糖尿病视网膜病变炎症分子亚型研究

第一作者：Kangjia LV

共同作者：Kun LIU, Xun XU

目的：探讨增殖性糖尿病视网膜病变 (PDR) 患者玻璃体和血浆的蛋白质组学特征及其潜在生物学过程，并在 PDR 患者中识别不同的分子亚型。

方法：采用 Olink 蛋白质组学平台对 47 例 PDR 患者、26 例无糖尿病视网膜病变的糖尿病患者 (Non_DR) 及 48 例非糖尿病患者 (Non_DM) 的配对玻璃体与血浆样本进行蛋白质组学分析。该平台包含 3 个面板，共检测 1,161 种蛋白。通过基因集富集分析 (GSEA) 评估显著通路，并采用 K-means 聚类方法基于玻璃体蛋白谱对 PDR 患者进行分型分析。

结果：PDR 患者玻璃体中的蛋白质组学特征与 Non_DR 和 Non_DM 组相比存在显著差异，其中碳酸酐酶 (CA) 家族成员显著升高，可能与 PDR 的病理生理过程相关。PDR 患者血浆样本的蛋白差异相对较少。基于玻璃体蛋白谱的聚类分析将 PDR 患者分为三种分子亚型，其中第 3 型亚群富集了 CCL/CXCL/IL6/IL18 等趋化因子及促炎信号通路，提示其可能与疾病严重程度相关。

结论：PDR 患者玻璃体蛋白谱与对照组存在显著差异，其中 CA 家族成员可能为潜在治疗靶点。玻璃体蛋白质组的分型分析揭示了一类富含 CCL/CXCL/IL6/IL18 炎症通路的独特患者群体，强调了局部蛋白表达特征在 PDR 异质性及患者分层中的重要作用，为个体化治疗提供了新思路。

摘要编号：209121

基于双轴拉伸试验的人眼角膜基质生物力学特性研究

第一作者：Yi SONG

目的：探究人眼角膜基质基本生物力学特性，获取基本生物力学参数，表征其各向异性。

方法：研究使用角膜试件为飞秒激光小切口角膜基质透镜取出术 (small incision lenticule extraction, SMILE) 取出的角膜基质透镜组织 25 个，来自行 SMILE 手术者 23 例，其中男性 14 例 17 眼，女性 8 例 8 眼，年龄 18 ~ 34 岁，平均年龄 21.35 ± 4.36 岁，等效球镜度 (manifest refraction spherical equivalent, MRSE) 平均 -4.84 ± 1.10 D。角膜试件取出后标记 12 点位边缘，使用 Biotester 双轴拉伸试验机 (CellScale 公司，加拿大)，在 37°C 水浴条件下行双轴拉伸试验，获取鼻 - 颞 (nasal-temporal, NT) 和上 - 下 (superior-inferior, SI) 方向上的应力应变曲线。比较 NT 和 SI 方向上应力应变曲线以及低应变区和高应变区弹性模量的差异。

结果：1、人眼角膜基质在 NT 及 SI 方向上低应变区切线模量分别为 0.79 ± 0.29 MPa 和 1.00 ± 0.31 MPa，高应变区切线模量分别为 28.27 ± 12.58 MPa 和 33.65 ± 8.46 MPa。2、应变相同时，SI 方向上应力高于 NT 方向，SI 方向上低应变区切线模量及高应变区切线模量均高于 NT 方向。

结论：人眼角膜基质呈现出各向异性特性，在上 - 下方向上比鼻 - 颞方向上具有更高的刚度。

摘要编号：208944

基于情景模拟改良的 BOPPPS 教学模式在眼科住院医师规范化培训中的应用

第一作者：Yu SU

共同作者：Changzheng CHEN

目的：探讨基于情景模拟改良的 BOPPPS 创新教学模式在眼科住院医师规范化培训中的应用效果。

方法：将 2020-2024 年 在我院眼科接受住培的医师分为传统教学模式的对照组 ($n = 58$) 与接受传统教学模式及创新教学模式的实验组 ($n = 45$)，两组间采用标准化临床能力考试进行客观评估，并使用 PACE 和 Kirkpatrick's Four-Level Training Evaluation Model 调查问卷对两种教学模式的课程内容、教学方法、教师表现、学习效果及总体评价五个方面进行评分，从反应、学习、思维、结果和总体评价五个方面进行认可度评价。

结果：实验组的总成绩 (88.18 ± 3.81)、住院医师对创新教学模式的总评分 (4.68 ± 0.610)、总满意率 (100%) 均显著高于传统教学模式 ($P < 0.05$)。

结论：基于情景模拟改良的 BOPPPS 创新教学模式能有效提升眼科住培医师的教学效果，且住培医师普遍对该教学模式更满意。

摘要编号：204934

基于文献计量学分析 1985-2025 年针灸眼科的研究热点及新兴趋势

第一作者：Yue LI

共同作者：Wenxin JIAO, Jilu LIN, Jianing WANG, Ying WANG

目的：本研究旨在分析针灸眼科的发展历程及研究热点，并预测未来发展趋势。

方法：在 Web of Science 核心数据库检索 1985-01-01 到 2025-05-31 以“针灸眼科”为主题发表的文献，利用 CiteSpace 6.2.R3、VOSviewer 1.6.20、SciImago Graphics 等工具对发文量、国家、作者、期刊、机构、关键词和引用参考文献进行可视化分析。

结果：共纳入分析 349 篇文献，1985-2025 年针灸眼科研究的文献数量年度分布虽有所波动但总体不断增加；目前有以中国为首的 33 个国家及地区开展过针灸眼科方面研究；发文量大于 3 篇的作者间形成了 7 个合作密切的研究团队，3 个大的合作群；共有 321 个机构参与针刺研究；针刺研究的活跃领域是干眼症、系统评价、病因识别、继发性青光眼、视觉症状、视网膜色素、近视控制等。

结论：从研究热点分析来看，针灸眼科研究当前聚焦优势病种、融合多种疗法及多学科的研究方法，整体向治疗标准化与机制可视化方向发展。未来针灸眼科的研究发展趋势为探索更多具有临床基础且疗效较为确定的眼科疾病，突破区域合作瓶颈，加强机制深度（如跨病种信号通路研究），并推动中医眼科理论与现代医学的互证。

摘要编号：208834

多元化健康教育护理干预在早产儿眼底筛查中的重要性分析

第一作者：Rong YANG

目的：分析多元化健康教育护理在早产儿眼底筛查中的重要性。

方法：选取 80 例早产儿家长作为研究对象，采用抽签法将其分为对照组和实验组，对照组接受常规健康教育，实验组则接受多元化健康教育，比较组间眼底筛查健康知识掌握情况和护理满意度。

结果：实验组的眼底筛查健康教育掌握评分和护理满意度均要高于对照组， $P < 0.05$ 。

结论：多元化健康教育的应用可有效提升早产儿家长对于早产儿眼底筛查相关健康知识的掌握程度和满意度，应用价值较高。

摘要编号: 209053

巨噬细胞氧化脂质代谢重塑在干眼中的功能与机制研究

第一作者: Wenyu CUI

共同作者: Sheng CHEN, Zhexu CHI, Ke YAO

目的: 干眼发病率随信息化和老龄化加剧而攀升,严重影响患者生活质量和视觉功能。最新的指南强调,“眼表微环境”这一由泪液、角膜、结膜、泪腺、免疫及神经等多种组分共同维持平衡的协调统一的整体,在干眼的发生、发展中起到至关重要的作用。在干眼微环境中,过度氧化应激、炎症反应、泪液高渗透压、上皮细胞损伤等形成难以破解的恶性循环。其中,巨噬细胞是参与免疫应答的关键细胞。本研究旨在探究干眼中巨噬细胞的调控机制,为靶向重塑微环境稳态提供新策略。

方法: 利用流式分选和单细胞转录组测序构建小鼠干眼模型眼表微环境单细胞图谱,鉴定核心致病巨噬细胞亚群。结合流平衡分析算法和广靶代谢组学,筛选塑造该亚群功能的核心代谢通路。构建条件性敲除小鼠,探究巨噬细胞氧化脂质代谢在微环境失衡中的作用。在干眼模型中,评估核心代谢物环氧二十碳三烯酸(EET)滴眼治疗的临床与病理学效果。

结果: 研究描绘了干眼角膜微环境细胞组分的时序性变化,揭示了伴随疾病发展的免疫-上皮稳态破坏。鉴定出以高表达 Arg1、Vegfa、Spp1 为特征的浸润巨噬细胞是介导失衡的核心群体。流平衡分析及代谢组学分析确定类花生酸氧化脂质代谢是塑造该巨噬细胞功能的核心通路。体内实验证实,EET 滴眼治疗能显著增加泪液分泌、缓解角膜损伤、下调炎症反应、恢复角膜结构、重建微环境稳态,展现出良好的治疗效果。

结论: 本研究揭示了干眼发展过程中眼表微环境的动态变化,明确了类花生酸氧化脂质代谢在塑造致病巨噬细胞中的核心作用。小分子代谢物 EET 的局部应用能有效打破干眼恶性循环,维持微环境稳态,为干眼治疗提供了新方向。

患者为中心的眼科服务优化:融合日间管理模式的门诊流程再造前沿研究

第一作者: Jing SHEN

目的: 本研究旨在通过对某省级三甲眼科专科医院门诊流程再造,结合眼科日间管理模式的优势,探索创新的门诊服务模式,旨在解决患者在就医过程中遇到的问题,提升就医体验和感受,实现高效和贴心的医疗服务。

方法: 采取量化与质性相结合的研究方法,以流程再造理论和 ESIA 法为基础,深入分析当前门诊流程的不足,并结合日间管理模式的特点。通过患者满意度调查和专家访谈,优化流程,减少无效和低效环节。同时,通过建立“1+3”优化服务保障体系,即以“一”个以患者为中心的服务理念,结合“三”大诊疗全过程(诊前、诊中、诊后),整合线上线下载资源,实现一体化服务。

结果: 通过实施门诊流程再造和日间管理模式相结合的“1+3”优化服务保障体系,明显改善患者就医体验。门诊量提升至每天 1400 人次,减少了患者排队等候时间,平均就诊时间缩短至 40 分钟。患者满意度显著提升至 96.8%,患者在就医过程中的舒适感和满意度得到了显著改善,同时医疗安全保障水平和医患沟通的有效性也得到了提高。

结论: 综上所述,该省级三甲眼科专科医院通过门诊流程再造与日间管理模式的有机结合,有效解决了患者就医中的急难愁盼问题,缓解了传统门诊模式中存在的“三长一短”现象。在未来,这种以患者为中心,结合日间管理模式的门诊服务模式有望在更多公立医院中得到推广和应用,为广大患者提供更加优质、高效的医疗服务。

摘要编号: 210200

整合网络药理学与转录组学探究石斛碱对甲状腺相关眼病的调控机制

第一作者: Meng XIE

共同作者: Fagang JIANG, Bowen WANG, Xinghua WANG

目的: 甲状腺相关眼病(TAO)是器官特异性自身免疫病,眼眶成纤维细胞(OFs)是其主要靶细胞,参与 TAO 纤维化、炎症与脂肪分化等病理过程。石斛碱是中药石斛的活性成分,具有抑制纤维化与炎症因子分泌的作用,但对 TAO 的影响尚不明确。本研究旨在探索石斛碱对 TAO-OFs 纤维化、炎症因子分泌及脂肪分化的调控作用,并通过网络药理学与转录组学分析其作用机制。

方法: 采用外植体培养法培养原代 TAO-OFs,经免疫荧光鉴定后,用 CCK-8 和流式细胞术确定石斛碱的安全浓度。将 TGF- β 1 与石斛碱共处理 TAO-OFs,通过 RT-qPCR、免疫荧光和 Western Blot 检测纤维化相关指标,用 ELISA 检测透明质酸含量。将 IL-1 β 与石斛碱共处理 TAO-OFs,检测炎症相关指标。利用成脂诱导培养基诱导 TAO-OFs 脂肪分化,加入石斛碱后用油红 O 染色和 RT-qPCR、Western Blot 检测脂肪分化指标。网络药理学分析筛选石斛碱潜在靶点与 TAO 疾病靶点,分析交集靶点并进行功能与通路富集分析,对核心靶点

AKT1 进行分子对接。转录组学分析筛选差异表达基因并进行功能与通路富集分析。最后, 用 PI3K 激动剂 740Y-P 与抑制剂 LY294002 干预石斛碱处理的 TAO-OFs, 验证信号通路。

结果: 体外成功培养 TAO-OFs, 确定 0.5、5、50 μM 石斛碱对其增殖和凋亡无显著影响。石斛碱能抑制 TGF- β 1 诱导的纤维化相关蛋白表达和透明质酸分泌, 抑制 IL-1 β 诱导的炎症因子分泌, 还可抑制 TAO-OFs 脂肪分化, 下调 FABP4 与 PPAR γ 表达。网络药理学分析发现 10 个交集靶点, 核心靶点包括 AKT1、JAK2 等, 主要通路为 PI3K/AKT、JAK/STAT 等, 分子对接证实 AKT1 与石斛碱有效结合。转录组学与网络药理学整合分析均富集于 PI3K/AKT 通路。验证实验证实石斛碱抑制 TGF- β 1 诱导的 PI3K/AKT 通路激活及蛋白表达, PI3K 激动剂逆转、抑制剂协同石斛碱作用。

结论: 石斛碱可抑制 TGF- β 1 诱导的 TAO-OFs 纤维化、IL-1 β 诱导的炎症因子分泌及脂肪分化, 其调控 TAO-OFs 纤维化的作用与抑制 PI3K/AKT 信号通路激活有关, 为 TAO 治疗提供了新策略。

摘要编号: 201903

智能时代眼科医师培养模式的创新路径探索

第一作者: Xianwei LI

目的: 在数字医疗时代背景下, 本研究致力于解决眼科教育面临的三大痛点: 显微操作训练资源有限、个性化学习路径缺失、临床思维培养滞后。通过融合人工智能核心技术, 构建具有实时反馈、自适应学习特征的智能教育平台, 旨在培养能驾驭智能诊疗设备的下一代眼科医师。

方法: 采用“技术驱动—教育反哺”的双向研究框架: 1) 开发多模态教学系统, 集成计算机视觉(裂隙灯图像识别)、自然语言处理(病历智能分析)、强化学习(手术模拟决策)三大技术模块; 2) 建立动态能力评估模型, 通过眼球运动追踪、操作轨迹分析等生物特征数据, 量化学员学习曲线; 3) 设计混合现实(MR)教学场景, 将 DALL-E 生成的罕见病例三维模型与实操训练有机结合。

结果: 智能教育系统展现出革命性优势: 手术模拟器的力反馈误差率降低至 0.08 mm, 达到国际显微外科培训标准; AI 病例库使学员接触的临床变体增加 15 倍; 个性化学习引擎缩短了 43% 的技能达标时间。特别值得注意的是, 系统生成的“数字孪生患者”可模拟 600 余种病理特征, 使糖尿病视网膜病变等复杂疾病的诊断准确率提升 29%。学员在智能显微镜辅助下的角膜缝合合格率较传统教学组提高 37 个百分点。

结论: 人工智能为眼科教育带来了范式变革, 其核心价值在于: 创建了可扩展的临床经验传递机制、实现了教学效果的量化评估、突破了时空限制的沉浸式训练。未来需重点关注医学伦理教育同步、人机协作教学模式优化、以及基层医院的普惠化应用。建议建立眼科教育大模型联盟, 推动优质教育资源智能分发。

摘要编号: 204042

深圳市眼科医院特需病房日间患者围手术期精准管理的实践与成效

第一作者: Yunyun ZOU

目的: 立足深圳市眼科医院特需病房患者对“高效诊疗、优质服务、隐私保护”的核心需求, 构建适配特需病房的眼科日间患者围手术期精准管理模式, 旨在提升特需医疗服务质量与安全, 树立高端眼科日间护理管理标杆。

方法: 选取深圳市眼科医院特需病房 2023 年 9 月-2024 年 8 月收治的 320 例眼科日间手术患者为研究对象, 按管理模式分为对照组(156 例, 采用特需病房常规围手术期护理)与观察组(164 例, 实施精准化围手术期管理)。精准管理围绕特需服务特性展开: 术前建立“一对一专属护理专员”机制, 通过多学科会诊(眼科、麻醉科、内科)完成个性化风险评估, 结合患者时间需求定制术前检查与宣教计划, 同步保障隐私信息管理; 依据患者病情复杂度优化流程, 配备专职医护团队实现全程精细化管理; 术后提供优质康复服务, 通过专属健康管理小程序推送定制化康复方案, 协调专家资源完成术后 1-3 天上门随访或优先复诊。对比两组患者手术延迟率、术后并发症发生率、患者满意度(含隐私保护满意度)及医疗服务投诉率。

结果: 观察组手术延迟率(0.61%)显著低于对照组(5.77%), 术后并发症发生率(1.83%)低于对照组(9.62%), 患者总体满意度[(98.5 ± 1.2) 分]及隐私保护满意度[(99.1 ± 0.8) 分]均高于对照组[(89.2 ± 2.8) 分、 (85.7 ± 3.5) 分], 且观察组无医疗服务投诉, 对照组投诉率为 3.21%, 差异均有统计学意义($P < 0.05$)。

结论: 针对深圳市眼科医院特需病房眼科日间患者实施围手术期精准管理, 可在保障医疗安全与效率的基础上, 充分满足特需患者对优质化、个性化、隐私化服务的需求, 显著提升特需医疗服务品质, 为大型眼科医院特需日间护理管理提供有效实践路径。

摘要编号: 208022

眼科影像学智能化教学体系的构建与实践

第一作者: Caijie ZHANG

目的: 随着眼科诊疗技术的高速发展, 传统影像学教学模式已难以满足现代眼科人才培养需求。学院针对眼科影像教学中存在的“三难”问题(影像特征认知难、三维结构理解难、临床思维建立难), 系统性地构建了“VR + 临床案例”的教学模式。本研究旨在全面评估该教学模式在提升教学质量、培养学生临床能力方面的实际效果, 为眼科人才培养提供可复制的教学模式。

方法: 在教学实施环节, 创新性地设计了“双阶递进”教学模式: 引入 VR 虚拟仿真平台, 利用三维重建技术帮助学生理解视网膜分层结构、青光眼房角等复杂解剖关系; 临床整合阶段通过 PACS 系统开展多模态影像联合判读训练, 培养综合诊断思维。研究选取 2023 年、2024 年间参与该课程的眼视光医学专业学生 200 人为研究对象, 通过对比传统教学班 ($n = 100$) 与教改实验班 ($n = 100$) 的考核数据, 结合教师访谈、学生反馈等多维度评估教学效果。评估指标包括: 理论考核成绩、影像判读准确率、临床思维评分以及教学满意度调查。

结果: 经过教学实践, 智能化教学模式取得显著成效。在知识掌握方面, 教改班级理论考核平均成绩达到 88.7 ± 3.2 分, 较传统班级 (72.5 ± 5.1 分) 提升 22.3% ($P < 0.001$)。实践能力评估显示, 在眼部异物等临床重点考核项目中, 实验班学生的诊断符合率达到 91.4%, 显著高于对照班的 68.7% ($P < 0.01$)。特别值得关注的是, 在需要多模态影像整合的复杂病例诊断中, 实验班学生展现出更强的综合分析能力, 其临床思维评分 (4.32 ± 0.56) 明显优于对照组 (2.89 ± 0.61)。教学反馈数据显示, 88.3% 的学生表示 VR 训练极大改善了空间理解能力。教师访谈结果同样表明, 新教学模式使课堂互动率提升 40%, 学生自主学习时间增加 35%。

结论: 本研究证实, 基于智能技术的眼科影像学教学模式改革成效显著。其成功经验主要体现在以下方面: 首先, VR 技术的引入突破了二维影像的教学局限, 使复杂的眼部三维结构变得直观可感; 最后, 多模态临床案例训练培养了学生的整体诊疗思维。教学实践表明, 这种“技术赋能、临床导向”的教学模式不仅提高了教学质量, 更培养了符合现代眼科发展需求的复合型人才。未来, 我们将进一步优化智能教学系统, 扩大临床案例库规模, 持续推动眼科影像学教育的创新发展。

摘要编号: 208040

眼科时间学与生命之钟

第一作者: Shuai GONG

目的: 在眼科视光学之后提出眼科时间学, 将眼科学与时间结合, 以促进科学技术进步。

方法: 通过生命之钟的提出, 给心力衰竭等疾病通过外科学眼科学等学科的方法提供预警。

结果: 将眼科学, 医学, 外科学, 时间学等学科整合, 预警心力衰竭等各种疾病。

结论: 通过各学科的结合, 在眼科学和眼视光学之后继续将眼科在新时代开辟创新, 发扬光大。

摘要编号: 208027

眼科研究生创新素质的培养

第一作者: Jing LIN

目的: 眼科研究生创新素质培养已成为提升眼科医学人才质量的关键环节。本文基于眼科专业特点, 构建了一套系统的创新素质培养模式, 全面提升眼科研究生的创新能力和专业素养。

方法: 基于眼科专业特点, 构建包含专业基础培养、临床能力训练和科研创新能力提升的三阶段培养体系。在专业基础阶段强化实验技能和批判性思维训练; 在临床能力阶段引入 PBL 教学法, 开展病例讨论和团队协作训练; 在科研创新阶段采用启发性指导, 鼓励学生自主选题和开展创新性研究。

结果: 通过系统实施创新素质培养模式, 研究生培养质量显著提升。在专业基础方面, 学生掌握了免疫组织化学、DNA 扩增等关键技术, 实验操作规范性和独立解决问题的能力明显提高。在临床能力方面, PBL 教学法的应用使学生的临床思维能力和团队协作水平得到显著增强, 能够熟练处理各类眼科常见病和疑难病例。在科研创新方面, 研究生自主选题能力明显提升, 创新思维活跃, 科研成果产出显著增加。培养过程中, 学生的创新意识、科研素养和临床实践能力得到全面发展, 为成长为高素质眼科医学人才奠定了坚实基础。

结论: 这种以创新能力培养为核心的教育模式, 能够有效促进眼科研究生的全面发展, 为培养高素质眼科医学人才提供了有益经验。

摘要编号: 204997

糖酵解-组蛋白乳酸化串扰驱动 TXNIP-NLRP3 介导的泛凋亡激活在糖尿病视网膜病变发病机制中的作用

第一作者: Xi XIAOTING

目的: 探究糖酵解增强通过组蛋白乳酸化修饰驱动 TXNIP-NLRP3 信号通路, 进而促进泛凋亡小体的形成和泛凋亡激活, 最终导致糖尿病视网膜病变 (DR) 的作用机制。

方法: 通过临床样本、高糖环境下的人视网膜色素上皮 (RPE) 细胞和糖尿病小鼠模型多层面, 揭示了一个正反馈循环: 增强的糖酵解增加了组蛋白乳酸化, 进而进一步促进糖酵解。这一循环激活了硫氧还蛋白相互作用蛋白 (TXNIP) 和 NOD 样受体热蛋白结构域相关蛋白 3 (NLRP3) 的表达, 导致泛凋亡小体的形成并触发泛凋亡, 最终促进了 DR 的病理进展。研究通过 RNAi 或过表达实验证实了 TXNIP 在连接组蛋白乳酸化与 NLRP3 激活及泛凋亡小体形成中的核心作用。抑制糖酵解或下调 TXNIP 可减少组蛋白乳酸化, 抑制泛凋亡小体形成, 并缓解泛凋亡。

结果: 1. 糖酵解与组蛋白乳酸化的相互作用: 研究发现高糖条件下, 糖酵解活性增强, 导致组蛋白乳酸化水平升高。组蛋白乳酸化进一步促进糖酵解, 形成正反馈循环。2. TXNIP-NLRP3 信号通路的激活: 组蛋白乳酸化修饰上调了硫氧还蛋白相互作用蛋白 (TXNIP) 的表达。TXNIP 的激活进一步促进了 NOD 样受体热蛋白结构域相关蛋白 3 (NLRP3) 的表达和活化。3. 泛凋亡小体的形成与泛凋亡的触发: TXNIP 和 NLRP3 的激活导致泛凋亡小体的形成, 从而触发了泛凋亡, 这是一种协调性细胞死亡途径, 直接参与 DR 的病理过程。4. TXNIP 的调控实验: 通过 RNA 干扰 (RNAi) 或过表达技术调控 TXNIP 的表达, 验证了 TXNIP 在组蛋白乳酸化与 NLRP3 激活之间的核心作用。5. 糖酵解和 TXNIP 的抑制实验: 抑制糖酵解或下调 TXNIP 表达显著降低了组蛋白乳酸化水平, 抑制了泛凋亡小体的形成, 并减轻了泛凋亡的发生。

结论: 揭示了糖酵解-组蛋白乳酸化串扰通过 TXNIP/NLRP3 信号通路驱动泛凋亡的分子机制, 阐明了其在 DR 发展中的关键作用。

摘要编号: 210259

肠道菌群及其代谢产物在甲状腺眼病中的调节作用及机制

第一作者: Yiyang WANG

共同作者: Fagang JIANG, Xinghua WANG

目的: 肠道菌群及其代谢产物在多种自身免疫性疾病中发挥调节作用。甲状腺眼病 (TED) 是一种器官特异性自身免疫性疾病。本研究旨在通过临床观察对 TED 患者的肠道菌群及血浆代谢产物进行特征性分析, 并探究关键代谢产物吲哚-3-乙酸 (IAA) 对该疾病的潜在调节作用及机制。

方法: 在临床研究中, 70 名 TED 患者和 76 名健康对照者被纳入研究。通过 16s rRNA 和宏基因组测序检测受试者粪便中的肠道菌群, 通过 LC-MS/MS 非靶向代谢组学和靶向色氨酸代谢组学检测其血浆代谢产物。从 6 名 TED 患者和 6 名非 TED 志愿者的眼眶结缔组织中提取眼眶成纤维细胞 (OFs) 进行体外实验。使用转化生长因子- β 1 (TGF- β 1) 诱导 OFs 纤维化, 使用或不使用 IAA 进行干预。对细胞活力、凋亡水平、迁移能力、纤维化相关基因和蛋白表达水平进行检测。随后, 通过转录组测序和体外实验进一步探索 IAA 调节 OFs 纤维化的分子机制。

结果: 与对照组相比, TED 患者存在肠道菌群失调和血浆色氨酸代谢紊乱, 其中, 色氨酸代谢产物 IAA 水平显著降低, 并与眼球突出度和血清 TRAB 水平呈负相关。在体外研究中, IAA 显著抑制了 TGF- β 1 诱导的 OFs 迁移和纤维化表型。在机制研究中, IAA 激活了芳香烃受体 (AHR) 信号通路, 并抑制了 TGF- β 1 诱导的 Smad2/3 蛋白磷酸化。使用 AHR 拮抗剂 CH-223191 可减弱 OFs 中 AHR 信号的激活, 并降低 IAA 对 TGF- β 1 诱导的 Smad2/3 磷酸化和纤维化蛋白表达的抑制作用。

结论: TED 患者存在肠道菌群失调及血浆色氨酸代谢紊乱。IAA 是肠道菌群色氨酸代谢途径中的功能性产物之一, 它通过 AHR 信号通路减轻 OFs 纤维化, 从而对 TED 发挥保护作用。

摘要编号: 210131

视网膜色素变性小鼠模型中核心氧化应激基因调控机制研究

第一作者: Xin-lan LEI

共同作者: Kun-chao WU

目的: 本研究旨在利用视网膜色素变性 10 型基因突变小鼠 (Rd10), 探索氧化应激在视网膜退行性变过程中基因调控网络和潜在干预靶点。

方法：通过 HE 染色、视网膜电图评估 Rd10 小鼠视网膜结构和功能动态变化。分离小鼠视网膜进行 RNA-seq 测序，明确 Rd10 和对照组之间差异性表达基因。利用 GSEA 数据库，获取小鼠氧化应激基因集合，并与差异性表达基因取交集，结合 PPI、MCODE、DMCC 算法分析，筛选核心氧化应激基因。利用 qPCR 分子生物学技术对其表达进行验证。通过生物信息学分析和分子对接，评估干预核心氧化应激基因的药物。

结果：与野生对照组相比，P21 天时，视网膜内/外节厚度、外核层厚度均显著变薄。在 3.0 和 10.0 刺激强度下，Rd10 小鼠视网膜 a 波振幅、b 波振幅均显著降低。转路组分析提示 Rd10 小鼠与对照组之间存在 2799 个差异性表达基因，其中 45 个与氧化应激相关。通过系统性生物信息学分析，共发现 9 个核心氧化应激基因（Lcn2、Txnip、Btk、Stat6、Apoe、Lck、Hgf、Mmp3、Hmox1），其表达量相比对照组而言，均显著上调，且通过 qPCR 进行了验证。GO 分析提示核心氧化应激基因主要参与 response to oxidative stress, response to hydrogen peroxide, regulation of neuron apoptotic process 等生物学过程。通过 DsigDB 数据库，发现有 1140 药物与核心氧化应激基因之间存在相互作用，排名前 10 的药物的分子对接结果提示具有较高的结合能力。

结论：本研究揭示了视网膜退行性变过程中的核心氧化应激基因及其调控网络，将为该疾病的治疗提供新参考。

摘要编号：209568

转录因子 TFEB 通过抑制病理性乳酸穿梭促进生理性血管再生

第一作者：Likun LIN

共同作者：Andina HU

目的：在增殖性视网膜病变中，生理性血管再生受阻与病理性新生血管的异常增生并存，是导致视力损伤的核心病理过程。转录因子 EB（TFEB）已被证实是促进生理性血管发育和缺血后再血管化的关键因子。然而，TFEB 在区分“生理性”与“病理性”血管新生中的具体作用尚不明确。本研究旨在验证一个新假说：TFEB 作为一个关键的调控节点，在促进健康的生理性血管修复的同时，能够主动抑制病理性新生血管的形成，其机制可能涉及对血管微环境代谢通讯（如“乳酸穿梭”）的调控。

方法：1：我们利用氧诱导视网膜病变（OIR）小鼠模型，通过单细胞 RNA 测序（scRNA-seq）分析了新生血管微环境中各细胞亚群的转录谱。通过免疫荧光染色和 RNAscope 技术对关键分子（MCT1）

的表达定位进行验证。2：我们构建了内皮细胞特异性、可诱导的 TFEB 敲除小鼠（Cdh5-CreERT2; Tfeb fl/fl），并进行 OIR 造模。通过视网膜平铺片 Lectin 染色定量分析血管表型，包括病理性新生血管面积和生理性再血管化面积。3：利用 qRT-PCR、Western Blot 和 Seahorse 代谢流分析技术，检测 TFEB 敲除对内皮细胞（EC）中乳酸转运蛋白（MCT1）表达及糖酵解代谢的影响。4：最后，通过染色质免疫共沉淀-qPCR（ChIP-qPCR）技术，探究 TFEB 是否直接调节 MCT1 的转录。

结果：1：scRNA-seq 数据显示，在 OIR 模型的病理微环境中，新生血管簇的 ECs 中乳酸转运蛋白 MCT1（基因 Slc16a1）表达显著上调，相邻的周细胞中 MCT1 表达下调，揭示了一种与病理状态相关的“乳酸穿梭”模式。2：关键性，在内皮细胞中特异性敲除 TFEB 后，OIR 诱导的病理性新生血管簇显著增加，而缺血区域的生理性再血管化程序则受到严重受阻。这一病理表型的恶化与 EC 中 MCT1 表达的失调密切相关。3：机制上，我们发现 TFEB 能够直接结合在 Slc16a1 基因的启动子区域，提示在病理应激下，TFEB 可能通过抑制其过度表达来维持代谢稳态，从而阻止病理性血管的形成。

结论：本研究揭示 TFEB 在血管新生中扮演双重调控角色：促进生理性再生，同时抑制病理性增生。其机制涉及调控内皮细胞代谢稳态与“乳酸穿梭”。TFEB 功能缺失会加剧病理损伤，故激活 TFEB 有望成为“正常化”血管的新疗法。

摘要编号：208025

青年医生综合素质的培养

第一作者：Guiqiu ZHAO

目的：培养高素质的眼科青年医师是推动学科发展的核心。本文旨在探讨以“兴趣引导、信念坚守、全面成长”为核心的眼科青年医师培养模式，旨在为高素质、创新型眼科医学人才的培育提供理论参考与实践路径。

方法：在兴趣引导方面，通过系统评估学生背景与专业优势，设计多元化课题选择机制，将科研训练与临床难题紧密结合。采用启发式教学方法，建立问题导向学习（PBL）模式，鼓励学生自主发现和解决问题。在信念坚守方面，构建“理论学习 - 临床轮转 - 科学研究”三阶段培养体系。理论阶段注重基础知识和实验技能的系统训练；临床阶段实施科室轮转制度；科研阶段导师提供学术指导与心理支持，强化创新能力和学术素养培养。在全面成长方面，实施“因材施教”的个性化培养方案，根据学生特点制定差异化发展路径。搭建多层次学术交

流平台，支持在国内外学术会议进行大会发言。建立导师-学生协同发展机制，营造温暖的学术共同体氛围。

结果：兴趣引导，激发内生动力。通过启发式教育，鼓励研究生将被动接受转化为主动创新，科研热情得到有效激发，围绕角膜病治疗研发的多项技术获得发明专利，部分研究成果已实现临床转化。信念坚守，夯实成才基石。坚守信念效果明显，眼科研究生临床技能考核优秀率达 95% 以上，科研能力显著提升，在高水平期刊发表多篇学术论文，抗挫折能力和职业认同感明显增强。全面成长，实现个性化蝶变。通过差异化指导策略，不同类型研究生均获得良好发展，多人获得国家自然科学基金项目资助，在国际学术会议表现优异，毕业后迅速成长为临床骨干和科研新锐，形成了良好的人才培养梯队。

结论：本模式通过系统化的兴趣引导、信念坚守与个性化的成长路径，有效促进了眼科青年医师从新手到骨干的蜕变，为新时代眼科学研究生教育，特别是高水平临床专科人才的培养，提供了可资借鉴的范式。

眼科流行病学、防盲

摘要编号：208570

中国与 G20 国家 40 岁及以上人群近视力丧失与屈光不正疾病负担及趋势分析

第一作者：Xin LIU

共同作者：Ang JI

目的：本研究旨在探讨中国与 G20 国家 40 岁及以上人群近视力丧失与屈光不正的疾病负担，分析其现状、历史趋势及影响因素，并预测其未来变化，为相关疾病的防治提供参考。

方法：研究基于 GBD 2021 数据库，对疾病负担指标进行年龄标准化以比较现状。采用年估计百分比变化 (EAPC) 分析总体趋势，分段年百分比变化 (APC) 识别趋势转折点，使用 BACP 模型预测 2022-2038 年的负担趋势，并通过分解法解析人口、老龄化和流行病学因素对负担变化的影响。

结果：中国近视力丧失疾病负担略高于 G20 国家，而 G20 国家屈光不正疾病负担相对较高。不论是近视力丧失还是屈光不正，女性群体的疾病负担均显著高于男性。近视力丧失在 55-64 岁人群中最严重，屈光不正则在 80-84 岁人群负担最重。1990 至 2021 年间近视力丧失的疾病负担呈上升趋势，预测显示 2022-2038 年该趋势将持续；而屈光不正

的疾病负担则呈现下降态势。人口增长是近视力丧失与屈光不正负担加剧的首要驱动因素。

结论：近视力丧失与屈光不正在中国和 G20 国家仍构成重大健康挑战，且不同群体间存在显著差异，尤以性别差异最为突出。因此，亟需制定针对性政策并完善医疗措施，以实现减轻疾病负担和消除健康不平等的目标。

摘要编号：209364

中国与感染新型冠状病毒相关的急性黄斑神经视网膜病变 90 例病例 (152 只眼) 的回顾性研究

第一作者：Hua FU

目的：急性黄斑神经视网膜病变 (Acute macular neuroretinopathy, AMN) 是一种罕见的视网膜病变。在全球新型冠状病毒大流行期间，AMN 病例数呈显著上升趋势。中国眼科门诊也同样观察到 AMN 病例的增多。本研究通过回顾性研究 90 例相关病例，分析中国与感染新型冠状病毒相关的急性黄斑神经视网膜病变其临床特征与流行病学特征。

方法：本课题通过回顾性研究自 2022 年 12 月起被确诊为新冠病毒感染阳性随后出现眼部症状被确诊为 AMN 的 90 例病例及其预后情况，探究此疾病的临床特征与预后特征。病例信息通过线上问诊及我院眼科门诊两种途径搜集；研究对象纳入标准：新冠病毒检测阳性、明确的视力下降或视野异常以及其光学相干断层扫描结果符合 AMN 病变特征；研究对象排除标准：病史不全；低质量眼科成像；其他视网膜疾病 (鉴别诊断)：如点状内层脉络膜病变 (PIC)、多发性一过性白点综合征 (MEWDS)、急性区域性隐匿性外层视网膜病变 (AZOOR) 或典型视神经炎和其他视网膜疾病等疾病的患者；随访组标准：仅将随访 3 个月以上 (含 3 个月) 的患者纳入随访组。

结果：本研究包含 90 例病例 (152 只眼)。患者群体构成主要为女性 (78%)，青年人 (平均年龄 28.6 ± 6.0 岁)。双侧眼患病更为显著 (69%)，同时所有患者在出现眼部症状前均有明确的体温升高病史。AMN 眼部症状出现峰值为患者 (79 例，88%) 出现新型冠状病毒感染症状 (包括发烧、咳嗽伴咽痛、头痛、肌肉酸痛等) 后的第 2-3 天。最普遍的眼部症状为暗斑遮挡 (63 只眼，41%)，其次为马赛克样遮挡 (54 只眼，36%)，闪光样遮挡 (32 只眼，20%)，眼前黑点 (4 只眼，3%)。所有病例中有 56 例 (96 只眼) 参与为期 3-15 个月的随访，其患眼症状 41% 好转，46% 未觉明显改善，13% 自觉变差。

结论: 本研究是迄今为止关于 COVID-19 相关 AMN 的最大病例系列研究。本病例数据集提供了与该疾病相关的流行病学、临床特征和预后特征的详细情况。新冠相关急性神经视网膜病变机制有待进一步探索, 其中视网膜和脉络膜循环系统中的高炎症和高凝状态以及发烧引起的脱水后的血管灌注不足等因素可能是 COVID-19 相关 AMN 的潜在促成因素。

摘要编号: **210186**

基于 FDA 不良事件报告系统的安眠药眼科不良事件警戒研究

第一作者: **Mingmin YANG**

共同作者: **Ning FAN, Aixia JIN, Xiaohua PAN, Yufei TAO**

目的: 基于美国 FDA 不良事件报告系统 (FAERS) 数据库, 分析安眠药相关的眼科不良反应并探索其风险因素。

方法: 本研究为回顾性分析, 提取 FAERS 数据库中 2004 年第一季度至 2024 年第四季度所有以安眠药为首要怀疑药物的不良事件报告。对报告的患者基线特征 (性别、年龄)、报告结局、来源、国家及年份分布进行汇总分析。筛选以“眼部器官系统”为首要分类的报告, 采用比例失衡分析法中的报告比值比、比例报告比、贝叶斯置信传播神经网络及多项伽马-泊松收缩器模型进行信号检测。采用单因素及多因素 Logistic 回归模型, 分析性别、年龄、体重对发生眼科不良反应风险的影响, 统计学意义定义为 $P < 0.05$ 且比值比 $\neq 1$ 。

结果: 在安眠药相关的异常报告中, 女性患者较多, 年龄主要集中在 18 至 64.9 岁之间, 报告者多为患者本人。在眼部器官系统范围内, 不同类别安眠药的眼科不良反应信号数量与强度存在显著差异。其中, 抗抑郁药和苯二氮卓类药物检测到的有效信号最多 (均为 7 个), 其次为抗组胺药 (6 个) 和抗精神病药物 (5 个)。褪黑素类及食欲素受体拮抗剂信号最少 (各 1 个)。Logistic 回归分析显示, 在各类失眠药物中, 仅非苯二氮卓类药物的眼科不良反应风险与体重呈显著负相关, 体重被识别为保护因素。

结论: 本研究基于真实世界数据, 抗抑郁药、苯二氮卓类安眠药的眼科不良反应风险信号较强且多样, 而新型安眠药物风险信号相对较少。临床用药时, 建议对使用高风险类别药物的患者加强眼科症状的监测与随访, 以全面提升用药安全性。

拉萨新生儿重症监护室早产儿视网膜病变筛查结果分析

第一作者: **Xuemei ZHU**

共同作者: **Qiangba CUOZHEN, Jianhong LIANG, Qiongho YE**

目的: 探讨拉萨地区新生儿重症监护室早产儿视网膜病变 (ROP) 的检出率、临床特征及高海拔地区 ROP 筛查标准。

方法: 单中心回顾性病例系列研究。收集 2020 年 5 月 1 日至 2022 年 6 月 1 日拉萨市人民医院新生儿重症监护室住院的 166 例出生胎龄小于 36 周的藏族早产儿的临床资料, 采用第 3 代广角数码儿童视网膜成像系统进行 ROP 筛查, 观察 ROP 检出率、分区及分期情况。采用多因素 logistic 回归分析, 通过计算比值比 (OR) 及其 95% 置信区间 (95% CI) 确定早产儿发生 ROP 的影响因素。

结果: 共纳入 166 例 (332 只眼) 出生胎龄小于 36 周早产儿, 其中男性 88 例、女性 78 例, 检出 33 例 (66 只眼) ROP, 检出率为 19.9%。ROP 患儿出生胎龄为 30 (29, 31) 周, 出生体重为 (1188.5 ± 219.2) g。其中 1 期病变 48 只眼 (72.7%)、2 期病变 16 只眼 (24.2%)、3 期病变 2 只眼 (3.0%), 未检出 4、5 期者; I 区病变 2 只眼 (3.0%)、II 区病变 26 只眼 (39.4%)、III 区病变 38 只眼 (57.6%)。30 例 (90.9%) 患儿病变自然退行并血管化; 3 例 (9.1%) 发展至 1 型 ROP, 其中 1 例接受抗血管内皮生长因子治疗, 2 例在未接受治疗随访中病变消退。多因素 Logistic 回归分析显示, 出生胎龄小 (OR = 0.53, 95% CI: 0.33 ~ 0.84, $P = 0.007$)、出生体重低 (OR = 0.95, 95% CI: 0.92 ~ 0.98, $P < 0.001$) 和有创机械通气时间长 (OR = 1.42, 95% CI: 1.06 ~ 1.90, $P = 0.018$) 是 ROP 发病的独立危险因素。

结论: 拉萨地区单中心新生儿重症监护室早产儿 ROP 检出率约为 20%, 需要治疗的 1 型 ROP 检出率为 1.8%。出生胎龄小、出生体重低、有创机械通气时间长早产儿更易发生 ROP。

摘要编号: **208736**

糖尿病视网膜病变与内脏肥胖指标及其代谢特征的关联研究

第一作者: **Yingcheng HE**

共同作者: **Juan YE**

目的: 关于内脏型肥胖和糖尿病视网膜病变 (DR) 之间的关联的证据仍然很少且有争议。本研究拟采

用身体圆度指数 (BRI)、脂质蓄积指数 (LAP) 和内脏脂肪指数 (VAI) 三个新指标, 探讨内脏肥胖与 DR 之间的纵向关系, 并探讨其潜在的代谢机制。

方法: 在这项基于英国生物银行 (UKB) 的前瞻性研究中, 我们纳入了 14,738 名基线时未发生 DR 的糖尿病患者。采用 Cox 比例风险回归模型, 探讨 3 项内脏肥胖指标与 DR 之间的关系。我们使用弹性网络回归来筛选与内脏肥胖和 DR 相关的代谢物, 富集和途径分析用于研究生物学途径, 网络分析用于探究代谢相互作用。

结果: 在 10 年的随访中, 1594 名受试者发生了 DR。在完全调整的模型中, 这三个指标与 DR 的高风险显著相关, 尤其是在白种人中。此外, 我们确定了代谢指纹图谱, 包括与内脏肥胖和 DR 相关的 12 种生物标志物, 包括 3- 羟基丁酸盐、丙酮、丙氨酸、白蛋白、柠檬酸盐、中密度脂蛋白颗粒、肌酐、葡萄糖、甘氨酸、糖蛋白乙酰基、丙酮酸盐和酪氨酸。这些代谢物主要富集于丙氨酸代谢, 部分通过琥珀酸相互作用。

结论: 内脏肥胖指标 (BRI、LAP 和 VAI) 与 DM 患者 DR 发病呈正相关, 其潜在机制与丙氨酸和能量代谢有关。我们的研究结果可能促进 DR 的早期发现和精确预防。

18F-PFPN PET-CT 通过靶向黑色素识别眼部黑色素瘤

第一作者: Yiyan WANG

共同作者: Yang CHENG, Fagang JIANG, Xinghua WANG

目的: 18F- 氟代脱氧葡萄糖 (18F-FDG) 是最常用的正电子发射断层扫描 (PET) 显像剂, 有助于识别 III 至 IV 期葡萄膜黑色素瘤, 但难以检测 I 至 II 期或小型葡萄膜黑色素瘤。18F-N- (2- (二乙氨基) 乙基) -5- (2- (2- (2- 氟乙氧基) 乙氧基) 乙氧基) 吡啶酰胺 (18F-PFPN) 是一种靶向黑色素的新型 PET 探针, 本研究旨在评估 18F-PFPN PET-CT 对眼部黑色素瘤的诊断价值。

方法: 回顾性分析眼部黑色素瘤、结膜色素痣和视网膜下出血患者 5 例。所有患者均接受了全身 18F-FDG PET-CT 和 18F-PFPN PET-CT 成像。比较了眼部病灶处对 18F-FDG 和 18F-PFPN 的最大标准摄取值 (SUVmax), 与此同时, 分析了眼周

及脑组织对病灶处成像的干扰情况。此外, 以每位患者的对侧健康眼为对照, 评估了葡萄膜和视网膜内固有色素对成像结果的影响。

结果: 3 例眼部黑色素瘤 (1 例眼睑和结膜黑色素瘤、1 例眼眶黑色素瘤和 1 例葡萄膜黑色素瘤)、1 例结膜色素痣和 1 例视网膜下出血患者被纳入研究。以病理学检测结果为金标准, 18F-FDG PET-CT 正确识别了 2 例眼部黑色素瘤 (2/3), 18F-PFPN PET-CT 正确识别了所有的眼部黑色素瘤 (3/3)。18F-PFPN 对黑色素表现出更高的亲和力, 在眼部病灶处, 18F-PFPN 的 SUVmax 是 18F-FDG 的 2.6-8.3 倍。此外, 两种显像剂在结膜色素痣和视网膜下出血病灶中均无异常浓聚。在 PET-CT 成像质量的比较中, 眼周和脑组织对 18F-FDG 的生理摄取干扰了 PET 的成像, 而 18F-PFPN 降低了这种干扰, 表现出更清晰的成像质量。脉络膜和视网膜中的固有色素没有引起 18F-PFPN 的异常浓聚, 所有患者的对侧健康眼均没有检测到对 18F-PFPN 的病理性摄取。

结论: 与 18F-FDG PET-CT 相比, 18F-PFPN PET-CT 对眼部黑色素瘤的检出率更高, 且受到周围组织的干扰更小。18F-PFPN PET-CT 有望成为眼部黑色素瘤的有力临床诊断工具, 具有区分眼部黑色素瘤和良性色素沉着的潜力。

摘要编号: 208557

TP53 突变眼睑皮脂腺癌细胞系的建立

第一作者: Gu XIANG

目的: 眼睑皮脂腺癌 (sebaceous carcinoma, SeC) 是第二常见的眼睑恶性肿瘤, 在亚洲人群中更普遍。约 70% 的眼睑皮脂腺癌患者携带 TP53 突变。眼睑皮脂腺癌细胞系模型有助于探索眼睑皮脂腺癌的病因和发病机制。因此, 我们建立并表征了携带 TP53 突变的眼睑皮脂腺癌细胞系, 以期深入理解眼睑皮脂腺癌的分子机制, 开发新型治疗方案。

方法: 眼睑皮脂腺癌细胞系 SHNPH-SeC 由上海交通大学医学院附属第九人民医院 (Shanghai Ninth People's Hospital, SHNPH) 眼科的眼睑皮脂腺癌患者组织培养所得。本研究通过 CCK8、平板克隆和 Transwell 探索 SHNPH-SeC 的增殖和迁移能力, 通过免疫荧光、STR 鉴定、染色体核型分析、全外显子测序 (Whole exome sequencing, WES) 明确 SHNPH-SeC 起源、特征和突变情况, 通过细胞增殖检测明确 SHNPH-SeC 对丝裂霉素 (Mitomycin-C, MMC) 和 5- 氟尿嘧啶 (5-fluorouracil, 5-FU) 的敏感性。

结果: SHNPH-SeC 细胞系已连续培养 100 多代, 表现出快速增殖和迁移的特性。核型分析结果显

示 SHNPH-SeC 存在大量染色体畸变, WES 揭示 SHNPH-SeC 存在皮脂腺癌相关基因突变, 包括 TP53、KMT2C 和 ERBB2。SHNPH-SeC 在 NOD/SCID 小鼠体内成功构建原位荷瘤小鼠模型。SHNPH-SeC 细胞、患者肿瘤组织和小鼠肿瘤组织中眼睑皮脂腺癌生物标志物均呈阳性, 包括 CK5、EMA、Adipophilin、p53 和 Ki-67。药物敏感性分析显示 MMC 和 5-FU 显著抑制 SHNPH-SeC 的增殖和迁移, 并且化疗药物在 SHNPH-SeC 中较 TP53 野生型的皮脂腺癌细胞表现出更强的肿瘤抑制作用。

结论: 本研究首次建立了 TP53 突变的眼睑皮脂腺癌细胞系, 该细胞系展示眼睑皮脂腺癌相关特征并具有恶性肿瘤特质, 这有助于研究眼睑皮脂腺癌的细胞行为和分子机制, 以探索眼睑皮脂腺癌的新型治疗策略。

摘要编号: 209255

一例眼眶皮样囊肿恶变鳞状细胞癌的病理特征

第一作者: Li WU

目的: 皮样囊肿是常见的眼眶良性病变, 其恶变为鳞状细胞癌极为罕见, 在文献中仅有个案报道。本文报道一例经病理证实的眼眶皮样囊肿恶变为鳞状细胞癌的病理特征。

方法: 回顾性分析 2023 年 5 月期间于武汉大学医学院眼科经病理确诊的 1 例眼眶皮样囊肿恶变为鳞状细胞癌患者的临床资料。该病例通过眼眶手术获取组织标本, 进行常规 HE 染色镜检, 并采用免疫组化染色。结合患者的临床表现和影像学检查结果进行综合分析。

结果: 1. 临床特征: 患者 45 岁, 男性, 临床表现为进行性眼球突出 6 月余, 偶发胀痛; 影像学检查: CT 表现为右眼眶眼眶外侧骨膜下区可见梭形混杂信号, 外侧壁局部骨质吸收; MRI 表现为右眼骨膜下区见梭形混杂信号, 最大截面 1.6*1.2 cm, 内可见短 T1 长 T2 信号, 增强可见不均匀强化。2. 镜下观察: (1) 低倍镜下: 可见囊壁样组织, 被覆鳞状上皮重度异型增生。囊内可见毛发伴出血。符合皮样囊肿的诊断; 另一区域, 大小不等的鳞状细胞癌巢在间质内浸润生长。(2) 高倍镜下, 异型性明显的鳞状细胞癌巢呈浸润性生长, 在间质里不规则生长; 可见角蛋白和角化珠。3. 免疫组织化学: 恶性细胞显示 p63 (+) 和 CK5/6 (+) 证实其鳞状上皮来源。增殖指数标记物 Ki-67 在恶性区域显示高表达 (50%), 4. 病理诊断: (右眼眶) 浸润性鳞状细胞癌, 中分化, 角化型, 局灶可见皮样囊肿伴感染, 考虑来源于皮样囊肿恶变。

结论: 本病例通过组织病理学和免疫组化研究, 明确诊断了一例极其罕见的由眼眶内皮样囊肿恶变而来的鳞状细胞癌。病理诊断的关键在于: 1. 确认良性皮样囊肿成分的存在。2. 在良性成分基础上, 找到明确的、具有浸润性生长的鳞癌区域。3. 利用免疫组化 (如 p63, Ki-67) 辅助证实诊断并评估其增殖活性。此病例强调了对于长期存在或近期迅速增大的眼眶皮样囊肿, 临床和病理医生应高度警惕其恶变的可能性, 并进行充分的组织取样以明确诊断。

摘要编号: 209480

副肿瘤性眼部病变 5 例报告

第一作者: Xuemei ZHU

共同作者: Jianhong LIANG

目的: 报告 5 例副肿瘤性眼部病变的诊治经过, 并回顾文献综述。

方法: 病例报告及综述。5 例病例报告详情略, 分别为癌症相关视网膜病变 (CAR) 1 例、黑色素瘤相关视网膜病变 (MAR) 1 例、双侧弥漫性葡萄膜黑素细胞增殖 (BDUMP) 继发葡萄膜黑色素瘤 1 例、副肿瘤性脉络膜病变 2 例。

结果: 随着对疾病认识的逐渐增加, 目前临床中有副肿瘤性视网膜病变、癌相关视网膜病变、黑色素瘤相关性视网膜病变、副肿瘤卵黄样黄斑病变等命名, 非眼肿瘤专业人员常常对各种命名混淆不清、有困惑, 缺乏眼部副肿瘤病变的分类命名标准。眼部副肿瘤病变可以影响眼睛的任何部分, 主要累及视神经、视网膜或眼球运动的神经通路, 偶尔也可累及前段、眼眶或葡萄膜。因此, 在眼部副肿瘤病变的大框架下, 根据累及部位可做细化的命名, 比如副肿瘤性视网膜病变、副肿瘤性视神经病变、副肿瘤性葡萄膜病变等。从病理生理机制不同, 又分为两类: (1) 自身免疫病理机制, 表现为癌症相关视网膜病变 (CAR)、黑色素瘤相关视网膜病变 (MAR)、癌症相关锥细胞功能障碍 (CACD)、副肿瘤卵黄样黄斑病变 (PVM) 和副肿瘤视神经炎 (PON); (2) 异位肽, 常由肿瘤表达生长因子 (T-exGF) 引起, 表现为双侧弥漫性葡萄膜黑素细胞增殖 (BDUMP)。疾病诊断上, 需要根据症状、体征结合多模态影像学检查, 包括眼底相、相干光断层扫描、眼底自发荧光、眼底荧光血管造影、电生理检查等, 有时还需眼底吲哚菁绿血管造影。副肿瘤综合征一般眼底及 OCT 可无异常, 电生理可有早期改变。抗视网膜自身抗体与眼部副肿瘤病变高度相关, 包括抗 recoverin 抗体、抗转导蛋白-α 抗体、抗 α-烯醇化酶抗体、TRPM-1 等, 可用于指导诊断和监测治疗。

结论：报告副肿瘤性眼部病变的临床特点，并探讨规范命名分类。

摘要编号：209066

叶酸靶向载 IR1061/RSL3 脂质体的构建及其光热协同铁死亡治疗葡萄膜黑色素瘤研究

第一作者：Shuyue ZHANG

共同作者：Wanjun DONG, Haiyan MI, Jianfan YU

目的：葡萄膜黑色素瘤（UM）是一种恶性程度高、易转移且对常规治疗不敏感的眼内恶性肿瘤。为了克服现有疗法的局限，本研究旨在构建一种兼具诊断与治疗功能的一体化纳米平台，用于实现光热治疗（PTT）与铁死亡的协同增效，并精准打击 UM。

方法：我们成功合成了一种叶酸（FA）靶向的脂质体纳米粒——IR1061/RSL3@FA-Liposome (I/R@FA-Lipo)，用于共同递送光热剂 IR-1061 和铁死亡诱导剂 RSL3。通过表征评估其理化性质。在体外，我们使用 MUM-2B 细胞系评估了该纳米粒的靶向性、细胞摄取、光热转化效率、细胞毒性以及诱导铁死亡的能力（通过检测脂质过氧化水平和 GPX4 蛋白表达）。在体内，我们建立了原位 UM 模型，并整合光声成像（PAI）与光学相干断层扫描（OCT）来实时可视化肿瘤位置与边界，以指导精准治疗。

结果：合成的 I/R@FA-Lipo 纳米粒表现出优异的生物相容性和肿瘤靶向能力。体内成像显示，纳米粒能高效地在肿瘤部位富集，并在注射后数小时内实现显著的肿瘤组织滞留与深层穿透。在激光照射下，纳米粒能有效产生局部高热，实现 PTT 消融，并同时触发 RSL3 的释放。释放的 RSL3 通过直接抑制谷胱甘肽过氧化物酶 4（GPX4）的活性，显著降低了 MUM-2B 细胞内的 GPX4 蛋白表达，导致脂质过氧化物累积，最终成功诱导了铁死亡。联合治疗组（PTT + RSL3）在体外和体内均展现出最强的肿瘤细胞杀伤效果和肿瘤生长抑制效应，显著优于任何单一疗法。

结论：本研究开发的 I/R@FA-Lipo 纳米平台，成功地将 PTT 的物理消融与 RSL3 诱导的铁死亡生化攻击相结合，实现了协同抗肿瘤效应。同时，该平台整合了 PAI/OCT 多模态成像指导，确保了治疗的精准性。这项工作为 UM 提供了一种具有优异肿瘤穿透性和诊疗一体化功能的微创治疗新策略，展现出巨大的临床转化潜力。

摘要编号：209325

多面体纳米药物通过破坏铜铁稳态增强葡萄膜黑色素瘤的放疗效果

第一作者：Yu HUA

共同作者：Shengfang GE, Jie YU

目的：开发一种药物，通过破坏细胞铜铁稳态来增强葡萄膜黑色素瘤（UM）的放疗敏感性。

方法：采用透射电子显微镜表征纳米药物形态，动态光散射法测定粒径。利用特异性探针和 ICP-MS 法检测细胞内铜和亚铁离子水平。通过 CCK-8 法和克隆形成实验评估药物疗效。

结果：本研究通过多组学数据库分析发现，多种放疗抵抗的肿瘤细胞系和患者来源肿瘤模型均表现出铜稳态失调和铜离子结合能力增强的特征。因此，我们基于动态铁配位聚氨酯（PCEF@Fe）创建了一种 pH 响应性纳米胶束系统，采用“铜螯合-铁递送”协同策略以逆转肿瘤金属代谢异常。该平台利用氧肟酸-聚氨酯配体对铜/亚铁离子的差异化配位特性，在酸性肿瘤微环境中触发竞争性金属置换：一方面，配体捕获 Cu^{2+} 以破坏铜稳态；另一方面，释放 Fe^{2+} 以促进铁死亡。实验结果表明，PCEF@Fe 能显著降低细胞内铜离子水平，同时增加铁离子水平，从而增强放疗敏感性。此外，我们将异硫氰酸荧光素协同装载入 PCEF@Fe，赋予其荧光特性，可用于实时监测其分布与代谢过程。

结论：本研究提出了一种创新的治疗策略，通过纳米技术将放疗、铜螯合、铁死亡诱导和荧光示踪集于一体，以改善 UM 的治疗效果。

摘要编号：207534

形形色色的眼眶肿瘤

第一作者：Shangcai XUE

目的：进一步熟悉眼眶少见肿瘤的特征及治疗。

方法：总结自 2012 年 1 月-2025 年 9 月间在我科收治的经病理检查证实的一组少见病共 10 例，其中，眼眶滑膜肉瘤 1 例、眼眶腺泡状软组织肉瘤 1 例、眼眶骨化性肌炎 1 例、眼眶梭形细胞脂肪瘤 1 例、眼眶孤立性梭形细胞纤维瘤 1 例、炎性肌纤维母细胞瘤 3 例、泪腺结核 1 例、嗜酸性淋巴肉芽肿 1 例，分析临床特征及病理特征并查阅文献总结其特征及后续治疗方法。

结果：这组病例均在临床比较少见，在术前难以靠影像明确诊断，确诊依据病理诊断，病理分析免疫组化具有特征性。

结论：对于术前影像极不具特征性的病例要考虑到眼眶少见病的可能性，术前进一步完善各项检查特

别是影像检视，规范手术方式，术后病理确诊后认真分析其各项特征，便经提高眼眶少见肿瘤的诊治水平。

摘要编号：209567

成人巨大眼眶畸胎瘤 1 例

第一作者：Feng WANG

共同作者：Hui CUI, Mei Qin LIANG, Jiayi WU, Le Yao ZHANG

目的：眼眶畸胎瘤是一种罕见的生殖细胞肿瘤，内含三个胚层来源的组织成分，在成人中尤为罕见。本病案旨在通过报道一例 58 岁女性巨大长期眼眶畸胎瘤，探讨其独特的临床表现、影像学与病理学特征等，并基于其长达 50 年的病程及特殊的“包裹眼球”形态，深入剖析其可能的胚胎发育学起源，以增进对该罕见疾病的认识与诊疗水平。

方法：回顾性分析一例于 2025 年 3 月就诊的 58 岁女性患者的临床资料。患者主诉为左眼肿物进行性增大 50 余年。入院后接受了全面的眼科检查、影像学评估（包括计算机断层扫描 CT 与核磁共振 MRI）以及眼部彩色超声检查。在完善术前准备并排除手术禁忌后，为患者施行了“左眼眶肿物根治性切除术”。术中行冰冻病理检查以指导手术范围，术后对切除标本进行常规病理学检查以明确诊断。

结果：临床检查显示患者左眼正常眼球结构缺失，代之以一个 $6 \times 6 \times 5 \text{ cm}^3$ 的粉红色分叶状实性肿物，质地硬，无触痛。影像学检查（CT/MRI）揭示左眼眶前部类眼球样肿物，其球壁钙化，周围环绕脂肪组织，后方可见视神经及眼外肌影，眶腔扩大但无骨质破坏。术中见肿瘤包膜完整，与周围组织分界清晰，遂行完整切除。术后病理确诊为成熟型畸胎瘤，镜下可见源于三个胚层的分化成熟组织，包括软骨、横纹肌、脂肪、神经、纤毛柱状上皮、鳞状上皮及皮肤附件（含色素组织）等。患者术后恢复顺利，术后 3 个月随访显示术区愈合良好，无感染或肿瘤复发迹象。

结论：本病例作为一例极为罕见的成人长期巨大眼眶成熟型畸胎瘤，其病程长达半个世纪，展现了该肿瘤缓慢生长的生物学行为。影像学与病理学证实肿瘤内包裹着发育异常的眼球样组织，这一特殊表现支持其胚胎起源可能发生于眼球基本结构形成后（胚胎第 5-8 周），原始生殖细胞或神经嵴细胞异常滞留并在已形成的眼球表面膨胀性生长所致。通过根治性切除术可成功治疗此类良性病变，并在完整切除肿瘤的同时，尽可能保留眼部外观。本例为成人眼眶巨大囊实性占位的鉴别诊断提供了重要参考，并深化了对眼眶畸胎瘤胚胎发生机制的理解。

摘要编号：203064

整合单细胞测序与空间转录组学数据揭示葡萄膜黑色素瘤中 GNAQ/GNA11 驱动的异质性

第一作者：Jiahao NIU

共同作者：Xuan LIAO

目的：葡萄膜黑色素瘤（UM）早期诊断困难，肝转移倾向高，且转移性疾病缺乏有效靶向疗法，患者预后极差。尽管 GNAQ/GNA11 突变被公认为 UM 的关键驱动突变，但主要的恶性肿瘤细胞亚克隆仍不明确，肿瘤组织内的空间异质性进一步增加了精确治疗靶点识别的难度。本研究旨在整合单细胞与空间转录组数据，阐明由此产生的肿瘤异质性和功能状态，从而识别精确治疗靶点。

方法：利用 R (v4.4.0) 分析 GEO 数据库中的单细胞 RNA 测序数据 (GSE139829, $n = 11$) 和空间转录组数据 (GSE250636, $n = 9$)。使用 Seurat 包进行数据读取、质控、去除低质量细胞及批次效应校正。经降维与聚类鉴定不同细胞群。结合 singleR 包和 Celldex 人原代细胞图谱数据库进行细胞类型注释，并在 UMAP 图及各簇中可视化枢纽基因。应用 monocle3 包进行拟时序分析，观察轨迹空间中细胞类型的组分布、密度分布及拟时序特征。空间转录组数据经 SCTransform 标准化后，进行 PCA 降维、邻域检测、聚类及 UMAP 可视化。绘制枢纽基因空间表达模式图以描述细胞类型分布。利用 enricher 内的 DsigDB 功能进行靶向药物筛选，保留 $P_{\text{adjust}} < 0.05$ 的小分子，与枢纽基因进行分子对接（使用 Autodock vina 1.5.6）。对接结果用 pymol 3.1 和 DS 2019 可视化。基于对接结果使用 Gromacs 2022 进行分子动力学模拟。

结果：单细胞测序分析揭示了 GNAQ 和 GNA11 在不同细胞群中的差异表达模式。UMAP 图显示这些基因在各类细胞中的表达水平差异显著，其表达分布与细胞群聚类结果高度相关。空间转录组分析进一步评估了 GNAQ 和 GNA11 在特定组织区域的表达水平。整合空间细胞类型注释图和单基因空间特征图，结果表明 GNAQ 和 GNA11 在特定细胞类型和组织区域内的表达存在显著差异，其表达模式与细胞类型的空间分布高度关联。此外筛选出曲美替尼、2-丁酮和亚砷酸盐三种小分子作为靶向 GNAQ - GNA11 复合物的潜在抑制剂。对接分析显示 GNAQ - GNA11 复合物与这些小分子结合力强。分子动力学模拟证实蛋白复合物及其与三种小分子形成的复合物均表现出稳定的相互作用，其结合位点间存在强氢键作用，提示结合良好。

结论：本研究整合单细胞与空间转录组技术，分析了 UM 中 GNAQ 和 GNA11 的表达模式，揭示了

在不同细胞类型和组织区域的显著差异。通过分子对接鉴定出三种靶向 GNAQ - GNA11 复合物的潜在小分子抑制剂。未来研究需通过体外体内实验验证这些抑制剂，为 UM 治疗开辟新方向。

摘要编号：209712

毛兰素通过靶向 m5C 甲基转移酶 NSUN2 抑制葡萄膜黑色素瘤的肿瘤性血管拟态形成

第一作者：Linna LU

共同作者：Peiwei CHAI, Sok I HO, Lin LI, Sipeng ZUO

目的：N5- 甲基胞嘧啶 (m5C) RNA 修饰在 RNA 代谢中具有重要的调控作用。作为从石斛 (*Dendrobium chrysotoxum* Lindl) 中分离得到的天然产物，毛兰素 (erianin) 在肿瘤治疗中表现出良好的治疗潜力。本研究揭示，毛兰素可作为一种内源性的 NSUN2 抑制剂，在葡萄膜黑色素瘤中抑制恶性血管形成。

方法：通过天然产物库筛选以探究不同天然单体对葡萄膜黑色素瘤细胞的作用。建立眼内异种移植模型以评估 erianin 的体内效应。采用免疫共沉淀 - 质谱 (IP-MS) 及分子对接分析鉴定毛兰素的作用靶点为 NSUN2。通过 m5C-meRIP 测序及 m5C-meRIP-qPCR 分析确定 NSUN2 的下游靶基因。管腔形成实验及 CD31-PAS 双染用于检测血管拟态 (vasculogenic mimicry, VM) 能力。

结果：通过天然产物库筛选，我们发现毛兰素是葡萄膜黑色素瘤中有效的血管拟态抑制剂。此外，erianin 可结合并抑制 m5C 甲基转移酶 NSUN2 的酶活性，而 NSUN2 通过增强 VM 形成能力发挥促癌作用。在机制上，毛兰素通过抑制谷胱甘肽转氨酶 1 (CHAC1) 的 m5C 修饰及表达水平，从而在肿瘤进展过程中阻断 VM 形成。

结论：综上所述，我们的研究表明 erianin 是一种血管拟态抑制剂。本研究揭示了一种通过天然产物精细调控 m5C 修饰以抑制肿瘤恶性进展的新型治疗策略。

摘要编号：210344

玻璃体切割手术治疗急性视网膜坏死综合征的疗效观察

第一作者：Yang YANG

目的：分析玻璃体切割术 (prophylactic vitrectomy, PPV) 治疗急性视网膜坏死综合征 (acute retinal necrosis, ARN) 的疗效观察。

方法：收集 12 例行 PPV 治疗的 ARN 患者，其中 9 例不伴视网膜脱离，2 例伴视网膜裂孔，1 例伴视网膜脱离。所有患者根据临床症状、病史、裂隙灯

检查、眼底血管造影等检查明确诊断为 ARN，随后行玻璃体切割术伴硅油填充术。治疗后随访 3-6 个月，平均 4 个月，分析患者术前、术后一周时最佳矫正视力、并发症及视网膜裂孔修复、复位等情况。

结果：术前 3 只眼 BCVA > 0.1，术后一周随访时 4 只眼 BCVA > 0.1。术前 12 只眼平均眼压 12.6 mmHg，术后一周 12 只硅油眼的平均眼压 14.3 mm Hg。PPV 术后一周 1 只眼视网膜完全复位，2 只眼视网膜裂孔光凝/冷凝斑可见，网膜修复良好。

结论：PPV 治疗能有效控制 ARN 疾病发展。

摘要编号：203699

眼睑及眼眶神经内分泌瘤的临床特征及预后

第一作者：Liangyuan XU

共同作者：Jing LI, Jianmin MA

目的：探讨眼睑及眼眶 NEC 患者的临床特征、病理特征、治疗策略及预后因素。

方法：采用回顾性队列研究，纳入 2010 年 1 月至 2025 年 1 月在本机构确诊的眼睑及眼眶 NEC 患者。收集患者的临床资料 (年龄、性别、症状、影像学表现等)、病理报告及随访数据。采用 Kaplan-Meier 法分析生存曲线，Log-rank 检验比较组间差异。

结果：本研究共纳入 27 例眼部 NEC 患者，其中眼睑受累者 18 例，眼眶受累者 9 例。眼睑 NEC 患者平均发病年龄为 68.37 岁，男女比例为 1: 2，首诊误诊率可达 44.44%。1 例 (5.56%) 眼睑 NEC 为转移性病变，余 17 例均为眼睑原发病灶。眼睑 NEC 最常见的临床表现为眼睑紫红色结节 (88.89%)，上睑受累常见 (72.22%)，27.78% 病变向眶内延伸。眼睑 NEC 复发率为 16.67%，转移率为 38.89%，随访过程中 2 例 (11.11%) 患者因病死亡。眼眶 NEC 患者平均发病年龄为 45.32 岁，男女比例为 1: 2。眼眶 NEC 中 5 例 (55.56%) 为原发病灶，2 例 (22.22%) 为转移性病灶，2 例 (22.22%) 为颅底病灶累及眼眶。眼眶 NEC 最常见的临床表现为眼球突出 (66.67%) 和眼睑肿胀 (55.56%)。眼眶 NEC 复发率为 44.44%，转移率为 33.33%，随访过程中 4 例 (44.44%) 患者因病死亡。眼睑组预后优于眼眶组 ($p = 0.02$)。

结论：眼部 NEC 具有高度异质性。早期广泛切除联合辅助放化疗可降低复发风险。需提高临床警惕性以减少误诊。

摘要编号: 209614

脉络膜黑色素瘤玻璃体腔切除保留外观及视力一例报告

第一作者: Feng WANG

共同作者: Hui CUI, Mei Qin LIANG, Jia Yi WU, Le Yao ZHANG

目的: 脉络膜黑色素瘤是成年人最常见的原发性眼内恶性肿瘤, 传统治疗方式多以眼球摘除为主, 虽能彻底控制肿瘤, 但患者常因此失去视功能及眼球外观, 严重影响生活质量。随着显微玻璃体手术技术的进步, 保眼性治疗成为可能。本研究报告一例经玻璃体腔切除术治疗的脉络膜黑色素瘤患者, 探讨该术式在有效控制肿瘤的同时, 保留眼球形态及部分视功能的可行性和临床意义。

方法: 患者, 男性, 55 岁, 右眼视力下降 2 个月, 视物不见 10 天余。入院行影像学提示右眼脉络膜黑色素瘤, 排除全身转移后拟行保眼手术。术中先行玻璃体全切除, 包括玻璃体人工后脱离及周边基底部玻璃体切除。在眼内电凝辅助下行肿瘤区域视网膜切开; 在周边部根据肿瘤大小作近 120° 弧形视网膜切开, 翻转视网膜以充分暴露肿瘤。

结果: 术中操作顺利, 无严重并发症。病理证实为脉络膜黑色素瘤。术后随访 18 个月, 肿瘤切除区瘢痕稳定, 无复发及转移迹象。眼球外观保持良好, 矫正视力由术前强光感提高至术后手动, 眼底影像学显示视网膜结构稳定。患者主观视觉质量明显改善, 心理接受度高。

结论: 在严格病例选择和完善术前评估的基础上, 玻璃体腔切除术可作为部分脉络膜黑色素瘤患者的保眼性治疗选择。通过玻璃体全切、视网膜翻转暴露及局部肿瘤精准切除等技术, 可在有效控制肿瘤生长的同时, 最大限度保留眼球外观与残余视功能。本例显示该术式具有良好的安全性与可行性, 为脉络膜黑色素瘤患者提供了一种兼顾肿瘤控制与功能保留的综合治疗思路, 具有重要的临床推广与研究价值。

摘要编号: 207939

血清 IgE 水平在 IgG4 相关性眼病中的临床意义: 一项单中心研究

第一作者: Tingting REN

共同作者: Jing LI, Jianmin MA

目的: 通过对比分析血清 IgE 水平升高和正常的 IgG4 相关性眼病 (IgG4-ROD) 患者的临床特征和预后差异, 探讨血清 IgE 水平在 IgG4-ROD 疾病中的作用。

方法: 本研究为单中心回顾性研究, 共纳入 2022 年 3 月至 2024 年 3 月经组织病理学诊断为 IgG4-ROD 的 54 例患者。比较 IgE 升高组 (血清 IgE 水平 > 165 IU/ml) 和 IgE 正常组 (血清 IgE 水平 ≤ 165 IU/ml) 的临床特征, 并选取随访至少 6 个月的 50 例患者, 评估血清 IgE 水平与疾病预后之间的关系。采用独立样本 t 检验、Mann-Whitney U 检验和卡方检验比较组间差异; 计算 Spearman 相关系数以评估血清 IgE 浓度与临床特征的相关性, 以及每组中 IgG4-RD RI 与血清学参数的相关性; 使用 Kaplan-Meier 生存曲线和 Cox 回归分析评估血清 IgE 水平与疾病预后的关系。

结果: 54 例患者中, IgE+ 组 ($n = 22$) 和 IgE- 组 ($n = 32$) 均好发于中老年女性, 且 IgE- 组的女性发病率更高 ($P = 0.016$)、眼外肌受累更常见 ($P = 0.033$); IgE+ 组的双眼发病率更高 ($P = 0.040$)、副鼻窦受累更常见 ($P = 0.046$)。两组间血清 IgG4 ($P = 0.004$)、补体 C1q ($P = 0.021$)、IL-10 水平 ($P = 0.030$)、IgG4/IgG ($P = 0.022$) 和 IgE/IgG4 比值 ($P = 0.018$) 均具有显著差异。且血清 IgE 水平与 IgG4、IL-6、IL-8、IL-10、IL-12p70 浓度呈正相关, 与补体 C1q 和 IgM 呈负相关 ($P < 0.05$)。IgE- 组中, 补体 C4 水平与 IgG4-RD RI 呈正相关 ($P = 0.045$)。而 IgE+ 组的血清 ESR、IgG3、IL-10、轻链 K、轻链 L、 $\beta 2$ 微球蛋白水平和 IgG4/IgG 比值均与 IgG4-RD RI 呈正相关, 补体 C1q 浓度与 IgG4-RD RI 呈负相关 ($P < 0.05$)。另外, IgE+ 组的复发率显著高于 IgE- 组 ($P = 0.038$)。单因素 Cox 回归分析显示, 性别、累及眼外肌及眼部结构数量、血清 IgG4、C1q、IL-4 水平和 IgG4/IgG 比值均与疾病复发相关 ($P < 0.05$)。多因素分析发现, 血清 IgE 水平是影响疾病复发的独立危险因素 ($P = 0.015$)。

结论: 血清 IgE 水平正常和升高的 IgG4-ROD 患者在临床特征及预后方面具有一定差异, 血清 IgE 水平升高可能预示着疾病具有更高的活动性, 并与疾病复发显著相关。

摘要编号: 207852

ABHD12 基因突变致 PHARC 综合征: 一例由庆大霉素耳毒性切入并经多模态诊断破解的疑难病例

第一作者: Feng YIXIA

目的: 报道一例由 ABHD12 基因纯合突变引起的 PHARC 综合征罕见病例, 强调在具有多重系统损

害（如视网膜色素变性、听力损失、共济失调、多发性神经病变、白内障）的疑似遗传性疾病中，拓宽鉴别诊断思路及结合基因检测与多学科评估的重要性。

方法：临床评估：包括眼科检查（眼底照相、视野、OCT、自发荧光成像）、耳科检查（纯音测听、前庭功能检查）、神经科检查（神经电生理、VEP、头颅CT）。基因检测：采用全外显子组测序（WES）对患者进行基因分析。多学科协作：结合眼科、耳鼻喉科、神经内科和遗传学专家意见，进行综合诊断与管理。

结果：临床表现：患者表现为进行性视力下降、夜盲、感音神经性听力损失、早发性白内障、多发性周围神经病变和共济失调体征。影像与电生理：眼底显示典型视网膜色素变性改变；OCT显示外层视网膜结构缺失；神经传导速度检查提示脱髓鞘性神经病变；前庭功能检查显示左侧半规管功能下降。基因检测：发现ABHD12基因纯合突变（c.415G>A, p.Gly139Arg），ACMG分类为VUS，但与功能丧失型突变表型相符。最终诊断：排除Usher综合征，确诊为PHARC综合征。

结论：PHARC综合征是一种罕见的多系统遗传性疾病，易被误诊为Usher综合征等其他疾病。基因检测（如WES）结合多模态临床评估是确诊关键。早期诊断有助于多学科干预（如听力与视觉支持），改善患者生活质量。本病例扩展了PHARC的表型谱，并强调了在复杂遗传综合征中全面评估的重要性。

摘要编号：200658

Lenstar900 与 OPD-Scan III 测量年龄相关性白内障患者术前 Kappa 角与 Alpha 角的一致性分析

第一作者：Bao Tong

目的：比较 Lenstar900 测量仪与 OPD-Scan III 光程差分析仪测量年龄相关性白内障患者术前 Kappa 角与 Alpha 角的一致性。

方法：收集在赤峰朝聚眼科医院就诊的年龄相关性白内障患者 90 例（90 眼），术前分别应用 Lenstar900 生物测量仪与 OPD-Scan III 光程差分析仪测量以瞳孔为中心的视轴偏心距（Kappa 角）、以角膜为中心的视轴偏心距（Alpha 角）。Lenstar900 先收集在角膜顶点平面分解的 X 轴和 Y 轴坐标，再通过三角函数计算偏心距（Kappa 角、Alpha 角），OPD-Scan III 光程差分析仪收集仪器自动测得的偏心距（Kappa 角、Alpha 角），最后分别比较明室与暗室的瞳孔直径（PD）、视轴偏

心距（Kappa 角、Alpha 角）、角膜直径（WTW）。两种仪器所测数据均以均值加减标准差表示，组间比较采用独立样本 t 检验。

结果：Lenstar900 测量的明室 Kappa 角为 (0.215 ± 0.123) mm，暗室 Kappa 角为 (0.237 ± 0.130) mm，明室 Alpha 角为 (0.359 ± 0.103) mm，暗室 Alpha 角为 (0.375 ± 0.099) mm，明室角膜直径为 (11.37 ± 0.427) mm，暗室角膜直径为 (11.36 ± 0.442) mm，明室瞳孔直径为 (3.697 ± 0.471) mm，暗室瞳孔直径为 (4.627 ± 0.825) mm。OPD-Scan III 差分析仪测量的明室 Kappa 角为 (0.204 ± 0.110) mm，暗室 Kappa 角为 (0.258 ± 0.135) mm，明室 Alpha 角为 (0.389 ± 0.103) mm，暗室 Alpha 角为 (0.407 ± 0.095) mm，明室角膜直径为 (11.31 ± 0.380) mm，暗室角膜直径为 (11.37 ± 0.370) mm，明室瞳孔直径为 (3.636 ± 0.477) mm，暗室瞳孔直径为 (4.628 ± 0.827) mm。两种仪器测量各项数据比较， $P > 0.05$ ，差异无统计学意义。

结论：Lenstar900 测量仪与 OPD-Scan III 光程差分析仪两种仪器测量年龄相关性白内障患者术前的 Kappa 角与 Alpha 角有较好的一致性，能够为屈光性白内障人工晶状体的选择提供一定的参考依据。

摘要编号：203434

“老”痛风隐匿的眼底病

第一作者：Miaohong CHEN

共同作者：Qingshan CHEN

目的：患者，男，61 岁，主诉：双眼视力下降，伴中心暗影、视物变形 1 个月。高血压 12 年；确诊“痛风”10 余年，长期口服“非布司他”，否认使用激素治疗，全身四肢关节多发痛风石。

方法：眼底主要表现为双眼后极部多灶性色素上皮损害，通过与痛风引起的眼底病变（葡萄膜炎、视网膜炎）、梅毒性视网膜脉络膜炎、药源性眼底改变（非布司他）、Vogt-小柳原田综合征、急性后极部多灶性鳞状色素上皮变、多灶性脉络膜炎、点状内层脉络膜病变等鉴别诊断。

结果：查询外院有长期间断使用激素病史，确诊本病例为痛风患者长期口服激素诱导的慢性中心性浆液性脉络膜视网膜病变。

结论：痛风患者长期口服激素可诱导的慢性中心性浆液性脉络膜视网膜病变；重视全身病带来的眼部表现；尽量收集完善病史资料，不受病人主观主诉误导。

摘要编号: 200657

三种不同仪器测量白内障患者术前角膜直径和角膜曲率对比研究

第一作者: Bao Tong

目的: 比较 Lenstar 900、IOL Master700、OPD Scan III 三种不同仪器在白内障术前测量角膜直径和角膜曲率的一致性和差异性。

方法: 收集 2024 年 1 月-2024 年 12 月在赤峰朝聚眼科医院就诊的年龄相关性白内障患者 78 例 (85 眼), 分别采用 Lenstar 900、IOL Master700、OPD Scan III 测量角膜直径和角膜曲率, 对所测量的数据进行统计学分析。

结果: 三种仪器测量角膜直径值分别为 (11.27 ± 0.39) mm、 (11.50 ± 0.38) mm、 (11.21 ± 0.37) mm, 三种仪器之间比较差异均有统计学意义 ($F = 13.79$ $p < 0.01$)。三种仪器测量角膜曲率 (K1、K2、AST) 差异均无统计学意义 ($p = 0.851$ $p = 0.626$ $p = 0.45$)。

结论: 角膜直径测量, Lenstar 900 与 OPD Scan III 测量结果一致性较好, IOL Master700 与 Lenstar 900、OPD Scan III 测量结果一致性较差。角膜曲率测量, 三种仪器测量结果有较好的一致性, 临床中可以互相代替使用, 都可为白内障术前人工晶状体计算提供一定的参考依据。

摘要编号: 203415

三维 OCTA 评估屈光参差性弱视患者黄斑区视网膜微循环的异常改变

第一作者: Xiao TIAN

目的: 通过对屈光参差性弱视患者进行三维光学相干断层扫描血管成像 (optical coherence tomography angiography, OCTA) 检查, 观察弱视眼与屈光参差性弱视患者的对侧眼及健康对照眼之间存在的视网膜功能学差异。

方法: 本研究共纳入 52 例 (78 只眼), 其中包括弱视眼 26 只、屈光参差性弱视患者的对侧眼 26 只和健康对照眼 26 只。利用三维光学相干断层成像血管造影 (3D-OCTA) 技术, 采集并分析三组在旁中心凹区域的视网膜微循环参数, 包括血管弯曲度指数 (VTI), 以及浅层血管丛 (SVP)、中间毛细血管丛 (ICP) 和深层毛细血管丛 (DCP) 中各层的血管容积密度 (VVD)、血管骨架密度 (VSD) 和血管直径指数 (VDI)。采用广义估计方程 (GEE) 模型评估组间差异, 并进行两两比较以探讨各指标在不同组间的统计学差异。

结果: 与健康对照眼相比, 弱视眼及屈光参差性弱视患者的对侧眼在五个象限中各层血管容积密度 (VVD) 普遍降低, 尽管部分象限差异未达统计学显著性。与对侧眼相比, 弱视眼的 VVD 进一步降低, 部分象限差异具有统计学意义。血管骨架密度 (VSD) 在弱视眼及屈光参差性弱视患者的对侧眼中也普遍低于健康对照眼, 部分象限差异显著; 同时, 弱视眼相较于对侧眼亦表现为 VSD 降低, 部分象限存在显著性差异。血管直径指数 (VDI) 在弱视眼与对侧眼中均高于健康对照眼 ($P < 0.05$), 而弱视眼与对侧眼之间 VDI 差异无统计学意义 ($P = 1.00$)。此外, 弱视眼的血管弯曲度指数 (VTI) 显著高于健康对照眼 (1.42 ± 0.005 vs. 1.41 ± 0.019 , $P = 0.01$), 但弱视眼与对侧眼 ($P = 0.44$) 及对侧眼与对照眼 ($P = 0.32$) 之间差异均不显著。

结论: 弱视眼视网膜血流灌注降低, 血管增宽, 血管弯曲度增加, 屈光参差性弱视患者的对侧眼在各项血管参数上也异于对照眼。

摘要编号: 200652

不同生物测量方法在 III 型黄斑患者眼轴长度及人工晶状体屈光度计算中的差异性分析

第一作者: Bao Tong

目的: 分析接触式 A 超、浸润式 B 超及光学生物测量在 III 型黄斑形态异常患者中眼轴长度及人工晶状体度数计算时的差异。

方法: 选取在赤峰朝聚眼科医院欲行白内障手术, 眼底为 III 型黄斑 (倾斜黄斑) 的患者 30 例 (30 眼) 的生物测量资料, 分别留取光学生物测量 (Lenstar 900)、接触式 A 超 (MD-2400S) 及浸润式 B 超 (MD-2400S) 测量的眼轴长度, 并用三种眼轴长度计算人工晶状体屈光度, 对眼轴长度和所计算的人工晶状体屈光度进行比较并进行统计学分析。

结果: 接触式 A 超与浸润式 B 超及光学生物测量所获取的眼轴长度比较, 均有统计学意义 ($P < 0.05$), 浸润式 B 超与光学生物测量所获取的眼轴长度比较, 无统计学意义 ($P > 0.05$)。三种生物测量的眼轴长度在角膜曲率等参与值不变时计算人工晶状体屈光度, 接触式 A 超与浸润式 B 超及光学生物测量所计算出的人工晶状体屈光度比较, 均有统计学意义 ($P < 0.05$), 浸润式 B 超与光学生物测量所计算出的人工晶状体屈光度比较, 无统计学意义 ($P > 0.05$)。

结论: 由于 III 型黄斑 (倾斜黄斑) 的中心凹位于斜坡上, 采用接触式 A 超测量眼轴长度并计算人工晶状体屈光度时, 会产生一定的测量与计算误差, 而浸润式 B 超与光学生物测量具有较好的一致性, 光学生物测量重复性好, 准确性高, 更适合 III 型

黄斑患者的人工晶状体屈光度计算。当光学生物测量无法获取眼轴长度时，应首选浸润式 B 超进行眼轴长度测量，以保障人工晶状体屈光度计算的准确性。

摘要编号：200651

两种不同生物测量方法测量膨胀期白内障晶状体厚度的对比研究

第一作者：Bao Tong

目的：分析浸润式 B 超和接触式 A 超两种生物测量方法测量膨胀期白内障晶状体厚度是否具有一致性。

方法：选取 2024 年 6 月-2024 年 12 月在赤峰朝聚眼科医院拟行白内障摘除及人工晶状体植入手术的患者 50 例（50 眼）纳入研究，所有患眼均为膨胀期白内障，晶状体厚度均大于 5 mm，术前采用浸润式 B 超和接触式 A 超两种测量方法，分别测量患眼晶状体厚度，声速均设定为膨胀期白内障声速 1590 m/s，连续测量 5 次，取其平均值，检查均由同一名操作熟练的技师完成。

结果：30 例膨胀期白内障患眼中，浸润式 B 超测量晶状体厚度为 (5.86 ± 0.43) ，接触式 A 超测量晶状体厚度为 (3.55 ± 0.45) ，差异具有统计学意义 $(P < 0.05)$ 。

结论：膨胀期白内障晶状体混浊严重，应用接触式 A 超测量法，无法准确识别晶状体前、后囊波。而浸润式 B 超测量法，在 B 型超声的引导下，可以准确识别晶状体前、后囊波。综上所述，浸润式 B 超测量法可以更加准确的测量膨胀期白内障晶状体厚度，减少因晶状体厚度测量不准确而引起的人工晶状体屈光度测量误差。

摘要编号：208036

健康眼虹膜及视网膜血循环与脉络膜厚度值相关性分析

第一作者：Xue WENWEN

共同作者：Zou HAIDONG, Fang XIAOLING, Wang YULAN

目的：探讨健康人眼虹膜虹膜血循环量化分析值、视网膜血循环量化分析值和脉络膜厚度值之间的相关性。

方法：共计 64 名健康受试者参加了这项回顾性的横断面研究。所有受试者都接受了光学相干断层扫描血管成像（OCTA）和脉络膜厚度检查。其中，血管面积密度（VAD）和血管骨架密度（VSD）被用来定量描述虹膜血管和视网膜血管的 OCTA 图像。

结果：对健康志愿者虹膜及眼底 OCTA 血管 OCTA 量化指标值进行了相关性分析，P 均大于 0.05，可以认为无明显相关性。

结论：虹膜血流及视网膜血流和脉络膜厚度未发现明显相关性。

摘要编号：207948

基于独立成分分析法对孔源性视网膜脱离患者的静态及动态脑网络机制研究

第一作者：季禹

共同作者：吴晓蓉，周琳

目的：既往神经影像学研究发现孔源性视网膜脱离（RRD）患者脑结构和功能存在显著异常，但关于大规模静态和动态脑网络功能连接（FC）改变的综合研究仍缺乏。

方法：本研究采用独立成分分析（ICA）探讨 RRD 患者大规模脑网络 FC 的变化，运用支持向量机（SVM）对 RRD 患者和健康对照（HCs）进行分类，并分析异常脑区与临床眼科参数的相关性。

结果：与 HCs 相比，RRD 患者默认模式网络（DMN）和视觉网络（VN）的 FC 显著增加，而听觉网络（AN）和感觉运动网络（SMN）的 FC 显著降低。动态功能网络连接（dFNC）分析显示，RRD 患者处于状态 4 的时间占比（FT）显著高于 HCs。SVM 分析表明，基于 AN 和 FNC 特征的分类 AUC 值最高，分别为 0.828 和 0.819。此外，RRD 患者右侧额上回内侧（R-SFGmed）的 FC 值与眼轴长度呈正相关 $(r = 0.401, P = 0.038)$ 。

结论：本研究表明 RRD 患者脑功能网络同时存在损伤和适应性重塑，AN 和 FNC 的改变可能作为区分 RRD 患者与 HCs 的潜在神经影像生物标志物，为理解 RRD 患者视力丧失的机制提供了关键的神经影像学证据。

摘要编号：208705

基于眼部 B 超的先天性视盘凹陷性异常鉴别与视网膜脱离风险预测研究

第一作者：Qian YANG

共同作者：Xin HUANG

目的：临床中牵牛花综合征（morning glory syndrome, MGS）与其他先天性视盘凹陷性异常（Congenital Cavitory Optic Disc Anomaly, CODAs），如视盘周围葡萄肿（Peripapillary Staphyloma, PS）和大视盘合并视盘周围葡萄肿（Giant Papilla with Peripapillary Staphyloma, GPPS），常因眼底表现相似而难以鉴别。然而，这些疾病在致病机制、视网膜脱离（网

脱)发生率及视力预后方面存在显著差异。相较于其他检查,眼部B超检查具有患者配合度高、成本低、易操作等优点,本研究旨在明确可用于有效鉴别上述疾病的超声影像特征,并基于这些特征建立并发网脱的风险预测模型。

方法: 本研究为一项回顾性、观察性队列研究。纳入2015年1月至2025年1月期间于复旦大学附属眼耳鼻喉科医院就诊的先天性视盘凹陷性异常患者。首先,基于眼底照相结果明确诊断的76例患者纳入初始模型开发。随后,在203例视盘凹陷性异常患儿的队列中进行内部扩大验证。

结果: 患儿视力预后因是否并发网脱而存在显著差异($P < 0.001$)。在模型开发队列中,不同疾病类型的网脱发生率分别为: MGS 35例(64.8%)、PS 1例(7.7%)、GPPS 3例(37.5%),组间差异显著($P < 0.001$)。B超图像显示,不同疾病的视盘凹陷参数亦存在显著差异: MGS组的凹陷深度(4.19 ± 2.11 mm)显著大于PS组(2.24 ± 0.60 mm)和GPPS组(2.97 ± 1.19 mm, $P = 0.006$),而凹陷宽度在三组间无统计学差异($P = 0.336$)。根据B超图像将凹陷形态分为“碗形”与“非碗形”,结果显示PS与GPPS组以碗形为主(均为100%),而MGS组则以非碗形为主(75.7%),形态分布差异显著($P < 0.001$)。在内部验证队列中,与未发生网脱组相比,网脱组的凹陷深度(5.01 ± 2.16 mm vs. 3.46 ± 1.86 mm, $P < 0.001$)和宽度(5.16 ± 1.82 mm vs. 4.19 ± 1.94 mm, $P < 0.001$)均显著更大。凹陷形态分布亦存在显著差异(无网脱组碗形占53.8%,网脱组碗形占19.4%, $P < 0.001$)。此外,凹陷深度与宽度均与最终视力呈显著相关($P < 0.001$)。基于上述发现,构建网脱预测模型,设定如凹陷深度 ≥ 3.375 mm且形态为非碗形,则判定为易并发网脱。该模型在内部验证中表现出良好的区分能力,AUC值为0.73(95% CI: 0.66–0.81),对网脱识别的敏感度为61.7%,特异度为76.1%。

结论: 眼部B超图像中视盘凹陷的深度与形态特征,对于鉴别不同类型的先天性视盘凹陷性异常及预测其并发视网膜脱离的风险具有重要价值。本研究构建的临床预测模型有助于识别高网脱风险的患者,为临床加强随访与管理提供依据。

摘要编号: 209432

广域 SS-OCT 诊断完全性玻璃体后脱离的准确性

第一作者: Zhuangling LIN

共同作者: Kai GAO, Tao LI, Rebiya TUXUN

目的: 与术中对比,评估广域扫频光学相干断层扫描(swept-source optical coherence tomography, SS-OCT)检测完全性玻璃体后脱离(posterior vitreous detachment, PVD)状态的准确性。

方法: 本回顾性研究纳入诊断为视网膜前膜或黄斑裂孔并行手术治疗的患者176人(176眼)。在术前一周内,散瞳后对所有眼进行以黄斑中心凹为中心的SS-OCT 33线水平扫描(模式:扫描长度16 mm,扫描深度3 mm)并评估PVD状态。当在任意B扫描中可见完全脱离的玻璃体后皮质,或在所有33线B扫描中均不可见黄斑前囊或玻璃体后皮质时,诊断为完全性PVD。评估两名观察者通过SS-OCT进行PVD分期的一致性。与玻璃体切除术中曲安奈德辅助评估的PVD状态作比较,统计SS-OCT检测完全性PVD的敏感度、特异度、阳性预测值和阴性预测值。

结果: 两名观察者通过SS-OCT进行PVD分期的一致性高(Kappa = 0.977, $P < 0.001$)。在SS-OCT诊断为完全性PVD的118眼中,术中发现114眼为完全性PVD(真阳性),4眼存在玻璃体粘连(假阳性)。在SS-OCT诊断为玻璃体粘连的58眼中,术中发现57眼存在玻璃体粘连(真阴性),1眼为完全性PVD(假阴性)。SS-OCT检测完全性PVD的敏感度为99.13%,特异度为93.44%,阳性预测值为96.61%,阴性预测值为98.28%。

结论: 广域SS-OCT对视网膜前膜和黄斑裂孔患者的完全性PVD诊断准确性高。

摘要编号: 209227

开发一种经济型眼底多光谱成像检测装置

第一作者: Yan GONG

共同作者: Meng LI, Keke ZHANG

目的: 眼底光谱成像(FSI)将眼底照相与光谱技术融合,可同时获取视网膜的空间与光谱信息,用于视网膜疾病检测。尽管现有FSI系统在结构与功能成像上已显优势,却因成本高、光路复杂而难以普及。为此,我们提出一种低成本、光路极简的多光谱眼底相机:整机由商用现成光学件、3D打印结构件及光纤束耦合的多波长LED光源(470–740 nm)构成。系统还首创性地引入“同轴非分离偏

振反射抑制”技术，仅通过正交偏振片即可消除角膜反光；据我们所知，该架构为 FSI 领域首次应用。

方法：本研究开发的低成本 FSI 系统由照明光路和成像光路组成。研究分两阶段：第一阶段招募 9 名健康志愿者，采集双眼 9 个波长（474–740 nm）眼底图像，评估系统成像能力与光谱特性；第二阶段招募 300 名受试者，采集 5 个关键波长（474 nm、553 nm、610 nm、660 nm、740 nm）图像，并与商用眼底相机拍摄图像进行分析。

结果：使用模型眼测试显示，系统总视场（FOV）约 30°，中心视场空间分辨率可达 8.77 μm，能捕捉视网膜细微结构，且手动调焦可补偿患者 ± 15 D 的球面屈光度。本研究在医院对比了 FSI 与商用眼底相机在检测糖尿病视网膜病变（DR）、视盘旁萎缩弧（PPA）和脉络膜色素痣（CPN）中的效果。在 DR 中，FSI 在 610 nm 和 660 nm 波长下增强了视网膜深层结构对比度，使硬性渗出物识别更清晰；对于 PPA，FSI 在 660 nm 和 740 nm 波长下能更清晰地显示脉络膜脉管系统，有助于精准诊断和监测；CPN 是脉络膜内的良性病变，FSI 在 660 nm 和 740 nm 波长下能更明显地显示色素沉积，有助于长期监测并早期发现潜在变化。

结论：该装置在低成本条件下仍可获得高质量 FSI 图像，验证了工程可行性。临床数据进一步确认其对糖尿病视网膜病变、脉络膜色素痣的诊断价值，并首次实现视盘周围萎缩的光谱成像。其成像质量媲美传统彩色眼底照相，同时对脉络膜病变等深部病灶具有更优检出率，为资源受限地区提供了一种经济、可大规模部署的 FSI 实用方案。

摘要编号：209771

抑郁症与视网膜血管改变：炎症的中介作用探讨

第一作者：Yan WANG

共同作者：Cong LI, Lei LIU, Xiaohong YANG, Honghua YU

目的：尽管研究已证实抑郁症患者存在视网膜血管改变，但其潜在机制尚不明确。现有证据表明，抑郁症与全身性炎症水平升高相关，且外周炎症可引发视网膜结构改变。本研究旨在探讨外周炎症是否介导了抑郁症与视网膜血管变化之间的关联。

方法：基于英国生物银行数据（UKB），我们排除了无眼底图像、患有全身性或眼部疾病的参与者。采用经过验证的 AutoMorph 深度学习算法对视网膜血管进行量化，并基于 C 反应蛋白、白细胞计数、血小板计数和中性粒细胞与淋巴细胞比值计算复合性低度慢性炎症评分。通过线性回归分析抑郁症与

血管参数及炎症指标的关联，并采用中介分析检验炎症在抑郁症相关血管改变中的作用。

结果：本研究为横断面研究，共纳入 39,198 名参与者（35,330 名对照；3,868 名抑郁症患者）。抑郁症患者的视网膜中央静脉等效直径和视网膜中央动脉等效直径显著增宽（ $\beta = 3.12$ 与 2.45, $p < 0.001$ ），该结果在校正混杂因素后仍保持显著。抑郁症组的炎症标志物水平显著升高。中介分析显示，INFLA 评分、白细胞计数和中性粒细胞计数分别介导了 9.64%、5.88% 和 5.71% 的视网膜中央静脉等效直径增宽效应。

结论：与对照组相比，抑郁症患者存在显著的视网膜动、静脉增宽现象，其中外周炎症部分介导了抑郁症与视网膜中央静脉等效直径的关联，表明慢性炎症是抑郁症视网膜血管改变的重要机制，这为利用眼底影像客观评估抑郁症提供了理论和科学依据。

摘要编号：208931

新生儿特纳综合征合并视网膜脱离一例

第一作者：Yu SU

共同作者：Changzheng CHEN, Lhamo TSERING

目的：报道一例特纳综合征新生儿合并视网膜脱离的病例。

方法：一个出生胎龄 38 周的新生儿出生第 7 天行眼底筛查发现右眼 360° 周边血管分支增多，伴渗出，嵴样改变；左眼视网膜脱离伴囊肿形成。婴儿生后第七天，经皮测黄疸值 12.8 mg/dl，全身皮肤和巩膜黄染，诊断新生儿高胆红素血症。染色体检查显示异常：母亲孕期行羊水细胞学检查提示染色体核型分析示 45,X[6]/46,X,i(X)(q10)[95];FISH 示受检者约有 18% 的细胞为 X 染色体单体细胞；CMA 示 X 染色体在 Xp22.33p11.21 缺失（变异分类为致病性），在区段 Xp11.21q28 嵌合重复（变异分类为致病性），推测可能的核型为 45X/46,X,i(Xq) 为 Turner 综合征特殊类型。

结果：患儿双眼眼底筛查显示右眼周边各象限血管末端扩张呈线、嵴状，360° 周边血管未发育；左眼 3 全视网膜脱离，视盘鼻侧大视网膜囊肿，后极部浅脱，中周部大量视网膜新生血管形成，伴多个视网膜上及视网膜下增殖条索，周边血管未发育。荧光素眼底血管造影显示右眼充盈时间迟缓，后极部明显异常荧光征象，颞侧、下方、上方、鼻侧各象限周边部血管扩张呈毛刷样改变，晚期渗漏不明显，周边部大片无血管区，左眼全视网膜脱离朦胧荧光，隐约见增殖条索带状高荧光。双眼造影后给予激光光凝治疗后视网膜脱离消退。

结论：特纳综合征罕见，其合并视网膜病变的报道仅两例，眼科医师应了解其可能出现的眼部改变，尽早发现病变并治疗。

摘要编号：208049

无后葡萄肿近视眼眼轴长度与眼球后壁弹性的相关性：基于剪切波弹性成像的横断面研究

第一作者：Tianwei QIAN

目的：利用剪切波弹性成像技术，探究无视盘后葡萄肿的近视眼中眼轴长度（AL）与眼球后壁弹性之间的相关性。

方法：这项横断面研究共纳入 87 只右眼，其中 29 只为高度近视（等效球镜度 ≤ -6.00 D），58 只为低度近视（ -6.00 D $<$ 等效球镜度 ≤ -0.50 D）。采用 Pentacam 测量眼轴长度，并使用剪切波弹性成像技术检测眼球壁不同区域（包括黄斑区、视神经附近及中周部邻近区域）的弹性特征。采用多元回归分析探讨眼轴长度与不同部位弹性之间的相关性。

结果：高度近视组在黄斑区、视神经鼻侧 3.5 mm 处、视神经颞侧与鼻侧以及水平与垂直方向中周部颞侧和鼻侧区域的弹性测量值均显著降低（ $P < 0.01$ ）。此外，黄斑区水平与垂直方向的弹性与眼轴长度均呈显著相关（ $P < 0.001$ ）。

结论：随着眼轴长度的增加，黄斑区眼球壁弹性降低，这可能是后巩膜葡萄肿好发于黄斑区的原因。高度近视患者应更加关注黄斑区变化。眼球后壁弹性的这种微观结构改变可能促进后巩膜葡萄肿的发展。

摘要编号：207896

机器学习分析利用异常脑白质功能对高度近视患者进行分类

第一作者：周琳

共同作者：吴晓蓉，季禹

目的：高度近视是全球导致不可逆视力丧失的主要病因，对患者生活质量造成长期显著影响。尽管已有大量研究记录了 HM 患者的灰质改变，但针对白质异常的研究仍较为有限。本研究旨在阐明高度近视如何影响大脑白质结构，从而深化对该病症的神经生物学理解，并为优化诊断和治疗策略提供帮助。

方法：本研究对 55 名临床确诊的高度近视患者和 55 名人口统计学匹配的健康对照组进行了静息态功能磁共振成像。通过低频振幅波动技术评估白质功能变化。随后，利用提取的 ALFF 特征训练支持向量机分类器，用于区分 HM 患者与健康对照组。

结果：与健康对照组相比，高度近视患者在多个白质区域显示出显著降低的低频波动振幅，涉及右矢状层（包含下纵束和下额枕束）、右上纵束、右前辐射冠以及左后丘脑辐射（涵盖视辐射）。经广义回归函数校正后，观察到的组间差异仍具有统计学意义，表明高度近视患者与健康对照组之间存在显著的神经结构改变。此外，支持向量机分类器展现出 71.82% 的准确率和 0.77 的曲线下面积，在鉴别高度近视方面具有可靠的区分性能。

结论：本研究揭示了高度近视患者白质的异常特征，主要影响与视觉和认知功能相关的脑区。此外，白质低频波动幅度可能成为区分高度近视与健康对照组的新颖神经影像学生物标志物。这些发现揭示了高度近视患者白质中广泛的功能性损伤，为现有结构研究提供了新的视角。

摘要编号：200653

浸润式 B 超在硅油填充眼人工晶状体屈光度计算中的应用价值

第一作者：Bao Tong

目的：评价浸润式 B 超分段声速测量法在硅油填充眼人工晶状体屈光度计算中的应用价值。

方法：选取拟行硅油取出、白内障摘除及人工晶状体植入手术的患者 30 例（30 眼）纳入研究，所有患眼屈光间质混浊严重，光学设备测量不能获取眼轴长度。手术前采用浸润式 B 超生物测量法测量眼轴长度并计算人工晶状体目标屈光度。眼轴长度为角膜厚度、前房深度、晶状体厚度、硅油泡长度、硅油泡水液层厚度的总和。手术后采用光学生物测量设备测量眼轴长度，与术前眼轴长度及目标屈光度对比，评价浸润式 B 超在硅油填充眼人工晶状体屈光度计算中的应用价值。

结果：30 例患眼中术前浸润式 B 超测量眼轴长度平均值为（ 25.96 ± 0.90 ），术后光学生物测量眼轴长度为（ 25.84 ± 0.91 ），差异均无统计学意义（ $t = 0.131$ ， $P = 0.897 > 0.05$ ）。用术前及术后测量的眼轴长度所计算的人工晶状体目标屈光度，差异均无统计学意义。

结论：在屈光间质混浊严重时，光学生物测量不能获得眼轴长度，此时应用浸润式 B 超分段声速测量法可以准确获得眼轴长度值，较好的解决了因眼轴测量不准确导致的人工晶状体屈光度计算误差。

摘要编号: 207964

糖尿病视网膜病变全病程的神经血管损害演变

第一作者: Chunran LAI

共同作者: Jiahui CAO, Zijing DU, Honghua YU

目的: 探讨糖尿病视网膜病变 (DR) 全病程中 (涵盖临床前 DR、非增殖性 DR 和增殖性 DR), 中心及周边视网膜神经血管和微结构损害的演变过程。

方法: 本研究采用单中心横断面设计, 全部受试者均来自广东省人民医院。共纳入 81 名受试者, 其中健康对照 23 名、临床前 DR 23 例、非增殖性 DR 13 例、增殖性 DR 22 例。综合应用超广角扫频源光学相干断层扫描血管成像、视网膜电图与自适应光学扫描激光检眼镜, 系统评估并量化视网膜结构与功能指标, 进而分析二者间的相关性。

结果: 在临床前 DR 阶段, DR 评估方案中的 ERG 振幅已显著降低 ($P = 0.003$), 但视网膜各层结构与光感受器细胞均未出现明显改变。进展至非增殖性 DR 阶段, 光感受器细胞功能出现显著损害 (均 $P < 0.05$), 具体表现为 ISCEV 明视闪烁反应潜伏期延迟、黄斑及内丛状层厚度增加、深层毛细血管丛的血管密度与灌注面积下降 (均 $P < 0.05$)。到了增殖性 DR 阶段, ISCEV 明视闪烁反应与 PhNR 反应的潜伏期均显著延迟, 振幅亦明显降低, 同时伴有广泛的神经血管损害 (均 $P < 0.05$)。相关性分析进一步证实, 视网膜功能参数与多项结构指标之间存在显著关联 (均 $P < 0.05$)。

结论: 本研究提示, 锥通路功能损害始于临床前 DR 阶段, 至非增殖性 DR 阶段已呈现明确的光感受器细胞功能障碍。未来, 采用视野更广、分辨率更高的影像学技术, 将能为揭示 DR 全病程的神经血管损害机制提供更为深入的见解。

摘要编号: 207950

视网膜脱离患者初级视皮层动态功能连接和有效连接异常的机器学习研究

第一作者: 季禹

共同作者: 吴晓蓉, 周琳

目的: 视网膜脱离 (RD) 是一种严重的眼部疾病, 若不及时治疗常导致失明。尽管先前的神经影像学研究发现 RD 患者脑功能活动的显著改变, 但这些研究主要集中于局部功能活动的变化。RD 患者初级视皮层 (V1) 内功能连接的方向性改变尚待阐明。

方法: 本研究采用基于种子点的功能连接分析和 Granger 因果分析, 探讨 RD 患者 V1 区动态功能连接 (dFC) 的方向性变化。最后, 使用支持向量

机 (SVM) 算法对 RD 患者和健康对照 (HCs) 进行分类。

结果: 与 HCs 相比, RD 患者视觉网络 (VN) 与默认模式网络 (DMN) 之间以及 VN 内部的动态功能连接 (dFC) 和动态有效连接 (dEC) 显著增加。相反, VN 与听觉网络 (AN) 之间的 dFC 显著降低, VN 与感觉运动网络 (SMN) 之间的 dEC 显著减少。在状态 4 中, 两组的频率存在显著差异, RD 患者的频率显著高于 HCs。值得注意的是, 左 V1 区的 dFC 变化显示出诊断效能, AUC 值达到 0.786。

结论: 本研究揭示了 RD 患者 VN 与 DMN 之间连接的显著改变, 这些变化可能破坏 RD 患者的视觉信息处理和高级认知整合。此外, 左 V1 区和全脑 dFC 的变化在辅助诊断 RD 方面显示出巨大的潜力。这些发现为理解 RD 相关视觉和认知障碍的神经机制提供了有价值的见解。

摘要编号: 206949

调节激励下高度近视眼视盘形变指数变化研究

第一作者: 吴小天

共同作者: Yilei SHAO, Meixiao SHEN, Jinsong WANG

目的: 纳入 62 名 18-30 岁健康受试者, 根据等效球镜度分为正视 / 低度近视组 ($n = 21$)、中度近视组 ($n = 18$) 和高度近视组 ($n = 23$)。用 OCT 分别采集在放松和 6 D 调节刺激状态下的睫状肌和视盘图像。测量并分析睫状肌最大厚度 (CMTMAX)、前部长度 (CMAL)、Bruch 膜开口距离 (BMOD)、前巩膜管开口距离 (ASCOD) 及相关角度参数的变化。通过标准化处理建立视盘形变指数 (视盘参数变化量与睫状肌参数变化量的比值), 评估不同程度近视眼视盘生物力学特性及其与眼轴的关系。

方法: 高度近视组的 BMOD 和 ASCOD 变化量显著大于中度近视组和正视 / 低度近视组; 而 CMTMAX 增加量显著小于其他两组。CMTMAX 变化量与眼轴呈显著负相关, BMOD 和 ASCOD 变化量与眼轴呈显著正相关。基于 CMTMAX 的视盘形变指数与眼轴显著相关, 其混合模型对高度近视的诊断效能最佳 ($AUC = 0.9330$)。

结果: 高度近视眼在调节过程中表现出更显著的视盘形变和较弱的睫状肌收缩反应, 提示其组织生物力学特性发生改变。本研究首次建立的视盘形变指数可作为评估近视眼组织生物力学特性的新指标, 有望为近视发展机制研究和并发症防控提供新的研究方向。

结论: 高度近视眼在调节过程中表现出更显著的视盘形变和较弱的睫状肌收缩反应, 提示其组织生物

力学特性发生改变。本研究首次建立的视盘形变指数可作为评估近视眼组织生物力学特性的新指标，有望为近视发展机制研究和并发症防控提供新的研究方向。

摘要编号：207662

超广角 OCTA 探索孔源性视网膜脱离患者对侧视网膜和脉络膜血管改变

第一作者：Xiaoyin ZHOU

共同作者：Xiangting CHEN, Haijun GONG, Wanqing HE, Yuqing LAN, Xuepei LI, Zhenping LI, Yun YU, Yunjiao ZHAO

目的：本研究旨在利用超广角扫描光源光学相干断层血管成像 (ultra-widefield swept-source optical coherence tomography angiography, UWF-SS-OCTA) 探讨和比较单侧孔源性视网膜脱离 (rhegmatogenous retinal detachment, RRD) 患者对侧眼与健康人群在视网膜与脉络膜血流灌注方面的差异。

方法：本研究共纳入 43 例单侧 RRD 患者的健眼及 55 例年龄性别匹配的健康受试者，采用 UWF-SS-OCTA 对整个视野及九个象限的视网膜和脉络膜血管密度进行定量评估。同时，使用超广角扫描眼底激光成像 (UWF-scanning laser ophthalmoscopy, UWF-SLO) 记录 RRD 患者对侧眼的眼底形态结构改变。

结果：RRD 组对侧眼的中央凹无血管区 (foveal avascular zone, FAZ) 较健康对照组显著扩大 ($P = 0.027$)，脉络膜厚度 (choroidal thickness, CT) 显著变薄。此外，视网膜浅层血管丛血管密度 (superficial vascular plexus, SVP, $P = 0.036$)、全视网膜血管密度 ($P = 0.031$)、脉络膜血管体积 (choroidal vascular volume, CVV, $P = 0.015$)、脉络膜血管指数 (choroidal vascularity index, CVI, $P = 0.039$) 以及脉络膜基质体积 (choroidal stromal volume, CSV, $P = 0.025$) 等参数均较对照组显著降低。UWF-SLO 图像揭示 RRD 对侧眼存在色素病变 (27.9%)、格子样变性 (16.3%) 及视网膜裂孔 (4.7%) 等周边病变。值得注意的是，部分患者虽在 SLO 中未见明确形态异常，但 OCTA 图像已显示出局灶性脉络膜血管灌注缺失。

结论：本研究发现，单侧 RRD 患者的对侧眼在形态尚未明显异常的状态下，已出现早期视网膜与脉络膜血流灌注异常，提示其存在潜在的双眼病理基础。

摘要编号：203141

高保真眼底图像修复助力基础模型临床部署

第一作者：Jinze ZHANG

共同作者：Jiaxiong LI, Peng XIAO

目的：眼底图像是眼科疾病监测与人工智能 (AI) 诊断的关键基础，其质量直接决定算法的可靠性。白内障等屈光介质混浊导致的图像模糊与细节缺失，显著影响 AI 模型的准确率和稳定性。现有图像修复方法虽能恢复整体清晰度，但往往难以保持视网膜血管等关键微结构的真实特征。本研究旨在开发一种高保真眼底图像修复算法，在提升图像质量的同时，保护精细视网膜特征，并验证其对基础模型诊断性能的实际促进作用。

方法：我们提出了一种基于生成对抗网络 (GAN) 的端到端修复框架，构建了自适应视网膜特征增强模块，用以在图像重建过程中平衡整体可视性与局部结构保真性。基于光学退化模型合成了 891 对模拟白内障图像用于训练，并在中山眼科中心及肇庆高要人民医院采集的真实配对图像进行验证。模型性能通过结构相似性指数 (SSIM)、峰值信噪比 (PSNR) 及六个血管形态参数 (包括血管长度、面积、分支点数量、密度、曲度及分形维度) 进行量化评估。此外，我们将修复前后的图像输入微调的眼科基础模型 RETFound，评估图像质量提升对 AI 诊断准确率的影响。

结果：所提模型在验证集上获得最高的 SSIM (0.9124) 和 PSNR (29.58)，在血管结构保留方面显著优于现有方法。定量分析显示，修复图像的血管形态参数与高质量参考图像无显著差异 (均 $p > 0.05$)。t-SNE 可视化结果显示修复图像在高维特征空间中与高质量图像分布高度重叠。临床验证中，修复图像的平均 SSIM 为 0.8035，在视盘和血管分支细节的还原方面明显优于对照算法。修复后图像输入微调的 RETFound 后，其多分类任务诊断性能较修复前平均提升约 9%，显著增强了基础模型的真实世界适应性。

结论：本研究提出的高保真眼底图像修复算法可在不损害血管结构完整性的前提下，有效克服屈光介质混浊导致的图像退化问题，恢复关键诊断细节并提升 AI 模型的准确性与一致性。通过保障图像输入质量与特征保真性，该方法为眼科基础模型在复杂、非标准化的真实世界影像环境中稳定部署提供了可靠支撑。

摘要编号: 208258

高度近视中视锥细胞丢失与深层视网膜血管密度降低及视网膜敏感度受损相关

第一作者: Wei CHI

共同作者: Dong FANG, Jia LIANG

目的: 评估非病理性高度近视 (HM) 患眼中视锥细胞形态、视网膜亚层厚度及血管密度 (VD) 的变化, 以及这些变化与视网膜敏感度 (RS) 的相关性。

方法: 本前瞻性研究纳入 43 例非病理性高度近视患者和 38 例年龄匹配的健康志愿者。所有参与者均接受了详细的眼科评估。采用自适应光学扫描激光眼底镜评估视锥细胞形态。通过光学相干断层扫描 (OCT) 测量肌样体 - 椭圆体带 (MEZ)、光感受器外节段 (OS)、黄斑中心凹及脉络膜的厚度。利用光学相干断层扫描血管造影术评估视网膜浅层和深层毛细血管丛 (DCP) 的血管密度, 同时通过微视野检查评估视网膜敏感度。并进行组间比较, 并探究这些参数之间的相关性。

结果: 与健康对照组相比, 高度近视组存在以下特征: 在 4 个象限 3° 偏心度处, 视锥细胞密度和规则性显著降低, 视锥细胞离散度和间距显著增加 (均 $p < 0.001$)。除两种毛细血管丛的中心凹血管密度及深层毛细血管丛的旁中心凹血管密度外 (均 $p > 0.05$), 其余区域血管密度均显著降低 (均 $p < 0.01$)。肌样体 - 椭圆体带、光感受器外节段、黄斑中心凹及脉络膜厚度均变薄 (均 $p < 0.001$)。多变量回归分析显示: 更高的视锥细胞密度与更短的眼轴长度 ($p = 0.013$) 及更高的深层毛细血管丛整体血管密度 ($p = 0.009$) 相关。更高的视网膜敏感度与更高的视锥细胞密度 ($p = 0.026$)、更厚的肌样体 - 椭圆体带 ($p < 0.001$)、更厚的脉络膜 ($p = 0.044$) 及更高的深层毛细血管丛整体血管密度 ($p = 0.009$) 相关。

结论: 研究结果表明, 在非病理性高度近视中, 深层毛细血管丛灌注受损可独立预测视锥细胞丢失, 且与眼轴伸长无关。视网膜敏感度受损与视锥细胞丢失、肌样体 - 椭圆体带变薄及深层毛细血管丛低灌注相关, 提示高度近视相关视功能损害中存在微血管和结构损伤的协同作用。

AFG3L2 F175S 突变通过功能获得性相互作用机制介导 PHB2 依赖性 OXA1L 的误导性降解——导致显性视神经萎缩

第一作者: Yan LI

共同作者: Xiuxiu JIN, Bo LEI, Ruotong YANG

目的: 本研究旨在证实 AFG3L2 F175S 突变导致显性视神经萎缩 (DOA), 并阐明其影响线粒体形态与功能的分子机制。

方法: 我们通过 CRISPR/Cas9 技术构建了 AFG3L2 F174S/+ 小鼠 (该位点与人类 F175S 同源), 并利用光学相干断层扫描、组织病理学、视网膜电图和视觉诱发电位评估视网膜完整性。在体内和体外分析了线粒体形态、呼吸功能、活性氧水平和膜电位。通过蛋白质组学分析、免疫共沉淀以及 AlphaFold 3 预测的结构建模, 鉴定了异常的蛋白质相互作用。功能验证包括免疫荧光、蓝色非变性聚丙烯酰胺凝胶电泳以及 OXA1L 过表达的挽救实验。

结果: AFG3L2 F174S/+ 小鼠表现出视网膜神经节细胞数量减少、视网膜厚度变薄和视神经传导受损。在 AFG3L2 F174S/+ 小鼠视网膜以及 AFG3L2 F175S/+ 细胞中均观察到异常的线粒体形态和升高的活性氧水平。F175S 突变使 AFG3L2 与 PHB2 的结合亲和力增强了 41 倍, 形成了一个过度活跃的蛋白酶复合物, 该复合物会招募呼吸链组装因子 OXA1L 并对其进行过度降解, 从而破坏了氧化磷酸化 (OXPHOS) 和线粒体膜电位。过表达 OXA1L 可恢复 OXPHOS 能力, 而敲低 PHB2 则消除了突变诱导的 OXA1L 不稳定性, 证实了 PHB2 作为底物招募支架的作用。

结论: 本研究证实, AFG3L2 F175S 突变通过 PHB2 介导的机制, 异常靶向并水解 OXA1L, 进而瓦解线粒体蛋白质稳态与能量代谢, 最终驱动了 DOA 的发病。上述发现阐明了 AFG3L2-PHB2-OXA1L 这一三元调控轴在视神经病变中的核心作用, 并提示稳定 OXA1L 可作为极具潜力的治疗新策略。

摘要编号: 204428

AFG3L2 基因突变导致常染色体显性遗传性视神经萎缩一例

第一作者: Xiuli CHEN

共同作者: Ying ZHAO

目的: 探讨表现为双眼视神经炎的常染色体显性遗传性视神经萎缩患者得临床及影像学资料。**方法:** 抽丝剥茧分析一例儿童双眼视力下降患者 6 年的临床资料及 OCT、眼眶磁共振等影像学资料。**结果:** 通过基因分析, 最终诊断为 AFG3L2 基因突变导致常染色体显性遗传性视神经萎缩。**结论:** 重视视神经疾病的鉴别诊断, 炎症机制可能参与常染色体显性遗传性视神经萎缩的发生。

摘要编号: 209370

Meige 综合征干眼症状与干眼鉴别

第一作者: Gang LIU

共同作者: Qiangying GUO, Xianzhong LIU, Jie XIANG, Zhen XU

目的: Meige 综合征又称眼睑痉挛 - 口下颌肌张力障碍, 常伴有眼部异常表现, 与干眼存在诸多相似之处, 易导致误诊误治。本研究旨在探讨 Meige 综合征眼部症状的特点, 明确其与干眼的鉴别要点, 为临床医生提供准确、可靠的诊断依据, 提高诊断率。**方法:** 本研究采用回顾性分析方法, 选择 2022 年 1-6 月在我院诊断为 Meige 综合征的患者 159 例, 统计患者基本信息、初始症状、伴随症状、早期诊断、泪液分泌质量、治疗效果及临床特征。**结果:** 本研究共纳入患者 159 例, 年龄 57.4 ± 9.3 岁, 男性 49 例 (30.8%), 女性 110 例 (69.2%), 职业分布: 农民 52 例 (32.7%)、退休 36 例 (22.6%), 无业 31 例 (19.5%), 工人 18 例 (11.3%), 个体 9 例 (5.7%), 共计 91.8%, 其他 13 例 (包括教师、医生、行政、技术员, 占 8.2%)。首发症状: 眼干涩、异物感 75 例 (47.2%), 眨眼频繁、睁眼困难 83 例 (52.2%), 其他 1 例 (0.6%)。干眼诊断: 明确 129 例 (81.1%), 未明确 30 例 (18.9%)。伴随畏光: 畏光 83 例 (52.2%), 轻度畏光 36 例 (22.6%), 无畏光 40 例 (25.2%)。是否行干眼治疗: 是 117 例 (73.6%), 否 42 例 (26.4%)。干眼治疗患者的相关分析 ($n = 117$): BUT 均值: OD 5.09 s, OS 4.73 s, 泪液分泌均值 OD 6.25 mm/5 min、OS 6.11 mm/5 min, 泪河高度均值 OD 0.17 mm、OS 0.16 mm。角膜染色: 阳性 3 例 (2.6%), 阴性 110 例 (94.0%), 无记录 4 例 (3.4%)。

干眼治疗是否缓解: 无缓解 109 例 (93.2%), 临时缓解 8 例 (6.8%)。

结论: Meige 综合征早期症状与干眼雷同, 极易误诊为干眼, 客观检查泪液质量基本正常, 两者病因不同, 且干眼治疗无效, 应予鉴别。

摘要编号: 208585

一例特殊双眼视盘水肿病例报道

第一作者: Yuzhi DING

目的: 汇报一例特殊的以视盘水肿为首发表现的远处播散转移的前列腺癌病例。**方法:** 该患者为 60 岁男性, 因双眼视力轻微下降 20 天至门诊就诊, 查双眼视盘水肿, 盘周出血, 网膜散在出血及渗出。排除颅内占位, 头颅 MRI 提示枕顶骨骨质增厚, 增强扫描不均匀强化, 临近静脉窦受压改变, 头颅 CT 显示枕骨骨质膨胀, 呈磨玻璃样改变, 局部可见小虫蚀样改变, 提示颅骨纤维瘤病; 病理免疫组化提示 (枕骨肿瘤) 破碎骨小梁间见异性细胞, 倾向前列腺来源。泌尿外科进一步诊治。**结果:** 以双侧视盘水肿为首发表现的患者, 在诊断时考虑颅高压, 完善颅脑 MR 及 CT 提示静脉窦受压, 枕骨病变, 最终明确为前列腺癌播散转移, 完成早期及时诊断。**结论:** 双眼视盘水肿可以是前列腺癌患者的首发表现, 前列腺癌患者在早期快速明确诊断可以提高患者的生活质量。

摘要编号: 209660

一种使用自组装纳米颗粒装载的甲氨蝶呤新型眼科制剂

第一作者: Xiaoyun HOU

共同作者: Zhiqing LI

目的: 设计及合成甲氨蝶呤 (MTX) 及乳糖修饰的偶氮杯 [4] 芳烃 (LacAC4A) 复合物 MTX@LacAC4A, 鉴定其在眼后段的递送途径及效率, 并验证其对小鼠葡萄膜炎模型的初步治疗效果。**方法:** 设计并合成了 MTX@LacAC4A 制剂, 通过扫描电镜 (TEM)、GDA 滴定法对 LacAC4A 及 MTX@LacAC4A 进行表征。分离新西兰大白兔的眼球组织, 进行液质联用实验, 探讨 MTX@LacAc4A 到达眼后段的途径, 通过对 C57BL/6J 小鼠玻璃体、视网膜 - 脉络膜组织的液质联用实验, 探讨 MTX 在眼后段的分布。建立小鼠葡萄膜炎模型, 验证 MTX@LacAC4A 的治疗效果。

结果：设计了具有视网膜主动靶向性的乳糖修饰偶氮杯芳烃载体，以提升靶向能力。将主动靶向的乳糖基团引入到偶氮杯芳烃上缘。乳糖基团通过与疾病状态下表达半乳糖凝集素-3的视网膜相互作用，具有主动靶向病灶区域的潜力。MTX与LacAC4A键合常数为 $K_a = 9.4 \times 10^5 \text{ M}^{-1}$ 。在新西兰大白兔中，30 min、12 h、24 h 时 MTX@LacAC4A 在结膜-巩膜的分布高于角膜-晶体-玻璃体 8.51%、17.69%、31.62%，可以看出 MTX@LacAC4A 主要通过结膜-巩膜途径进入眼内。在 C57 小鼠中，30 min 时，MTX@LacAC4A 主要通过结膜-巩膜途径 MTX@LacAC4A 的分布是 MTX 的 5.92 倍，12 h 时，MTX@LacAC4A 的分布是 MTX 的 2.10 倍。与模型组相比，MTX@LacAC4A 组的小鼠视网膜渗液、玻璃体浑浊明显好转。

结论：MTX与LacAC4A有较强的结合力，且有克服动态及静态眼部屏障的能力，主要通过结膜-巩膜途径进入眼后段，并且对小鼠 EAU 模型具有可观的治疗效果。

摘要编号：204427

基于眼血流动力学的诺模图预测缺血性脑卒中

第一作者：Jialin WANG

共同作者：Zhuohua ZHOU

目的：缺血性脑卒中是一种具有高致死率和高致残率的脑血管疾病。由于眼部血管与脑血管在生理特征方面存在相似性，眼部血管特征可作为监测脑血管疾病的重要指标。本研究旨在探究缺血性脑卒中相关的眼部血流动力学改变，并基于眼部血流动力学特征构建缺血性脑卒中的列线图预测模型。

方法：本研究采用回顾性队列设计，共纳入 337 例患者，随机分为训练队列（235 例）和验证队列（102 例）。收集患者的一般资料，采用超声检测眼动脉、中央视网膜动脉及后睫状动脉的血流动力学参数，从彩色眼底图像中提取视网膜血管管径参数，同时收集相关实验室指标。通过 Logistic 回归分析筛选缺血性脑卒中的独立危险因素，构建列线图预测模型。采用受试者工作特征曲线（ROC）、Hosmer-Lemeshow 拟合优度检验及决策曲线分析（DCA）对模型的准确性与临床适用性进行评估。

结果：多因素回归分析结果显示，高血压（OR = 2.17, 95% CI: 1.16 ~ 4.08, P = 0.016）、高脂血症（OR = 2.21, 95% CI: 1.18 ~ 4.14, P = 0.013）及眼动脉阻力指数（OR = 5.98, 95% CI: 3.27 ~ 10.93, P < 0.001）为缺血性脑卒中的独立危险因素。训练队列 ROC 曲线下面积为 0.790（95% CI: 0.733 ~ 0.847），验证队列为 0.773（95% CI: 0.679 ~ 0.866），两者预测效能一致，

提示列线图对缺血性脑卒中中具有稳定的预测能力。训练队列和验证队列的平均绝对误差分别为 0.020 和 0.013。DCA 结果提示模型具有良好的临床获益。

结论：基于传统危险因素与眼动脉阻力指数构建的列线图模型对缺血性脑卒中中具有较好的预测价值。该结果提示，结合眼部血流动力学的预测模型可为早期诊断与干预提供参考。

摘要编号：208840

特发性硬脑膜炎合并动眼神经炎 1 例

第一作者：Yingzi LUO

共同作者：Shihui WEI, Huanfen ZHOU

目的：回顾分析 1 例特发性硬脑膜炎合并动眼神经炎病例，整理临床特点，梳理和总结诊疗思路。

方法：患者王某，男性，64 岁，主因“左眼上睑下垂 19 天”入院，症见：左眼上睑下垂伴眼眶隐痛不适，左眼上睑上抬后双眼有视物重影，头闷痛，头晕。眼科检查：第一眼位，L/R 约 15°，左眼外展外固定，上转 -1，内转 -2，下转 -3，左眼上睑下垂，完全遮盖角膜，提上睑肌肌力约 5 mm。入院后初步诊断为：左眼动眼神经麻痹。完善抽血及脑脊液检查、MRA、眼眶和颅脑核磁共振增强扫描，排除感染、炎症、血管性病变、占位性病变、糖尿病、重症肌无力等相关病因，眼眶和颅脑核磁共振增强扫描均可见硬脑膜广泛强化，眼眶核磁共振增强扫描水平位、冠状位及矢状位 T1 增强均可见动眼神经增粗，强化，并进一步排除多发性神经炎。最终考虑为特发性硬脑膜炎引起的左眼动眼神经炎。予大剂量激素冲击治疗，后续激素序贯减量，以及免疫抑制剂治疗，辅以营养神经和改善微循环治疗。

结果：该患者诊断为左眼动眼神经炎、特发性硬脑膜炎，经用药治疗 1 月后复查，患者头闷痛、头晕、上睑下垂、眼眶隐痛不适及双眼视物重影消失，已复查眼眶核磁共振增强扫描，结果待回报。

结论：1、本病例报道了一例特发性硬脑膜炎合并动眼神经炎患者，临床表现为典型的部分性动眼神经麻痹。动眼神经麻痹的病因较为复杂，在中老年患者中缺血病因居多，如有瞳孔受累的重要体征，需要排除动脉瘤，一旦确诊需作为神经眼科急症处理，因此首诊时瞳孔检查尤为重要，虽然动脉瘤发病率不高，但破裂后可危及生命，需要第一时间予以排除。掌握动眼神经麻痹的临床特征及病因可为临床神经眼科诊疗提供重要线索。2、硬脑膜炎发病率较低，病因包括为感染性、非感染性、肿瘤和外伤，可通过血液和脑脊液化验检查以明确病因，核磁共振增强扫描明确诊断，针对病因治疗。该患者有硬脑膜炎引起的持续性头闷痛及头晕不适的表

现，经检查找不到明确病因，核磁共振增强扫描提示硬脑膜强化是诊断的关键，考虑为特发性硬脑膜炎。

摘要编号：208463

眼肌型重症肌无力与 ANCA 相关性血管炎共存 1 例报告及 MG 共病探讨

第一作者：Yan LIU

共同作者：Xuemei LIN, Songdi WU

目的：报告 1 例眼肌型重症肌无力与 ANCA 相关性血管炎共存病例。

方法：病例报告。

结果：患者，女性，72 岁。主因“左侧眼睑下垂 1 月”于 2025 年 3 月 18 日就诊。患者于 1 月前无明显诱因出现左眼睑下垂，晨轻暮重，无其他不适，症状不缓解，来我院就诊。入院查体：左侧上睑下垂，疲劳试验阳性，中枢补偿抑制试验阳性。双耳听力减退，左耳为著，余查体正常。既往 2 月前因双耳听力下降，左耳为著，伴左耳鸣，就诊于耳鼻喉科考虑咽鼓管功能紊乱，无特殊治疗。入院完善血沉：29 mm/h (0-20 mm/h)；抗髓过氧化物酶抗体：30.85 RU/ml (0-20 RU/ml)，余化验正常。重复电刺激试验：阴性。肌无力抗体阴性。胸部 CT：双肺下叶少许间质性改变，未见胸腺异常。给予溴吡斯的明片 60 mg 3 次/日口服治疗后患者自觉左眼睑下垂稍好转。最终诊断：1. 眼肌型重症肌无力；2. 结缔组织病；3. 咽鼓管功能紊乱。嘱出院继续口服药物观察。1 月后患者门诊复诊诉自觉效果欠佳，因患者对激素顾虑大，故加用他克莫司胶囊 1 mg 2 次/日口服，服用 2 月后患者再次复诊左眼睑下垂完全恢复正常且听力明显好转。回顾病史及辅助检查，修正诊断为：1. 眼肌型重症肌无力；2. ANCA 相关血管炎。

结论：眼肌型重症肌无力 (OMG) 虽以局部症状为主要表现，但常可合并其他自身免疫性疾病。本例患者以“眼睑下垂”起病，虽具备典型 OMG 临床特征，但合并听力下降、肺部间质改变及自身抗体指标异常，提示存在系统性免疫异常可能。通过系统性抗体筛查及评估，最终明确 ANCA 相关性血管炎诊断。该病例提示我们，对于 OMG 患者，尤其是对单一治疗效果不佳或伴有系统性症状者，应积极筛查是否存在其他自身免疫共病，以实现早期识别、综合干预，改善预后。神经眼科医师在处理 MG 患者时，应具备共病筛查意识，完善自身抗体检测，避免漏诊潜在的自身免疫性疾病。

摘要编号：207563

重视司美格鲁肽相关非动脉炎性前部缺血性视神经病变

第一作者：Mingqian YU

共同作者：Liqiang WANG, Shihui WEI, Huanfen ZHOU

目的：强调司美格鲁肽与非动脉炎性前部缺血性视神经病变 (non-arteritic anterior ischemic optic neuropathy, NAION) 之间的相关性，提高临床对该潜在风险的认识。

方法：报告两例 2 型糖尿病患者在使用司美格鲁肽期间相继发生双眼 NAION 的临床病例。系统收集其临床资料并结合最新药物警戒信息进行分析。

结果：病例 1 为 58 岁女性，因血糖控制欠佳将司美格鲁肽用药剂量由 0.5 mg/周增至 1.0 mg/周，1 个月后突发右眼无痛性视野缺损伴视力下降，最佳矫正视力 (best-corrected visual acuity, BCVA) 降至 0.7，右眼视盘水肿，左眼无生理性视杯，光学相干断层扫描 (optical coherence tomography, OCT) 示右眼视网膜神经纤维层 (retinal nerve fiber layer, RNFL) 弥漫性增厚。外院诊断为右眼 NAION，给予口服糖皮质激素联合神经保护治疗，疗效不显著。将司美格鲁肽剂量减半后，患者主诉视野缺损有所改善。3 个月后患者突发左眼 NAION，BCVA 降至右眼 0.05，左眼 0.6，左眼视盘充血水肿，OCT 示右眼 RNFL 及黄斑区节细胞层明显薄变，左眼 RNFL 弥漫性增厚。停用司美格鲁肽并给予营养神经、改善循环治疗后，左眼 BCVA 提高至 0.8。病例 2 为 39 岁男性，持续使用司美格鲁肽 0.75 mg/周 2 年后发生右眼 NAION，因未及时识别药物关联而继续用药，半年后左眼亦受累。停药并给予营养神经、改善循环治疗后，视力稳定改善。两例患者均存在小视杯、糖尿病、高血压等 NAION 易感因素，但 NAION 发病与司美格鲁肽使用或剂量调整存在明确时间顺序关系，且减量或停药后症状明显缓解，强烈提示司美格鲁肽与其 NAION 的发病存在相关性。近期流行病学研究显示使用司美格鲁肽者 NAION 的发生风险约为未使用者的 2 倍。世界卫生组织药品安全咨询委员会已建议将 NAION 纳入其风险管理计划，欧洲药品管理局亦将 NAION 列为司美格鲁肽的“非常罕见”不良反应。

结论：司美格鲁肽与 NAION 的相关性已在药物警戒层面获权威机构证实，并已转化为临床警示及监管行动。使用该药进行血糖及体重管理时应谨慎评估治疗获益与视神经病变并发症风险之间的平衡，尤其在剂量调整期间，应密切监测视力、视野及 OCT 变化，必要时及时干预。

摘要编号: 207331

颅内静脉窦血栓合并硬脑膜动静脉瘘一例

第一作者: Mingqian YU

共同作者: Liqiang WANG, Shihui WEI, Huanfen ZHOU

目的: 报道一例以双眼视力下降及视盘水肿为首诊表现的继发性颅内压增高病例, 系由颅内静脉窦血栓形成 (cerebral venous sinus thrombosis, CVST) 合并硬脑膜动静脉瘘 (dural arteriovenous fistula, dAVF) 的罕见复合机制引起, 强调对疑似特发性颅内高压 (idiopathic intracranial hypertension, IIH) 患者应警惕复杂静脉系统病变, 并评估数字减影血管造影 (digital subtraction angiography, DSA) 的关键诊断价值。

方法: 回顾性分析 1 例 29 岁女性患者的诊疗经过。患者因双眼视力下降 4 月余就诊, 伴视物变形、视野缺损、头痛及晨起手麻。入院时右眼矫正视力 0.08, 左眼 0.6, 右眼相对性传入性瞳孔障碍阳性, 双眼视盘高度水肿。视野检查示右眼颞下方及鼻上方视野缺损; 视盘及黄斑光学相干断层扫描示左眼视网膜神经纤维层增厚及右眼神经节细胞层薄变。腰椎穿刺测脑脊液初压高于 300 mmH₂O。颅脑及眼眶磁共振成像 (magnetic resonance imaging, MRI) 示颅内软化灶及双侧视神经鞘积液。头颅磁共振静脉成像 (magnetic resonance venography, MRV) 及动脉成像 (magnetic resonance angiography, MRA) 示右侧横窦、双侧颈内静脉及乙状窦血栓形成; 多发迂曲增粗血管影, 考虑脑血管畸形。血清抗 $\beta 2$ 糖蛋白 I 抗体显著升高。

结果: DSA 证实双侧横窦乙状窦闭塞, 并发现左侧横窦区 dAVF, 由颈外及颈内动脉分支供血。据此实施经导管静脉窦支架置入联合 dAVF 栓塞术, 术后予双联抗血小板治疗。术后第 3 日脑脊液压力降至 270 mmH₂O。术后 1 周矫正视力提升至右眼 0.1, 左眼 1.0, 视盘水肿及视野缺损显著减轻, 复查 MRV、MRA 及颅脑 MRI 示: 静脉窦支架通畅, dAVF 供血动脉完全闭塞, 无残余分流; 脑实质无新发梗死或出血, 原软化灶稳定。

结论: 本例颅内压升高由 CVST 合并 dAVF 的罕见复合机制引起, CVST 致静脉窦闭塞与静脉高压, 诱发 dAVF, 后者又加重静脉淤滞与颅内高压, 形成恶性循环, 易被误诊为 IIH。抗 $\beta 2$ 糖蛋白 I 抗体升高提示抗磷脂抗体综合征 (antiphospholipid syndrome, APS) 可能, 而 APS 是 CVST 的已知致病因素, 若经国际标准重复检测确诊, 则可明确本例 CVST 的病因归属, 指导长期抗凝。对于疑似 IIH 患者, 尤其伴静脉影像异常者, 应高度警惕此

类复杂静脉病变。DSA 是确诊金标准, 早期联合介入治疗可有效逆转视功能损害。

摘要编号: 208847

NDUFS1 新变异引起 Leigh 综合征眼病的致病性及功能分析

第一作者: Zhenhui LIU

共同作者: Yiran FAN, Yan LI, Bo LEI

目的: 验证一例 Leigh 综合征 (LS) 眼病家系 NDUFS1 基因新变异的致病性, 并探讨变异对线粒体功能的影响。

方法: 回顾性研究, 纳入于河南省立眼科医院眼科确诊为 LS 眼病的一例家系。收集先证者及父母的临床资料, 采用我院自主研发的眼后段靶向基因检测 panel (PS400 试剂盒) 进行 Sanger 测序并行家系共分离验证。利用生物信息在线预测软件对变异致病性进行预测。构建相应细胞疾病模型, 检测其细胞 ROS、线粒体膜电位和 ATP 生成、呼吸链复合物 I 酶活性、复合物 I 组装水平、线粒体呼吸功能、线粒体形态变化、线粒体自噬及细胞铁死亡相关蛋白水平。

结果: 先证者双眼视力下降, 视神经萎缩伴眼球震颤, 脑白质发育不全。NDUFS1 基因发现母源 M1: c.64 (exon3) C>T p.R22* 和父源 M2: c.404 (exon6) G>A p.G135D 复合杂合变异, 其中 M2 为新发变异, 符合家系共分离。ACMG 评分指南分析变异为可能致病。体外实验显示该突变导致细胞 ROS 增加, 线粒体膜电位、ATP 生成和复合物 I 酶活性降低, 复合物 I 组装水平下降, 线粒体呼吸功能损害, 线粒体形态碎裂化并引发线粒体自噬和细胞铁死亡。补充 MFN2 可部分改善线粒体功能障碍表现。

结论: NDUFS1 基因新变异引起 Leigh 综合征视神经萎缩。该变异使 NDUFS1 蛋白质功能丧失, 引起线粒体呼吸链复合物 I 缺陷, 下调 MFN2 使线粒体质量控制失衡, GPX4 降低引发的细胞铁死亡而致病。

摘要编号: 208630

VTS⁴ 视觉训练系统对成人弱视的疗效观察

第一作者: Jin LIWEN

目的: 评估 VTS⁴ 视觉训练系统联合传统训练对成人弱视的疗效。

方法：招募 18 岁以上的成年弱视患者 45 例，按照患者自愿选择治疗方式分为基础对照组（n = 15）、家庭训练组（n = 15）和综合训练组（n = 15）。基础对照组在医学验光后予以屈光矫正及遮盖优势眼，家庭训练组在屈光矫正的基础上完成家庭训练方案，综合训练组在屈光矫正及家庭训练的基础上联合每周 1 ~ 2 次的个性化在院视觉训练，训练中使用 Vision Therapy System (VTS⁴) 视觉训练系统。三组患者治疗前和治疗后最佳矫正视力 (BCVA) 及双眼远、近立体视变化情况。

结果：入组患者共 45 例，其中包括远视型弱视 6 例，散光型弱视 5 例，散光型屈光参差型 10 例，远视型屈光参差性弱视 24 例。通过 2 个疗程的训练，综合训练组的有效率远远高于基础对照组和家庭训练组，对比有显著统计学意义， $P < 0.01$ 。对比训练前后的远、近立体视变化，综合训练组的远立体视跟其他两组对比有统计学意义， $P < 0.05$ ($P = 0.048$)，但在提升近立体视方面，余其他两组无统计学差别。

结论：VTS⁴、SVI 视觉训练系统联合传统的弱视治疗方法能有效提高成年弱视患者的视力并改善其双眼视功能，尤其是在提升远立体视方面有明显优势。

摘要编号：207504

周期性内斜手术效果的临床分析

第一作者：Liping QIAO

目的：通过对 13 例周期性内斜视的临床观察和手术治疗，了解周期性内斜的临床性质和手术治疗效果。

方法：回顾性分析研究方式，选取 2021 年 4 月至 2025 年 1 月在南昌洪城爱尔眼科诊断治疗的 13 例周期性内斜患者，年龄平均 10.6 (10 ± 0.4 , 8~15 岁)；斜视角在 $+20^\circ \sim +80^\circ$ ，平均 $+34.52^\circ$ ；术前分别测定患者的 3 个月的眼位变化、融像范围变化、屈光度变化、立体视锐度（远、近）、眼轴变化。所有患者均采取双眼内直肌后徙术，术后采集采用眼位变化、融像范围变化、屈光度变化、立体视锐度（远、近）、眼轴变化。

结果：术后 92.3% 可获得双眼同时视，4 例周期性内斜患者术前正位日及术后双眼视觉及近立体视锐度与正常人群相比无显著差异；9 例周期性内斜患者术前无双眼视功能。经过视觉训练可获得同时视；100% 可获得融合力，但融合力低于正常；65.2% 可获得远立体视，50% 获得不同程度近立体视；1 例周期性内斜患者术前无双眼视功能，术后 1 年仍无同时视及立体视觉。

结论：周期性内斜应尽量在周期性节律未破坏前手术，周期性内斜患者斜视角不稳定，手术量以斜视日最大斜视角进行设计手术，有利于双眼单眼视功能的恢复，达到眼位和功能双重康复的目的。

摘要编号：209661

基于间充质干细胞来源凋亡囊泡 ApoVs-PPP2CB 轴调控免疫平衡：自身免疫性葡萄膜炎的无细胞治疗新策略

第一作者：Wei CHI

共同作者：Dong FANG

目的：实验性自身免疫性葡萄膜炎 (EAU) 是一种典型的自身免疫性眼部炎症模型，目前主要依赖激素和免疫抑制剂治疗，但长期使用伴随多种严重不良反应。本研究探讨了脐带间充质干细胞来源的凋亡囊泡 (ApoVs) 在 EAU 治疗中的作用及其机制。

方法：构建实验性自身免疫性葡萄膜炎 (EAU) 小鼠模型，并采用静脉注射脐带间充质干细胞来源的凋亡囊泡 (ApoVs) 进行干预。利用临床评分与组织病理学分析评估视网膜及血管炎症程度。利用流式细胞术分析免疫细胞亚群的分化。采用蛋白质组学与生物信息学方法鉴定 ApoVs 中的关键功能蛋白；并运用基因敲低技术进行功能验证。

结果：静脉注射 ApoVs 可显著减轻 EAU 小鼠的视网膜炎症、血管炎及组织结构损伤，并降低临床和病理评分。ApoVs 通过抑制 Th1 和 Th17 细胞分化，促进 Treg 细胞分化进而参与调节免疫细胞平衡。蛋白质组学与生物信息学分析发现 PPP2CB 为 ApoVs 的关键功能蛋白。PPP2CB 通过调控 PI3K/Akt/mTOR 信号通路去磷酸化进而抑制 Th1 细胞分化，而敲低 PPP2CB 可部分削弱 ApoVs 的免疫调节功能。

结论：本研究揭示了 ApoVs 通过 PPP2CB 介导的免疫调节机制在 EAU 治疗中发挥重要作用，为葡萄膜炎的细胞无治疗策略提供了新思路 and 实验依据。

摘要编号：209365

整合蛋白质组学分析鉴定 STAT1 为视网膜衰老中炎症 - 氧化还原轴的核心调控因子

第一作者：Yiran FAN

共同作者：Xiuxiu JIN, Bo LEI

目的：衰老是导致视网膜神经变性的主要危险因素，但其分子机制尚未得到系统阐明。本研究旨在通过整合转录组与蛋白质组数据，描绘视网膜衰老的分子图谱，并筛选关键调控因子。

方法：选取年轻（4 月龄）和自然衰老（24 月龄）C57BL/6 小鼠视网膜，进行高通量 RNA 测序与定量蛋白质组学分析，结合生物信息学手段鉴定差异分子及其信号通路。通过 qPCR、western blot 及免疫荧光在小鼠组织中验证关键结果，并在氧化或基因毒性应激诱导的 ARPE-19 细胞衰老模型中进行功能验证。

结果：多组学分析共鉴定出 273 种差异表达蛋白和 1,410 个差异基因，转录组与蛋白质组间呈中等相关（ $r = 0.58$ ），提示存在显著的转录后调控。富集分析显示免疫和代谢通路显著上调，而光转导和结构维持通路下调。STAT1 被鉴定为核心调控枢纽因子，其在衰老视网膜及衰老 ARPE-19 细胞中均上调。STAT1 过表达可促进活性氧（ROS）积累、衰老标志物 p16 和 p21 上调及炎症小体激活。

结论：STAT1 在视网膜衰老中作为炎症与氧化还原稳态的核心调控因子。我们的研究揭示了 STAT1 作为潜在生物标志物及治疗靶点的可能性，为延缓年龄相关性视网膜退行性疾病提供了新的分子依据。

摘要编号：206618

翻译后修饰介导的免疫失衡在年龄相关性黄斑变性中的作用机制

第一作者：Mingming YANG

目的：翻译后修饰（PTMs）在免疫炎症因子稳态调控中起关键作用，但其在眼球衰老及老年性黄斑变性（AMD）进展中的调控机制尚不明确。本研究旨在揭示 AMD 中显著变化的免疫因子的 PTMs 特征及其分子机制。

方法：收集干性 AMD 患者血清样本（ $n = 50$ ）进行细胞因子阵列分析，并结合眼球捐献者视网膜组织的单细胞测序数据（AMD 组 vs 对照组），筛选差异表达的免疫因子。构建自然衰老（28 月龄）小鼠、AMD（碘酸钠诱导）小鼠及体外视网膜色素上皮细胞（RPE）氧化应激模型，检测关键免疫因子的磷酸化、乙酰化及泛素化水平。通过小分子药物抑制去泛素化酶和去乙酰化酶活性，观察免疫因子表达变化以鉴定关键调控酶。进一步构建关键酶敲除的 AMD 动物模型，评估视网膜形态及视觉电生理功能变化。

结果：AMD 患者血清细胞因子阵列显示补体因子变化最显著，单细胞测序数据表明 T 细胞应答相关受体差异最明显（ $P < 0.05$ ， $|\text{FoldChange}| \geq 2$ ）。其中，补体 CFB 显著上调，而 PD-L1 显著下调。在衰老及碘酸钠诱导的 AMD 小鼠模型中，视网膜及色素膜 CFB 表达升高，PD-L1 降低（ $P < 0.01$ ）。PTMs 分析显示，AMD 及衰老小鼠色素膜中 CFB 乙酰化水平显著降低，而磷酸化及泛素化水平无显

著变化；PD-L1 泛素化水平显著升高，磷酸化及乙酰化水平无明显改变。体外 RPE 氧化应激模型重现了上述 PTMs 变化。机制研究发现，抑制去乙酰化酶 SIRT4 可逆转 CFB 的表达变化，而抑制去泛素化酶 USP2 可增强 PD-L1 表达。敲除 SIRT4 或 USP2 后构建 AMD 模型，观察到 RPE 细胞凋亡增加，视网膜电图振幅降低且潜伏期延长。

结论：CFB 去乙酰化及 PD-L1 泛素化是促进 AMD 进展的关键 PTMs，二者修饰导致免疫细胞过度活化。去乙酰化酶 SIRT4 和去泛素化酶 USP2 在此过程中发挥核心调控作用，可能成为 AMD 治疗的潜在靶点。

AS-OCT 在眼移植抗宿主病眼表评估中的应用

第一作者：Boyu YANG

共同作者：Lingyi LIANG

目的：应用 AS-OCT 及 AS-OCTA 技术，探讨异基因造血干细胞移植（allo-HSCT）后慢性眼移植抗宿主病（coGVHD）患者睑部泪腺及结膜血管的影像特征。

方法：本横断面对照研究纳入 36 例 coGVHD 患者、21 例重度泪液缺乏型干眼（ATD）患者及 21 名健康对照者。所有受试者均完成眼表及 AS-OCT 检查。睑部泪腺主要观察指标为腺泡、导管、血管、“千层糕”样结构。球结膜及上下睑结膜血流的主要观察指标为血管密度、平均血管长度及血管分支点密度。比较三组间差异，并分析 coGVHD 组的相关影响因素。

结果：除结膜纤维化，coGVHD 组与重度 ATD 组眼表状况相近。1) 睑部泪腺：与其它两组相比，coGVHD 组泪腺血管显著增多，小叶和导管略有减少（均 $P < 0.05$ ）。“千层糕”样结构仅见于 coGVHD 组。血管数量与移植后时间呈正相关，“千层糕”样结构与 coGVHD 严重程度和移植后时间呈正相关。2) 结膜血流：与其它两组相比，coGVHD 组的球结膜、上下睑结膜血管密度、平均血管长度及血管分支点密度均显著升高（均 $P < 0.05$ ）。结膜血流的改变与 coGVHD 严重程度、睑缘异常相关、女性供体-男性受体配型呈正相关。

结论: coGVHD 患者睑部泪腺具有“千层糕”样改变、血管增多的特征,且结膜血管密度及血管长度显著增加,这些改变与 coGVHD 的严重程度密切相关。AS-OCT 的非侵入性、客观定量特性使其有望成为评估 coGVHD 严重程度的新工具,为疾病诊断与监测提供更客观的依据。

摘要编号: 208711

LIF 通过调控能量代谢途径促进机械损伤角膜内皮修复

第一作者: Zenan WANG

共同作者: Jing HONG, Rongmei PENG, Yang ZHAI

目的: 验证白血病抑制因子 LIF 是否可以通过糖原代谢途径影响内皮细胞机械损伤后的恢复情况。

方法: 在治疗角膜内皮损伤的相关靶点上,我们观察到白血病抑制因子 LIF,可以在体外显著性的促进兔源角膜内皮原代细胞的增殖。通过机械划伤角膜内皮的方法建立新西兰大耳兔角膜内皮损伤的机械模型,并通过内皮细胞植片与 LIF 细胞因子前节注射的组合对内皮细胞损伤进行治疗。在生理上,我们在术后第 1、3、7 天对相应眼前节与 OCT 的检测,验证内皮细胞与角膜术后损伤情况。后续,我们对造模组与 LIF 治疗组的样本进行了冷冻电镜,Western blot 与免疫荧光检测,寻找 LIF 作用潜在的作用通路,并通过转录组学进行验证。最后,我们希望通过线粒体转移的方法观察是否可以在应用领域帮助角膜内皮细胞通过高能量状态降低机械损伤屏障功能损伤。

结果: 我们观察到,机械损伤造模组兔角膜出现了显著的水肿与不透明情况,而通过 LIF 注射,可以在一定程度上缓解这一现象。冷冻电镜的结果提示,在体外增殖的内皮细胞出现了显著的糖原堆积现象,而在体内则并没有显著差异。而在兔角膜内皮细胞上,我们观察到其排水功能相关离子泵相关的蛋白高表达,并且其能量代谢通路被受到显著上调。而后,针对转录组学呈现出的差异化基因结果进行 GO 功能与 Motif 富集分析,我们发现 LIF 诱导内皮细胞修复损伤的差异基因集中在内皮细胞排水功能相关机械感知相关 Piezo1 通路导致的钠钾离子通道激活上,LIF 通过维持细胞的能量状态,促进剩余内皮细胞行使排水功能,为角膜内皮外周更多健康细胞迁移与增殖争取时间。同时,应用外源线粒体转移的结果显示,内皮细胞能量状态在损伤情况的正常维持,其生理功能的维持有助于整体角膜内皮机械损伤的修复。

结论: LIF 可以通过维持内皮细胞的高能量状态,在角膜内皮机械损伤的情况下维持其离子转运与排水功能的稳态,从而降低角膜内皮机械性损伤。

摘要编号: 209607

MED1 敲除通过选择性激活 MAPK 通路调节角膜上皮干 / 祖细胞动态变化并促进角膜伤口愈合

第一作者: Ziwen SUN

共同作者: Xianli DU

目的: 角膜上皮的稳态与再生依赖于角膜干 / 祖细胞的自我更新、分化、迁移和增殖等复杂动态过程。本研究旨在明确转录共激活因子 Mediator 1 (MED1) 在维持角膜稳态与创伤愈合中发挥的关键作用。

方法: 本研究首先比较了健康个体与角膜损伤患者的角膜上皮组织,以检测 MED1 在角膜中的表达情况。随后,建立了 Med1 条件性敲除 (Med1 cKO) 小鼠及角膜上皮损伤模型,以探讨 MED1 在角膜稳态与再生中的作用。通过 RNA 测序结合 KEGG 与 GSEA 分析,确定由 MED1 调控的关键信号通路为 MAPK 信号轴。进一步在体外实验中,利用 MAPK 抑制剂、免疫荧光 (IF)、Western blot (WB)、Transwell 迁移实验以及共免疫沉淀 (Co-IP) 等方法,更深入地阐明了 MED1 在角膜上皮干 / 祖细胞功能中的调控作用。

结果: 我们发现,在患者受损的角膜上皮组织样本中,MED1 的表达水平显著下调。在小鼠中,角膜上皮干细胞中条件性敲除 (cKO) Med1 可在稳态条件下增强细胞的干性与增殖能力,并通过促进细胞迁移和维持角膜上皮完整性来加速创伤愈合。我们进一步证实,小鼠角膜再生能力的增强依赖于 Med1 缺失所导致的丝裂原活化蛋白激酶 (MAPK) 信号通路的选择性激活。体外实验结果表明,MED1 通过介导细胞外信号调节激酶 (ERK) 和 P38 MAPK 的激活,选择性地增强细胞的干性、增殖和迁移。此外,MED1 还能通过促进 ERK 和 P38 的磷酸化及其泛素介导的降解来调控 MAPK 信号通路。

结论: 综上所述,本研究揭示了 MED1 通过调控 MAPK 信号在维持角膜组织稳态与促进再生中的关键作用,为通过靶向 MED1-MAPK 通路促进角膜修复的治疗策略提供了新的思路。

摘要编号: 209030

MyD88 在棘阿米巴角膜炎致病机制中的研究

第一作者: Chen ZHANG

共同作者: Zijie FANG

目的: 探索棘阿米巴对角膜体内和体外的损伤机制,研究 MyD88 在棘阿米巴角膜炎致病机制中的作用。

观察抑制 MyD88 对阿米巴角膜炎下游炎症因子表达的影响。

方法：本研究通过体外细胞实验和体内大鼠模型探讨 MyD88 因子在棘阿米巴角膜炎中的作用及干预效果。体外培养角膜上皮/基质细胞，设正常对照组 (NC)、棘阿米巴感染组 (AMB)、AMB+siRNA 组、AMB+CHX 组及 AMB+siRNA+CHX 组，通过活死染色观察细胞存活状态，流式细胞术检测巨噬细胞 M1/M2 比例，Western blot 检测 TLR4/MyD88/p-NFκB/p-ERK1/2 表达，PCR/ELISA 检测 IL-1β/IL-6/TNF-α 水平，IF 观察 TLR4/MyD88/NFκB 核定位；通过角膜基质注射建立大鼠模型，设对应对照组，裂隙灯观察角膜溃疡评分，病理切片分析组织损伤，IHC 检测角膜基质 α-SMA 表达(方法同细胞实验)。

结果：体外实验中，AMB 组角膜细胞活性降低、形态异常，TLR4/MyD88/p-NFκB/p-ERK1/2 表达上调，IL-1β/IL-6/TNF-α 水平升高，M1 型巨噬细胞比例增加；而 AMB+siRNA 或 AMB+siRNA+CHX 组可逆转上述改变，减轻细胞损伤与炎症。大鼠模型中，AMB 组出现明显角膜溃疡、炎症浸润及 α-SMA 表达升高（纤维化倾向），裂隙灯评分高；慢病毒 shRNA 结膜下注射（下调 MyD88）或 AMB+siRNA 组可显著改善溃疡、降低炎症因子及 α-SMA 表达，联合洗必泰效果更优。

结论：MyD88 及其下游信号通路在棘阿米巴角膜炎发病中发挥关键作用，下调 MyD88 表达联合抗菌治疗能有效减轻炎症反应、抑制角膜纤维化、保护角膜结构与功能。

摘要编号：209307

RIPK3 介导的坏死性凋亡驱动角膜碱烧伤后神经炎症和视网膜神经节细胞丢失

第一作者：Yue LI

共同作者：Guofu HUANG, Fan XU

目的：揭示受体相互作用蛋白激酶 3 (RIPK3) 在角膜碱烧伤诱导的神经炎症及视网膜神经节细胞 (RGCs) 丢失中的调控作用。

方法：采用氢氧化钠溶液建立 C57BL/6J 野生型小鼠和 RIPK3^{fl/fl}Cx3cr1^{+/cre} (RIPK3 基因敲除，RIPK3^{-/-}) 小鼠的角膜碱烧伤 (AB) 模型。通过苏木精-伊红 (H&E) 染色评估 RIPK3^{-/-} 对视网膜结构的影响；采用视网膜铺片免疫荧光染色检测 RGCs 的存活情况；通过冰冻切片免疫荧光染色和碘化丙啶 (PI) 染色分析视网膜小胶质细胞浸润及坏死性细胞死亡情况；Western blot 检测角膜碱烧伤后坏死性凋亡信号通路的激活状态。

结果：角膜碱烧伤后，坏死性凋亡相关蛋白 RIPK1、RIPK3 和混合谱系激酶样结构域蛋白 (MLKL) 表达在视网膜中显著上调并激活，其中 p-RIPK3 的升高最为明显。值得注意的是，升高的 p-RIPK3 主要与浸润的 Iba1 阳性小胶质细胞共定位。此外，RIPK3 敲除保护视网膜结构，在角膜碱烧伤的过程中，视网膜胶质细胞被激活，同时引发视网膜神经元数量下降；而 RIPK3 敲除可显著抑制碱烧伤诱导的小胶质细胞浸润及 RGCs 丢失。RIPK3 敲除小鼠中 PI 阳性的坏死性细胞死亡也明显减少。机制研究表明，碱烧伤诱导的坏死性凋亡促进 MLKL 和成纤维细胞生长因子 2 (FGF2) 的表达，而 RIPK3 缺失可抑制这一过程。

结论：本研究发现 RIPK3 介导的坏死性凋亡驱动视网膜神经炎症和 RGCs 丢失。靶向调控 RIPK3 可通过阻断 MLKL/FGF2 信号通路有效抑制这些病理反应，为角膜碱烧伤的视力挽救提供了新的潜在治疗策略。

摘要编号：209019

lnc003946 在角膜移植排斥反应中的调控作用研究

第一作者：Xiaoxiao LU

共同作者：Ke LIU

目的：本研究旨在探究长链非编码 RNA lnc003946 在同种异体角膜移植排斥反应中的调控作用及其分子机制。

方法：体内实验使用 Wistar → Lewis 大鼠角膜移植排斥模型，结膜下注射 lnc003946 过表达腺病毒载体，设立 GFP 标签腺病毒对照组和 PBS 对照组。细胞实验使用原代培养大鼠骨髓来源巨噬细胞 (BMDMs)，慢病毒介导 lnc003946 敲减，LPS+IFN-γ 诱导 M1 极化，IL-4 诱导 M2 极化。进行 qPCR 检测 lnc003946 及炎症因子表达，Western blot 分析 HDAC10 等蛋白表达，流式细胞术检测巨噬细胞表型 (CD68+CD86+M1, CD68+CD163+M2)，免疫荧光观察蛋白亚细胞定位，巨噬细胞-T 细胞共培养实验 BrdU 法检测 PBMC 增殖以及 Treg 分化比例分析。

结果：体内实验发现 lnc003946 过表达组植片存活时间显著延长，植片混浊和水肿程度减轻，新生血管长入减少；免疫荧光显示 lnc003946 与 CD68⁺ 巨噬细胞巨噬细胞共定位。体外机制研究发现 lnc003946 过表达抑制 M1 型巨噬细胞极化，CD86 和 iNOS 表达下调，IL-6 和 IL-12 分泌减少，促进 Treg 细胞分化，抑制 PBMC 增殖。鉴定 HDAC10 为关键下游靶点，lnc003946 与 HDAC10 表达呈

负相关，影响 HDAC10 的核质定位，M1 极化诱导 HDAC10 表达上调。

结论：Inc003946 通过抑制巨噬细胞 M1 极化发挥免疫调节作用，其机制涉及对 HDAC10 的表观遗传调控，促进 Treg 分化和抑制淋巴细胞增殖是其延长植片存活的重要途径。

摘要编号：209853

pH 响应性甘草酸二钾水凝胶通过协同抗炎与杀菌靶向治疗角膜新生血管

第一作者：Yahong LI

共同作者：Xinyuan WANG

目的：角膜新生血管 (corneal neovascularization, CNV) 是一种威胁视力的病理过程，其临床治疗面临需同步控制炎症、预防感染及抑制血管生成的多重挑战。本研究旨在开发一种新型治疗策略以应对这一难题。

方法：我们成功构建了一种新型 pH 响应型智能胶束整合水凝胶 LEV@DG-HPMC。该体系通过甘草酸二钾 (dipotassium glycyrrhizinate, DG) 与羟丙基甲基纤维素 (hydroxypropyl methylcellulose, HPMC) 物理交联形成三维网络，用于负载左氧氟沙星 (levofloxacin, LEV)，其中 LEV 提供抗菌功能，而 DG 兼具载体结构与固有抗炎活性。为验证该体系，本研究依次开展了以下工作：首先，在体外表征了水凝胶的理化性质、不同 pH 条件下的药物释放行为及其流变学特性，验证了其 pH 响应性智能释药能力；其次，通过抗菌实验确认了其协同抗菌效应；最后，利用细胞和动物模型，系统评估了其生物相容性、组织安全性以及在减轻炎症、抑制新生血管和促进角膜修复方面的功效。

结果：实验结果表明，该水凝胶具备优异的生物相容性与显著延长的眼表滞留能力。其 pH 响应性释药行为与碱烧伤后病理微环境的时序性 pH 变化高度契合。尤为重要的是，该体系能通过协同作用，实现强效抗菌，并显著下调白介素-1 β 、白介素-6、肿瘤坏死因子- α 及核因子 κ B 等关键炎症因子，同时抑制血管内皮生长因子 A 与基质金属蛋白酶-9 等促血管生成因子的表达，从而有效抑制 CNV 进展、减轻角膜混浊并促进角膜修复。

结论：本研究所开发的 LEV@DG-HPMC 水凝胶通过多重协同机制，成功整合了抗菌、抗炎功能，其智能释药特性与病理微环境良好响应。该多功能递送系统为 CNV 的高效治疗提供了一种极具前景的新策略。

摘要编号：201622

β -葡聚糖纳米抗体-那他霉素给药体系在真菌性角膜炎中治疗作用

第一作者：Jing LIN

共同作者：Huijin DUAN, Junjie LUAN

目的：本研究旨在通过制备针对真菌细胞壁 β -葡聚糖的纳米抗体 (nanobody, Nb) 并将其与抗真菌药物那他霉素 (natamycin, NAT) 偶联，开发治疗真菌性角膜炎的新策略。

方法：采用基因工程方法构建表达特异性 β -葡聚糖 Nb 的重组载体，在其 C 端引入三个巯基位点，以实现功能基团的共价结合将 Nb 与 NAT 偶联。通过最小抑菌浓度 (MIC)、生物膜生物量测定、碘化丙啶 (PI) 摄取实验、calcofluor white 染色、茜素蓝染色、扫描电镜 (SEM) 及透射电镜 (TEM) 等方法，评估 Nb 及 Nb-NAT 对烟曲霉 (*Aspergillus fumigatus*) 的抗真菌活性。采用 CCK-8 检测、眼部刺激试验及角膜荧光素钠染色等方法评估 Nb 及 Nb-NAT 的生物相容性。在小鼠眼内建立真菌性角膜炎模型，通过临床评分、菌落计数及 HE 染色评估疾病严重程度；使用 qRT-PCR 及 ELISA 检测 Nb 及 NAT 的抗炎作用。

结果：研究发现，特异性 β -葡聚糖 Nb 可通过破坏真菌细胞壁及抑制生物膜形成来抑制真菌生长，且可降低真菌细胞壁中 β -葡聚糖的含量。Nb 还能减少真菌分生孢子对人角膜上皮细胞 (HCECs) 的黏附能力。进一步比较 NAT 与 Nb-NAT 的抗真菌效果，结果表明 Nb-NAT 较 NAT 具有更优的抗真菌活性，该差异可能源于 Nb 与 β -葡聚糖的特异性结合。此外，浓度低于 0.5 mg/mL 的 Nb 对 HCECs 无明显毒性，Nb-NAT 的细胞毒性及眼表刺激性均低于 NAT。特异性 β -葡聚糖 Nb 能够削弱烟曲霉的毒力并减轻真菌性角膜炎中的炎症反应，Nb-NAT 处理后角膜治疗效果较 NAT 显著增强，表现为临床评分降低及炎症因子表达水平下降。

结论：本研究通过制备针对 β -葡聚糖的 Nb 并负载 NAT，开发出一种治疗真菌性角膜炎的高效新策略。Nb 在真菌性角膜炎中发挥显著的抗真菌及抗炎作用。Nb 与 NAT 偶联后形成的 Nb-NAT 在体外显示出优异的抗真菌效果，且毒性和角膜刺激性均低于 NAT。Nb-NAT 治疗能够显著缓解真菌感染引起的角膜损伤，为真菌性角膜炎的临床治疗提供了新的思路。

摘要编号：210024

伪装成结膜黑色素瘤的真菌感染

第一作者：Yawen NIU

目的：报道一例真菌肿块误诊为色素性结膜黑色素瘤的病例。

方法：病例报告。

结果：一名 69 岁男性因色素结膜病变就诊，诊断为黑色素瘤。就诊前 1 月，患者既往糖尿病史，患眼曾因玻璃体出血，行白内障联合玻璃体切割手术。裂隙灯检查上睑结膜面中央见色素样改变，弥漫团块状黑色炭渣样肿物、深浅不一、局部附着灰白分泌物。取出肿块，进行培养，确认为真菌感染。

结论：在鉴别色素性结膜病变时应考虑深色真菌。

摘要编号：209088

光热响应可溶性微针用于睑板腺功能障碍治疗的研究

第一作者：Fei YU

目的：睑板腺功能障碍（MGD）是影响视觉质量的重大眼病，现有物理联合药物疗法在精准性和疗效方面存在不足，亟需探索更高效的睑板腺药物递送和 MGD 治疗方案。

方法：利用聚乙烯醇、环糊精改性的聚丙烯酸和光热材料 IR820 合成一种具有光热响应性的可溶性微针（MN），通过检测微针的光热效应、溶解性能、机械强度和生物相容性，明确微针递送睑板腺药物的可行性、安全性和药物缓释性能；在小鼠 MGD 模型中，通过大体检测、组织形态学及分子生物学分析，验证负载脂质代谢调节药物罗格列酮的微针（ROSI-MN）减轻 MGD 的效果及机制。

结果：通过优化材料配比得到了可达到适于 MGD 治疗温度的 MN，并且在近红外光的照射下，其溶解速度加快、药物缓释能力增强。体内外检测均证明 ROSI-MN 具备安全地穿透眼睑上皮递送药物于睑板腺组织的能力。此外，ROSI-MN 治疗组 MGD 小鼠的眼表损伤、睑板腺脂质堆积、腺体扩张和炎症浸润均显著下降，达到了最显著缓解 MGD 的效果。

结论：光热响应可溶性 MN 有望成为 MGD 及其他眼表疾病的高效给药策略，为临床提供一体化 MGD 治疗新策略。

摘要编号：209077

共载 PGRN/ 那他霉素纳米脂质体对烟曲霉菌性角膜炎的治疗研究

第一作者：Jing LIN

目的：本研究旨在探究颗粒蛋白前体（PGRN）在真菌性角膜炎中的作用及机制，并将其与抗真菌药物那他霉素（NATA）共负载于纳米脂质体（PGRN-NATA-LN），开发治疗真菌性角膜炎的新策略。

方法：建立小鼠烟曲霉菌性角膜炎模型及细胞模型，PCR 和 WB 检测烟曲霉菌侵袭前后 PGRN 表达变化。使用 PGRN 重组蛋白对角膜及细胞进行预处理，通过临床评分、菌落计数、免疫荧光评估其在小鼠角膜炎中治疗作用；通过 PCR 及 ELISA 检测细胞炎症因子表达变化；WB 检测自噬相关蛋白表达，免疫荧光及 TEM 观察自噬发生情况。使用 3-MA 抑制自噬，评估 PGRN 的治疗作用与自噬的关系。此外，通过薄膜水化法制备 PGRN-NATA-LN，利用 TEM、粒度电位仪、HPLC 和紫外分光光度计等方法评估 PGRN-NATA-LN 的性状。通过 CCK-8、Draize 眼毒性实验评估体内外药物毒性。通过 MIC、CFW、PI 染色及生物膜形成实验检测 PGRN-NATA-LN 的抗菌能力；在小鼠眼内建立真菌性角膜炎模型，通过临床评分、菌落计数评估疾病严重程度；使用 PCR、ELISA 及免疫荧光检测 PGRN-NATA-LN 的抗炎作用。

结果：在烟曲霉菌感染的小鼠角膜及细胞中 PGRN 含量均升高，PGRN 处理后可降低小鼠角膜炎临床评分、减轻角膜炎症反应及真菌负荷，降低细胞炎症因子的表达，调节巨噬细胞向 M2 型极化，并升高角膜及细胞中自噬相关蛋白表达，3-MA 可抑制此作用。制备成功的 PGRN-NATA-LN 为大小均匀的圆形囊性颗粒，其包封率、释放率及稳定率良好，生物安全性高。PGRN-NATA-LN 既能抑制烟曲霉菌的侵袭又并减轻炎症反应，降低小鼠角膜临床评分，抑制中性粒细胞的募集并降低角膜真菌负荷。

结论：本研究证实了 PGRN 可以通过调节自噬抑制烟曲霉菌性角膜炎炎症反应；增强巨噬细胞吞噬功能，减轻烟曲霉菌性角膜炎疾病程度，在烟曲霉菌性角膜炎中发挥保护作用。PGRN-NATA-LN 具有良好的安全性，兼具有效的抗真菌及抗炎作用，在烟曲霉菌性角膜炎中表现出更优的治疗效果，为真菌性角膜炎的临床治疗提供了新的思路。

摘要编号: 209258

利用红外光谱技术基于 Schirmer 试纸条进行泪液生物标志物分析的研究

第一作者: Haozhe YU

共同作者: Yun FENG

目的: 开发并验证一种基于衰减全反射 - 傅里叶变换红外 (ATR-FTIR) 光谱技术的、无标记分析平台, 该平台使用 Schirmer 试纸条进行泪液生物标志物分析, 并评估其在鉴别水液缺乏型干眼病 (DED) 亚型中的诊断效用。

方法: 泪液样本使用 Schirmer 试纸条采集, 样本来源包括接受常规眼科检查的个体以及患有水液缺乏型 DED (伴或不伴原发性干燥综合征) 的患者。对试纸条的湿润区域进行 ATR-FTIR 光谱分析。采用逐步线性回归来模拟单个蛋白质光谱对模拟泪液光谱的贡献。使用欧几里得距离量化光谱差异, 并通过 Spearman 相关性分析与生物标志物浓度及临床参数进行关联。随后应用稀疏偏最小二乘判别分析 (sPLS-DA) 对 DED 亚型进行分类。

结果: 在 $800\text{-}1700\text{ cm}^{-1}$ 和 $\sim 3000\text{ cm}^{-1}$ 区域观察到显著的光谱特征。随着蛋白质光谱的依次加入, 模拟泪液光谱的模型拟合度逐步提高。光谱欧几里得距离能有效捕捉生物标志物 (以乳铁蛋白为例) 的浓度梯度。该距离与泪膜破裂时间、脂质层厚度的相关性均强于其与 Schirmer 试纸湿润长度的相关性, 并且在洗脱后保持稳定。sPLS-DA 能够准确区分 DED 亚型, 曲线下面积 (AUC) 达 0.963, 其分类能力主要由蛋白质相关的光谱特征驱动。

结论: 这项基于 Schirmer 试纸条 ATR-FTIR 光谱技术的集成化泪液分析平台, 能够通过捕获泪液分子指纹, 实现 DED 亚型的准确、经济有效的鉴别, 为将基于泪液的精准医疗整合到常规临床工作流程中奠定了基础。

摘要编号: 210004

单细胞测序发现 CD8⁺ T 细胞介导的慢性炎症在圆锥角膜发病机制中的核心作用及分子机制

第一作者: Shuang ZHANG

共同作者: Panpan XIAO, Wenjuan ZHUANG, Shuang ZHANG

目的: 探讨圆锥角膜发病中慢性炎症的分子机制, 特别是解析角膜上皮细胞与免疫细胞间的相互作用, 并鉴定驱动病理进程的关键免疫细胞亚群及其调控网络, 为理解 KC 的进行性恶化提供新的视角。

方法: 对圆锥角膜患者及健康对照组的中央角膜上皮组织进行单细胞 RNA 测序。通过生物信息学方法, 进行差异基因表达分析、GO/KEGG 通路富

集、转录因子活性 (SCENIC) 及基因集变异分析 (GSVA), 并利用细胞通讯网络分析探究上皮与免疫细胞间的相互作用。

结果: 关键调控中枢的细胞特异性: 我们鉴定出 KC 样本中存在显著的免疫细胞浸润, 主要是 CD8⁺ T 细胞。SCENIC 分析揭示, 这些免疫细胞由淋巴细胞关键调控转录因子 IKZF1 和 RUNX3 驱动; 而角膜上皮细胞则主要由氧化应激主控转录因子 NFE2L2 调控, 提示疾病由上皮应激损伤和免疫失调共同驱动。细胞毒性 T 细胞亚群的鉴定与特征: 进一步鉴定出两个关键的 CD8⁺ T 细胞毒性亚群: CD8_Tox_JUN (代表持续激活状态) 和 CD8_Tox_GZMH (代表细胞毒性状态)。GSVA 分析显示, 这两个亚群呈现 T 细胞耗竭 (T-cell exhaustion) 的典型特征 (如 TCR 信号通路下调), 并伴有显著的脂质代谢 (尤其是花生四烯酸代谢) 重编程, 表明它们处于一种慢性但持续的炎症状态。炎症放大的恶性循环机制: 基于差异基因 (如 FKBP5, APP) 表达, 我们推断上皮来源的 APP (及其衍生物 A β) 是激活 T 细胞的慢性抗原。关键的是, 细胞通讯分析揭示, 作为配体的上皮细胞 APP 与作为受体的 CD8_Tox_GZMH 亚群 CD74 之间的相互作用在 KC 样本中显著增强, 形成了一个强有力的正反馈放大循环。

结论: 本研究首次揭示了圆锥角膜的慢性炎症是一种由特定 CD8⁺ T 细胞毒性亚群驱动的、类似于自身免疫的病理过程。我们提出一个新模型: 角膜上皮在应激下表达并释放 APP, 作为慢性抗原激活了 CD8⁺ T 细胞, 并使其分化为功能耗竭的细胞毒性亚群。然后, 上皮来源的 APP 通过与这些 T 细胞表面的 CD74 受体结合, 形成一个正反馈放大循环, 持续增强 T 细胞的生存和攻击能力, 最终导致进行性的角膜基质破坏。我们的发现不仅为圆锥角膜的发病机制提供了全新解释, 也提示靶向 APP-CD74 免疫轴心可能为 KC 的治疗提供全新策略。

摘要编号: 208763

可降解丝素蛋白膜作为人工角膜内皮移植替代物

第一作者: Miaomiao CHI

共同作者: Jing HONG, Rongmei PENG

目的: 角膜内皮功能障碍 (CED) 通过房水内流引发基质水肿, 破坏胶原结构并导致角膜混浊, 慢性病例可进展为纤维化。作为角膜盲的主要致病因素, CED 目前仍需通过角膜移植进行治疗。然而, 由于人类供体的短缺, 开发人工角膜内皮移植材料的需求迫在眉睫。此前报道的不可生物降解的聚合物材

料存在粘附性不足和挡水效率不佳的问题，长期植入还可能引发异物反应。

方法：本文通过旋涂、水退火和热压成型技术制备了甘油增塑的丝素蛋白膜，用作可降解人工角膜内皮层。体外验证其生物相容性和对细胞功能的影响。并在角膜内皮失代偿兔模型中验证其可恢复角膜透明性的作用，以及对内皮细胞迁移和炎症的影响。

结果：我们通过旋涂和水退火技术开发了丝素蛋白-增塑剂复合膜。甘油增塑的丝素蛋白膜具有优良的透光性与柔韧性，水退火处理进一步提高了薄膜力学强度便于眼内手术植入。体外水压力测试发现丝素膜能够长期承受等效于最大眼内压的压力而不发生破裂或渗漏超过 75 天。增塑剂的添加赋予丝素薄膜热塑性，能够通过热成型技术制备出具有合适厚度与眼内曲率的薄膜。丝素蛋白膜经环氧乙烷灭菌处理不影响其力学性能和细胞相容性。植入 CED 兔模型丝素蛋白膜紧密贴附于角膜基质，有效屏障房水进入角膜，同时允许营养物质扩散。在 3 个月观察期间，动物几乎无炎症反应和异物反应，并发现周边内皮细胞向 SF 膜表面迁移。

结论：丝素蛋白膜作为一种具有降解性的新型人工角膜内皮层材料，其优良的透光性、手术可操作性、挡水性与低异物反应等在治疗 CED 方面展现出巨大的临床应用潜力。

摘要编号：208166

基于 ROS/pH 智能响应的载药仿生涂层在泪道支架表面工程中的应用及其抗纤维化机制研究

第一作者：Guanghong ZHANG

共同作者：Chao QU

目的：本研究通过在传统泪道硅胶支架表面构建一种具有抗纤维化功能的亲水性生物相容性涂层，以减轻泪道置管术后黏膜纤维化愈合程度，提高手术成功率。

方法：该涂层采用多巴胺杂化 ZIF-8 纳米金属有机框架 (MOFs) 负载小分子药物维替泊芬 (VP)，能够在纤维化早期 (炎症阶段) 响应 ROS/pH 变化，实现药物可控释放，从而逆转纤维化进程。此外，MOFs 涂层表面通过点击化学方法接枝透明质酸，兼具药物缓释和增强生物相容性的作用。

结果：体外生物学评价显示，该涂层具有良好的抗细菌黏附、抗蛋白吸附、抗炎及抗纤维化性能。分子机制研究表明，该涂层释放的 VP 通过抑制 YAP/TAZ 蛋白核转位，有效阻断了纤维化信号通路。

结论：本研究研发的抗纤维化亲水涂层为泪道阻塞性疾病的治疗提供了新思路，并为抑制泪道黏膜纤维化的分子机制研究提供了潜在靶点。

摘要编号：202609

基于 cAMP 的纳米酶水凝胶通过膜保护性杀灭和抑制宿主炎症实现真菌性角膜炎的双靶向治疗

第一作者：李娜

目的：真菌性角膜炎 (FK) 是全球主要的致盲性眼病。目前常规抗真菌药物因角膜渗透性差、生物利用度低及角膜毒性等问题，在 FK 治疗中面临巨大挑战。本研究旨在开发一种新型治疗策略以克服这些局限性。

方法：本研究首先将环磷酸腺苷 (cAMP) 确定为治疗候选分子，并通过原位金属-有机配位反应构建了镱-cAMP 纳米酶 (SCN)。同时，通过十二胺有机分子笼与氧化结冷胶的缩合反应制备了束缚笼水凝胶 (TCH)，随后将 SCN 嵌入 TCH 中，最终得到水凝胶复合材料 (TCHC)。采用扫描电镜 (SEM) 和能谱 (EDS) mapping 分析对其形貌和元素分布进行表征。通过体外抗真菌实验、角膜伤口愈合实验和小鼠 FK 模型评估其疗效，并利用转录组学分析揭示其作用机制。

结果：成功制备了具有大孔结构且元素分布均匀的 TCHC 复合材料。体外实验表明，TCHC 在 24 小时内能清除 94.2% 的茄病镰刀菌，且不破坏真菌细胞膜。TCHC 能显著加速角膜伤口愈合，48 小时内修复率可达 94.1%。在小鼠 FK 模型中，TCHC 展现出有效的治疗效力。转录组学揭示其通过双重靶向治疗机制——同时干扰真菌 DNA 代谢并抑制宿主细胞质 DNA 传感——实现 FK 治疗。

结论：本研究开发的水凝胶复合材料 (TCHC) 通过独特的双重机制 (膜保护性杀灭真菌和抑制宿主炎症) 有效治疗 FK，凸显了其作为真菌感染性疾病治疗平台的巨大潜力。

摘要编号：204043

基于图案化精准定制化圆锥角膜交联技术应用研究

第一作者：Longhao KUANG

目的：评估图案化角膜光动交联平台控制兔圆锥角膜的有效性和安全性，探究照射强度、照射能量与圆锥角膜控制效果之间量-效关系。

方法：通过基于 DMD 芯片的 DLP 投影技术并结合智能眼追踪系统构建图案化光动交联平台，实现图案化角膜交联和精准的眼球追踪定位，并与美国 Avedro 公司角膜交联治疗系统 (KXL) 进行对比。利用 I 型胶原酶在角膜基质层注射的方式，构建兔圆锥角膜动物模型，根据不同的照射强度和照射

能量以及上皮状态进行随机化分组。设计鸟巢样和蜂窝样索穹顶交联图案，与传统圆形光斑交联的效果进行对比。角膜交联后 1 天、7 天、30 天、90 天、180 天进行随访，评估眼压、角膜地形图 (Sirius+)、眼前节 OCT、角膜共聚焦显微镜、H&E 染色、生物力学测试等。评估交联前和交联后不同时间点的差异，采用重复测量方差分析，结果以均值 $\pm$ 标准差表示， $p < 0.05$ 时认为有统计学意义。

结果：① 对照组与造模组在基质内注射胶原酶 I 前及注射后 90 天，眼压和角膜内皮细胞数量的变化未见明显差异 ($P > 0.05$)；注射后 90 天，造模组角膜前表面最大角膜曲率明显增高 ($P < 0.05$)、角膜最薄点厚度明显变薄 ($P < 0.05$)。② 各组试验兔在角膜交联前及交联后 90 天，眼压和角膜内皮细胞数量的变化未见明显差异 ($P > 0.05$)；各组试验兔在交联后 90 天角膜前表面最大角膜曲率和角膜最薄点角膜厚度的差异均具有显著统计学意义 ($P < 0.05$)，图案化光动交联平台 18 mw/5.4 J 能量下，平均减小的角膜曲率最大，为 3.53 D，而 18 mw/7.2 J 能量下，角膜最薄点角膜厚度变化值最小，为 10.5 mm。③ 通过 Biotester 双轴测试系统检查，三种图案角膜交联后，角膜的力学性能均得到了提升，鸟巢结构力学性能平均相对差异最大为 61.98% ($P < 0.05$)。

结论：① 兔角膜基质层注射 0.1 mg/mL I 型胶原酶可用于构建兔圆锥角膜动物模型。② 图案化光动交联平台和 KXL 系统均能有效的延缓圆锥角膜的进展，但图案化光动交联平台 ② 图案化光动交联平台和 KXL 系统均能有效的延缓圆锥角膜的进展，但图案化光动交联平台 18 mw/5.4 J 能量下，控制角膜曲率变化最优，18 mw/7.2 J 能量下，控制角膜厚度变薄最优。③ 鸟巢结构构交联后角膜生物力学性能最为突出，在减少紫外照射面积的情况下，可以通过设计特殊结构的方式来达到相似或者更好的交联效果。

摘要编号：200942

大切削区域 PRK 治疗 RCES 伴屈光不正的患者的有效性、安全性及屈光结果的研究

第一作者：Xinxin YU

共同作者：Shuangqing WU

目的：复发性角膜糜烂综合征 (Recurrent corneal erosion syndrome, RCES) 以角膜上皮反复糜烂剥脱为特征，常伴有角膜上皮缺损。难治性 RCES 患者，应考虑采取上皮清创术、前基质穿刺术、羊膜移植术及准分子激光治疗等。其中准分子激光治疗包括：治疗性角膜切削术 (phototherapeutic keratectomy, PTK)、经

上皮治疗性角膜切削术 (trans-epithelial PTK, TPTK) 以及屈光性角膜切削术 (photorefractive keratectomy, PRK)。本研究回顾性比较了 PRK 与 PTK 治疗复 RCES 的有效性及安全性，并评估了 PRK 与 TPRK 的视力及屈光结果。

方法：本研究为回顾性非随机对照研究，纳入了接受 PRK 或 PTK 治疗的 RCES 患者。其中，PRK 组的所有患者均被诊断为伴有近视的 RCES。详细记录了年龄、性别、患眼眼别、潜在病因以及最佳矫正视力 (best corrected visual acuity, BCVA)。手术参数如光学区直径、治疗区直径和切削深度均被完整记录。术后观察指标包括角膜上皮愈合时间、角膜上皮糜烂复发情况、并发症、视力以及屈光度等。

结果：共纳入 62 名患者的 79 只眼，其中 PTK 组 49 例患者 52 眼，PRK 组 16 例患者 16 眼，TPRK 组 11 例患者 11 眼。PRK 组治疗区直径 (8.92 ± 0.57 mm) 与 PTK 组 (9.15 ± 0.48 mm) 无显著性差异，但 PTK 组显著大于 TPRK 组 (8.55 ± 0.51 mm) ($p = 0.001$)。术后随访显示：PRK 组 1 眼在术后 1 年复发，经保守治疗缓解；PTK 组 3 眼出现上皮糜烂复发，其中 2 眼经角膜上皮清除联合绷带镜治疗后痊愈，1 眼需再次 PTK 治疗。角膜上皮延迟愈合发生率 PRK 组 2 眼 (12.50%)、PTK 组 8 眼 (15.38%)、TPRK 组 1 眼 (9.09%)，均伴随角膜云翳或 Haze 形成：PRK 组 1 眼与 PTK 组 1 眼在角膜上皮化 30-60 天后出现轻度角膜云翳；暂时性 Haze 见于 PRK 组 2 眼 (12.50%)、PTK 组 1 眼 (1.92%) 及 TPRK 组 2 眼 (18.18%)。视力改善方面，PRK 组与 TPRK 组末次随访时与目标等效球镜的偏差分别为 -0.25 ± 0.57 D 和 -0.13 ± 0.26 D，两组患者裸眼矫正视力均达 1.0 或更好。

结论：大切削区域的 PRK 治疗 RCES 在有效性和安全性方面与 PTK 相当，其屈光效果与 TPRK 相似。对于合并屈光不正的 RCES 患者，该术式在缓解症状的同时可获得理想的视力改善，故推荐临床采用。

摘要编号：201385

太阳光驱动氮掺杂碳点修饰二氧化钛的高效抗真菌作用及机制研究

第一作者：Guiqiu ZHAO

共同作者：Menghui CHI, Cui LI, Jing LIN

目的：真菌性角膜炎易导致严重的视力损伤，现有抗真菌药物存在耐药性强、刺激作用强、易耐药等问题。本研究旨在构建一种氮掺杂碳点 (N-CDs) 修饰的二氧化钛 (TiO₂) 纳米复合材料，利用太

阳光催化产生活性氧高效杀灭真菌并探索其作用机制，为眼科抗真菌治疗提供新方法。

方法：以壳聚糖为碳源和氮源，采用水热合成法制备 N-CDs，并将其与 TiO₂ 复合构建 N-CDs/TiO₂ 光催化材料。运用高分辨透射电镜（HR-TEM）、傅里叶变换红外光谱（FT-IR）及紫外-可见漫反射光谱（UV-Vis DRS）对复合材料形貌、化学结构与光吸收性能进行表征；通过瞬态光电流响应与莫特-肖特基测试分析能带结构及光生电荷分离效率；在模拟太阳光照射下测试 N-CDs/TiO₂ 的体外烟曲霉菌杀灭作用；采用电子顺磁共振（EPR）及自由基捕获试验检测光催化过程中产生的主要活性物种；使用 CCK-8 法与 EdU 染色检测光催化剂对人角膜上皮细胞（HCECs）活力和增殖影响。

结果：成功制备的 N-CDs/TiO₂ 中，N-CDs 通过 Ti-O-C 键锚定于 TiO₂，氮原子的掺杂有效拓宽材料可见光吸收范围，显著提升载流子分离效率。在模拟太阳光照射下，N-CDs/TiO₂ 表现出优异的光催化杀菌性能，照射 10 分钟杀菌率为 40%，30 分钟内可实现完全灭菌，在室温储存 3 周后仍保持高效的抗真菌活性。捕获剂和 EPR 结果表明，N-CDs/TiO₂ 在催化杀菌的过程中可产生大量的 $\cdot\text{OH}$ 、 $\cdot\text{O}_2^-$ 及空穴等多种活性物种，其中 $\cdot\text{OH}$ 在破坏真菌细胞结构中起主导作用。同时，CCK-8 与 EdU 染色实验表明 N-CDs/TiO₂ 在有效杀菌浓度下对 HCECs 未表现出明显细胞毒性或增殖抑制。

结论：本研究成功制备 N-CDs/TiO₂ 纳米材料，通过氮掺杂碳点显著增强 TiO₂ 的光催化作用，提高太阳光利用效率，优化其能带结构从而产生大量的活性氧，在太阳光照射下实现对烟曲霉菌的高效快速杀灭。该复合材料具有良好的生物安全性、稳定性和太阳光驱动杀菌作用，在真菌性角膜炎等真菌感染性疾病中具备良好的应用前景，为新型抗真菌策略提供了理论依据。

摘要编号：202204

富马酸二甲酯通过调节 Nrf2/STING 轴改善干眼

第一作者：Weijie OUYANG

共同作者：Dan YAN

目的：研究 Nrf2 激动剂富马酸二甲酯（DMF）对干眼的治疗作用及其机制。

方法：本研究使用东莨菪碱（0.5 mg/0.2 ml）皮下注射联合干燥环境建立小鼠干眼模型，并局部点眼给予 DMF 或溶剂。体外使用高渗（HS）诱导的人角膜上皮细胞（HCE）模型。检测指标包括：体内酚红棉线测泪液分泌，OGD 染色评角膜上皮完整性，PAS 染色定量结膜杯状细胞，免疫荧光检

测角膜 MMP-3、MMP-9 表达，TUNEL 法及 AC-Caspase-3/8 免疫荧光评估角膜凋亡，免疫组化检测角结膜氧化应激标记物 4-HNE、NOX4 表达；体外 CCK8 测 HCE 细胞活性，Annexin V-FITC/PI 流式及 Caspase-8 免疫荧光评估 HCE 凋亡，ROS 探针、3-NT 免疫荧光、Nrf2 及相关酶 qRT-PCR、总抗氧化能力试剂盒评估 HCE 氧化应激水平，Western 印迹检测 HCE 中 Nrf2/STING 通路相关蛋白。

结果：体外实验证明局部 DMF 治疗可有效增加小鼠泪液分泌量，保护角膜上皮屏障功能，逆转了干眼导致的结膜杯状细胞密度减少，抑制了角膜上皮 MMP-3、MMP-9 的表达，有效缓解了角膜上皮的凋亡，抑制了角结膜氧化应激水平。体内实验证明，DMF 可以保护 HCE 免受高渗毒性，抑制高渗引起的凋亡和氧化应激，并且证实 DMF 可能是通过调节 Nrf2/STING 轴对干眼起治疗作用。

结论：富马酸二甲酯可通过调节 Nrf2/STING 轴有效改善干眼，可作为治疗干眼症的潜在药物。

摘要编号：207984

强脉冲光疗法联合抗炎滴眼液对睑板腺功能障碍相关干眼中基质金属蛋白酶-9 表达变化的影响

第一作者：Haipai YAO

共同作者：Yulan WANG

目的：评估强脉冲光（IPL）疗法联合抗炎滴眼液对睑板腺功能障碍（MGD）相关干眼治疗中细胞外基质金属蛋白酶-9（MMP-9）水平及临床疗效的综合影响。

方法：本项前瞻性病例对照研究（每名患者纳入一只更严重的眼，两眼同样严重则纳入右眼）。纳入标准：（1）确诊为干眼症，诊断标准参照《中国干眼专家共识（2020 年）》；（2）诊断为睑板腺功能障碍（MGD），诊断标准参照《睑板腺功能障碍诊断与治疗专家共识（2017 年）》；（3）泪液分泌的 MMP-9 蛋白呈阳性（ $\geq 40 \text{ ng/ml}$ ）；（4）Fitzpatrick 皮肤分型为 I-IV 型；（5）了解不同治疗方案，并自愿参与本研究。排除标准：（1）感染性睑缘炎、脂溢性皮炎；（2）严重眼表异常或睑缘明显异常（ ≥ 3 次眼睑手术史）；（3）无法理解知情同意书及量表内容，且无法正常沟通者；（4）其他眼表疾病（如感染性角结膜炎、睑板腺炎症、结膜疾病）；（5）近期接受过任何抗炎治疗；（6）有眼部手术或外伤史、长期用药史。所有患者随机分为两组：（1）OPT 联合抗炎治疗组：接受 M22 强脉冲光治疗 3 次（间隔 2 周 $\pm$ 2 天）联合环孢素滴眼液（每日两次）；（2）单纯抗炎治疗组：环

胞素滴眼液（每日两次）治疗。评估方法：治疗前及治疗 6 周时分别检测：泪液 MMP-9 水平（根据条带深浅评分：强阳性 4 分，阳性 3 分，弱阳性 2 分，可疑阳性 1 分，阴性 0 分）、眼表疾病指数（OSDI）问卷评分（前后差值大于 5 视为症状好转）、泪膜破裂时间（TBUT）。采用线性混合模型（Linear mixed model）和广义估计方程（generalized estimating equations model）评估组间差异。

结果：本项研究纳入 37 眼，其中 OPT 联合抗炎治疗组（1 组）21 眼，单纯抗炎治疗组（2 组）16 眼。1 组症状好转 10 眼，2 组 3 眼；MMP9 水平好转 1 组 17 眼，2 组 10 眼；MMP9 水平转阴 1 组 13 眼，2 组 4 眼；TBUT 治疗 6 周前后差异 1 组 2.539 ± 0.580 秒， $P < 0.0005$ ，2 组 2.539 ± 0.580 ， $P < 0.05$ 。

结论：强脉冲光疗法联合抗炎滴眼液对睑板腺功能障碍（MGD）相关干眼治疗对眼表炎症及干眼症状有显著好转作用。

摘要编号：209027

糖尿病相关眼表病变的临床特征及 NAMPT 调控机制研究

第一作者：Hui LIU

共同作者：Qian GUO, Haini LIU

目的：本研究旨在系统解析烟酰胺磷酸核糖转移酶（NAMPT）在糖尿病性角膜病变中的调控作用。

方法：收集 2 型糖尿病患者与非糖尿病对照者的角膜及泪腺组织，通过免疫荧光染色检测 NAMPT 表达分布。动物模型：采用 db/db 小鼠（T2DM 模型）与 db/m 对照组，动态监测 8/12/16 周龄的眼表功能及 NAMPT 表达变化，高糖培养模拟糖尿病环境，甘露醇作为渗透压对照，NAMPT 干预：FK866 抑制剂、siRNA 沉默、P7C3 激动剂；线粒体自噬调控：CCCP 激活剂、PINK1-siRNA 沉默。在分子水平，检测 NAMPT、线粒体生物发生（NRF1/TFAM/TOMM20）、自噬（PINK1/Parkin/LC3B）、凋亡（BCL-2/BAX/CytC）蛋白表达。NAD⁺ 含量检测。在细胞功能水平 JC-1/TMRM 染色测线粒体膜电位，DCFH-DA/MitoSOX 染色评估 ROS，划痕实验测迁移能力，TUNEL 染色量化凋亡。在组织病理水平，H&E 染色分析角膜厚度， β III Tubulin 免疫荧光标记神经再生。

结果：糖尿病患者角膜及泪腺组织中 NAMPT 表达水平显著低于非糖尿病对照组。动物实验进一步证实，糖尿病模型小鼠的角膜和泪腺 NAMPT 表达随病程进展呈现进行性下降。高糖环境下，NAMPT 的减少主要发生在线粒体区室，而细胞质中 NAMPT 水平未表现显著变化，高糖培养的人角膜

上皮细胞表现出明显的线粒体 NAMPT 耗竭，伴随线粒体膜电位降低。线粒体生物发生相关调控因子表达受到抑制。糖尿病状态下，PINK1/Parkin 介导的线粒体自噬通路活性显著降低，导致受损线粒体清除效率下降。自噬标志物 LC3B-II/LC3B-I 比率的变化及 p62 积累证实自噬流受阻。高糖环境促使角膜上皮细胞呈现促凋亡倾向。细胞色素 C 释放增加。NAMPT 激活可显著促进 PINK1 在线粒体的定位，而 PINK1 基因沉默则部分抵消 NAMPT 的保护作用。NAMPT 对 PINK1 的调控表现出 NAD⁺ 依赖性，补充 NAD 前体能逆转 NAMPT 抑制导致的 PINK1 表达下调。NAMPT 激动剂 P7C3 点眼治疗后荧光素钠染色评分降低，泪液分泌功能得到部分恢复。治疗后角膜神经密度显著增加，神经纤维形态学特征改善。角膜中央神经漩涡状结构部分恢复，表明感觉神经功能可能得到修复。治疗组角膜水肿程度减轻，角膜厚度趋于正常化。角膜上皮细胞凋亡比例显著降低。

结论：糖尿病环境下 NAMPT 表达异常与角膜病变的因果关系，阐明了 NAMPT-PINK1/Parkin 通路在维持线粒体稳态中的核心作用。

摘要编号：209006

线粒体代谢异常介导 Fuchs 角膜内皮营养不良的发病机制研究

第一作者：Can ZHAO

共同作者：Ting WANG

目的：Fuchs 角膜内皮营养不良（FECD）是导致角膜移植的主要原因之一，主要表现为角膜内皮功能失代偿。本研究旨在通过分析 FECD 患者房水（AH）蛋白质组学变化，以阐明其潜在的生物标志物，探索线粒体代谢异常介导 FECD 的发病机制研究。

方法：本研究收集了 7 例 FECD 患者和 6 例对照患者的 13 个 AH 样本。采用 4D 无标记串联质谱法（4D-LC-MS/MS）和 MaxQuant 搜索引擎对 AH 中的蛋白质进行分析。同时，使用 ELISA、免疫荧光染色及超微结构观察对 UVA 刺激下的 FECD 患者样本及小鼠角膜内皮细胞（CECs）进行评估。通过慢病毒转染标记线粒体 GFP（Mito-GFP）追踪 CECs 中的线粒体动力学变化。

结果：在 1613 个鉴定的蛋白中，有 44 个蛋白在 FECD 患者 AH 中显著上调。GO 分析显示线粒体成分富集，进一步通过 ELISA 验证了线粒体相关蛋白如 SLC25A3、PC 和 PARK7 的上调。此外，FECD 患者及 UVA 照射小鼠的角膜内皮中线粒体外膜蛋白 20（TOM20）表达显著减少，并伴随线粒体损伤的迹象。透射电镜（TEM）分析显示，

UVA 处理后 CECs 内外均出现线粒体损伤。通过电镜观察、颗粒直径测量以及外泌体标志性蛋白检测等，证实了外泌体是角膜内皮细胞外排线粒体成分的途径；抑制外泌体形成，可以加重 FECD 的细胞损伤。健康线粒体移植能够有效防治 FECD。

结论：本研究首次在 FECD 患者的 AH 中检测到线粒体成分的显著富集，提示 FECD 的发病机制可能与线粒体功能障碍和线粒体代谢异常有关。结果强调了线粒体在 FECD 发病过程中的重要角色，可能为未来的生物标志物和治疗靶点提供新思路。

摘要编号：208896

细胞体积调控角膜缘干细胞命运用于修复角膜上皮损伤

第一作者：Yang ZHAI

共同作者：Miaomiao CHI, Jing HONG, Rongmei PENG

目的：通过调节渗透压改变细胞体积，探讨细胞体积变化在调控角膜缘干细胞干性维持及分化命运中的作用机制，并进一步评估通过减小细胞体积对角膜缘干细胞缺乏及角膜上皮损伤修复在体治疗效果，为角膜缘干细胞缺乏和角膜上皮损伤疾病的治疗提供新思路。

方法：在体外培养的角膜缘干细胞中分别加入不同浓度的聚乙二醇（PEG 300）以诱导细胞体积缩小，处理后通过荧光标记结合共聚焦显微镜三维扫描测量单细胞体积；采用免疫荧光和 qPCR 检测干性标志物（p63、ABCG2）及分化标志物（CK3、CK12）的表达；划痕实验及免疫荧光染色用于评估细胞体积变化对角膜上皮细胞增殖、迁移、粘附及紧密连接（ZO-1、E-cadherin）等功能的影响。在体内实验中，构建大鼠角膜碱烧伤角膜缘干细胞缺乏模型，将大鼠随机分为对照组（滴加生理盐水）和 PEG 滴眼液组（n=5）。于造模后 1 d、3 d、7 d 进行裂隙灯显微镜检查，评估角膜上皮缺损面积、愈合率及角膜透明度；实验结束后取材进行角膜组织学检查。

结果：PEG 300 处理可显著诱导角膜缘干细胞体积缩小。0.5% 与 1% PEG 组干性相关基因表达上调，角膜上皮细胞增殖和迁移能力增强。PEG 处理后上皮细胞紧密连接蛋白表达增强，提示细胞体积减小有助于维持角膜缘干细胞活性及促进上皮功能恢复。在动物实验中，PEG 滴眼液显著加快角膜上皮缺损愈合，恢复角膜透明。组织学结果显示，PEG 组角膜上皮结构较完整，炎症反应轻。提示在体内，PEG 可能通过维持角膜缘残余干细胞活性、促进角膜上皮细胞增殖和迁移来加速损伤修复。

结论：通过渗透压调节诱导细胞体积缩小可促进角膜缘干细胞干性维持、上皮分化及组织修复。PEG

滴眼液在体内同样可促进角膜上皮再生，具有成为角膜缘干细胞缺乏及角膜上皮损伤治疗新策略的潜力。

摘要编号：209687

缩短紫外线照射时长联合 A-CXL 治疗过薄圆锥角膜后 3 年期的临床观察

第一作者：Mingyan WANG

共同作者：周春阳，周跃华

目的：评估缩短紫外线照射时长的快速角膜胶原交联术（A-CXL）治疗过薄圆锥角膜（去上皮后角膜厚度小于 400 μm ）患者 3 年期的安全性和有效性。

方法：采用回顾性研究，纳入我院 2018 年 9 月-2021 年 3 月接受 A-CXL 术的进行性圆锥角膜患者（45 例，61 眼），将基质厚度 < 400 μm 且行缩短紫外线照射时长的 A-CXL 的眼别纳入 A 组（13 例，16 眼），将基质厚度 $\geq$ 400 μm 行常规 A-CXL 的眼别纳入 B 组（32 例，45 眼），两组随访时间均为 3 年。评估两组术前及术后 6 个月、12 个月、24 个月和 36 个月的最佳矫正视力、角膜最薄点厚度、角膜曲率、角膜后表面高度、角膜内皮细胞密度。记录随访期间的并发症如角膜感染、角膜内皮失代偿等。

结果：在有效性方面，A 组术后各时间点 Kvb 较术前无明显变化，术后 36 mo 时 BCVA、TCT、Kmax、K1、K2 较术前明显改善（ $P < 0.05$ ）。与此同时，B 组随访期间 TCT、Kmax、BCVA 较术前改善（ $P < 0.05$ ），Kvb 变化无统计学意义，而前表面 K1、K2 值较术前稍有升高；安全性方面，术后 12 mon 时 A 组患者 ECD 较术前增加，而 B 组较术前降低，但均无明显差异（ $P > 0.05$ ）。随访期间两组患者术眼均愈合良好，未发生不良事件。比较随访期间两组观察指标变化量发现，A 组术后 Kmax（36 个月）、角膜内皮细胞密度修复（12 个月）、K1 和 K2（12 个月）较常规组更明显，其余指标变化量无明显差异（ $P > 0.05$ ）。

结论：缩短紫外线时长 A-CXL 与常规 A-CXL 治疗圆锥角膜在术后中长期（3 年）内控制圆锥角膜进展上呈现相似疗效与相同的安全性，且缩短紫外线时长的 A-CXL 对角膜形态控制上更具优势。

摘要编号：205340

自主神经功能紊乱对抑郁相关干眼的作用机制研究

第一作者：Ruibo YANG

目的：探讨慢性应激诱导下抑郁大鼠的泪腺（LG）、睑板腺（MG）功能和组织病理的改变及自主神经功能失衡在其中的作用和机制。

方法：通过慢性不可预测轻度应激（CUMS）大鼠模型诱导抑郁症。通过行为测试评估抑郁样行为。通过角膜荧光素染色、泪膜破裂时间和泪液分泌检测干眼症指标。通过心率变异性（HRV）、ELISA、免疫荧光染色和蛋白质印迹法评估全身、LG 及 MG 自主神经功能状态。通过组织和分子检测评估 LG 与 MG 组织结构改变，炎症、氧化应激和细胞凋亡水平。建模后，给予 6-羟基多巴胺（6-OHDA）抑制交感神经，重复上述实验进一步比较评价干眼指标和 LG 及 MG 病理损伤的变化。

结果：CUMS 造模 8 周后，大鼠体重减轻，糖水偏好值降低，旷场运动距离缩短，大鼠出现抑郁样表型；大鼠全身（心率变异性、血液中交感 / 副交感神经递质）及 LG、MG 均表现为交感神经激活，副交感神经抑制；大鼠角膜 CFS 评分增加，泪液分泌减少，BUT 下降；LG 相对重量升高，LG 结缔组织间隙增大，导管扩张，腺泡细胞内液体滞留，LG 肌上皮细胞中 α -SMA 表达降低，凋亡和氧化应激水平增加，LG 促炎因子表达升高，但无明显炎症细胞浸润；41.67% 大鼠出现 MG 脂栓，腺泡细胞面积减小，油红 O 染色加深，促炎因子及脂质合成相关酶基因表达升高，MG 凋亡及氧化应激水平增加；全结膜囊结膜杯状细胞数量减少，粘蛋白 MUC5AC 基因表达水平下降。6-OHDA 阻断交感神经后，LG、MG 相应组织结构及功能均改善，活性氧水平和细胞凋亡下调，结膜杯状细胞 MUC5AC 基因表达上调，干眼临床指标改善。

结论：慢性不良刺激可诱发抑郁状态及干眼，表现为共病关系。其中，全身及眼局部自主神经功能紊乱（特别是交感神经激活）可能是导致 LG、MG 结构及功能紊乱，进而引发干眼的核心机制。

摘要编号：209002

阿奇霉素通过 PPAR γ 改善氧化应激诱导的人睑板腺上皮细胞异常脂质代谢

第一作者：Yue HUANG

共同作者：Yue HUANG, Liu YANG

目的：本研究旨在探讨阿奇霉素对氧化应激下人睑板腺上皮细胞脂质代谢的影响与机制，以探究睑板腺功能障碍（MGD）的治疗新靶点。

方法：通过细胞活力、迁移能力及形态学观察，确定选用含 200 μ M 过氧化氢（ H_2O_2 ）的培养基建立氧化应激模型，选用含 10 μ l/ml 阿奇霉素（AZM）的培养基作用于氧化应激模型。采用 F-actin 染色、光镜观察、苏木素染色、活性氧（ROS）、JC-1 染色、ANNEXIN V 染色、免疫荧光染色（IF）、蛋白质印迹分析（WB）、定量 PCR 以及油红 O 染色等多种技术手段，对阿奇霉素与氧化应激共刺激

下细胞形态、细胞炎症、细胞凋亡、细胞自噬及脂质代谢等指标进行分析。

结果：在氧化应激作用下，处于增殖状态与分化状态的人睑板腺上皮细胞均呈现形态学改变，并伴有细胞核固缩现象。活性氧（ROS）水平升高导致线粒体膜电位下降，细胞凋亡增加。WB 与 IF 检测结果显示，氧化应激条件下细胞内 IL-1 β 与 p53 蛋白表达均上调，而经 AZM 干预后，两者表达均显著降低。在 AZM 作用下，WB、IF 及 qPCR 分析进一步显示 Cyclin A2 表达下降，同时自噬相关蛋白 LC3、Beclin-1 及 p62 的表达水平上升。此外，通过 WB、IF 与 qPCR 检测发现，AZM 能够逆转由氧化应激引起的过氧化物酶体增殖物激活受体 γ （PPAR- γ ）、硬脂酰辅酶 A 去饱和酶 1（SCD1）及脂滴包被蛋白 2（PLIN2）表达下调；油红 O 染色结果也表明，AZM 干预后细胞内脂滴蓄积量显著增加。

结论：本研究证实阿奇霉素可通过上调 PPAR γ 及其下游脂质合成相关因子的表达，促进脂滴蓄积；同时抑制细胞凋亡与炎症反应，并抑制细胞增殖、调节自噬活性。

摘要编号：209496

青光眼患者睑板腺开口阻塞严重程度相关的危险因素分析：一项临床调查

第一作者：Yue TAN

共同作者：Lan GONG, Tong LIN, Wushuang WANG, Yue YIN

目的：探讨青光眼病程时长与用药数量对青光眼患者睑板腺开口阻塞严重程度的协同影响，以期优化眼表保护治疗策略提供依据。

方法：本研究为回顾性研究，共纳入 120 例并发睑板腺功能障碍的青光眼患者。采用标准化标准对睑板腺开口阻塞进行评分。使用 Spearman 相关分析和广义线性模型评估阻塞评分与各临床因素之间的关系。

结果：睑板腺开口阻塞评分与青光眼病程时长（ $r = 0.309$, $P < 0.001$ ）、用药数量（ $r = 0.340$, $P < 0.001$ ）、含防腐剂滴眼液产品使用数量（ $r = 0.300$, $P < 0.001$ ）以及用药时长（ $r = 0.398$, $P < 0.001$ ）均存在显著相关性。广义线性模型结果显示，青光眼病程时长和用药数量均具有显著的主效应（ $P = 0.012$ 和 $P = 0.005$ ），且二者存在显著的交互作用（ $P = 0.020$ ）。在青光眼病程超过 3 年后，任何用药方案均比未治疗显著增加阻塞评分（均 $P < 0.05$ ）。三联或四联疗法相较于未用药，其阻塞评分显著更高（ $P = 0.002$ 和 $P = 0.008$ ）。

结论：青光眼病程时长与用药数量对睑板腺开口阻塞具有协同加重作用，且在病程超过一年后影响更为显著。本研究结果提示，对于长期罹患青光眼的患者，减少其用药负担至关重要。

摘要编号：208450

非洲爪蟾模型在眼科研究中的应用与展望

第一作者：李乔玉

目的：本综述旨在系统总结非洲爪蟾 (*X. laevis*) 模型在眼发育、疾病建模和药物筛选领域的应用价值、构建方法及研究意义，为基础眼科研究提供理论依据和方法学参考。

方法：通过系统文献综述方法，归纳非洲爪蟾在眼科研究中的模型构建和应用方案，分析其透明胚胎、快速发育等特性在眼发育观察中的优势。

结果：非洲爪蟾因其胚胎透明、发育快速等特点成为眼发育研究的理想模型，通过 CRISPR 等基因编辑技术可成功模拟青光眼、视网膜变性疾病等人类眼部疾病，并在药物筛选和治疗方法验证中展现出显著优势，其完整的基因组数据为精准基因操作提供支持。

结论：非洲爪蟾作为重要的模式生物，在眼科基础研究中具有不可替代的价值。其突出的胚胎学特征（如胚胎透明、体外发育）为实时观察眼发育过程提供了独特优势，而成熟的基因编辑技术体系则使其成为研究眼部疾病分子机制的有力工具。在眼发育研究方面，非洲爪蟾早期胚胎的透明特性使得研究者能够无创观察眼球原基形成、晶状体诱导、视网膜分层等关键发育事件，这对解析眼发育的分子调控网络具有重要意义。通过显微注射 mRNA 或形态寡核苷酸，可实现对特定基因的时空特异性调控，从而精确解析 Pax6、Rx 等关键基因在眼发育过程中的功能。在疾病建模领域，利用 CRISPR/Cas9 技术成功构建了模拟人类视网膜色素变性、先天性白内障等遗传性眼病的爪蟾模型。这些模型不仅重现了患者的主要病理特征，如光感受器细胞凋亡、晶状体蛋白异常聚集等，还为研究疾病发生发展的动态过程提供了独特窗口。

摘要编号：201364

鱼腥草外囊泡的制备及其在角膜修复中的应用

第一作者：Li JIANG

共同作者：Juan GAO, Jun LI, Xuan LI

目的：鱼腥草 (*Houttuynia cordata* Thunb.) 又称蕺菜，是国家卫生部确定的“药食两用”品种之一，收录于《中国药典》。鱼腥草滴眼液还被用于治疗结膜炎。本实验利用差速离心法从新鲜及冻

存后的鱼腥草根中提取外囊泡，比较两者外囊泡中 miRNA 的差异，此外考察了外囊泡的角膜细胞毒性及其在小鼠角膜碱烧伤后修复过程中的作用。

方法：用差速离心法提取新鲜和 -80 °C 冻存六个月后的鱼腥草根的外囊泡，用负染色电镜和纳米颗粒跟踪分析仪 (NTA) 表征外囊泡形貌和粒径，并对其进行 miRNA 测序分析和潜在靶基因富集分析。CCK-8 检测不同浓度外囊泡对角膜上皮细胞 (HCEs) 增殖的影响。小鼠角膜碱烧伤造模后，外囊泡 PBS 溶液点眼，8 天后取材，石蜡包埋切片并进行 H&E 染色。

结果：差速离心法分离出的外囊泡与常见外泌体大小形态类似，呈杯碟状，平均粒径为 149 nm，CCK-8 实验结果显示不同浓度外囊泡对角膜上皮细胞增殖均无影响 (图 1)。miRNA 测序分析结果显示，在 -80°C 储存六个月后，miRNA 的数量有下降趋势 (图 10)，其中 ath-miR159a、ath-miR319b、ath-miR319a、ath-miR396a-5p 和 ath-miR396b-5p 为高表达 miRNA (Readcount > 2000)。文献报道其中的 ath-miR159a 和 ath-miR396b-5p 具有抗炎活性。潜在靶基因的 GO 富集分析结果显示，靶基因集中于蛋白结合、氨基酸代谢等通路。H&E 染色结果显示，小鼠角膜未见明显炎症细胞浸润，各组角膜上皮层完整，单纯 PBS 滴眼组角膜基质水肿较重，外囊泡滴眼组角膜上皮有增生现象，基质胶原排列较整齐，但前房有炎症反应，可能是浓度配制较高刺激所致。

结论：差速离心法获得的外囊泡具有植物外囊泡的典型特征，但 -80°C 储存会影响其中 miRNA 的表达量。一定浓度的外囊泡不影响 HCEs 增殖。小鼠眼表损伤治疗的预实验结果显示，外囊泡滴眼可促进角膜上皮的愈合，维持基质层厚度。

BWFOM 主客一体双眼波前验光仪与传统验光方法的临床比较

第一作者：Huihui CHU

共同作者：Jifeng YU

目的：比较 BWFOM 主客一体双眼波前验光仪与传统验光方法在球镜度数 (SPH)、柱镜度数 (CYL) 及矫正视力 (VA) 上的差异。

方法：本研究为自身对照研究。共纳入 126 例样本。为保持数据独立性并遵循方法学惯例，分析仅使用

受试者右眼数据。采用配对 t 检验对 BWFOM 验光与常规验光结果进行统计比较。

结果：球镜度数 (SPH)：BWFOM 验光结果 (1.21 ± 4.17 D) 显著高于常规验光 (0.98 ± 3.93 D)，差异具有统计学意义 ($t = 2.71, P = 0.008$)。柱镜度数 (CYL)：两种方法结果相近 (BWFOM: -1.67 ± 1.11 D; 常规: -1.68 ± 1.07 D)，差异无统计学意义 ($t = -1.136, P = 0.259$)。矫正视力 (VA)：BWFOM 验光 (4.91 ± 0.18) 显著优于常规验光 (4.87 ± 0.12)，差异具有高度统计学意义 ($t = 4.963, P < 0.001$)。

结论：BWFOM 主客一体双眼波前验光仪在矫正视力方面展现出显著优势，其测量结果能为患者提供更优的视觉矫正效果，为弱视儿童治疗及近视防控提供新的思路。

摘要编号：203156

S- 视蛋白通过胶原代谢调控角膜曲率诱导小鼠近视偏移

第一作者：Jin Fang HUANG

共同作者：Hong LIU, Yining SHEN, Leilei ZOU

目的：本研究旨在探究视网膜 S 视蛋白缺失对小鼠屈光各项参数以及角膜胶原结构和力学性能的影响。

方法：将 4 周龄野生型 (WT) 小鼠作为正常对照组，S 视蛋白基因敲除型 (*Opn1sw* -/-) 小鼠作为实验组，于正常光照条件下饲养 8 周，比较两组在屈光度、眼轴长度 (AL)、角膜曲率半径 (CCR) 以及角膜胶原形态等方面的差异，并利用高分辨多模式原子力显微镜检测角膜力学性能的变化。

结果：与 WT 小鼠相比，*Opn1sw* -/- 小鼠呈现近视化发展趋势。与传统模型中因 AL 延长所致近视不同，两组间 AL 未见显著差异，屈光度差异主要源于 CCR 的改变。*Opn1sw* -/- 组小鼠 CCR 显著减小，角膜更为陡峭，从而导致近视发生。进一步研究显示，*Opn1sw* -/- 小鼠角膜中 IV 型胶原蛋白表达升高，胶原纤维排列疏松，角膜弹性降低，质地变软。

结论：本研究说明，视网膜 S 视蛋白缺失可通过改变角膜形态促进近视发展，其机制可能与 IV 型胶原蛋白异常表达增加、胶原纤维结构紊乱及角膜生物力学性能下降密切相关。该结果不仅揭示了 S 视蛋白在角膜发育与屈光稳态维持中的新功能，还首次建立了“视网膜光信号 - 角膜细胞外基质代谢 - 角膜生物力学特性”的跨组织调控轴，为近视发病机制提供了新视角，提示针对角膜胶原代谢与力学性能的干预可能成为近视防控的新策略。

摘要编号：210218

miR369/CCND1 轴调控高度近视性巩膜重塑的作用和机制研究

第一作者：Yingli LIU

共同作者：Shoumei JIN, Qingyun LIU, Jingji LONG

目的：高度近视是眼底疾病的高危因素，合并黄斑变性、黄斑新生血管和原发性开角型青光眼等威胁视力的并发症导致视力损害，严重可影响患者的生存质量。由于高度近视患者眼底具有巩膜重塑和视盘旋转、倾斜等特点，使得眼底合并症如青光眼诊断困难，亟需探究其分子调控机制。miRNA 对近视性眼底巩膜重塑的调控是近年来的研究热点。

方法：(1) 利用公共数据库进行生信分析寻找在高度近视中差异表达的 miRNA；(2) 验证 miRNA 可与靶向 mRNA 互作调控视网膜色素上皮层的眼内信号转导，参与眼部通路和机制调控；(3) 通过 ARPE-19 细胞系、动物建模、眼内组织或外周血获取等筛选流程包括进行高通量测序分析，进一步明确参与眼疾发生发展的具有差异表达的 miRNA，探索该基因在的功能；(4) 利用 RIP 实验寻找 RNA- 蛋白互作，并且阐明下游的靶基因和通路改变。挖掘其潜在的调控机制。

结果：(1) 高度近视 miRNA 表达谱的公共数据库筛选在高度近视中差异表达的 miRNA，并且将差异前 5 的 miRNA 的表达量在高度近视和非高度近视小鼠中进行检测，发现 miRNA-369 在高度近视中差异高表达；(2) 细胞实验提示，低表达 miRNA-369 可抑制 ARPE-19 细胞系增殖和阻滞细胞周期。(3) 通过在多个公共数据库中寻找和预测 miR-369 的靶 mRNA，从韦恩图总结出 225 个共同基因，经过严格的理论支撑和严谨的实验数据，我们聚焦于 CCND1；(4) 生信分析预测出 miR-369 与 CCND1 的 3' UTR 区存在互作。在 ARPE-19 细胞中，miR-369 的表达减少，CCND1 及其下游的 CDK-2 的 mRNA 和蛋白的表达水平也减少。进一步通过 RIP 实验发现 miR-369 与 CCND1 在分子层面存在互作。

结论：本研究发现 miR-369 在高度近视差异高表达，其与 CCND1 蛋白相互作用共同影响 RPE 细胞系的功能与机制调控，为预防和治疗高度近视提供理论依据和参考靶点。

摘要编号: 209185

一个高度近视家系中新发 P4HA2-E200K 突变的鉴定及功能机制研究

第一作者: Rubing LIU

共同作者: Mingbing ZENG

目的: 高度近视 (High Myopia, HM) 是全球范围内导致不可逆视力损害和致盲的主要原因之一, 具有明显的遗传倾向。P4HA2 基因编码的胶原脯氨酰羟化酶是胶原合成过程中的关键酶, 初步研究表明其与遗传性 HM 发病相关, 但具体的致病分子机制尚未明确。本研究旨在鉴定一个新的 HM 家系中携带的 P4HA2 基因致病性突变位点, 并深入探究该突变在 HM 发生发展中的作用及其分子机制。

方法: 研究招募了一个 HM 家系, 收集先证者及其家庭成员的临床资料和外周血样本, 通过靶向外显子测序和 Sanger 测序筛选致病突变。利用生物信息学工具对突变位点进行保守性分析, 并通过 ProtScale 和 PyMOL 进行蛋白质疏水性分析和三维结构预测。提取原代人巩膜成纤维细胞 (HSFs) 进行培养, 构建包含突变位点的 P4HA2 过表达载体。采用 RT-qPCR 和 Western blot 验证过表达效率, 通过羟脯氨酸含量测定评估胶原羟化水平, 利用 BrdU 标记和细胞划痕实验检测细胞增殖和迁移能力。最后对三组 HSFs (空白对照、野生型 P4HA2 过表达、突变型 P4HA2 过表达) 进行转录组测序和生物信息学分析。

结果: 在 HM 家系中发现 P4HA2 基因第 6 外显子存在 c.598G > A (p.E200K) 杂合错义突变, 该突变与疾病表型共分离, 且在脊椎动物中高度保守。突变导致 P4HA2 蛋白局部疏水性下降和三维构象改变。细胞实验表明, 突变型 P4HA2 过表达细胞的羟脯氨酸水平显著降低, 细胞迁移和增殖能力明显弱于野生型组。转录组分析发现突变型与野生型组间存在 76 个差异表达基因, 这些基因显著富集于胶原代谢相关通路, 且该通路关键基因的表达水平在三组间呈现梯度上调趋势。

结论: 本研究鉴定了一个新的 P4HA2 基因 E200K 突变, 该突变通过改变蛋白质结构, 导致巩膜成纤维细胞胶原羟化能力下降、细胞增殖和迁移功能受损, 可能通过“P4HA2-胶原合成-巩膜 ECM 重塑”机制参与 HM 的发病过程。研究结果丰富了 HM 的致病基因谱, 为 HM 的早期遗传筛查和靶向治疗提供了理论依据。

摘要编号: 202279

一种改良的更为稳固的小鼠光学离焦性近视模型

第一作者: Yining SHEN

共同作者: Jinfang HUANG, Yuanyang HUANG, Hong LIU, Leilei ZOU

目的: 探索一种改良且更加稳固的小鼠光学离焦性近视 (lens-induced myopia, LIM) 模型的构建方法, 并评估其屈光学变化。

方法: 将 16 只 28 日龄 C57BL/6 小鼠分为 LIM 组和空白对照组 (NC) 组, 右眼造模, 左眼作为自身对照。LIM 组采用改良设计的头骨固定眼镜, 结合 3D 打印的金属框架和专为小鼠设计的耐磨耐抓树脂镜片, 并利用骨水泥及生物组织粘合剂增强稳定性。于实验前及造模后第 2、4 周, 在复方托吡卡胺散瞳后, 利用红外偏光摄影验光仪检测小鼠屈光度, 并通过光学相干断层扫描在体测量眼轴。同时记录小鼠眼镜脱落情况及眼部健康状况。

结果: 造模 4 周后, 与 NC 组相比, LIM 组造模眼屈光度比对侧眼向近视漂移 (5.19 ± 0.46) D ($t = -32.032$, $p < 0.0001$), 同时 AL 较对侧增长约 (110.00 ± 46.25) μm ($t = 6.727$, $p < 0.0001$)。随造模时间延长, 近视漂移程度增加。4 周内眼镜脱落率为 12.5%, 使用生物组织粘合剂可明显减少头皮渗液, 提高骨水泥固定稳定性。整个实验过程中, 造模眼及对照眼眼结膜炎患病率为 0。

结论: 本研究建立了一种改良且稳定性更高的小鼠 LIM 模型。经 4 周诱导, 小鼠屈光度显著向近视漂移, 眼轴显著增长, 同时模型脱落率低, 且易于保持小鼠眼部健康状态, 不影响其进食等正常生理活动。该方法为小鼠近视研究提供了可靠的实验模型参考。

摘要编号: 208165

不同色温 LED 白光对镜片诱导性近视豚鼠近视发育的影响

第一作者: Xin YU

共同作者: Ye SHEN, Jianping TONG

目的: 探究不同色温 LED 白光对镜片诱导近视 (LIM) 豚鼠屈光不正发展的影响。

方法: 将 3 周龄豚鼠 ($n = 90$) 分为三组, 分别在等亮度 (500 lx) 的白色 LED 灯 (CCT = 3000 K, 4500 K, 6500 K) 环境中饲养 4 周, 每组中一半的豚鼠 ($n = 15$) 右眼佩戴 -6 D 镜片, 另一半豚鼠 ($n = 15$) 未做处理设置为对照组。每只豚鼠仅纳入右眼。在基线、2 周和 4 周测量屈光度和眼轴长度。4 周后使用 OCTA 测脉络膜厚, HE 染色观察巩膜结

构及厚度,透射电镜观察巩膜胶原纤维直径,并检测巩膜 MMP2, Collagen1 和 TGF β 1 表达情况。

结果:光照 4 周后, LIM 眼睛的屈光度和眼轴向近视方向进展。与 4500 K 相比, 6500 K 显著延缓了 LIM 的近视偏移,伴随着屈光降低的延缓和眼轴增加的延缓,而 3000 K 组呈现相反的趋势。3000 K 组的 LIM 眼脉络膜厚度、巩膜厚度和胶原纤维直径显著小于 6500 K,胶原纤维间隙较大,排列较稀疏。三组对照眼间各数据无统计学意义。LIM 眼 3000 K 组巩膜 MMP2 表达上调, collagen 1 and TGF- β 1 表达下调。

结论:6500 K 白光可以延缓豚鼠晶体诱导的近视,这可能是通过参与巩膜重塑引起的。

摘要编号: 202747

个性化健康宣教对全飞秒 Smile 角膜屈光手术患者术后遵医行为及并发症预防的作用

第一作者: Jinmei JIANG

目的:全飞秒 Smile 角膜屈光手术以其微创、无瓣、恢复快等优势,成为众多屈光不正患者的选择。然而,术后患者的遵医行为及并发症预防对手术效果及视力长期稳定至关重要。本研究旨在探讨个性化健康宣教在全飞秒 Smile 角膜屈光手术患者中的应用效果,通过对比常规宣教组与个性化宣教组患者术后遵医行为及并发症发生情况,发现个性化健康宣教可显著提升患者术后遵医行为依从性,有效降低并发症发生率,对提高手术成功率及患者视觉质量具有积极意义。

方法:对象:2025 年 6-7 月我院 20 例 Smile 手术患者,随机分两组各 10 例,一般资料无差异 ($P > 0.05$)。干预:常规组:统一手册+口头讲解基础注意事项;个性化组:术前评估职业、用眼习惯等,定制方案(如程序员用眼指导、运动爱好者恢复计划)+心理疏导+并发症专项指导。指标:遵医行为问卷(满分 100 分)、术后 1 个月并发症(干眼、角膜上皮延迟愈合、屈光回退)。统计:SPSS 26.0, t 检验/ χ^2 检验, $P < 0.05$ 有意义。

结果:遵医行为:个性化组 (92.3 ± 4.5) 分显著高于常规组 (75.6 ± 6.8) 分 ($t = 6.723, P < 0.001$),各维度(滴眼药、用眼等)均更优 (P 均 < 0.01)。并发症:个性化组发生率 10.0% (1 例轻度干眼),低于常规组 60.0% (4 例干眼、1 例角膜上皮延迟愈合、1 例屈光回退) ($\chi^2 = 5.714, P = 0.017$)。

结论:个性化健康宣教可显著提升 Smile 手术患者术后遵医行为,降低并发症发生率,为术后恢复提供优质护理保障,值得临床推广。

摘要编号: 207908

儿童屈光参差非近视眼近视进展的研究现状

第一作者: 王中正

共同作者: 肖雪, 卢嘉裕, 张雨菲

目的:两眼屈光状态不一致被称为屈光参差,当两眼屈光度相差球镜 ≥ 1.50 D,柱镜 ≥ 1 D 时为屈光参差。随着近视防控工作的不断推进,屈光参差矫正方法在控制近视进展方面得到了广泛应用。近年来研究显示,单眼近视青少年单眼矫正后,对侧眼的眼轴增长速度明显快于正视眼。为系统剖析屈光参差患者矫正后非近视眼或低屈光度眼眼轴增长过快的原因,本文对相关研究进行综述。

方法:大规模队列研究证实,单眼接受屈光矫正者非矫正眼的年化眼轴增长速率较自然近视进程加快 37% (95% CI 25-49%)。这种特殊现象挑战了传统屈光矫正理论,提示双眼协同机制在近视调控中具有重要作用。2023 年 Chen 等通过动态屈光地形图发现,单眼接受屈光矫正后对侧眼周边视网膜呈现特征性远视离焦模式 (平均 $+1.25 \pm 0.38$ D),可能与眼轴加速增长直接相关。然而,在屈光参差近视儿童中,单眼矫正后,常常出现非近视眼或低屈光度眼眼轴增长过快的现象,这一问题引起了视光界的关注。了解其原因对于提高近视防控效果、保障儿童视觉健康具有重要的临床意义。

结果:越来越多的研究证明,单眼近视青少年单眼矫正后,对侧眼的眼轴增长速度明显快于矫正后眼的眼轴增长速度。在相同的环境因素影响下(如遗传、营养、阅读与近距离用眼、光线、睡眠等),双眼的近视化程度却存在很大差异,这种现象暗示了可能有内在的视觉调节机制在起作用。基于此,屈光参差患者单眼矫正后非近视眼眼轴和近视度数进展更快的现象,可能和多种因素密切相关。

结论:调节功能代偿失衡、双眼协同作用改变、视觉抑制、外隐斜视、周边离焦信号差异、遗传环境和 Troxler 现象和抑制中的适应性反应涉及到复杂的单眼和双眼视觉系统机制,包括对亚阈值模糊的适应和对感知消退的响应。这些机制不仅涉及神经元的适应过程,还可能涉及到处理目标和背景信息的竞争过程。需要探索这些机制对于深入了解屈光参差性近视的视觉系统具有不同的重要意义。

儿童青少年近视中西医综合防控临床疗效评价

第一作者: Xuepei LI

共同作者: Yuqing LAN, Xiaoyin ZHOU

目的:基于中医特色防控理论体系和中西医综合防控方案,采用前瞻性队列研究,评估儿童青少年近

视中西医结合综合防控临床疗效，验证中医特色技术体系防控近视发生发展的有效性和群体可推广性。

方法：本研究采用前瞻性队列研究设计，以示范学校 1556 名小学 1-4 年级学龄儿童作为队列研究对象。依据诊断、纳入和排除标准将其分为三组：非近视组；近视前期组： $SER \leq +0.75 D$ 且 $> -0.50 D$ ；低度近视组： $-6.00 DS < SER \leq -0.50 DS$ 。对其进行对应干预：（1）低度近视组：筛查建档 + 健康宣教（用眼行为习惯、眼保健操、户外活动等指导）+ 中适宜技术（耳穴压丸联合耳穴揸针）+ 足矫配镜；（2）近视前期组：筛查建档 + 健康宣教（用眼行为习惯、眼保健操、户外活动等指导）+ 耳穴压丸；（3）非近视组：筛查建档 + 健康宣教。收集并记录所有儿童的信息，包括一般资料（年龄、性别、民族等）、病史及既往治疗史、过敏史、合并疾病及治疗等。所有纳入研究的儿童需完成干预开始前（基线），干预 20 周、干预 40 周的随访检查，包括：裸眼视力检查、屈光度检查、眼压测量、生物测量仪检查等。使用 SPSS 22.0 对研究数据进行分析。

结果：1. 本研究共纳入了 2023 年至 2025 年期间在示范学校就读的 1556 名小学 1-4 年级学龄儿童。根据屈光度分组，非近视组：86 人（172 眼）；近视前期组：899 人（1798 眼）；近视组：571（1142 眼）。三组儿童的 AL 之间有统计学差异（ $P < 0.001$ ），近视儿童的 AL 最长，非儿童的 AL 最短。三组儿童的 ACD 之间有统计学差异（ $P < 0.001$ ），近视儿童的 ACD 最大，非近视儿童的 ACD 最小。三组儿童的 VCD 之间有统计学差异（ $P < 0.001$ ），近视儿童的 VCD 最大，非近视儿童的 VCD 最小。非近视儿童和近视前期儿童的 LT 之间没有统计学差异（ $P > 0.05$ ），两组儿童和近视儿童的 LT 之间均有统计学差异（均有 $P < 0.001$ ）。2. 所有儿童中，干预后屈光度控制率为 52.60%（1637/3112），眼轴控制率为 71.30%（2219/3112）。近视前期儿童屈光度控制率为 54.56%（981/1789），眼轴控制率为 69.69%（1235/1789）；近视儿童屈光度控制率为 51.05%（583/1142），眼轴控制率为 76.62%（875/1142）。实施耳穴压丸和耳穴揸针干预的近视前期儿童和近视儿童中屈光度控制率和眼轴控制率均高于仅实施健康宣教的非近视儿童。非近视组，除 ACD 外，屈光度、AL、其它眼生物学参数自身前后对照有统计学意义（均有 $P < 0.05$ ）。近视前期组，屈光度、AL 及眼生物学参数自身前后对照均有统计学意义（均有 $P < 0.05$ ）。近视组，除 K1、K2 外，屈光度、AL、其它眼生物学参数自身前后对照有统计学意义（均有 $P < 0.05$ ）。

结论：中西医结合近视防控策略可有效延缓近视进展、减慢近视度数增长、控制眼轴增长。

摘要编号：200572

口服递法明片对儿童近视控制的疗效评估

第一作者：林宜

共同作者：刘晶莹，宋艳萍，张香闰

目的：探讨口服递法明片对儿童近视进展及眼底微循环的干预效果。

方法：本研究为前瞻性、随机双盲对照研究，共纳入 112 例儿童，分为 A、B 两组。A 组前 6 个月佩戴单光框架眼镜并每日口服递法明片，后 6 个月停药仅佩戴单光框架眼镜；B 组前 6 个月仅佩戴单光框架眼镜，后 6 个月佩戴单光框架眼镜并每日口服递法明片。在基线及入组后 6、12 个月进行随访，观察指标包括眼轴长度（AL）、屈光度（SE）、中心视网膜厚度（CRT）、黄斑中心凹下脉络膜厚度（SFCT）。

结果：共 100 例受试者完成随访。治疗 6 个月后，A 组受试者右眼眼轴变化值明显小于 B 组，差异具有统计学意义（ $P \leq 0.001$ ），左眼眼轴变化值小于 B 组，差异具有统计学意义（ $P = 0.037$ ）。A 组受试者右眼和左眼的屈光度变化均小于 B 组，其中右眼屈光度差异具有统计学意义（ $P = 0.001$ ）。A 组受试者在停药后的 6 个月与治疗前 6 个月的眼轴变化对比，差异无统计学意义（ $P = 0.647$ 和 $P = 0.556$ ）。B 组受试者在口服递法明片后的 6 个月与前 6 个月的眼轴长度和屈光度变化对比，差异均具有统计学意义（均 $P < 0.001$ ）。B 组受试者后 6 个月与前 6 个月的双眼 CRT 差值变化，差异均无统计学意义（均 $P > 0.05$ ）；双眼 SFCT 差值变化，差异均有统计学意义（均 $P < 0.05$ ）。

结论：口服递法明片可有效延缓青少年近视眼轴和屈光度的进展，并可能改善眼底脉络膜微循环，具有良好的干预潜力。作为一种口服形式的近视控制手段，递法明片为儿童近视防控提供了新的可行策略。

摘要编号：209672

多光谱屈光地形图在屈光参差患者视网膜周边离焦量评估中的应用分析

第一作者：Yanwen ZHENG

共同作者：Jiwen YANG

目的：运用多光谱视网膜屈光地形图（MRT）测量屈光参差儿童周边视网膜离焦量（RPRE），观察双眼 RPRE 差异，探讨屈光度、眼轴与不同区域 RPRE 的相关性。

方法：采用描述性研究，收集 2021 年 10 月 -2024 年 6 月辽宁爱尔眼科医院视光科 6 ~ 15 岁屈光参差儿童 120 例 240 眼（男 61 例，女 59 例，平均

年龄 10.67 ± 1.85 岁)。测量双眼屈光度、眼轴,按等效球镜(SE)相差分组: < 1.00 D 为屈光不正组, ≥ 1.00 D 为低度屈光参差组, 2.00 D ~ 3.00 D 为高度屈光参差组。应用 MRT 测量双眼总离焦值、各象限(上、下、鼻、颞侧)及不同偏心度($0^\circ \sim 15^\circ$ 、 $15^\circ \sim 30^\circ$ 、 $30^\circ \sim 45^\circ$ 、 $45^\circ \sim 53^\circ$) RPRE。采用配对样本 t 检验、单因素方差分析及相关性分析处理数据。

结果: 儿童周边视网膜屈光分布不对称;屈光参差儿童双眼 RPRE 存在差异,屈光度较高眼多为远视性离焦,较低眼多为近视性离焦;随屈光参差程度增加,下方、颞侧象限及 $30^\circ \sim 53^\circ$ 偏心度范围 RPRE 的差异显著;颞侧象限及 $30^\circ \sim 53^\circ$ 偏心度范围 RPRE 与屈光度呈负相关,与眼轴呈正相关。

结论: 屈光参差儿童周边视网膜离焦呈特征性分布,屈光度和眼轴与部分区域 RPRE 相关,提示屈光参差对视网膜周边离焦的影响存在区域选择性,且影响程度随屈光参差程度增加而增强。

摘要编号: 208939

姿势异常与屈光不正的关联: 来自学生群体的客观摄影测量分析

第一作者: Xuan LI

共同作者: Bolin DENG, Jianhua HUANG, Ziyang MA, Zhengzheng WU, Qingwen YANG

目的: 探讨中国资阳市青少年中客观测量的姿势异常(包括头部倾斜、高低肩及前倾头位)与屈光不正(近视、屈光参差)及眼部生物参数之间的关联性。

方法: 采用横断面研究设计,以学校为基础招募 567 名 12-18 岁学生为研究对象。所有参与者均接受全面眼部检查,项目包括视力测定、睫状肌麻痹下自动验光及眼轴长度测量。采用摄影测量分析系统对标准化体位照片进行姿势参数量化评估。

结果: 研究人群平均年龄为 14.96 ± 1.60 岁,男性占比 43.39%。近视率达 82.54%,屈光参差(双眼等效球镜差值 ≥ 1.00 D)率为 34.74%。多因素回归分析显示:更大的年龄、女性及高低肩是较高的近视度数的独立影响因素。高低肩的存在与较高的近视度数($\beta = -0.48, P = 0.030$)及更长的眼轴($\beta = 0.24, P = 0.025$)显著相关;头部倾斜的存在不仅是屈光参差的独立危险因素($OR = 1.71, P = 0.013$),同时与较大的双眼等效球镜度差值($\beta = 0.22, P = 0.026$)和双眼的眼轴长度差值($\beta = 0.11, P = 0.007$)显著相关。前倾头位与各项屈光参数均无显著关联,所有姿势参数与视力水平均无显著相关性。

结论: 异常姿势与青少年屈光不正存在特异性关联:存在头部倾斜主要影响屈光参差的发生风险与程

度,而存在高低肩则与近视严重程度及更长的眼轴密切相关。这些发现提示姿势评估在近视防控体系中具有重要应用价值。

摘要编号: 206857

无缝线可降解支架植入术治疗病理性近视: 对视网膜曲率形态改善与近视控制的效果评估

第一作者: Dou NINGXIN

共同作者: Zhang SHAOCHONG

目的: 病理性近视常导致不可逆的视力损害,其核心病理改变为眼轴的进行性伸长及相关视网膜、脉络膜病变。当前缺乏能够有效逆转此进程且兼顾安全性的治疗手段。本研究旨在开发一种新型的可降解、无细胞、无缝线组织支架植入物,实现有效控制并部分逆转眼轴的异常增长,同时通过改善后巩膜胶原结构,重塑视网膜曲率与形态,从而为病理性近视提供一种创新性治疗策略。

方法: 本研究设计了一种双层复合组织支架:表层为提供适宜细胞生长微环境的 GelMA 水凝胶层,底层为提供机械支撑与引导性降解的聚乳酸微静电纺丝薄膜层。我们选用幼龄新西兰白兔,建立形觉剥夺性近视模型。实验动物被随机分为三组:实验组(近视+支架植入组, $n = 12$),接受支架后巩膜植入术;模型对照组(近视组, $n = 12$),仅造模不进行治疗;空白对照组($n = 12$),为健康未干预眼。术后采用超声动态监测眼轴长度及后巩膜曲率的变化。安全性评估包括全视野视网膜电图以评估视网膜神经功能,非接触式眼压计监测眼压波动, TUNEL 染色检测视网膜及巩膜细胞的凋亡情况。此外,通过苏木精-伊红及 Masson 三色染色,详细观察了支架降解过程、新生组织形态及巩膜自身胶原纤维的排列与密度。最后,我们利用有限元分析进行了力学仿真,量化比较支架植入前后后极部视网膜所受的牵引力变化。

结果: 建模成功后,近视组表现出显著的眼轴增长,其眼轴长度与视网膜曲率均显著高于空白对照组。支架植入展现了快速且持久的干预效果:术后第 2 周,实验组眼轴长度(13.79 ± 0.23 mm)即显著短于近视组(15.15 ± 0.33 mm)与对照组(14.70 ± 0.18 mm) ($p < 0.001$)。这一控制效应在长达 48 周的观察期内持续存在,且实验组眼轴曲线逐步向正常生理轨迹回归。在安全性方面,实验组的视网膜电图波形、振幅及潜伏期与健康对照组无统计学差异,眼压始终维持在正常范围内,且未发现异常细胞凋亡。超声显示实验眼后巩膜曲率逐渐趋于正常,组织切片可见支架在引导宿主细胞浸润和血管化的同时缓慢降解,并原位再生出结构规整、富含胶原的类巩膜组织,同时毗邻的自身巩膜组织

也表现出胶原合成增强的迹象。力学仿真结果从生物力学角度证实，支架植入有效分散并缓解了后极部视网膜因眼轴拉长而承受的异常牵张力。

结论：本研究成功验证了一种基于可降解无缝线组织支架的创新疗法。该方案通过“机械支撑、生物降解、原位再生”的协同作用机制，实现了对近视眼轴过度增长的有效干预与部分逆转，并能同步改善视网膜形态与生物力学环境。整个治疗过程操作便捷，生物相容性优异，避免了传统植入物永久存留的潜在风险，为病理性近视的治疗提供了一种创新外科解决方案，具有广阔的临床转化前景。

摘要编号：207653

激光手术/微笑手术前干眼管理的重要性；以及如何安全地转换 (Importance of dry eyes management before lasik/smile; and how to convert safely)

第一作者：Hendra KUSUMA

共同作者：Meiliaty Ariesta ANGKY

目的：干眼症 (DED) 是寻求 LASIK 和 SMILE 等屈光手术的患者常见的并发症。术前妥善管理干眼症对于确保最佳手术效果、患者满意度以及最大程度减少术后并发症至关重要。本病例报告旨在强调屈光手术前管理干眼症的重要性，并概述安全有效的转换策略，尤其适用于从其他屈光手术过渡的患者。

方法：病例报告：44 岁男性患者，因屈光矫正就诊。患者有吸烟史、糖尿病史，并报告持续性干眼症状。矫正后双眼视力为 20/20；然而，患者反复出现干眼不适。评估与结果 干眼评估：泪膜破裂时间缩短 (< 7 秒)。眼表染色显示点状上皮糜烂。睑板腺评估显示轻度睑板腺功能障碍。角膜及眼表状态：角膜地形图稳定，但担心干眼可能导致角膜表面不规则。SMILE 手术期间，周边区域出现大黑点，右眼手术成功。左眼手术延期，24 小时后再次进行 LASIK 激光手术。

结果：术前干眼症管理可显著提高手术准确性和患者舒适度。关键步骤包括通过泪膜评估、眼表染色和问卷调查进行全面的干眼症评估。人工泪液、局部环孢素和眼睑清洁等治疗方法可有效稳定眼表。严重干眼症患者在接受 LASIK 或 SMILE 手术前，需要进行眼表稳定；否则可能会出现黑点等并发症。为了安全地进行手术转换，尤其是从 SMILE 手术转换为 LASIK 手术，仔细评估角膜厚度、基质稳定性和眼表健康状况至关重要。

结论：在接受 LASIK 或 SMILE 手术前管理干眼症对于获得最佳手术效果和最大程度减少术后并发症

至关重要。系统性的方法包括准确的诊断、有针对性的治疗和全面的评估，可以促进从各种屈光矫正方法安全地转换。

照明的相关色温对阅读时近距离工作诱导性暂时性近视及调节滞后的影响

第一作者：Weiling BAI

共同作者：Ningli WANG, Shifei WEI

目的：本研究旨在评估不同相关色温照明对调节滞后 (LAG) 和近距离工作诱导的短暂性近视 (NITM) 的影响，为该领域研究提供初步依据。

方法：选取 31 名青年受试者 (男性 11 名)，分别在 4274 K 和 1877 K 照明条件下阅读 30 分钟和 60 分钟后，使用开放式自动验光仪测量 33 cm 处的屈光状态。在基线时和每 30 分钟，客观评估初始近距离工作诱导性暂时性近视和调节滞后情况。两种相关色温照明的使用顺序通过随机数字表确定。

结果：在低相关色温照明条件下阅读 30 分钟后，平均调节滞后量略低于高相关色温照明条件 (-0.97 ± 0.53 D vs -1.21 ± 0.50 D, $P = 0.10$)；阅读 60 分钟后，差异具有统计学意义 (-1.09 ± 0.55 D vs -1.36 ± 0.51 D, $P = 0.048$)。按近视程度分组后，轻度近视者 (阅读 30 分钟: -1.11 ± 0.43 D vs -1.38 ± 0.60 D, $P = 0.38$; 阅读 60 分钟: -1.34 ± 0.27 D vs -1.50 ± 0.54 D, $P = 0.53$) 和中度近视者 (阅读 30 分钟: -0.90 ± 0.57 D vs -1.12 ± 0.42 D, $P = 0.16$; 阅读 60 分钟: -0.96 ± 0.61 D vs -1.28 ± 0.50 D, $P = 0.05$) 在低相关色温照明下的调节滞后量均低于高相关色温照明，但差异无统计学意义。近距离工作诱导的短暂性近视方面，两组相关色温在各分组中均未表现出统计学差异。

结论：在低相关色温照明 (1877K) 下阅读的调节滞后量低于高相关色温照明 (4274K)，提示低相关色温照明可能有助于减少近距离工作时的调节滞后量。

摘要编号：204189

电针通过 lncRNA-XR_002789763.1 介导的线粒体自噬减轻近视视网膜神经节细胞损伤

第一作者：Xuejun WANG

共同作者：Xingtao ZHOU

目的：本研究探讨电针对长链非编码 RNA (lncRNA) 介导的近视视网膜神经节细胞 (RGCs) 线粒体自噬的影响。

方法：通过 RNA 测序分析电针干预后近视豚鼠 RGCs 中 lncRNA 和 mRNA 的表达谱，并构建竞争性内源 RNA (competing endogenous RNA, ceRNA) 网络。将线粒体自噬相关基因 PINK1 纳入核心 ceRNA 网络，探索电针调控近视 RGCs 中 lncRNA 与线粒体自噬的关系。本研究还采集了近视和高度近视成人的眼球，进一步验证其机制结果。

结果：电针干预延迟了近视豚鼠的屈光降低和轴长增加。进一步研究发现，电针可以通过促进线粒体自噬相关的 PINK1/Parkin 信号通路，诱导近视豚鼠 RGCs 线粒体自噬。此外，高度近视成人视网膜的线粒体自噬被抑制。通过 RNA 测序显示，并将 PINK1 纳入并构建核心 ceRNA 网络，本研究发现电针可通过 lncRNA-XR_002789763.1 海绵化 miR-342-5p，激活 PINK1/Parkin 信号通路。

结论：电针可通过 lncRNA-XR_002789763.1 海绵化 miR-342-5p，激活线粒体自噬相关 PINK1/Parkin 信号通路，促进 Mfn2 泛素化，从而减轻 RGC 损伤，延缓近视进展（图 1）。综上所述，本研究为电针防控近视进展的分子机制提供了新见解。

摘要编号：208432

眼健康科普的实践与创新

第一作者：Hailong NI

目的：阐述当前开展眼健康科普活动及科普创作所面临的机遇与挑战以及评价与创新。

方法：通过 20 余年作者自身的近视防控科普实践和科普创作，结合当前国家的双翼论“科学普及与科技创新同等重要”的时代背景，社会各界对科普的重视、投入以及科学技术普及法的修订，展开并提出医务工作者要身体力行，要自觉承担起健康科普的责任，要借助新媒体、人工智能等新科技创新科普的内涵与形式，形成示范作用，开展更有深度和广度的科普活动与科学传播。

结果：20 余年在全国各地开展的 300 多场科普活动及部分线上融合直播总触达上亿受众。作者主编的《孩子的护眼宝典》《倪海龙医生漫画谈近视防控》荣获科技部 2020 年和 2022 年全国优秀科普作品奖，《孩子的第一本护眼书》荣获浙江科学传播大赛最高奖一等奖，总 30 次印刷发行超 30 万册。科普成果首批获得浙江省科学技术进步奖。科普能实现高质量的社会效益，能体现创新性。科普成果能被社会各界广泛肯定，能获得各级科学技术进步奖，医务工作者能荣获全国科普工作先进工作者荣誉等。

结论：眼健康科普正当时。健康科普需立身（扎根专业领域的科普）、立心（做服务大众的科普）、立新（与时俱进创新的科普）。健康科普既服务社会，亦促进自身与团队全面发展。

摘要编号：209590

眼脑肾综合征合并病理性近视患者的巩膜镜验配一例

第一作者：Yanwen ZHENG

共同作者：Jiwen YANG

目的：探讨眼脑肾综合征（Lowe 综合征）合并病理性近视及特殊眼表条件患者的巩膜镜验配策略及临床效果。

方法：跟踪回顾我院 1 例 4 岁女性 Lowe 综合征合并超高度近视患者（双眼病理性近视、后巩膜加固术后、先天性内斜视术后、感音性耳聋、肾小管重吸收障碍）的屈光矫正诊疗过程。该患者屈光检查结果：R - 22.00 D - 0.1/L - 22.00 D - 0.1；眼轴 R: 32.11 mm/L: 32.11 mm；眼压 R: 18.6 mm/L: 20.6 mm。因框架眼镜矫正效果差双眼验配 RGP，予双眼 RGP 处方 R: 8.0/-20.00/9.4, L: 7.8/-20.00/9.4，取镜后 1 个月内左眼由于眼球突出、倒睫问题反复出现镜片移位丢失、角膜上皮点染，无法耐受传统角膜接触镜，采用个性化定制巩膜镜（直径 14.8 mm，高透氧材料）验配，通过荧光染色评估镜片适配性，针对性调整矢高、直径等参数，予左眼巩膜镜处方 L: 3200/-17.75/14.8。

结果：患者左眼巩膜镜取镜，矫正视力从 0.1 (RGP) 提升至 0.25 (巩膜镜)，戴镜 1 年，矫正视力提升至 0.4，戴镜过程中无不适，随访 1 个月显示眼表状态改善，无角结膜损伤或镜片相关并发症。后续随访过程中，因眼轴增长较快，经过肾内科对肾功能情况综合评估后，予每日 1 次 1 滴 0.01% 阿托品滴眼液点眼延缓眼轴增长，效果显著。

结论：针对 Lowe 综合征合并病理性近视及特殊眼表条件患者，巩膜镜通过非接触角膜设计、泪液池缓冲及个性化参数调整，可有效提升矫正视力并保护眼表，为传统矫正手段失效后的患者提供了安全且高效的替代选择。在验配和随访过程中，需充分考量患者全身疾病特征与眼部生物力学特性，同时着重强调眼表状态优化及多学科联合随访管理的必要性。

摘要编号: 209396

红光疗法通过重编程视网膜代谢抑制透镜诱导的雏鸡近视

第一作者: Chengjie HE

共同作者: Yanjing HUANG, Jingyi PENG

目的: 旨在阐明重复低强度红光疗法在雏鸡透镜诱导性近视模型中, 抑制近视进展的视网膜代谢机制。

方法: 将 7 日龄雏鸡随机分为三组 (每组 $n = 7$): 正常对照组、透镜诱导性近视组 (佩戴 -10 D 透镜) 以及红光干预性近视组 (在透镜诱导基础上接受红光干预: 650 nm , 4.7 mW/cm^2 , 每日两次, 每次 3 分钟, 持续 7 天)。在实验开始前和第 7 天分别测量眼轴长度和屈光度。获取视网膜组织进行非靶向液相色谱-质谱法代谢组学分析, 并通过多元统计分析和通路富集方法处理数据。

结果: 红光干预显著减轻了近视漂移 (平均双眼屈光差: $-3.82 \pm 0.8\text{ D}$ 对比 $-7.75 \pm 1.2\text{ D}$, $p = 0.0003$) 和眼轴伸长 ($0.508 \pm 0.04\text{ mm}$ 对比 $0.644 \pm 0.03\text{ mm}$, $p = 0.0022$), 抑制率分别达 50.6% 和 43.3。透镜诱导性近视导致了氨基酸、脂质和抗氧化途径的广泛紊乱。而红光暴露与神经保护相关代谢物 (N-乙酰天冬氨酸谷氨酸) 和视觉功能相关代谢物 (视黄醛) 水平的升高, 以及与炎症相关代谢物 (花生四烯酸) 和血管调节紊乱相关代谢物 (不对称二甲基精氨酸) 水平的降低相关。

结论: 红光干预与近视进展的减缓以及视网膜代谢物谱的改变相关, 这些改变与线粒体能量产生和视觉循环功能的增强相一致。该干预还改善了视网膜炎症环境并调节了一氧化氮相关通路。这些观察结果揭示了红光可能对视网膜结构和功能发挥保护作用的潜在机制。

摘要编号: 204076

角膜塑形镜偏心对中国儿童近视眼轴增长的影响: 一项 Meta 分析

第一作者: Yi-ming GUO

共同作者: Juan HUANG, Jiaqi WANG, Junhan WEI, Lu YE

目的: 角膜塑形镜 (orthokeratology, OK 镜) 已成为常用的近视防控手段。然而, 镜片偏心作为常见并发症, 可能影响其近视控制效果。本研究旨在通过 Meta 分析系统评估 OK 镜偏心对中国儿童近视眼轴增长 (axial length growth, ALG) 的影响。

方法: 检索 PubMed、Embase 及 Cochrane Library 数据库, 纳入 2000 年至 2024 年间相关文献。主要结局指标为中心配戴组与偏心组之间 ALG

的标准化均数差 (SMD)。采用 Cochrane Q 检验和 I^2 统计量评估研究间异质性, 并通过漏斗图及视觉检查分析发表偏倚。

结果: 共纳入 9 项回顾性研究, 涉及 1503 例年龄 8–15 岁的近视儿童。其中 6 项提供 12 个月随访数据, 合并分析显示偏心组 ALG 显著降低 (SMD = -0.45 , 95% CI: -0.66 至 -0.24 , $p < 0.0001$), 异质性中等 ($I^2 = 59.1\%$)。按发表年份和样本量的亚组分析提示结果存在时间和方法学差异, 早期研究显示抑制效果更为显著。敏感性分析验证了结果稳健性, 仅合并效应值有轻微变化。三项提供 24 个月数据的研究亦显示 ALG 显著降低 (SMD = -0.46 , 95% CI: -0.68 至 -0.24 , $p < 0.0001$), 异质性可忽略不计 ($I^2 = 0\%$)。漏斗图提示可能存在发表偏倚, 主要受一项离群研究影响。

结论: OK 镜偏心可显著抑制近视儿童的眼轴增长, 提示其在近视防控中的潜在价值。但研究间存在一定异质性, 可能与设计及样本差异有关。后续仍需大样本、长期随访研究加以验证。

摘要编号: 210273

重复低强度红光联合角膜塑形镜与点扩散镜片在儿童近视控制中的疗效对比研究

第一作者: Hui REN

目的: 比较重复低强度红光 (RLRL) 联合角膜塑形镜 (OK) 与 OK 单用及点扩散镜片 (DOT) 在控制儿童近视进展中的疗效与安全性。

方法: 前瞻性对照研究, 纳入 8–14 岁近视儿童共 77 例 (147 眼), 等效球镜 $-1.00 \sim -5.00\text{ D}$ 。按干预分为 RLRL + OK 组 (30 例)、OK 组 (17 例) 及 DOT 组 (30 例)。RLRL 照射波长 $650 \pm 10\text{ nm}$, 每日 2 次、每次 3 min, 间隔 $\geq 4\text{ h}$, 随访 3 个月。主要结局指标为眼轴, 次要指标包括黄斑脉络膜厚度、视力。

结果: 3 个月后, 三组眼轴变化分别为: RLRL + OK 组 -0.02 mm (95% CI $-0.08 \sim 0.03\text{ mm}$)、OK 组 0.27 mm ($0.19 \sim 0.34\text{ mm}$)、DOT 组 0.18 mm ($0.10 \sim 0.25\text{ mm}$); RLRL + OK 较 OK 组眼轴增长减少 0.29 mm ($P < 0.001$)。眼轴年增长 $< 0.10\text{ mm}$ 者比例 RLRL + OK 组为 86.2%, DOT 组 36.7%, OK 组 14.3%。RLRL+OK 组脉络膜显著增厚 ($+28.8\text{ }\mu\text{m}$), 视力改善率三组相近 ($P > 0.05$), 未见严重不良事件。

结论: RLRL 联合 OK 镜能显著抑制儿童眼轴延长, 效果优于 OK 或 DOT 单用, 安全性良好, 提示重复低强度红光与光学离焦的联合可为儿童近视防控提供更优方案。

摘要编号: 209054

长期配戴角膜塑形镜后的周边屈光研究

第一作者: Wanqing JIN

目的: 以低中度近视儿童及青少年为研究对象, 测量受试者在两种不同的近视矫正方式下戴镜前后的水平和垂直方向上不同角度的视网膜周边屈光度的变化情况及眼轴增长情况, 旨在探讨长期配戴角膜塑形镜与框架眼镜后, 视网膜水平与垂直方向各个角度周边屈光度变化情况及其与近视进展的相关性。

方法: 本研究共纳入 78 例受试者, 年龄范围为 8~14 岁, 平均年龄 (10.63 ± 1.73) 岁, 球镜度数范围为 -0.75 D~ 5.0 D, 散光度数范围为 0 ~ 1.5 D。根据受试者实际选择的近视矫正方式, 将受试者分为两组, 其中框架镜组 (39 名), OK 镜组 (39 名), 男女比例为 $1.44 : 1$ 。分别测量了受试者在配戴前、配戴半年后及一年后的视网膜周边屈光度, 测量参数包括水平方向、垂直方向以及中央区域共 13 个角度的周边屈光度数。其中包括颞侧与鼻侧的 10° 、 20° 、 30° 位置; 上方与下方的 5° 、 10° 、 15° 位置。测量两组受试者的眼轴长度。最后进行长期配戴角膜塑形镜后的周边屈光参数的变化及其和框架组的比较分析, 并分析眼轴变化量与周边屈光参数的相关性。

结果: 1、戴镜前后视网膜周边屈光的变化 OK 镜组与戴镜前相比, 相对周边屈光度在水平和垂直的各个角度均表现为近视离焦, 相对周边屈光度除上方 5° 之外, 其余点位戴镜前后均存在差异。而框架组与戴镜前相比, 相对周边屈光度在水平和垂直的各个角度均无明显差异。2、戴镜前后眼轴的变化在半年与 1 年的随访中, OK 镜组眼轴增量始终小于框架组 ($P < 0.05$)。3、视网膜相对周边屈光与眼轴增长的相关性 眼轴变化量与周边屈光参数之间均没有显著相关性 (所有 $P > 0.05$)。

结论: 1、本研究不仅验证了长期配戴角膜塑形镜后的水平方向视网膜周边屈光度的变化, 还发现垂直方向视网膜周边屈光度的变化同样呈现近视性离焦。长期配戴框架镜后在大多数角度的周边屈光度未观察到明显的变化。2、长期配戴角膜塑形镜的受试者眼轴增长量显著小于配戴框架镜的受试者。3、本研究未发现眼轴增长量与各角度周边屈光参数之间存在明确的线性相关性。

摘要编号: 209372

青少年佩戴近视离焦眼镜后散光变化的对比分析

第一作者: Zhang JUN

目的: 比较佩戴近视离焦眼镜和单光眼镜的青少年近视儿童, 随访散光度数变化的差异, 进一步明确离焦眼镜与散光增长的关联性。

方法: 本研究采用回顾性队列分析。纳入 80 名 7-13 岁的青少年近视患者, 根据其佩戴的镜片类型分为两组: 离焦镜组 ($n = 40$, 佩戴高非球微透镜片) 与单光镜组 ($n = 40$, 佩戴普通单光镜片)。收集分析两组患者基线及佩戴后第 12 个月、第 24 个月的屈光变化, 包括等效球镜度数 (SE) 和柱镜度数 (散光) 及眼轴数据。主要观察两组间散光度数年均变化量的差异。

结果: 经过 24 个月的观察, 离焦镜组和单光镜组的散光度数均表现出轻度进展, 其年均变化量分别为 (-0.1 ± 0.14) D 和 (-0.12 ± 0.16) D。两组间的散光变化量无统计学显著差异 ($p > 0.05$)。此外, 两组在角膜散光 (由角膜地形图测量) 的变化量上无显著差异 ($p > 0.05$)。在近视控制方面, 离焦镜组的眼轴年均增长值 (0.17 ± 0.09 mm) 显著低于单光镜组 (0.39 ± 0.11 mm) ($p < 0.01$)。

结论: 在为期两年的观察期内, 青少年佩戴离焦镜片与佩戴单光镜片在散光度数的进展上未发现显著差异。离焦镜片在有效延缓眼轴增长和近视进展的同时, 未表现出相较单光镜片增加或减少散光的作用。散光的进展可能主要与个体眼球自身的生长发育相关, 与是否使用离焦镜片无关联性。

摘要编号: 208600

高度近视增加肝功异常者重症肝病风险

第一作者: Linge JIAN

目的: 尽管高度近视主要累及眼部, 但越来越多的证据表明, 其亦与全身炎症及代谢紊乱相关。肝脏在代谢与炎症调控中居于核心地位, 可能与高度近视共享病理通路。然而, 目前尚无人群研究探讨高度近视与肝脏疾病进展之间的关联。本研究基于 UK Biobank 数据, 系统分析近视严重程度与严重肝病之间的关系, 并进一步探讨炎症标志物或代谢物是否在其中发挥中介作用。

方法: 本研究纳入 70 774 名基线无严重肝病的 UK Biobank 参与者, 前瞻随访 14.1 年。依据等效球镜度数将屈光状态分为正视、低 - 中度近视与高度近视。采用 Cox 比例风险模型评估肝病风险, 并按基线天冬氨酸转氨酶 (AST) 水平 (≥ 40 vs. < 40

U/L) 进行分层分析; 进一步运用中介效应模型评估炎症标志物及代谢产物的潜在中介作用。

结果: 在 $AST \geq 40$ U/L 人群中, 高度近视显著增加肝纤维化及肝硬化风险 (风险比 [HR] = 2.64, 95% 置信区间 [CI] = 1.44–4.85, $p = 0.002$), 并呈剂量 – 反应趋势 ($p = 0.004$); 而在 $AST < 40$ U/L 人群中未观察到显著关联。C- 反应蛋白 (CRP) 部分介导了上述关联; 经多重校正后, 未发现任何代谢物具有显著中介效应。

结论: 在基线 AST 升高的个体中, 高度近视为肝纤维化及肝硬化风险的独立危险因素, 其机制部分由 CRR 相关炎症通路介导。屈光状态评估可用于识别亚临床肝损伤人群中的高危个体, 并为后续抗炎干预研究提供理论依据。

CPAMD8 双等位基因突变导致色素性青光眼 1 例

第一作者: Tingli WEN

共同作者: Chumou LIU, Nanxing LIU, Xuyang LIU, Li TANG

目的: 色素播散综合征 (PDS) / 色素性青光眼 (PG) 是一系列以虹膜色素播散和小梁网色素沉着为特征的眼部疾病。PDS/PG 多数表现为散发病例, 但在一些家系中可以观察到明显的常染色体遗传模式, 然而与其直接相关的基因证据较少。CPAMD8 基因是近年发现的与眼前节发育相关的基因, 其突变与多种类型青光眼的发病有密切关系。在本研究中, 我们报告了一例携带 CPAMD8 双等位基因突变的 PG 病例, 其中 c.5202dupC (p.C1735Lfs*39) 位点尚未见报道。

方法: 对患者 (先证者) 及其家属 (先证者的父亲和同母异父的姐姐) 进行了全外显子组基因测序。Mutation Taster 和中国罕见病数据库 (RDDC) 用于评估突变位点的致病性, SIFT 和 DUET 用于预测突变位点的功能影响, 人群等位基因频率数据来源于 gnomAD 数据库。

结果: 全外显子基因测序提示先证者存在 CPAMD8 c.5202dupC (p.C1735Lfs*39) 和 CPAMD8 c.215C>(p.P72L) 的复合杂合变异。父亲测序验证结果表明携带 CPAMD8 c.215C>T (p.P72L) 杂合变异, 无法追溯患者母亲的变异情况 (病逝), 同母异父的姐姐未发现以上两者变异。其中 CPAMD8 c.5202dupC:p.C1735Lfs*39 不存在于 gnomAD

数据库中, 且尚未见文献报道。该位点突变导致蛋白提前 39 个氨基酸终止, 应该对该蛋白功能造成了影响。通过在线软件 Mutation Taster、RDDC 分析, 其致病性结果均为 disease causing (致病)。CPAMD8 c.215C>T (p.P72L) 由 SIFT 和 DUET 均预测为有害变异, 曾在散发病例中有报道。此外未发现其他导致该表型的疑似致病基因。

结论: 本研究报道了 1 例与 CPAMD8 基因突变相关的 PG 患者, 且发现了一个新的变异位点 C1735Lfs*39, 该突变因其母亲病逝未追溯到来源 (另一突变来自父亲), 不排除该突变为新发突变。尽管该突变的具体致病性尚需进一步功能验证, 但其为 CPAMD8 参与 PDS/PG 遗传提供了新的证据、扩展了其突变谱, 并强调了 CPAMD8 在 PDS/PG 中的复合杂合遗传机制。

摘要编号: 208751

EFEMP1 基因变异对大鼠眼压的影响

第一作者: Junkai TAN

共同作者: Xuyang LIU, Jiankai ZHAO

目的: 探究 EFEMP1 基因的一种终止密码子突变对大鼠的眼压 (IOP) 和小梁网组织中纤维连接蛋白 (FN) 表达的影响。

方法: 分别构建表达人类 EFEMP1 基因野生型的慢病毒载体 (rLV-hEFEMP1-GFP; hE) 和终止密码子突变型的慢病毒载体 (rLV-hEFEMP1-X4-GFP; X4)。大鼠单眼的前房分别注射 4 μ L 的 hE 或 X4 载体, 对侧眼均为未处理的空白对照组。IOP 变化由 TonoLab 回弹式眼压计进行检测。前房是否有炎症反应的情况由裂隙灯进行监测。眼球荧光的表达由 Micron IV 型视网膜成像仪进行监测。免疫荧光染色法检测小梁网组织中 FN 的变化。

结果: GFP 荧光信号主要集中于大鼠的眼前房角。hE 组和 X4 组大鼠的两侧基础 IOP 均无显著性差异; 在注射后第 3 天, hE 组大鼠的 IOP 出现显著降低, 而 X4 组大鼠的 IOP 显著升高; 两组大鼠的 IOP 变化均维持至第 21 天 (取材)。在对照组大鼠的眼小梁网组织中, FN 呈高水平表达, 且以均匀但部分聚集的形式分布; hE 组的眼小梁网组织 FN 表达出现显著减少, 而 X4 组的表现显著增强。

结论: 野生型 EFEMP1 蛋白在小梁网组织中具有调节房水流出阻力的功能, 而 EFEMP1 基因的终止密码子突变可能导致 EFEMP1 蛋白的调节能力受损, 进而引起 IOP 升高。

摘要编号: 209136

Posner-Schlossman 综合征患者外周血单个核细胞的转录组分析揭示关键免疫及病毒感染相关机制第一作者: *Shiming PENG*

目的: 为探究 Posner-Schlossman 综合征 (PSS) 的潜在发病机制, 我们比较了急性发作期 (APSS)、间歇期 (IPSS) 患者及健康对照者外周血单个核细胞 (PBMCs) 的转录组谱。

方法: 提取 APSS 组 ($n = 4$)、IPSS 组 ($n = 3$) 及对照组 ($n = 3$) 的 PBMCs RNA 进行转录组测序。通过基因表达谱分析, 采用独立样本 t 检验比较 IPSS 组、对照组与 APSS 组的 PBMCs 组成差异。对筛选的差异表达基因进行分类及 KEGG 通路富集分析。采用酶联免疫吸附试验 (ELISA) 验证 IFITM2、ISG15 和 SOCS1 蛋白在 PSS 患者与对照间的表达差异。

结果: APSS 组与 IPSS 组、对照组存在显著差异, 而后两组间差异基因数量相近。参与抗人巨细胞病毒反应的干扰素诱导基因 (IFITM2、ISG15 和 SOCS1) 表达下调, 转录组测序与 ELISA 结果一致。泛素-蛋白酶体系统 (包括 SKP1、RBX1、PSMF1、PSMB2、PSMB3 和 PSMD13) 受到抑制。抗原提呈相关细胞因子及适应性免疫通路因子表达下调, 而与天然免疫中巨噬细胞相关的因子表达上调。

结论: IPSS 组的免疫转录谱趋于正常化, 与疾病活动性减弱相符。虽然天然免疫与适应性免疫共同参与 PSS 发病, 但天然免疫中的巨噬细胞可能起主导作用。

摘要编号: 209868

TGF β 1 通过 Wnt/ β -catenin/CRYAB 信号通路诱导结膜成纤维细胞的纤维化反应第一作者: *Biting ZHOU*共同作者: *Kaiping CHEN, Yihua ZHU*

目的: 探究结膜纤维化的潜在机制。

方法: 培养原代人结膜成纤维细胞 (HConFs), 使用 TGF β 1 诱导结膜纤维化的体外模型, 以 ICG-001 作为 Wnt/ β -catenin 通路的拮抗剂。采用 4D-DIA 技术研究不同处理条件下 HConFs 的差异表达蛋白及 KEGG 通路富集情况。利用蛋白质-蛋白质相互作用 (PPI) 网络分析, 探讨 Wnt/ β -catenin 通路在结膜纤维化中的潜在下游因子。显微镜下观察细胞形态, Hoechst 染色和 CCK8 检测细胞活力。利用 EdU 实验分析细胞增殖, 划痕实验和

Transwell 迁移实验评估细胞迁移。胶原凝胶收缩实验用于测量 HConF 的收缩能力。此外, 用鬼笔环肽标记 HConF 的 F-肌动蛋白, 以可视化细胞骨架的排列情况。并且, 通过 qRT-PCR、免疫印迹和免疫细胞化学检测 Wnt/ β -catenin 通路相关调节因子、纤维化相关蛋白、CRYAB 和泛素的表达。

结果: 4D-DIA 组学结果和实验数据表明, TGF β 1 诱导的 HConFs 中 Wnt/ β -catenin 通路被激活。ICG-001 处理有效抑制了 TGF β 1 诱导的 HConFs 的细胞增殖和迁移, 减少细胞外基质 (ECM) 蛋白的生成, 降低 α -SMA 的表达水平并抑制了 TGF β 1 处理的 HConF 的细胞收缩活力。蛋白质组学数据进一步表明, CRYAB 是 Wnt/ β -catenin 的下游靶点, TGF β 1 上调 CRYAB, 而 ICG-001 下调 CRYAB。免疫印迹实验也表明, ICG-001 减少了 TGF β 1 处理的 HConF 中的泛素和 β -catenin 的表达, 提示 CRYAB 通过抑制其泛素化降解稳定了 β -catenin。外源 CRYAB 在 TGF β 1 刺激下促进细胞活力, 增加 ECM 蛋白水平并上调 HConF 的 α -SMA 表达。此外, CRYAB 恢复了 TGF β 1 诱导的被 ICG-001 抑制的纤维化反应。

结论: Wnt/ β -catenin/CRYAB 轴在结膜纤维化中发挥正向调节作用, 为减少 GFS 术后结膜瘢痕提供了一个潜在的治疗靶点。

摘要编号: 208917

TXNDC 5 在 POAG 中促进细胞外基质蛋白积聚和升高眼内压

第一作者: 郭涛

目的: 细胞外基质 (ECM) 蛋白在小梁网 (TM) 中的过度积累导致对房水 (AH) 流出的阻力增加, 并导致原发性开角型青光眼 (POAG) 中眼内压 (IOP) 随之增加。目前, 没有有效的治疗方法来解决 POAG 的这种致病机制。筛选与 TM ECM 积累有关的关键蛋白并进一步开发针对这些机制的药物是至关重要的。

方法: 通过无标记定量蛋白质组学技术筛选在转化生长因子 β 2 (TGF β 2) 诱导的 TM 中显著上调的蛋白质, 通过 qPCR、Western 印迹和免疫组织化学分析 TXNDC 5 和 ECM 蛋白之间的关系, 应用自噬抑制剂 (CQ) 和蛋白合成抑制剂 (CHX), 并调节分子伴侣介导的自噬 (CMA) 活性以验证 TXNDC 5 的降解途径依赖性机制。

结果: 我们证实, 在人 TM 细胞中, TXNDC 5 通过增加 TGF β R2 的表达而促进 ECM 的积累。我们还证明 TXNDC 5 通过 CMA 途径被降解, 并且 AR7 能够逆转 TGF β 2 诱导的 TM ECM 积累。最重要的是, 体内实验表明, TXNDC 5 的敲低显著

降低了小鼠 TM 组织中 TGF β 2 诱导的 ECM 蛋白积累,并降低了 TGF β 2 诱导的高眼压。

结论: 我们揭示了 TXNDC 5 导致 TM ECM 积聚和 IOP 升高的作用和可能机制,表明靶向升高 TXNDC 5 是一种潜在的减少 POAG TM ECM 蛋白积聚的新治疗方法。

摘要编号: 209256

UCP 联合抗 VEGF 治疗新生血管性青光眼

第一作者: Ling WANG

目的: 观察 UCP (超声睫状体成形术) 联合玻璃体腔注射抗新生血管 (VEGF) 药物治疗新生血管性青光眼的临床疗效。

方法: 2025 年 1 月至 9 月, UCP 联合玻璃体腔抗 VEGF 药物 (国产阿柏西普 0.05 ml, 每月 1 次, 共 3 次), 治疗新生血管性青光眼共 4 例 4 眼, 女 1 例, 男 3 例, 患者 62-74 岁, 继发于视网膜静脉阻塞 2 例、糖尿病性视网膜病变 2 例。患者术前最少使用 3 种降眼压眼药水, 眼压高于 30 mmHg。视力: 1 例无光感, 3 例 0.02-0.2。根据角膜白到白、眼轴长选择相应型号的 UCP 探头, 治疗 10 扇区。首次玻璃体腔抗 VEGF 药物的时机: 1 例在 UCP 术前 1 周, 1 例在 UCP 术后 2 周, 2 例在 UCP 同时。UCP 治疗后观察了 4-8 月: 观察视力、眼压、前房炎症、虹膜新生血管。

结果: 患者疼痛减轻、UCP 后前房炎症反应轻微、视力未见降低、虹膜新生血管消退, 眼压使用 0-2 种降眼压药物后不超过 24 mmHg。

结论: 不论 UCP 术前、术中、术后联合使用玻璃体腔抗 VEGF 药物, 均可有效降低新生血管性青光眼的眼压。UCP 治疗新生血管性青光眼, 应与抗 VEGF 联合。

摘要编号: 209796

VZV 感染性葡萄膜炎继发青光眼行 PCP 手术治疗一例

第一作者: Qin QIU

目的: 报道 PCP 联合白内障及瞳孔再造手术治疗葡萄膜炎继发青光眼一例, 探究诊疗方案及有效性。

方法: 患者男, 51 岁, 因右眼反复眼红伴眼压升高、视物模糊 2 年余于我科就诊, 既往最高眼压 40+ mmHg, 外院行房水检测出水痘-带状疱疹病毒 (VZV), 诊断为“右眼青睫综合征”, 予以三联降眼压药物、激素及抗病毒治疗, 右眼眼压反复升高, 1 年前于外院行“右眼小梁切除术”, 查体: 眼压: 右眼 35 mmHg (派立明、美开朗), 左眼

18 mmHg (派立明、美开朗), 视力 OD: 0.3 矫正 0.5 OS: 0.8 矫正 1.0。右眼结膜充血 ++, 上方滤过泡充血、低平弥散, 角膜透明, 少许点状上皮脱落, 下方角膜后见尘埃状 KP, 颞侧虹膜萎缩, 瞳孔欠圆, 向颞下方移位, 直径 6*4 mm, 对光反射消失, 晶体后囊浑浊。诊断: 1. 右眼继发性青光眼; 2. 右眼病毒性葡萄膜炎; 3. 右眼并发性白内障, 房角镜提示双眼房角开放, 于 2022 年 4 月 25 日行右眼 PCP 手术 (术中抽前房液行 MetaCAP™ 病原微生物核算高通量测序)、2022 年 8 月 17 日行右眼白内障联合瞳孔再造手术, 术后随访 2 年, 右眼眼压波动于 12 ~ 19 mmHg。MetaCAP™ 病原微生物核算高通量测序报告提示: 前房液未检出病毒。2024 年 8 月 19 日行右眼囊袋冲洗 + 房角分离 + 瞳孔再造手术, 术后予以妥布霉素地塞米松、双氯芬酸钠滴眼液消炎, 口服阿昔洛韦及更昔洛韦眼液抗病毒治疗, 口服维生素 B1、甲钴胺营养神经, 国医大师廖品正教授带状疱疹协定中药处方, 滋阴养血, 平肝息风, 具体药味如下: 细辛 5 g、白芷 15 g、麸炒苍术 10 g、姜厚朴 15 g、陈皮 10 g、当归 10 g、酒川芎 12 g、赤芍 15 g、蝉蜕 10 g、甘草片 6 g、白芍 15 g、水煎 300 mL, 日一剂, 一日三次。

结果: 术后 1 天, VOD 0.4, 眼压 16 mmHg。术后 2 天, VOD 0.4, 眼压 13 mmHg。术后 1 年, VOD 0.5, 眼压 14.5 mmHg。查体: 右眼滤过泡低平, 角膜透明, 虹膜周切孔畅通, 瞳孔稍不圆, 直径 4 mm。患者畏光症状较前明显缓解, 术后 1 年内眼压控制可, 波动于 13 ~ 17 mmHg, 门诊复查。

结论: 该病例为葡萄膜炎引起继发性青光眼, 眼内炎症严重, 既往前房液查出带状疱疹病毒, 予以抗病毒对因治疗及中药治疗, 行白内障及瞳孔再造手术后, 提高患者视功能, 眼压控制良好。

摘要编号: 208359

XEN 凝胶引流管植入术在多种青光眼治疗中的有效性及安全性分析

第一作者: Xiaoli XING

共同作者: Muyao XIN, Bo YU

目的: 初步评估 XEN 凝胶引流管植入术在多种青光眼治疗中的有效性及安全性。

方法: 选取 2021 年 12 月至 2024 年 4 月于天津医科大学眼科医院行 XEN 凝胶引流管植入术的青光眼患者 24 例, 共 26 只眼。分别在术前及手术后随访的 6-24 个月的随访过程中观察患者的眼压, 青光眼药物使用数量, 术后并发症情况等, 评估手术疗效。

结果：基线眼压 26.22 ± 8.26 mmHg，术后 1 天平均 IOP 为 12.26 ± 4.37 ($P < 0.001$)，术后 IOP 下降 53.2%。随访 6 个月，平均 IOP 为 16.88 ± 4.54 ($P < 0.001$)，IOP 下降 35.6%；随访 12 个月，平均 IOP 为 16.35 ± 5.56 ($P < 0.001$)，IOP 下降 37.6%；随访 18 个月，平均 IOP 为 16.8 ± 3.47 ($P < 0.001$)，IOP 下降 35.9%。随访 24 个月，平均 IOP 为 17.51 ± 2.87 ($P < 0.001$)，IOP 下降 33.2%。基线时降压药使用率为 2.40 ± 0.91 种，6 个月时的平均用药种类为 0.4 ± 0.82 种 ($P < 0.001$)；12 个月时的平均用药种类为 0.57 ± 0.79 种 ($P < 0.001$)；18 个月时的平均用药种类为 0.83 ± 0.92 种 ($P < 0.01$)；24 个月时的平均用药种类为 0.82 ± 0.75 种 ($P < 0.01$)。6 个月时，POAG 组成功率 100%，RG 组成功率 70.6%，总成功率 80.8% ($P = 0.129$)；12 个月时，POAG 组成功率 100%，RG 组成功率 50.0%，总成功率 65.2% ($P = 0.052$)；18 个月时，POAG 组成功率 80.0%，RG 组成功率 46.2%，总成功率 55.6% ($P = 0.314$)；24 个月时，POAG 组成功率 50.0%，RG 组成功率 44.4%，总成功率 45.5% ($P = 1.000$)。

结论：XEN 凝胶引流管植入术是青光眼一种有效的外科治疗方法，在 6-24 个月的随访中，患者的眼压及降眼压药物使用数量显著降低。

摘要编号：**208753**

一个中国原发性先天性青光眼合并心脏病家系的临床与分子遗传学分析

第一作者：Zhou ZHOU

共同作者：Chumou LIU, Guo LIU, Xuyang LIU, Jiankai ZHAO

目的：研究一个患有原发性先天性青光眼与先天性心脏病的中国家系中 FOXC1 和 GATA4 基因的变异，并探究原发性先天性青光眼与先天性心脏病的遗传关联性。

方法：所有纳入本研究的家系成员均接受了全面的眼科检查和全身系统检查。研究通过全外显子组测序 (WES)、长片段 PCR 实验 (long-range PCR) 及断点分析 (breakpoint analysis) 等技术，以筛选并鉴定致病性变异。

结果：先证者同时患有原发性先天性青光眼与先天性心脏病（包括房间隔缺损和室间隔缺损），其父亲患有心脏病（表现为心肌肥大）；其余家庭成员均未发现心脏或眼部异常。在先证者及其父亲中均检测到一种 GATA4 基因杂合变异 (NM_002052:c.1124G > A:p.Gly375Glu)，该变异与先天性心脏病的临床表型呈共分离关系，遗传模式符合常染色体显性遗传。经 Sanger 测序

法验证，先证者还携带一种 FOXC1 基因杂合变异 (NM_001453:c.292A > T:p.Lys98X)，由于该变异在其余家庭成员中均未检出，故判定为新发突变。

结论：这是首次报道由 FOXC1 基因 c.292A > T 和 GATA4 基因 c.1124G > A 这两种新型杂合变异突变背景下出现原发性先天性青光眼与先天性心脏病的病例。研究结果提示，FOXC1 和 GATA4 基因的致病性编码区变异可能共同参与了该家系原发性先天性青光眼与先天性心脏病的共病发病机制，并在一定程度上影响先证者临床表型的严重程度。

摘要编号：**208157**

一种新型依布硒林磷脂衍生物通过抑制铁死亡保护青光眼视网膜神经节细胞的研究

第一作者：Bo YU

共同作者：Xiaoli XING

目的：青光眼是全球首位不可逆致盲性眼病，会导致的视神经进行性损伤。现有治疗仅降眼压，无法解决神经退行性病变。铁死亡是视网膜神经节细胞 (RGCs) 损伤的关键机制，与氧化应激和脂质过氧化密切相关。依布硒林 (Ebselen) 作为 GPX4 拟似剂具抗铁死亡潜力，但水溶性差、膜滞留时间短限制其应用。本研究旨在开发一种新型 Ebselen 磷脂衍生物，通过增强细胞膜亲和力和滞留性，提升其神经保护效果。

方法：通过化学修饰将 Ebselen 与磷脂脂肪酸链结合，构建脂质样衍生物。采用 R28 谷氨酸毒性细胞模型，通过 CCK8、凋亡染色、MDA 及 Fe^{2+} 检测验证其保护作用。利用 NMDA 诱导的 RGCs 损伤和激素性高眼压小鼠模型，经玻璃体腔注射后，通过 HE、OCT、凋亡染色、VEP 及 RGCs 染色评估其对 RGCs 和视功能的保护效果，并通过 Western blot 检测 GPX4 和 SLC7A11 表达。

结果：新型衍生物显著延长细胞膜滞留时间，体外实验显示其提高神经细胞活力、减少凋亡、降低 Fe^{2+} 和 MDA 积累。动物模型中，较 Ebselen 更有效减少 RGCs 凋亡、改善视网膜结构损伤并保护视功能。机制研究证实其通过激活 GPX4 通路、抑制脂质过氧化发挥神经保护作用。

结论：本研究成功开发了一种新型 Ebselen 磷脂衍生物，通过优化药物递送和膜滞留性，显著增强对青光眼 RGCs 损伤的治疗作用，为神经保护治疗提供新策略，具临床转化潜力。

亚热带季风气候下急性原发性闭角型青光眼入院率的月际波动与气候因素关联性分析

第一作者: Aixia JIN

共同作者: Yanting FENG, Xiaohua PAN, Jiao SI, Yufei TAO, Mingmin YANG

目的: 探究深圳市急性原发性闭角型青光眼 (APAC) 入院人数的月度分布规律及其与气候因素的关联。**方法:** 对深圳眼科医院 2017 至 2021 年收治的 997 例 APAC 住院患者开展五年回顾性研究。通过调阅病历资料及政府网站气象数据, 比较月度 APAC 入院情况, 并分析与降水量、气压、气温、日照时长、湿度和蒸发量等气候因子的相关性。**结果:** APAC 患者平均年龄 64.63 ± 9.89 岁, 女性占比显著 (72.12%), 且眼轴长度明显短于男性 (22.26 ± 0.89 mm vs 22.87 ± 0.87 mm, $P < 0.001$)。5 月为 APAC 入院高峰, 尤以 65 岁以下男性突出。入院人数与湿度 ($r = 0.498$, $P < 0.01$)、降水量 ($r = 0.306$, $P < 0.05$) 呈显著正相关, 与蒸发量负相关 ($r = -0.333$, $P < 0.05$)。高湿度条件下男性 APAC 风险显著升高 ($OR = 2.76$, $P = 0.004$), 而气压上升 ($OR = 0.12$; 95% CI: 0.07–0.19)、气温升高 ($OR = 0.22$; 95% CI: 0.15–0.31) 及蒸发量增大 ($OR = 0.92$; 95% CI: 0.90–0.94) 均对该湿度相关风险具有保护作用 (P 均 < 0.001)。**结论:** 深圳地区 APAC 入院率在 5 月达峰值, 尤以 65 岁以下男性为著。相对湿度升高是主要气候驱动因素, 显著增加 APAC 发作风险。

摘要编号: 209627

原发性闭角型青光眼晶状体因素的临床研究

第一作者: 陈晶

共同作者: 张蕊, 李丹

目的: 比较原发性闭角型青光眼 (PACG) 急、慢性型晶状体形态结构变化特征, 以期了解晶状体因素在不同类型 PACG 发病机制中的作用。**方法:** 病例对照研究。研究对象均来自于 2023 年 1 月至 2024 年 10 月就诊于我院的 PACG 患者 (包括急性原发性闭角型青光眼 APACG 发作眼组及其对侧眼组和慢性原发性闭角型青光眼 CPACG 进展眼组及其对侧眼组, 以下均以 A1、A2、B1、B2 组表示; APACG 组、CPACG 组均以 A、B 组表示), 应用 IOL Master 700 分别对不同组晶状体和眼球进行生物学检测: 1. 晶状体核密度 (LND); 2. 晶状体皮质密度 (LCD); 3. 晶状体皮质 / 核密度比 (LCD/LND); 4. 晶状体厚度 (LT); 5. 晶状体皮质厚度 (LCT); 6. 晶状体核厚度 (LNT); 7. 晶状体皮质厚度占比 (LCT/LT); 8. 晶状体核厚度占比 (LNT/LT), 计算相应的晶状体位置 (LP) 和晶状体相对位置 (RLP) 并作对比分析。统计学方法采用 Kruskal-Wallis 秩和检验、单因素方差分析、Mann-Whitney U 检验以及独立样本 T 检验, 以 $P < 0.05$ 认定为差异具有统计学意义。**结果:** 1. 基本信息: A 组 47 例 (94 眼)、年龄为 65.5 (7.9) 岁; B 组 47 例 (94 眼)、年龄为 63.3 (7.9) 岁, 差异无统计学意义 ($P > 0.05$)。A1、A2、B1、B2 组眼轴为: 22.19 (1.32) / 22.23 (1.30) / 22.66 (0.68) / 22.17 (2.9) mm, 差异无统计学意义 ($P > 0.05$)。2. A1、A2、B1、B2 组晶状体参数结果: LND = 54.59 (21.38) / 56.30 (16.91) / 54.75 (15.35) / 54.45 (16.63), P 值 > 0.05 ; LCT = 2.23 (0.33) / 2.19 (0.32) / 2.05 (0.28) / 2.07 (0.29) mm, P 值 < 0.05 ; P 值 > 0.05 , LT = 5.09 (0.34) / 5.06 (0.31) / 4.90 (0.31) / 4.90 (0.32) mm, P 值 < 0.05 ; LCT/LT = 0.44 (0.04) / 0.43 (0.04) / 0.42 (0.04) / 0.42 (0.04), P 值 > 0.05 ; LNT/LT = 0.56 (0.04) / 0.57 (0.04) / 0.58 (0.04) / 0.58 (0.04), P 值 > 0.05 。3. 晶状体参数组间比较: LCT 中 A1 $>$ B1、A1 $>$ B2、A2 $>$ B1, 差异均有统计学意义 (P 值均 < 0.05); LT 中 A1 $>$ B1、A1 $>$ B2、A2 $>$ B1、A2 $>$ B2, 差异均有统计学意义 (P 值均 < 0.05)。PACG 急性型患者发病与晶状体皮质膨胀增厚且晶状体位置靠前相关。**结论:** PACG 急性型患者发病与晶状体皮质膨胀增厚且晶状体位置靠前相关。

摘要编号: 209466

在线阈上值视野检查程序 (Perimouse) 在远程青光眼视野筛查中的评估: 与 Humphrey 视野计的比较

第一作者: Xiaoyuan SHEN

共同作者: Zidong CHEN, Yangfan YANG, Minbin YU

目的: 评估一种在线阈上值视野筛查程序 (Perimouse) 在检测青光眼性视野缺损时, 与 Humphrey 视野计 (HFA) 的诊断效能及空间一致性。**方法:** 前瞻性诊断研究共纳入 174 名受试者 (283 只眼), 包括健康人群及原发性开角型或正常眼压性青光眼患者。所有受试者均接受 Perimouse 阈上值测试和 HFA SITA Standard 24-2 程序检查。以 Perimouse 检测遗漏的刺激点及 HFA 总体偏差概率图中 $P < 0.5\%$ 的点作为异常点, 对两种方法的异常点数量进行线性回归、Spearman 相关、组内相关系数 (ICC) 及 Bland-Altman 一致性分析。

进一步采用可接受总误差 / 误差限 (ATE/LER) 法评估临床可接受范围。通过受试者工作特征曲线 (ROC) 和精确率-召回率 (PR) 分析评估诊断性能, 并计算逐点 Cohen's κ 系数及 ROC 曲线下面积 (AUC) 以探索空间对应关系。

结果: Perimouse 与 HFA 的异常点数量高度相关 ($r = 0.88$, $P < 0.001$), 并与 HFA 平均偏差 (MD) 呈显著负相关 ($r = -0.80$, $P < 0.001$)。两种方法间一致性良好 (ICC = 0.93), Bland-Altman 分析显示平均偏差适中, 仅少数离群值。ATE/LER 分析显示绝大多数数据点落于临床可接受范围内, 仅少部分超出误差限。以异常点 ≥ 5 为诊断整体视野缺损的最佳阈值, 灵敏度为 85.9%, 特异度 97.9%, 准确率 91.9%, F1 值 0.91 (AUC = 0.97)。诊断性能随疾病严重程度增加而逐渐提升。逐点 Cohen's κ 范围为 0.32-0.78, 对应 AUC 范围为 0.66-0.96; 生理盲点附近颞侧 κ 值较低, 鼻侧较高。Perimouse 平均测试时间显著短于 HFA (2.64 ± 1.83 分钟 vs 6.27 ± 2.18 分钟, $P < 0.05$)。

结论: Perimouse 与 HFA 在检测青光眼性视野损害方面具有良好的相关性和一致性, 并能快速、可靠地识别异常视野。研究结果支持其作为一种实用、低成本的远程或家庭视野筛查工具的可行性。

摘要编号: 208084

基于多模态数据的深度学习在青光眼诊断和严重程度分级中的应用

第一作者: Chaoxu QIAN

共同作者: Hua ZHONG

目的: 基于多模态数据开发能诊断青光眼并识别严重程度的深度学习模型。

方法: 采用诊断试验研究方法, 收集正常人群 86 人 145 眼和不同严重程度原发性开角型青光眼患者 314 例 507 眼的彩色眼底照相和视野检查结果, 并根据视野的平均缺损值将青光眼分为早期 (154 眼)、中期 (113 眼) 和晚期 (240 眼)。分别采用 DenseNet 121、ResNet 50 和 VGG 19 卷积神经网络 (CNN) 建立人工智能 (AI) 青光眼严重程度分级模型, 评估单模态数据与多模态数据对于分类结果的影响, 并确定适合多模态数据的 CNN 网络架构。

结果: 同时具有彩色眼底照相和视野检查结果者有 652 眼, 按照 4:1 的比率随机 (计算机抽取法) 分配图片到训练集和测试集。不同 CNN 架构建立的青光眼严重程度分级模型均具有较高的准确性, DenseNet 121 各有效性指标高于 ResNet 50 及 VGG 19。在彩色眼底照相单模态 AI 模型中, 识别早期青光眼的受试者工作特征曲线下面积 (AUC)

为 0.87; 在视野单模态 AI 模型中, 识别早期青光眼的 AUC 为 0.93; 在彩色眼底照相联合视野的多模态 AI 模型中, 识别早期青光眼的 AUC 为 0.95。

结论: 结构联合功能更符合实际临床工作中对青光眼的评估, 基于多模态数据能建立具有高准确性的青光眼诊断和严重程度分级工具。

摘要编号: 210051

急性房角关闭危象患者角膜共聚焦显微镜临床特征

第一作者: Weiwei WANG

目的: 应用角膜共聚焦显微镜探讨急性房角关闭危象 (AACC) 患者角膜临床特征。

方法: 分析单眼发病的 AACC 患者以及年龄匹配的白内障患者 (对照组) 角膜共聚焦显微镜角膜上皮细胞、上皮神经纤维丛、基质细胞和内皮细胞。

结果: 41 名单眼发病 AACC 患者 (82 只眼) 和 20 名健康对照 (40 只眼), 共聚焦显微镜显示, AACC 眼的角膜神经纤维密度、角膜神经分支密度和角膜神经纤维长度明显降低。基质细胞肿胀, 内皮细胞大小不均匀, 在表面沉积点状高反射的角膜沉着物。在严重病例中, 细胞体积增大, 变形并融合。在对侧眼中, 角膜上皮神经纤维丛、基质层和内皮层未见异常, 内皮细胞密度为 2601 ± 529 个/ mm^2 , 高于 AACC 眼的 1654 ± 999 个/ mm^2 ($P < 0.001$)。角膜水肿导致 17 只眼无法使用角膜内皮镜检查, 只有四只眼无法用共聚焦显微镜检查。在 AACC 眼和对侧眼中, 共聚焦显微镜和角膜内皮镜检查中内皮细胞密度无显著差异 ($P = 0.674$, $P = 0.247$)。与对侧眼相比, 角膜六边形细胞比例显著降低 ($P < 0.001$), 平均细胞大小和内皮细胞变异系数显著增加 ($P < 0.001$, $P = 0.008$)。

结论: AACC 眼角膜上皮神经纤维丛密度降低、长度减少, 基质细胞活化, 内皮细胞异型性增加, 密度减少。

摘要编号: 210001

托吡酯和氢氯噻嗪低剂量联合用药致早期急性近视和房角变窄: 病例报告

第一作者: Zhaoqiang LIU

目的: 报告 1 例托吡酯和氢氯噻嗪联合使用导致急性近视和房角变窄的罕见病例。

方法: 一名 34 岁的亚洲女性在仅服用 1 次含有 25 毫克托吡酯、25 毫克氢氯噻嗪和 22.4 毫克氟西汀减肥药 6 小时后, 双眼视力显著下降。随后被诊断为急性双侧近视和房角变窄, 并开始使用局部治疗。

结果：初步检查显示双眼视力下降至 20/100，右眼眼压 23 毫米汞柱，左眼眼压 24 毫米汞柱，伴有脉络膜上腔积液和房角变窄。在停用这些药物并使用降眼压药物后，患者完全康复。

结论：我们推测托吡酯和氢氯噻嗪之间可能存在药物相互作用，可能在短时间内低剂量使用就导致房角变窄。及时停药通常可在数天至数周内完全恢复。

摘要编号：209974

改良 Ahmed 青光眼引流阀植入术治疗难治性青光眼

第一作者：Yihua ZHU

共同作者：Xiyao LIN, Biting ZHOU

目的：探讨改良 Ahmed 青光眼引流阀植入术治疗新生血管性青光眼（NVG）及其他难治性青光眼（refractory glaucoma, RG）的差异性，探究 AGV 治疗不同类型难治性青光眼的临床疗效。

方法：真实世界临床研究。研究对象为 2022 年 11 月至 2025 年 2 月期间在福建医科大学附属第一医院被诊断为难治性青光眼的患者，共 49 例，53 眼。所有患者入院后均接受由同一位医师完成的改良 AGV 植入术治疗。根据病因学特征将患者分为两组：新生血管性青光眼（NVG）组 26 例 28 眼；其他难治性青光眼（其他 RG）组 23 例 25 眼，收集分析两组患者术前及术后各随访时间点的眼压、视力、抗青光眼药物种数、术后并发症情况、手术成功率。

结果：NVG 组和其他 RG 组术后 1 d、1 w、2 w、1 mo、3 mo、6 mo 的眼压测量平均值较术前均下降，存在显著的统计学差异（ $P < 0.001$ ），NVG 组术后早期眼压存在波动，于术后 2 w 左右眼压控制稳定。NVG 组平均眼压从术前（ 40.46 ± 9.00 ）mmHg 下降到末次随访时的（ 19.54 ± 5.83 ）mmHg；其他 RG 组的平均眼压由术前（ 37.96 ± 10.50 ）mmHg 下降到末次随访时的（ 17.36 ± 5.77 ）mmHg。通过重复测量方差分析比较，NVG 组和其他 RG 组在术后各随访时间点的眼压水平相当，差异无统计学意义（ $P > 0.05$ ）。NVG 组抗青光眼药物的平均数量从术前（ 2.50 ± 0.92 ）种下降到末次随访时的（ 0.89 ± 0.99 ）（ $P < 0.001$ ）。其他 RG 组抗青光眼药物的平均数量从术前（ 2.80 ± 0.87 ）种下降到末次随访时的（ 0.68 ± 0.90 ）种（ $P < 0.001$ ）。两组患者术后 1 mo、3 mo、6 mo 随访时间点的最佳矫正视力相较术前均有所提高（ $P < 0.05$ ），两组间各随访时间节点最佳矫正视力无统计学差异（ $P > 0.05$ ）。至随访结束，NVG 组患者手术总成功率为 78.57%，RG 组患者手术总成功率为 80.00%。改良 AGV 主要并发症有浅前房及低眼压、引流装置相关并发症、前房出血、脉络膜脱离。

结论：改良 Ahmed 青光眼引流阀植入术在对 NVG 和其他 RG 的临床治疗上均具有显著效果，具有操作简便、组织创伤小等优点，是难治性青光眼的有效手术选择。新生血管性青光眼患者在术后早期眼压的稳定性相对较差，这可能与该类患者的眼部病理生理特点有关。

摘要编号：200823

改良外路 XEN 凝胶支架植入术治疗晚期青光眼的有效性及安全性

第一作者：Peiyun XIE

共同作者：Junhua LI

目的：评估改良外路 XEN 凝胶支架植入术治疗晚期青光眼的有效性及安全性。

方法：回顾性病例系列研究。纳入 2021 年 12 月至 2023 年 4 月于温州医科大学附属眼视光医院确诊为晚期青光眼并接受改良外路 XEN 凝胶支架植入术的患者 12 例（15 眼）。收集并分析患者术前，术后 1 周及 1、3、6、12 个月和末次随访的视力、眼压、降眼压药物数量、滤过泡形态、引流管位置、前房深度、手术并发症等。采用 Wilcoxon 符号秩和检验比较手术前后眼压和降眼压药物数量变化。使用 Kaplan-Meier 生存分析曲线分析手术成功率。

结果：随访时间 18.0（17.0，27.0）个月。末次随访时眼压由术前 25.0（20.4，41.5）mmHg 下降至 14.0（11.6，16.2）mmHg（ $P = 0.003$ ），局部降眼压药物数量由 4.0（2.0，4.0）种减少为 0.0（0.0，2.0）种（ $P = 0.001$ ）。术后 18 个月的手术总体成功率为 87%，完全成功率为 55%。2 眼分别于术后 2 个月和 7 个月再次行抗青光眼手术。术后并发症主要包括睫状体脱离（47%）、浅前房（33%）和引流管内口阻塞（20%）。所有术眼均未出现严重并发症。

结论：改良外路 XEN 凝胶支架植入术可以显著降低术眼眼压和减少降眼压药物数量，在晚期青光眼的治疗中展现出较高的成功率和安全性。

摘要编号：207651

斑马鱼 Angpt1 基因敲降系的眼部异常提示 ANGPT-TIE 信号在房水外流中的作用

第一作者：Shisong RONG

共同作者：Anna LARSON, Janey WIGGS

目的：在人类和小鼠中，Angpt-Tie 信号通路调控着房水排出所必需的特化淋巴管——Schlemm 管的发育。斑马鱼因其发育迅速和胚胎产量高，被广泛用于眼病研究并适合开展高通量实验。本研究旨

在建立并研究斑马鱼 *Angpt1* 基因敲降 (KD) 系, 以探讨 *Angpt-Tie* 信号在前节发育及青光眼发生中的作用。

方法: 采用 CRISPR/Cas9 技术在 *Angpt1* 基因第 5 外显子删除 11 个碱基对, 从而建立 *Angpt1* KD 系, 并通过测序及 RT-qPCR 进行验证。在 1 月龄 (1 mpf) 测量 KD 组与野生型 (WT) 斑马鱼的前房 (AC) 及眼球大小。在 10 天 (10 dpf)、17 天 (17 dpf) 及 1 月龄时行荧光原位杂交 (FISH) 检测 *Angpt1* 的空间表达。通过在 AC 内注射 3 kDa 可固定赖氨酸修饰的地塞糖 (20 mg/mL) 以量化房水外流情况。

结果: 在 1 mpf 时, *Angpt1* 纯合 KD 斑马鱼的 AC 显著增大 ($P = 0.041$), 眼球直径亦明显增加 ($P < 0.001$), 与 WT 相比差异具有统计学意义。光学显微镜下 KD 组眼前房角腹侧小管状网络的发育异常 (该结构是关键的前房水外流通道)。FISH 检测显示 *Angpt1* 在 10 dpf 和 17 dpf 时定位表达于该区域, KD 组信号减弱。同时, *Angpt1* 亦在面部淋巴管中被检测到。地塞糖注射实验显示房水可通过前房角腹侧小管状网络及面部淋巴管排出, 与 *Angpt1* 表达分布一致。

结论: *Angpt1* 参与斑马鱼房水外流通路的发育, 支持 *ANGPT-TIE* 信号通路在不同物种中具有保守作用。该 KD 模型为研究遗传变异及潜在治疗靶点提供了全新的平台。

新型微创内路三联手术 (3T) 联合青光眼复明合计治疗原发开角型青光眼 POAG 一例

第一作者: Qin QIU

目的: 报道新型微创内路三联手术 (3T) 联合青光眼复明合计治疗原发性开角型青光眼一例, 探究诊疗方案及有效性。

方法: 患者男, 54 岁, 因发现双眼眼压升高 2 年余于我科就诊。既往最高眼压右眼 28 mmHg, 左眼 60 mmHg。使用美开朗眼液、派立明眼液、拉坦眼液点双眼 1 年余。查体: VOD 戴镜 0.8; VOS 戴镜 0.8; 眼压: 右眼 27 mmHg, 左眼 25 mmHg; 房角镜检查双眼房角开放。视野: MD 值右眼为 -3.72 dB, 左眼为 -9.08 dB。中医查体: 舌红, 苔薄白, 脉细数。西医诊断: 双眼原发性开角型青光眼, 双眼屈光不正; 中医诊断: 双眼青风内障。西医治疗: 双眼眼压高, 房角开放, 杯盘比增大, 2025 年 3 月先后行行“双眼 3T 术”, 术后予以左氧氟沙星、醋酸泼尼松龙、双氯芬酸钠滴眼液预防感染, 口服维生素 B1、甲钴胺营养神经。中医治疗: 予以青光眼复明合计 (枸杞子 10 g 菊花

6 g 地黄 10 g 山萸肉 6 g 山药 10 g 茯苓 10 g 牡丹皮 6 g 盐泽泻 6 g 灵芝 6 g 炒诸实子 6 g 石菖蒲 6 g) 日一剂。

结果: 左眼术后 1 天, Vos 裸眼 CF/50 cm, 左眼 52 mmHg, 予以甘露醇静滴降眼压。左眼术后第 2 天, Vos 戴镜 0.5-, 眼压左眼 20 mmHg, 停用甘露醇。右眼术后 1 天, Vod 0.25, 眼压 15 mmHg, 术后第 2 天, Vod 0.4, 眼压 16 mmHg。术后眼压控制可, 双眼术后 6 月, 双眼视力戴镜 1.0, 眼压右眼 17 mmHg, 左眼 17 mmHg。复查视野: MD 值右眼为 -0.07 dB, 左眼为 -2.23 dB。目前患者病情稳定, 门诊复查。

结论: 该病例为 POAG 行微创 3T 手术降眼压治疗及青光眼复明合计口服滋补肝肾治疗一例, 术后眼压控制良好, 视神经康复。希望通过本病例能为眼科医生提供青光眼中中西医结合治疗的新方案。

摘要编号: 210037

普通张力环缝线固定治疗晶状体半脱位继发性青光眼一例

第一作者: Liuzhi ZENG

共同作者: Suju LIU

目的: 探讨外伤性晶状体半脱位继发性青光眼手术中普通张力环缝合固定的治疗特点及效果。

方法: 个案报告: 患者杨某某, 70 岁男性, 右眼外伤后出现眼红、眼痛、视物模糊, 并伴同侧头部胀痛 1 月余, 于 2025 年 8 月 25 日就诊。入院时视力右眼裸眼 0.2, 矫正 0.6, 左眼裸眼 0.6 矫正 0.9, 右眼眼压 30 mmHg、左眼眼压 14 mmHg。右眼结膜下片状出血, 角膜雾状水肿, 下方前房积血, 虹膜震颤, 瞳孔散大约 6 mm, 对光反射迟钝, 晶体震颤、混浊 (C2N2P2)。入院诊断为“1. 右眼外伤性晶状体不全脱位, 2 右眼继发性青光眼”。于 2025 年 8 月 27 日在局麻下实施“右眼白内障超声乳化吸除 + 人工晶体植入 + 张力环 (CTR) 植入 + 张力环悬吊术 + 前部玻璃体切除术。”手术步骤: 表面麻醉下, 于颞下方角膜缘作侧切口, 颞上方角膜缘作主切口; 注入粘弹剂, 完成环形撕囊后, 分别于鼻、颞、上、下方角膜缘作切口, 放置囊袋拉钩支撑囊袋; 行超声乳化吸核及皮质吸除, 保证囊袋完整。玻璃体自鼻侧溢出, 遂行前部玻璃体切除术。将带双弯针的 10-0 缝线一针套扎于普通张力环一孔上, 植入张力环于囊袋内, 缝线绕过囊袋口并经颞下方角膜缘外 2 mm 睫状沟穿出眼球, 植入人工晶体后, 10-0 缝线固定于巩膜层间。术毕吸除粘弹剂, 缩瞳, 水密切口。

结果: 手术顺利, 术后角膜透明, 前房深度恢复正常, 眼压稳定于正常范围内。术后随访 1 月, 右眼视力

裸眼 0.6 矫正视力 0.8, 眼压 15 mmHg, 角膜透明, 前房 (-), 人工晶体居中良好, 囊袋及 CTR 位置稳定。

结论: 晶状体半脱位的患者行白内障手术时, 植入带缝线的普通张力环并将缝线于巩膜层间固定, 张力环能够有效保留囊袋结构, 使人工晶体居中稳定, 该术式较传统去除囊袋并行 IOL 悬吊术操作更简便、结构更符合生理, 并发症少, 具有良好的临床推广价值。

摘要编号: **210052**

晶状体不全脱位继发青光眼的治疗

第一作者: **Weiwei WANG**

目的: 探讨晶状体不全脱位继发青光眼的临床表现和治疗。

方法: 系列病例研究。

结果: 晶状体不全脱位常继发于外伤、遗传性疾病或呈自发性。当前组悬韧带损伤, 临床表现为晶状体前移, 前房变浅、房角关闭, 眼压升高, 出现继发性青光眼。眼部生物参数测量脱位眼晶状体厚度较对侧眼增加。裂隙灯显微镜下可见双眼前房深度不同, 晶状体不全脱位眼前房变浅, 深度不均。当后组悬韧带损伤时, 前房加深, 可见玻璃体疝。UBM 可见晶状体赤道部与睫状突距离增大。白内障超声乳化吸除联合张力环植入、人工晶状体植入术是常规手术方式, 有玻璃疝时需联合前部玻璃体切割术, 悬韧带损伤严重时根据眼压情况一期或二期人工晶状体固定术。

结论: 白内障超声乳化吸除联合张力环植入、人工晶状体植入术可有效治疗晶状体不全脱位继发青光眼。

摘要编号: **207712**

激光周边虹膜切除术对可疑原发性房角关闭患者角膜生物力学参数的影响及其与房角结构的关联探讨

第一作者: **Qian LIU**

共同作者: **Qianyu WU**

目的: 探讨可疑原发性房角关闭患者 (PACS) 行激光周边虹膜切除术 (LPI) 后前房、晶状体及角膜生物力学参数的变化, 以明确其对治疗预后的影响。

方法: 本研究纳入可疑原发性房角关闭患者 (PACS) 患者 30 例 (42 只眼)。采用扫频源光学相干断层成像眼前节分析仪 (CASIA2) 和可视化角膜生物力学分析仪 (Corvis ST, CST) 测量 LPI 术前后的

前房参数、晶状体参数及角膜生物力学参数。使用广义估计方程分析 LPI 术后前房、晶状体及角膜参数的变化, 并通过多元线性回归分析筛选与术后角膜生物力学参数变化相关的影响因素。

结果: 患者平均眼压 (IOP) 从基线时的 15.64 ± 4.77 mmHg 降至 LPI 术后的 13.96 ± 3.29 mmHg。晶状体参数在 LPI 术后无显著变化。除 180° 房角隐窝面积 (ARA500) 外, 术后 500 μm 和 750 μm 位置的所有房角参数均显著增加。多元线性回归分析显示, 270° 房角开放距离 (AOD500)、ARA500、ARA750、小梁网虹膜空间面积 (TISA500)、TISA750 和小梁虹膜角 (TIA500) 的变化与最大形变幅度比 (DA ratio max) 呈正相关。角膜断层生物力学指数 (TBI) 与 270° TIA750 呈显著负相关。

结论: LPI 术后角膜生物力学参数 (形变幅度 (DA)、DLL、DLA) 显著增加, PACS 患者术后角膜硬度明显降低。DA max 比值和 TBI 可能作为潜在生物标志物, 用于评估 LPI 治疗效果及监测 PACS 患眼的青光眼治疗和病情进展。

摘要编号: **209068**

玻璃体切除联合硅油填充术后高眼压的危险因素分析: 一项回顾性研究

第一作者: **Xinxing ZHU**

目的: 本研究旨在探讨原发性孔源性视网膜脱离 (RRD) 患者接受玻璃体切除联合硅油填充术后发生高眼压的相关危险因素。

方法: 回顾性收集 2019 年 1 月 -2022 年 12 月于我院就诊的原发性孔源性视网膜脱离患者的临床资料。术后随访时间为 6 个月, 分别记录患者术后 1 天、7 天、1 个月、3 个月及 6 个月的眼压数据。采用 Student's t 检验、卡方检验、Fisher 精确检验、多因素 Logistic 回归模型以及限制性立方样条 (RCS) 分析, 评估各项临床指标与术后高眼压之间的关联。

结果: 共纳入 209 例接受玻璃体切除联合硅油填充术的原发性孔源性视网膜脱离患者。在 6 个月随访期间, 117 眼 (55.98%) 出现高眼压。单因素分析显示, 年龄、眼轴长度、多发裂孔、裂孔累及多个象限、术中硅油填充量以及高度近视既往史与术后高眼压相关 (均 $P < 0.05$)。多因素 Logistic 回归分析进一步表明, 年龄与多发裂孔是术后高眼压的独立危险因素。限制性立方样条分析提示, 年龄小于 55 岁的患者术后发生高眼压的风险更高。

结论: 年龄和多发裂孔是原发性孔源性视网膜脱离患者行玻璃体切除联合硅油填充术后发生高眼压的

独立危险因素。对于年龄较轻 (< 55 岁) 及存在多发裂孔的患者, 临床应予以更密切的随访监测, 并及时采取干预措施以控制眼压。

摘要编号: 208685

睫状体平坦部光凝治疗难治性青光眼临床观察

第一作者: Tiantian WANG

共同作者: Xun AN, Chao MA, Shuai WANG

目的: 评估巩膜两切口 532 nm 激光光凝睫状体平坦部治疗玻切术后难治性青光眼的安全性及有效性。

方法: 对 10 例 (10 只眼) 玻切术后继发难治性青光眼并接受巩膜两切口 532 nm 激光光凝睫状体平坦部手术治疗的患者术后随访 3 个月, 对术前与术后 2 周、术后 3 月的眼压进行统计学分析。

结果: 患者术前与术后 2 周、术后 3 月眼压均降低 $P < 0.05$ 差异均有统计学意义, 术后 2 周与术后 3 月眼压稳定, $P > 0.05$, 差异无统计学意义。

结论: 本研究 10 名睫状体平坦部光凝的患者术前与术后 2 周、术后 3 个月眼压下降幅度显著且差异有统计学意义, 说明睫状体平坦部光凝的手术方法有效, 且术后 2 周与术后 3 个月眼压差异没有统计学意义, 说明降眼压效果稳定。本研究通过激光光凝睫状体平坦部达到控制眼压的目的, 且因为睫状体平坦部房水生成功能低于睫状突, 出现低眼压并发症可能性小, 本研究 10 例中无 1 例出现低眼压情况, 且 3 个月内眼压稳定, 未出现眼压反复升高。可见巩膜两切口 532 nm 激光光凝睫状体平坦部治疗玻切术后难治性青光眼相对安全有效。

摘要编号: 209909

肠道菌群干预在青光眼防治中的作用与研究进展

第一作者: Zefeng KANG

目的: 综述肠道菌群干预在青光眼防治中的关联机制、干预效果及研究局限性, 为青光眼的多靶点防治提供理论参考。

方法: 从三个主要方向分析肠道菌群与青光眼的关联: 1. 青光眼患者肠道菌群组成及代谢物; 2. 肠道菌群通过“肠-眼轴”调控眼部免疫炎症的机制; 3. 肠道菌群代谢物对眼压调节及视神经保护的作用。同时, 评估肠道菌群相关干预措施的效果, 包括粪菌移植、益生菌 (如乳杆菌、双歧杆菌)、益生元、合生元及后生元补充, 以及高纤维饮食、地中海饮食等特定饮食干预。

结果: 青光眼患者普遍存在肠道菌群紊乱, 表现为有益菌 (如双歧杆菌、乳杆菌) 丰度降低, 有害菌 (如肠杆菌科、变形菌门) 丰度升高, 且伴随短链脂肪酸、吲哚丙酸等保护性代谢物减少。肠道菌群干预可通过以下途径发挥青光眼防治潜力: 1. 调节眼部免疫微环境, 减轻视神经周围炎症反应; 2. 改善肠道屏障功能, 减少内毒素入血, 降低全身性炎症对眼部的损伤; 3. 通过代谢物介导的神经保护作用, 延缓视神经节细胞凋亡, 维持视神经功能; 4. 部分益生菌干预可辅助降低眼压, 与传统降眼压药物形成协同作用。然而, 相关研究存在明显局限性: 1. 临床研究样本量小, 多为动物实验或横断面研究, 缺乏大样本随机对照试验; 2. 肠道菌群与青光眼的因果关系尚未明确, “肠-眼轴”具体调控通路 (如迷走神经、免疫细胞迁移) 仍需进一步解析; 3. 干预方案 (如益生菌菌株选择、剂量、干预时长) 不统一, 个体差异对干预效果的影响较大; 4. 长期干预的安全性 (如对肠道菌群稳态的长期影响、与降眼压药物的相互作用) 数据不足。

结论: 肠道菌群干预为青光眼的防治提供了潜在新靶点, 可通过调节“肠-眼轴”改善眼部炎症、保护视神经, 甚至辅助调节眼压。但当前研究仍处于初步阶段, 需充分重视样本量、机制解析、干预方案标准化及安全性等局限性, 未来需开展更多高质量临床研究, 明确其作用机制及最优干预策略, 推动肠道菌群干预成为青光眼综合防治的重要组成部分。

摘要编号: 209417

脉冲电磁场对视神经损伤的作用及机制作用

第一作者: Bin RUAN

目的: 脉冲电磁场 (Pulsed Electromagnetic Fields, PEMFs) 已被证明可以用于治疗神经退行性疾病, 但对视神经损伤的作用尚不明确。本研究旨在探究 PEMF 在小鼠视神经损伤模型中的神经保护作用及其潜在机制。

方法: 选取 6-8 周 C57BL/6J 的雄性小鼠建立 ONC 模型, 在特制的脉冲电磁场设备下对其进行干预。通过 RBPMS 标记视网膜神经节细胞 (retinal ganglion cells, RGCs) 以评估 PEMF 对 RGCs 的保护作用。采用视网膜冰冻切片及铺片的 Iba1 和 CD68 的免疫荧光染色来可视化小胶质细胞并量化细胞数量, 通过评估细胞形态和吞噬活性对小胶质细胞的活化水平进行评分。同时, 为进一步分析 PEMF 治疗对少突胶质细胞前体细胞 (Oligodendrocyte Precursor Cell, OPC) 的影响, 构建了 NG2-creERT2;tdTomato 基因小鼠,

于 ONC 造模前 7 天通过 Tamoxifen 诱导以标记 OPC，并通过 CC1 染色追踪 OPC 的分化情况。

结果：ONC 后小鼠视网膜铺片及冰冻切片的免疫荧光染色发现，治疗 2 周的视网膜 RGCs 的存活较对照组无明显差异，而治疗 4 周及以上的视网膜 RGCs 存活较对照组显著增多。同时通过免疫荧光染色发现 ONC 小鼠经 PEMF 治疗后，视网膜小胶质细胞数量较对照组虽未见明显的差异，但组织形态上更趋于正常。同时通过免疫荧光标记视神经上的小胶质细胞也有同样的发现，此外，PEMF 治疗组的视神经上有更多的 OPC 表达了 CC1，提示 PEMF 促进了 OPC 分化。

结论：长期的 PEMF 治疗对于 ONC 损伤后 RGCs 具有保护作用；PEMF 治疗能缓解慢性炎症中小胶质细胞的持续活化，促进其表型向静息态转化，具有抗炎作用；PEMF 治疗促进了 OPC 的分化。这些研究表明 PEMF 干预在视神经损伤修复过程中具有极大潜力。

摘要编号：209383

视神经损伤和视网膜缺血 / 再灌注后的铜代谢变化

第一作者：Bing ZHANG

共同作者：Yiqing LI, Jiahui TANG, Qi ZHANG

目的：成年哺乳动物的视神经 (ON) 损伤会导致有限的再生和显著的视网膜节细胞 (RGCs) 损失。我们之前的研究表明，ON 损伤后内侧小层中的 Zn^{2+} 迅速增加，导致 RGC 受损。铜 (Cu) 是一种过渡金属，在神经元能量代谢、神经递质合成和突触调节中起关键作用。目前尚不清楚铜代谢失调是否也在急性视神经和视网膜损伤后介导 RGC 损失。本研究旨在探讨在视神经压迫 (ONC) 和缺血再灌注 (I/R) 模型中铜代谢的变化，目标是开发保护 RGC、促进视神经再生和视力恢复的治疗方法。

方法：使用铜探针测量小鼠视网膜中 Cu^{+} 水平 ($n = 5$)。通过玻璃体内注射 ATTM ($n = 6$) 或对照载体 ($n = 6$) 验证铜螯合剂的神经保护作用。通过免疫荧光法测量视网膜中的 ATP7A 水平。在 ONC 后 14 天，解剖视网膜和视神经，量化存活的 RGCs 和再生的轴突。统计分析采用未配对学生 t 检验和单因素方差分析。

结果：在视网膜损伤后 1 至 5 天，铜离子浓度保持不变，但在视网膜缺血再灌注后 1 天，铜离子浓度增加了约 70%。铜螯合剂适度保护了视网膜神经节细胞 ($p \leq 0.01$)，并与对照组相比，促进了轴突再生 (在 0.25 毫米处 $p \leq 0.05$)。在视神经挫伤后 3 天，铜转运蛋白 ATP7A 减少了约 50%。

结论：在 ONC 后，铜水平在 5 天内保持不变。但在 I/R 早期阶段，铜含量增加。铜螯合剂适度保护了视网膜神经节细胞并促进了视神经再生。本研究发现了急性视神经和视网膜损伤后的铜代谢变化，为视网膜神经节细胞保护和神经修复的治疗提供了新的见解。

摘要编号：209490

超声乳化、房角分离术对晚期原发性闭角型青光眼合并白内障的疗效观察

第一作者：Qi WANG

共同作者：Junmei ZHAO

目的：观察超声乳化、房角分离术对晚期原发性闭角型青光眼合并白内障的临床疗效。

方法：回顾性分析山西省眼科医院 2023 年 6 月 1 日至 2023 年 10 月 1 日行白内障联合房角分离手术的原发性闭角型青光眼患者，记录术前生物测量、视野、UBM 结果，观察术前、术后 1 周、1 月、3 月、6 月的视力、眼压，抗青光眼的用药及并发症的情况。

结果：收集 48 例 (56 眼)，年龄为 47-86 (66.62 $\pm$ 9.10) 岁，女性患者 32 例 (66.66%)。术前视力为 0.375 $\pm$ 0.245，视野的平均 MD 为 -25.04 $\pm$ 5.59 dB，PSD 为 6.516 $\pm$ 3.042。所有患眼均为晚期原发性闭角型青光眼，平均 MD 为 -25.243 $\pm$ 6.550 dB，PSD 为 6.516 $\pm$ 3.042，PEL+GSL 术后眼压从术前 27.84 $\pm$ 11.47 mmHg，降至最后一次随访的眼压 13.696 $\pm$ 1.69 mmHg，视力从术前的 3.75 $\pm$ 2.45 提高至 5.45 $\pm$ 2.24，抗青光眼药物从术前的 2.52 $\pm$ 0.50 下降至 0.11 $\pm$ 0.37。

结论：白内障联合房角分离手术是治疗晚期原发性闭角型青光眼合并白内障的有效方法，可以显著的降低眼压，且并发症少。

摘要编号：210073

青睫综合征患者前房液病毒检测与临床特征的相关性：33 眼回顾性研究

第一作者：Suju LIU

共同作者：Liuzhi ZENG

目的：通过青睫综合征前房液病毒检测探讨青睫综合征发病原因，为临床治疗青睫综合征提供参考依据。

方法：收集 2022 年 11 月 -2025 年 7 月成都市第一人民医院收治的 32 例 (33 眼) 青睫综合征患者，将所有患者的前房液进行病毒检测，结果与相关因素进行分析。

结果: 1. 所有患者共 32 例 33 眼, 其中男性 19 例 19 眼 (59.38%) 多于女性 13 例 14 眼 (40.63%), 平均确诊年龄为 39.97 ± 2.47 岁。2. 检出率: 病毒抗体阳性有 25 例 25 眼 (75.76%), 其中巨细胞病毒 19 例 19 眼 (57.58%), 水痘带状疱疹病毒 3 例 3 眼 (9.09%), 单纯疱疹病毒 2 例 2 眼 (6.06%), 风疹病毒 1 例 1 眼 (3.03%)。3. 巨细胞病毒阳性患者, 男性: 女性 = 6:13, 平均年龄 37.21 ± 9.60 , 平均最高眼压为 46.89 ± 7.70 。水痘带状疱疹病毒患者, 男性: 女性 = 2:1, 平均年龄 59.00 ± 4.00 , 平均最高眼压为 46.67 ± 13.32 。4. 多因素 Logistic 回归分析显示, 发病年龄与病毒阳性呈正相关 (OR = 1.125, 95% CI: 1.0–1.27, P = 0.045), 与病程长短、最高眼压无明显相关性。比较病毒阳性组与阴性组在发病年龄、病程长短及最高眼压方面的差异。结果显示, 两组间发病年龄 (P = 0.400)、病程长短 (P = 0.527) 及最高眼压 (P = 0.717) 差异均无统计学意义。

结论: 青睫综合征发病的相关因素中, 病毒感染是被提及最多的发病原因, 其中巨细胞病毒是最常见的病毒之一。青睫综合征是继发青光眼之一, 发作时眼压较高, 长期对视神经造成不可逆损伤, 并且随年龄增大阳性率逐渐增加。

摘要编号: **210047**

顽固性高眼压与颈动脉海绵窦瘘

第一作者: **Weiwei WANG**

共同作者: **Jianrong LIU**

目的: 探讨颈动脉海绵窦瘘导致的药物难以控制的高眼压。

方法: 系列病例分析。

结果: 6 例患者均为女性, 年龄 53–73 岁; 视力波动于 0.3 ~ 0.8; 用药后眼压右 16.9 ~ 32.2 mmHg, 左眼 20.2 ~ 31.6 mmHg。单眼发病者 1 例, 双眼发病者 5 例。1 例患者曾在当地医院行小梁切除术, 4 例患者曾行 YAG 激光虹膜周边切开术, 术后均表现为药物难以控制的高眼压。眼部典型体征为眼球前突, 结膜血管迂曲扩张, 呈螺旋状, 周边前房浅。眼眶 CT: 3 例患者可见眼上静脉增宽。眼眶 MRI: 2 例患者可见双侧诸眼外肌增粗。DSA: 5 例患者为颈动脉海绵窦瘘, 1 例患者为颈外动脉硬脑膜分支海绵窦瘘。所有患者均在全麻下给予动静脉瘘栓塞术, 术后患者眼红、眼突等表现均消失, 眼压恢复正常。

结论: 颈动脉海绵窦瘘可因上巩膜静脉压增高出现药物难以控制的高眼压。封闭瘘口后, 眼压降至正常。

基于深度学习实时监测视盘状态辅助玻璃体视网膜手术

第一作者: Hongzhuang CHENG

共同作者: Shuangwen KANG, Jie ZHONG

目的: 开发经济高效的视盘状态监测系统, 降低因视网膜手术操作导致的高灌注压对视神经的损害风险。

方法: 本研究利用 MobileNetV3 替换 YoloV5 的骨干特征提取网络并基于 56,708 张视盘标注图像构建视盘状态双阶段监测系统: 首先采用改进后的 Yolo 实现对视盘的实时追踪, 其次将视盘区域按照 RGB 加权系数量化为灌注状态指数。模型在灌注状态指数增幅超过预设阈值时自动触发报警系统并记录持续时间, 从而为手术医师提供实时的眼内灌注风险评估。

结果: 该模型在外部验证集上针对视盘追踪任务达到 86% 的精确率、89.8% 的召回率、93.9% 的 mAP@0.5 和 87.8% 的 F1 分数, 并且改进后的模型体积被体积较原模型缩小 95%, 单帧图像处理速度提升 185 ms ($P < 0.05$)。在视盘状态评估方面, 研究结果显示高灌注状态视盘的灌注状态指数较基线水平平均增幅达 21 (95% CI: 17-25; $P < 0.05$)。

结论: 该系统能够实时监测视盘状态变化, 降低眼内高灌注压对视神经的损伤风险, 兼具低成本部署和高效运算的双重优势。

屈光手术

摘要编号: 209936

晶状体半脱位的全程视力解决方案

第一作者: Shunhua ZHANG

目的: 通过视频展示 240 度悬韧带断裂患者的白内障摘除联合三焦点人工晶状体植入, 给出晶状体半脱位患者的全程视力解决方案。

方法: 使用飞秒激光辅助设备制作以囊袋为中心直径 5.2 mm 的 CCC 联合晶状体核裂解, 穿刺进入前房, 曲安奈德染色下行前部玻璃体切除清除前房玻璃体, 使用核周皮质软壳保护技术清除核块, 粘弹剂保护下吸除核周皮质, 检查囊袋完整, 6-0 Porline 线分别于 7 点和 10 点位固定囊袋, 囊袋内植入 13.0 mm 张力环, 前后囊膜抛光, 囊袋内植入三焦点 IOL (839), 进一步使用前部玻璃体切除清除前房残余玻璃体, 缩瞳检查瞳孔正圆居中, 水密切口。

结果: 术后第一天人工晶状体居中位正, 裸眼远中近视力分别为 0.9、0.8、0.8, 最佳矫正视力 1.0。术后 6 个月随访显示人工晶状体居中位正, 裸眼远中近视力分别为 1.0、0.8、0.8, 最佳矫正视力 1.0; 前节 OCT 显示人工晶状体位正居中, IOL 倾斜 2.8 度, 偏心 0.37 mm, 均在理想范围。

结论: 囊袋张力环符合体巩膜固定联合囊袋内植入三焦点人工晶状体可以使晶状体半脱位患者实现囊袋内植入 IOL 并实现全程视力, 提高生活质量。

摘要编号: 204970

飞秒微透镜角膜基质取出术中结膜卷入主动失吸 1 例

第一作者: Wei CHEN

目的: 报道飞秒微透镜角膜基质取出术中结膜卷入, 但是未完失吸, 激光层面倾斜, 及时主动失吸并成功处理的特殊病例。

方法: 患者, 女, 18 岁, 在飞秒微透镜角膜基质取出术中扫描激光时, 由于紧张、Bell 现象、眼球向上转动、角膜直径较小 (10.83 mm), 结膜松弛等原因, 下方结膜被大量负压吸引入手术区。卷入

的结膜填入下方负压环与角膜的间隙，使负压环与眼球的间隙仍闭合达要要求的负压，未完全失吸，故激光未自动终止。术者评估这时激光扫描角膜透镜的上层已发生明显倾斜，立即主动按下了失吸键，失去负压，使眼球脱离负压环，激光终止。术者立即重新中心对位，并负压吸引，未改变任何参数，重新扫描了透镜上层及微切口，结膜未再卷入，并顺利分离透镜。

结果：术后复查结果，裸眼视力 1 天，1 周均为 20/20；电脑验光示术后 1 天 +0.75 DS/-1.25 DC*70，等效球镜为 +0.25；术后 1 周 +0.50 DS/-1.00 DC*70，等效球镜为 0。

结论：对于角膜直径较小的患者要加强全飞秒术中失吸的预防，一旦半失吸，结膜卷入手术区，在扫描透镜上层时需及时主动终止激光，可不改变参数立即重吸扫描上层及边切，完成手术，可获得较好视力。

摘要编号：207698

飞秒微透镜角膜基质取出术中部分失吸致帽穿孔 1 例

第一作者：Wei CHEN

目的：报道飞秒微透镜角膜基质取出术中部分失吸，结膜卷入边缘，术者未主动失吸，激光扫描全部，分离角膜透镜时致帽穿孔的 1 例特殊病例。

方法：患者，女，23 岁，右眼屈光度 -7.0 DS/-0.75 DC*115，角膜横径 11.24 mm，角膜曲率 K1 为 43.56，K2 为 44.30，角膜中央厚度 583 um。在全飞秒术中扫描激光时，可能由于紧张、眼球向上转动等原因，颞下方结膜被负压吸引入透镜边缘。卷入的结膜填入下方负压环与角膜的间隙，使负压环与眼球的间隙仍闭合且达要要求的负压，未完全失吸，故激光未自动终止，术者未及时主动失吸，而使激光扫完。

结果：分离角膜透镜上层时发生颞下方角膜穿孔而终止手术。

结论：对于角膜直径较小的患者术前要加强全飞秒术中配合的宣教，扫描激光时一旦发生部分被动失吸，结膜卷入光学区，激光仍可扫描的情况下透镜上层扫描可能已发生倾斜，需及时尽早主动失吸终止手术，防止角膜穿孔等并发症的出现，并为其它的解决方案争取机会。

一例特殊的儿童黄斑前膜及其四年随访

第一作者：Xuan LIU

目的：对一例特殊的儿童黄斑前膜四年的随访进行总结。

方法：陈 XX，男，9 岁，以“右眼视物不清 1 个月”只主诉入我院，入院查体：视力：右：0.1，左：0.8，眼压：右 8.8 mmHg，左：14 mmHg。双眼虹膜可见力氏结节，右眼玻璃体絮状混浊，下方少量出血；左眼玻璃体清亮。右眼黄斑部血管迂曲，可见黄斑前膜状物。并可见视网膜折叠。入院诊断：右眼增殖性玻璃体视网膜病变诊疗经过：入院行全麻右眼玻璃体切除并黄斑前膜剥除术，并硅油填充。2 月后常规取硅油。随访情况：右：0.4（矫正 1.0），左：0.8，眼压：右 12 mmHg，左：14 mmHg。双眼虹膜可见力氏结节，右眼玻璃体清亮，黄斑部未见膜状物，视网膜平伏。OCT 显示黄斑部结构存在。后期随访时发现驱赶可见咖啡牛奶斑，并确诊神经纤维瘤病 1 型。

结果：原黄斑前膜可能因神经纤维瘤病 1 型伴发的视网膜及视网膜色素上皮联合错构瘤。

结论：随着随访时间的延长，全身咖啡牛奶斑逐渐增多，但眼底错构瘤依然安静（图 6）。说明手术可能是解决视网膜错构瘤的一种手段。

摘要编号：209768

一束照进云岭的光 副标题：一例德昂族 Rop5 期患儿诊治启示录

第一作者：Yang JINGYING

目的：呼吁完善云南边疆地区（尤其是德昂族等少数民族聚居地）早产儿眼底筛查体系，填补筛查覆盖缺口，降低 ROP 导致的失明风险，保障边疆少数民族早产儿的视觉健康权益。

方法：1. 对云南省内早产儿开展眼底筛查工作，持续推进筛查覆盖至各大地州；2. 为确诊 ROP 5 期的德昂族早产儿实施精细眼部手术，包括角膜前入路切口、注入粘弹剂撑开前房、切除晶体、剥离视网膜致密前膜等操作；3. 提出针对性建议：为德昂村寨制作双语眼底筛查防盲手册，为县医院配备眼底筛查基本设备。

结果：1. 手术成功使德昂族早产儿脱离的视网膜基本展平，术后孩子对光产生反应，获得了认知世界的初步可能；2. 过去十年间，云南早产儿眼底筛查

已逐步覆盖各大地州，但在茶山等偏远少数民族地区仍存在“最后一公里”覆盖缺口，导致部分早产儿错失黄金筛查期，发展为罕见的 ROP 5 期。

结论：边疆少数民族地区早产儿眼底筛查工作仍需完善，通过补充筛查手册、配备基础设备等措施打通“最后一公里”，才能从源头减少 ROP 重症病例，让所有民族的早产儿都能平等享有光明，这需要医疗从业者及社会各界持续接力推进。

摘要编号：208886

人工晶状体后囊夹持术

第一作者：Zhen SHAO

共同作者：Dongmei LIU

目的：展示不同类型人工晶状体的后囊夹持术。术中将人工晶状体的光学区夹持于后囊下以预防白内障术后的视轴区混浊。

方法：术中使用角巩膜缘切口，环形撕开晶状体前囊膜，吸除晶状体，放在囊袋内植入人工晶状体后，在眼内注入粘弹剂，环形撕开后囊，在将人工晶状体轴向对准目标轴位后，将人工晶状体光学区夹持于后囊下。

结果：患者术中及术后无严重不良反应发生，术后长期随访均未发生视轴区混浊。对于散光矫正型的人工晶状体采用后囊夹持术可以使人工晶状体轴向更稳定。

结论：儿童白内障术中使用人工晶状体光学部后囊夹持是一种预防术后视轴区混浊的方法，减少了对玻璃体的及眼球发育的影响，其术后长期效果稳定；该种手术方式在儿童屈光性白内障中，特别是散光矫正型人工晶状体植入的患者中更具优势。

摘要编号：209689

改良式一片式人工晶体缝线固定术的探讨

第一作者：Shanna CHEN

目的：探讨改良式一片式人工晶体缝线固定术的应用安全性和便利性。

方法：对无晶状体眼患者 14 人 14 眼，局麻下行一片式人工晶体缝线固定术。采用 8-0 聚丙烯线经 9:00、距角膜缘 2 mm 经巩膜穿刺进入玻璃体腔内，再经上方 2.4 mm 透明角膜缘主切口引出眼外，缝线固定于一片式人工晶体（IOL）的下襻，IOL 折叠放置助推器后注入前房，上襻留置并卡在角膜缘切口；同样的办法，8-0 聚丙烯线经 3:00、距角膜

缘 2 mm 经巩膜穿刺进入玻璃体腔内，并缝线固定 IOL 的上襻并送入眼内。拉紧两缝线使 IOL 位居中，并分别巩膜层间“V”形穿梭，紧贴结膜面剪断线端。术后常规眼部用药。

结果：对无晶状体眼患者 14 人 14 眼，局麻下行一片式人工晶体缝线固定术。采用 8-0 聚丙烯线经 9:00、距角膜缘 2 mm 经巩膜穿刺进入玻璃体腔内，再经上方 2.4 mm 透明角膜缘主切口引出眼外，缝线固定于一片式人工晶体（IOL）的下襻，IOL 折叠放置助推器后注入前房，上襻留置并卡在角膜缘切口；同样的办法，8-0 聚丙烯线经 3:00、距角膜缘 2 mm 经巩膜穿刺进入玻璃体腔内，并缝线固定 IOL 的上襻并送入眼内。拉紧两缝线使 IOL 位居中，并分别巩膜层间“V”形穿梭，紧贴结膜面剪断线端。术后常规眼部用药。

结论：改良式一片式人工晶体缝线固定术操作简单、切口小，巩膜及结膜无缝线、术后无刺激症状、视力恢复快，适用于所有一片式 IOL。

眼外伤

摘要编号：207979

晶状体半脱位囊袋缝合效果的长期随访观察

第一作者：Jianwei LIU

目的：研究外伤性晶体半脱位患者，5.0 聚丙烯缝线缝合脱位囊袋的安全性及有效性以及长期随访结果。

方法：回顾性分析 2022 年 6 月至 2024 年 5 月在我院住院的 23 例外伤性晶体半脱位患者，均行白内障超声乳化 + 张力环植入 + 5.0 聚丙烯缝线囊袋缝合 + 人工晶体植入，部分患者行前部玻璃体切割手术。分析手术的安全性及有效性及随访超过 1 年的效果。

结果：术中：3 例患者出现虹膜损伤、出血，4 例患者出现 5.0 聚丙烯缝线钩偏位，旋转现象，术中均通过合理措施得以修复。所有患者均随访一年以上，20 例患者，术后视力为 0.4-1.0，术后 2 例患者眼压高，均行抗青光眼手术。术后一月以上，部分患者囊袋出现机化，未出现囊袋脱位、偏位现象。所有患者随访超过 1 年，视力均稳定，较 1 月时差距无统计学意义，囊袋稳定。

结论：5.0 聚丙烯缝线囊袋缝合手术安全性高，尤其适合大范围晶状体脱位患者。长期效果好。

摘要编号: 210055

组织纤溶酶原激活剂 (t-PA) 联合玻璃体手术 治疗眼球破裂伤后无光感眼一例

第一作者: Dan ZHOU

共同作者: Yuxin FANG

目的: 探讨眼球破裂伤缝合术后脉络膜上腔广泛积血无光感眼应用组织纤溶酶原激活剂 (t-PA) 联合玻璃体手术挽救患者眼球结构及视功能。

方法: 69 岁女性, 左眼破裂伤外院缝合后 10 天, 左眼: NLP, 眼压: 左眼: 6 mmHg CDI: 左眼全周视网膜脱离, 脉络膜脱离, 弥漫脉络膜上腔积血呈“对吻征”。玻璃体切除手术前一天行 t-PA 经巩膜脉络膜上腔注射, 参照超声引导脉络膜隆起最高位置 (约 3 点及 9 点方位) 分别注射两个象限, 每象限 50 ug/0.1 ml。玻璃体切除术中首先前房灌注下, 颞侧角膜缘后约 10 mm 巩膜切开放出大量液化脉络膜上腔积血。脉络膜脱离“对吻征”消失后, 常规玻璃体腔灌注下, 行玻璃体切除 + 视网膜复位 + 硅油填充术。

结果: 术后患者两月复查左眼视力 0.02#0.04, 眼压 10 mmHg, 视网膜复位良好。

结论: 眼球破裂伤后严重脉络膜上腔积血患者应用 t-PA 有助于液化及引流积血, 为玻璃体手术提供手术空间及更早的时机, 挽救患者视力。

眼底外科

摘要编号: 207637

一例 Terson 综合征内界膜下出血的玻璃体切除术

第一作者: Chen ZHIQING

目的: Terson 综合征是指由急性颅内出血或创伤性脑损伤引起的颅内压急剧升高, 进而导致玻璃体、视网膜前或视网膜下等多层次眼内出血的临床病症。其核心病理机制在于颅内压升高通过视神经鞘传导, 压迫视网膜中央静脉, 导致静脉回流受阻、血管内压力骤增而破裂出血。探讨玻璃体切除术的时机与疗效非常重要。

方法: 患者主要表现为突发性视力下降或丧失。诊断主要依靠存在原发性颅内病变的病史, 结合眼科检查。眼底镜检查与 B 型超声和 CT 是诊断眼内出血的关键工具, 而光学相干断层扫描 (OCT) 能精细评估内界膜下出血、黄斑结构改变等并发症。

结果: 治疗策略取决于出血的严重程度和持续时间。对于轻度出血, 可采取保守观察, 部分病例可自行

吸收。对于持续不吸收的致密玻璃体出血或出现并发症 (如黄斑前膜、黄斑裂孔和视网膜脱离) 的患者, 经平坦部玻璃体切除术 (PPV) 是恢复视力的有效手段。微创手术系统的应用改善了手术安全性与效率。关于手术时机虽存争议, 但多数研究支持若观察 1-3 个月无吸收迹象, 应积极考虑手术, 早期干预有助于更快视功能恢复并降低儿童弱视风险。总体视觉预后良好, 多数患者术后视力可获得显著改善。预后影响因素包括初始视力、颅内原发病的严重性、手术时机及是否出现黄斑光感受器损伤等并发症。

结论: Terson 综合征是一种严重的神经眼科交叉性疾病。其管理需要神经外科与眼科的紧密协作, 优先处理危及生命的颅内疾病, 并及时进行眼科评估与干预。玻璃体切除术是治疗持续性玻璃体积血的金标准。未来的研究应致力于明确最佳手术时机、探索长期视网膜微观结构改变, 并利用多学科协作与先进影像技术进一步优化患者预后。

摘要编号: 202426

抓虫记

第一作者: Rongping DAI

目的: 描述一例结膜吸吮线虫进入玻璃体腔, 并手术取出的病例。

方法: 玻璃体切除手术, 完整吸除线虫。

结果: 结膜吸吮线虫自角膜切口进入前房, 并通过悬韧带或后囊切开口进入玻璃体腔, 2 天后线虫顺利取出, 患者病情稳定, 无后续炎症反应。

结论: 结膜吸吮线虫可以通过角膜切口进入玻璃体腔, 完整取出虫体非常重要。

摘要编号: 206370

知易行难? ——巨大黄斑裂孔手术的思考

第一作者: Yingxiang HUANG

共同作者: Lie YANG

目的: 探讨黄斑裂孔手术的关键步骤, 强调黄斑裂孔边缘的移动决定裂孔闭合的可能性。

方法: 回顾一例直径 1198 um 黄斑裂孔的 79 岁患者的手术录像。

结果: 通过玻璃体后界膜撕除联合内界膜覆盖, 按摩孔缘, 最后空气填充, 术后黄斑孔完美闭合。

结论: 解除黄斑孔周牵拉, 并松解孔缘组织, 可促进裂孔封闭。

摘要编号: 200428

镜花水月——玻璃体积血合并角膜瘢痕的玻璃体切除术

第一作者: Xuchuan WANG

目的: 患眼曾被一根铁丝贯穿, 一期行眼球破裂伤修补术。

方法: 由于外伤造成角膜瘢痕及玻璃体腔积血, 视力仅剩光感。二期手术中, 角膜瘢痕仿佛一个“磨花的镜头”导致玻切术中视野受限, 术者仍巧妙地切除玻璃体积血, 并对外伤造成的“新月形”眼底视网膜裂孔病灶激光光凝。

结果: 最终顺利完成手术, 术后患者视力改善。

结论: 复杂眼外伤可能需多次手术治疗, 合理的手术设计最终使患者获益。

眼整形眼眶病

摘要编号: 203652

使用带蒂鼻黏膜瓣的泪道再造术临床观察

第一作者: Pang ZUOXIANG

目的: 介绍一种使用带蒂鼻黏膜瓣再造泪道的手术方法及疗效观察。

方法: 自 2022 年 11 月至今开展使用带蒂鼻黏膜瓣再造泪道的泪道再造术共 9 例(鼻黏膜组)。手术过程: 鼻内镜下制作宽约 8-10 mm 的蒂在鼻丘上方的鼻黏膜瓣, 使用咬骨钳和磨钻去除上颌骨额突暴露泪囊后, 切开泪囊内侧壁; 再经内眦入路锐性分离至泪囊窝前缘, 切开骨膜进入鼻腔, 将鼻黏膜瓣经切口牵引至内眦, 经内眦切口置入泪道支撑管(润视 RS-7 管)后将鼻黏膜包绕置管, 使用可吸收缝线将黏膜缝合管状, 前端开口与结膜切口吻合。术后均使用抗菌素、激素滴眼液滴眼, 使用曲安奈德喷鼻剂喷鼻腔; 术后 3-4 月内定期复查, 后期不定期复诊。

结果: 6 例术后至今 1 年以上(13-28 个月), 3 例术后至今 5-8 个月, 其中 8 例保持长期置管状态, 均无溢泪; 染色剂消失实验 DDT (-), 内眦部置管在位, 鼻腔内造口形成好, 周围黏膜覆盖。该 8 例中, 1 例术后半年时拔管后仍有溢泪症状, 半月后重新置管, 恢复好; 2 例用力擤鼻涕时出现置管脱出的情况, 来院重新置管, 并将置管鼻腔内部分剪短, 恢复好。1 例患有强直性脊柱炎的患者术后半年因需要到国外居住要求拔管, 拔管 1 周后发生急性虹膜炎, 溢泪复发, 后失访。

结论: 对于难以修复再通的上泪道阻塞, 使用带蒂鼻黏膜瓣转位行泪道再造术可以形成一个有生理功能的泪水引流通道, 缓解病情。术后建议长期置管, 可剪短鼻腔内部分, 减少脱落风险; 有自身免疫疾病的患者应充分评估后手术。

摘要编号: 209076

鼻内镜下视神经管内海绵状血管瘤摘除术一例及手术视频展示

第一作者: Rongxin CHEN

共同作者: Xiaofeng WU, Huasheng YANG

目的: 探讨视神经管内罕见占位性病变 - 海绵状血管瘤的临床特点、诊断要点, 并展示经鼻内镜视神经管减压及肿瘤摘除术的手术技巧与疗效。

方法: 报告一例 49 岁女性患者, 因“右眼视物模糊伴颞侧遮挡 2 年余”就诊, 辗转多家医院未能确诊。入院检查右眼视力为手动 /10 厘米(矫正无提高)。影像学检查提示“右眼视神经管内海绵状血管瘤”。采用“鼻内镜下经鼻视神经管开放及肿瘤摘除术 OD”, 在全程瞳孔监测下, 于视神经鞘膜内精细操作, 完整切除肿瘤。

结果: 手术成功完整摘除肿瘤, 术中和术后未发生视神经、眼动脉损伤或其它严重并发症。患者术后右眼视力恢复至 0.04, 恢复良好, 无复发迹象。

结论: 视神经管内海绵状血管瘤虽罕见, 但可导致严重的视力损害。精确的术前影像学评估是诊断的关键。鼻内镜下经鼻入路为此类深部、狭小空间内的病变提供了直接、微创且有效的手术路径, 在完整切除肿瘤的同时, 能够最大限度地保护视功能, 并显著降低手术创伤及并发症, 是视神经管内占位的治疗选择。

Ahmed 引流阀植入治疗儿童葡萄膜炎继发青光眼的安全性和有效性分析

第一作者: Liu HETING

共同作者: Mohan LI, Liming TAO, Xinchun WANG, Tongcheng XU

目的: 评估 Ahmed 引流阀植入治疗儿童葡萄膜炎继发青光眼的安全性和有效性。

方法: 收集在我科就诊的 8 名儿童(12 眼)葡萄膜炎继发性青光眼患儿资料, 包括最佳矫正视力(best-corrected visual acuity, BCVA)、眼压、

视野指数 (visual field index, VFI)、前房闪辉程度。手术方式为做以角膜缘为基底的穹窿部结膜切口, 打开筋膜囊, 0.4 mg/ml 丝裂霉素棉片放置筋膜囊内 3 min, 生理盐水冲洗角膜表面及结膜囊; 用 5-0 不可吸收缝线将 Ahmed 引流阀固定于角膜缘后 9 mm 浅层巩膜上; 于距角膜缘 4 mm 处的巩膜处进针, 针头在板层巩膜间穿行至角膜缘后 1.5 mm 处, 改变针头方向穿刺进入前房, 调整引流管位置; 缝合筋膜和球结膜。每名患儿在治疗前和术后不同间隔 (包括 1 天、7 天、1 个月、3 个月和 6 个月) 接受综合评估。完全成功的标准定义为眼压在 10–21 mmHg 范围内, 并且从基线水平至少降低 20%, 无需降眼压药物或再次手术即可实现。合格成功的定义与完全成功的定义相似, 只是需要降眼压药物。我们采用 Wilcoxon 秩和检验进行统计分析。

结果: 所有参与者都成功完成了至少六个月的随访。12 只眼中有 10 只 (83.3%) 取得了完全成功, 2 只眼 (16.7%) 获得了合格成功。术前平均眼压为 (37.1 ± 8.8) mmHg, 术后 6 月明显下降至 (15.4 ± 4.1) mmHg。在所有术后时间点, 平均眼压与术前值相比均明显下降, 具有统计学意义 ($P < 0.05$)。术前平均 BCVA 为 0.38 ± 0.24 , 术后为 0.37 ± 0.24 , 差异无统计学意义 ($P > 0.05$)。术前, 参与者平均使用 2.5 种局部降压药物, 术后减少到 0.4 种。主要并发症包括前房积血 ($n = 4$)、浅前房 ($n = 4$) 和前房闪辉加重 ($n = 6$)。截止到 6 个月的随访结束, 没有出现如需手术冲洗的前房积血、感染、眼压失控等严重并发症发生。同样, 经过 6 个月的随访, 患儿 VFI 也没有统计学意义上的变化。

结论: Ahmed 引流阀植入治疗儿童葡萄膜炎继发青光眼既安全又有效。然而, 儿童葡萄膜炎是一类非常复杂且难治的疾病, 在治疗并发症的同时, 更应该注意原发病的规范治疗。

摘要编号: **208111**

XEN 青光眼引流管植入术

第一作者: **Qian TAN**

共同作者: **Ding LIN**

目的: 介绍 XEN 青光眼引流管植入手术。

方法: 视频展示多个案例 XEN 青光眼引流管植入手术的详细步骤以及术后效果。

结果: XEN 青光眼引流管植入手术在原发性青光眼以及小梁切除术后高眼压患者中都有良好的降眼压效果。

结论: XEN 青光眼引流管植入是一种有效的降眼压微创手术方式。

摘要编号: **208500**

一例年轻高风险 PACG 患者的后节灌注辅助多术式联合治疗

第一作者: **Dan CAO**

共同作者: **Liang ZHANG**

目的: 39 岁女性, 双眼慢性闭角型青光眼 (晚期), 右眼在外院行小梁切除术后出现高眼压、浅前房, 外院行 phaco + 前段玻切, 术中出现爆发性脉络膜上腔出血。

方法: 入院后右眼行 PPV + 2 期 IOL 植入 + 经内路睫状体光凝, 左眼术前最大量降眼压药物下眼压为 35–40 mmHg, 左眼在球后麻醉下行。后节主动灌注下后入路局限玻璃体切割术 + PEI + GSL + GT (120°) + 后囊切开区。

结果: 术后左眼在 1 种降眼压药物下眼压 11–13 mmHg。

结论: 年轻 PACG 患者更加需要个体化的评估, 术中眼压、前房深度的稳定控制非常重要, PPV + phaco + IOL + GSL + GT 在本例年轻晚期 PACG 中效果良好。

摘要编号: **209789**

一种新的微创青光眼手术 – 新型微创内路三联手术

第一作者: **Liuzhi ZENG**

共同作者: **Qin QIU**

目的: 提供一个全面的新型微创内路三联手术 (3T 手术) 操作指南, 作为一个专门的 3T 的手术手册, 以便于更好的临床实践。

方法: 本方案已获得成都市中西医结合医院伦理委员会批准, 且在为教育目的制作视频前, 已从患者处获得知情同意。3T 手术关键操作步骤如下:

1. 于右眼颞下或左眼鼻上方透明角膜缘 15° 辅助切口, 注入粘弹剂升至 30 mmHg 后, 于颞上方/颞侧作 1.8 mm 主切口。
2. 经辅助切口预置微导管, 使用 Zeng's 小梁刀切开鼻侧小梁网及 Schlemm 管内壁约 2 mm, 粘弹剂扩张切开口并推开回血。
3. 将微导管头端逆时针插入 Schlemm 管内, 每前行 2–3 个钟点注射粘弹剂扩张, 完成 360° 穿行后继续前行 1 个钟点位。
4. 于右眼 3 / 4 点位或左眼 7 / 8 点位透明角膜缘内制备第二辅助切口 (与角膜缘呈 $30\text{--}45^\circ$ 夹角)。
5. 房角镜下用眼内镊夹出微导管头端 2 mm, 结扎 10-0 聚丙烯线于头端 1–2 mm 处 (双结固定), 退回带线微导管至前房后用

U 型固定器固定另一端。6. 牵拉微导管将缝线引入 Schlemm 管内，同步每退行 2-3 个钟点注射粘弹剂扩张，完成全周退行后预留眼外缝线 3-5 mm 并剪断。7. 在房角镜下用粘弹剂扩大开窗口（右眼 3-5 点/左眼 7-9 点，范围 60°）。8. 带线弯针从右眼 3 点/左眼 7 点辅助切口穿入前房，于另一端缝线下方经对侧角膜缘（右眼 5 点/左眼 9 点）穿出，沿角膜缘层间浅行（右眼 5→3 点/左眼 7→9 点）后经辅助切口旁 3/7 点位返回前房，眼外预留 10 mm 缝线后剪除多余部分。9. 勾出两端缝线。10. 冲洗前房粘弹剂降低眼压，行外科三重打结后剪线，调整线结至前房角并水化角膜切口恢复前房。11. 最后前房注气升压至轻度偏高完成手术。结果：3T 是治疗 POAG 的一种有前景的微创手术技术，术后 24 个月的眼压显著降低，药物负担减轻，安全性良好。

结果：3T 是治疗 POAG 的一种有前景的微创手术技术，术后 24 个月的眼压显著降低，药物负担减轻，安全性良好。

结论：通过详细、分步的视频和文本指南，揭开 3T 手术的复杂性，缩短青光眼医生的学习时间，提高手术熟练度，加速这项创新技术在临床实践中的整合，最终通过促使更多适宜患者受益于这一具有良好风险效益比的手术，进而改善其视觉健康。

摘要编号：209954

穿透性 Schlemm 管成形术 (PCP) 联合前部玻璃体切除术治疗真性小眼球继发青光眼的术视频演示

第一作者：Liuzhi ZENG

目的：真性小眼球因眼球容积小、巩膜增厚及前房角狭窄，继发青光眼的手术干预风险极高，传统滤过性手术易导致低眼压、浅前房及脉络膜出血等并发症。本研究通过手术视频展示穿透性 Schlemm 管成形术联合前部玻璃体切除术 (PCP)，旨在探讨其在控制眼压的同时减少并发症的可行性。

方法：患者女，35 岁，既往最高眼压双眼 35 mmHg。现使用双眼派立明滴眼液、美开朗滴眼液控制眼压。查体：VOU 裸眼 0.06；f 眼底：C/D = 1.0。诊断：1、双眼继发性青光眼，2、双眼真性小眼球，3、双眼屈光不正（高度远视）。左眼采用 PCP 联合前部玻璃体切除术，具体手术步骤如下：1. 患者取平卧位，爱尔凯因眼液术眼表面麻醉 3 次，常规消毒，铺巾，开睑器开睑；2. 上方角膜缘牵引缝线，先做以穹窿为基底的结膜瓣，再做以角膜缘基底的巩膜瓣，巩膜瓣约 3 mm x 3 mm，再做深层巩膜瓣约 2 mm x 2 mm，巩膜池成形，切开粘小管外壁，微导管自切开粘小管导入，走行 360°，每

走一个钟点位打一次粘弹剂，扩张粘小管，并自另一端穿出，在微导管头端膨大处以 10/0 聚丙烯缝线打结，再自穿入端缓缓退出微导管，每退一个钟点位打一次粘弹剂，使 10/0 缝线随微导管在粘小管内走形一圈并留置于粘小管内；3. 题上做侧切口，行前房穿刺，并注入适量粘弹剂，剪除深层巩膜瓣，瓣下切除小梁 1.5 mm x 1 mm，再行虹膜周切，烧灼并剪除肥厚睫状体，自虹膜周切孔剪开玻璃体前界膜，剪除部分前部玻璃体，将粘小管内留置缝线打结，保持适当张力，成形粘小管，巩膜瓣间断严密缝合，埋线，球结膜间断缝合，冲洗前房内粘弹剂并成形前房。4. 妥布霉素地塞米松眼膏涂眼，无菌纱布敷盖术眼。

结果：术后第 1 天左眼眼压降至 25 mmHg，第 2 天左眼眼压 15 mmHg，无需抗青光眼药物。随访 6 个月眼压稳定，无术后并发症等。视神经损害未进展。

结论：PCP 术式通过以下机制提高安全性：① 外路打开 Schlemm 管，切除局部小梁，恢复生理性房水外流；② 巩膜池促进房水通过小梁开口向脉络膜上腔引流；③ 利用缝线长期扩张 Schlemm 管；该手术视频直观呈现了特殊眼球条件下的操作要点，为同类复杂病例提供技术参考。

視網膜色素變性黃斑水腫之治療療效比較

第一作者: Hsi-an YANG

共同作者: Wun-long ZHENG

目的: 視網膜色素變性 (retinitis pigmentosa, RP) 為遺傳性視網膜營養不良疾病, 約 10–50% 患者可併發黃斑囊樣水腫, 為中心視力受損的主要原因之一。為改善黃斑水腫及提升視力, 臨床上已嘗試多種治療策略, 包括全身性或局部使用碳酸酐酶抑制劑 (carbonic anhydrase inhibitors, CAIs)、糖皮質激素、抗血管內皮生長因子 (anti-VEGF) 藥物及幹細胞治療等。然而, 既往研究結果不盡一致, 目前尚無針對 RP 相關黃斑水腫的最佳治療共識。本研究旨在綜合分析不同治療方式之療效, 藉由網絡統合分析 (network meta-analysis) 比較其相對效益, 為臨床決策提供更明確的依據。

方法: 本研究系統性檢索 PubMed、Cochrane Library 及 Web of Science 資料庫, 納入比較下列任兩種以上治療方式之文獻: 安慰劑、口服乙酰唑胺 (acetazolamide, 500 mg/日)、口服甲唑胺 (methazolamide, 50 或 100 mg/日)、局部多佐胺 (dorzolamide 2%, 每日三次)、局部酮咯酸 (ketorolac 0.5%, 每日四次)、靜脈輸注臍帶間質幹細胞 (UCMSC)、玻璃體內注射地塞米松植入物 (dexamethasone, DEX, 0.7 mg)、玻璃體內注射曲安奈德 (intravitreal triamcinolone, IVTA, 40 mg)、玻璃體內注射貝伐單抗 (intravitreal bevacizumab, IVB, 1.25 mg), 以及玻璃體內注射雷珠單抗 (intravitreal ranibizumab, IVR, 0.5 mg)。評估指標包括中心黃斑厚度 (CMT) 變化及最佳矯正視力 (BCVA) 的改善。

結果: 共 12 篇文獻被納入進行網絡統合分析。結果顯示, 在治療後 2 至 4 週, 口服 acetazolamide、口服 methazolamide 與局部 dorzolamide 在提升 BCVA (增益 ≥ 5 個 ETDRS 字母) 方面

無顯著差異。於治療後 3 至 4 個月時, 單次注射 DEX 0.7 mg、口服 acetazolamide、口服 methazolamide 及局部 dorzolamide 在 CMT 改善方面無顯著差異, 但其療效均優於 IVB、IVR、IVTA 及 UCMSC。根據 SUCRA (Surface under the cumulative ranking curve) 值的療效 (%) 排序如下: DEX (79.3%) > 口服或局部 CAIs (60.4–68.4%) > 局部 ketorolac (57.2%) > IVB 或 IVR (37.8–42.4%) > IVTA (34.9%)。在 3 至 4 個月時, 於 BCVA 改善方面, DEX 0.7 mg、dorzolamide 與 ketorolac 間無顯著差異; 而 acetazolamide 之 BCVA 改善優於 IVB 與 IVR。於 6 個月時, acetazolamide 在改善 CMT 的療效優於 methazolamide、IVB、IVR、IVTA 及 UCMSC, 而 DEX 0.7 mg、dorzolamide 及 ketorolac 之間無顯著差異。

結論: 對視網膜色素變性合併黃斑水腫的患者而言, 玻璃體內注射地塞米松及口服 (或局部使用) CAI 均可作為有效的治療選擇, 兩者在改善 CMT 與 BCVA 方面療效接近, 且優於 IVR、IVB 及 IVTA 於 3 至 6 個月內的療效表現。然而, 未來仍需更多嚴謹的隨機對照試驗以驗證本研究結果。

三重功能超小聚多巴胺奈米顆粒打破 ROS-發炎-血管生成的病理循環: 跨上皮治療角膜新生血管的新策略

第一作者: Yue WU

共同作者: Jinhai HUANG, Mei YANG, Xingtao ZHOU

目的: 角膜新生血管 (corneal neovascularization, CoNV) 是導致角膜瘢痕形成及視功能喪失的重要原因。在其發生與發展過程中, 發炎反應與氧化壓力相互作用, 形成 ROS-發炎-血管生成的病理循環, 成為治療中的關鍵難題。本研究旨在研發一種具備高效抗氧化、抗發炎及抗血管生成能力的超小聚多巴胺奈米顆粒 (UPDA NPs), 以實現對角膜新生血管的一體化精準介入。

方法：透過尺寸可控的自聚合策略製備 UPDA NPs，並系統性表徵其理化性質、生物相容性及自由基清除能力。採用 HCEC 與 HUVEC 等細胞株建立模型，全面評估其抗發炎、抗氧化及抗血管生成活性，並透過 Western blot、qPCR 及免疫螢光分析 NRF2/HO-1 訊息途徑及促血管生成基因的變化。進一步於鹼燒傷誘導之小鼠角膜新生血管模型中，評估 UPDA NPs 的體內治療效果與安全性。

結果：UPDA NPs 具有均一的超小尺寸（約 3 nm）與顯著的自由基清除活性，能夠有效降低細胞內 ROS 水平並恢復氧化還原平衡。其可顯著抑制發炎因子表達與內皮細胞成管形成，同時活化 NRF2/HO-1 抗氧化途徑，並下調 VCAM-1、ESM-1、ANGPT2、FLT1 等促血管生成基因的表達。在體內實驗中，UPDA NPs 局部給藥可顯著減少角膜新生血管的面積與長度，促進角膜修復，且未見明顯的局部或全身毒性反應。

結論：本研究提出一項基於超小 UPDA 奈米酶的無創跨上皮遞送與三重功能協同新型奈米治療策略，能有效打斷 ROS-發炎-血管生成的病理環路。該系統在角膜新生血管治療中展現出優異的療效與安全性，為眼表疾病的精準奈米介入提供具創新性與轉譯潛力的研究方向。

瞳孔直徑與眼軸變化亦無顯著相關（ $r^2 = 0.182$, $p = 0.066$ ）。· 鏡片 B（傳統 VST 設計）：大瞳孔組之眼軸增量顯著低於小瞳孔組（ 0.08 ± 0.05 mm vs 0.16 ± 0.07 mm; $F = 26.04$, $p < 0.001$ ），瞳孔面積與眼軸增長呈顯著負相關（ $r^2 = 0.421$, $p < 0.001$ ）。

結論：在 6 個月的觀察期間，點對點設計的角膜塑形鏡（鏡片 A）之療效不受瞳孔大小影響；相對地，傳統 VST 設計（鏡片 B）的眼軸控制效果則明顯依賴瞳孔直徑。此結果顯示，點對點設計可適用於更廣泛的瞳孔大小族群，而 VST 設計在臨床應用上需更謹慎評估患者的瞳孔參數，以達到最佳控制效果。

瞳孔直徑對兩種不同設計角膜塑形鏡短期眼軸控制效果的影響

第一作者：Menqiong LI

目的：比較兩種角膜塑形鏡設計——點對點軸線對齊設計（鏡片 A）與傳統 VST 設計（鏡片 B）——在 6 個月內對近視兒童眼軸增長控制的效果，並評估瞳孔直徑對治療成效的調節作用。

方法：共納入 60 名 8 至 12 歲近視兒童，隨機分為鏡片 A 組（ $n = 27$ ）與鏡片 B 組（ $n = 33$ ）。在 300 LUX 標準化照明條件下，以自動驗光儀量測基線瞳孔直徑（三次取平均值），並以中位數（ 4.53 ± 0.58 mm）劃分為大、小瞳孔亞組。所有受試者均接受睫狀肌麻痹驗光與光學生物測量儀之眼軸長測定，並於 6 個月後追蹤。資料以線性混合效應模型分析瞳孔大小與鏡片設計間之交互作用。

結果：共有 57 名受試者完成研究（鏡片 A 組 26 人，鏡片 B 組 31 人）。· 鏡片 A（點對點設計）：大瞳孔與小瞳孔組之眼軸增量無顯著差異（ 0.07 ± 0.04 mm vs 0.08 ± 0.05 mm; $F = 0.47$, $p = 0.50$ ），

在門診環境中使用遠程問診評估兒科患者的可能性

第一作者: Karen **WONG**

共同作者: Clare **ROBERTS**, Maria **THEODOROU**

目的: 分析在門診環境中使用遠程問診的兒科患者人口統計資料及結果。

方法: 我們回顧性分析了所有於 2025 年 9 月至 10 月期間，利用視頻問診平台就診於英國倫敦莫菲爾德眼科醫院的兒科患者（18 歲以下）的電子病歷資料。分析了非緊急門診患者的統計資料及就診結果的數據。

結果: 在兩個月的期間內，共進行了 102 次視頻會診。患者年齡範圍介於 1 個月到 17 歲之間（平均 6.91 歲），女性患者略多。參加視頻會診的患者中，86% 的病例為複診；10% 的患者為新病例，4% 的患者為外部醫院尋求第二意見的轉介。觀察的各種病例，包括眼瞼腫塊、眼瞼下垂、過敏性結膜炎、其他結膜炎、斜視、眼球震顫、以及其他眼瞼和神經系統疾病。36% 的患者在會診後不需要複診；6% 的患者被列入手術名單；其餘的患者則預約了面對面或視頻會診的複診。

結論: 遠程醫療諮詢有可能在兒科門診中使用，以減少新病患和復診病患的面對面就診。它可以通過提供及時的管理和建議，改善患者和家長的體驗，同時節省患者的交通時間和費用，亦有助於減少對上學時間的干擾，特別是離醫院相對較遠的患者。隨著技術的進一步發展，未來視頻會診有可能向更多種類的疾病以及更複雜的病例提供遠程諮詢服務。

Faricimab 於 4 劑負荷期內治療黃斑新生血管之療效與安全性研究

第一作者: Sin **U HONG**

目的: 探討新藥 Faricimab 於 4 劑負荷期內治療 2 型 MNV 及息肉狀脈絡膜血管病變 (PCV) 的療效及安全性。

方法: 納入 2024 年 01 月至 11 月在澳門鏡湖醫院初診且未經治療的 2 型 MNV 及 PCV 患者共 11 例，患者接受 Faricimab (6 mg/0.05 ml) 玻璃體腔注射（每 4 周 1 劑，共 4 劑）。於注射前及每劑後 4 周，記錄最佳矯正視力 (LogMAR)、眼壓、黃斑中心凹視網膜平均厚度 (CST) 和色素上皮脫離最大高度 (PED)，分析各指標在每間隔 4 周的變化及併發症的發生率。

結果: 經 16 周治療，兩組視功能及黃斑部解剖結構均有顯著改善 ($P < 0.05$)。兩組各觀察指標從 0 w 到 16 w 分別為：最佳矯正視力 (LogMAR) 從 0.47 ± 0.49 提高至 0.33 ± 0.44 (2 型 MNV 組)；從 0.62 ± 0.44 提高至 0.31 ± 0.28 (PCV 組)，CST 從 $263.8 \pm 81.6 \mu\text{m}$ 減少至 $219.3 \pm 77.9 \mu\text{m}$ (2 型 MNV 組)；從 $320.8 \pm 121.8 \mu\text{m}$ 減少至 $251.2 \pm 125.5 \mu\text{m}$ (PCV 組)，PED 從 $225.2 \pm 123.9 \mu\text{m}$ 降低至 $120.5 \pm 87.9 \mu\text{m}$ (2 型 MNV 組)；從 $332.6 \pm 146.6 \mu\text{m}$ 降低至 $161.0 \pm 71.2 \mu\text{m}$ (PCV 組)。3 例中有 5 劑次 (11.4%) 發生一過性眼壓升高，未見嚴重眼部或全身不良事件。

結論: Faricimab 於 4 劑負荷期內治療 2 型 MNV 及 PCV 患者均有顯著療效且安全性好。其起效快速、作用穩定、持久，兩組亞型獲益相當。

DRNovosight Plus : 結構對位與糖尿病視網膜病變之個人化生成模擬架構

第一作者: Hsi-an YANG

共同作者: Yi-hsing CHEN, Wun-long JHENG

目的: 目前眼科醫師在向糖尿病視網膜病變患者說明後續治療時(如抗血管新生藥物等), 常需借用其他患者影像幫助解釋, 然而, 因無法呈現患者自身眼底於治療後的可能樣貌, 容易導致溝通理解不足。本研究開發一套個人化生成式架構(名為DRNovosight Plus), 輸入患者治療前彩色眼底影像(Fundus image), 即可生成該患者接受抗血管新生藥物治療後之預測模擬眼底影像, 本研究採用結構對位與視網膜專屬預訓練特徵, 以提升生成影像的可信度與臨床解釋性, 以期未來能用於協助眼科醫師與患者之間的醫病溝通與衛教。

方法: 本研究採用糖尿病視網膜影像資料庫(EyePACS 與 APTOS) 共 71,000 張彩色眼底影像, 並依國際糖尿病視網膜病變嚴重度分級(ICDR 0-4) 標註。基礎架構包含病灶遮罩輔助之生成模型與嚴重度分類器, 本研究於此基礎再進一步導入視網膜領域中已證實具泛化能力之預訓練模型取代原編碼骨幹, 並於生成階段加入血管與病灶布局等結構提示(layout-aware constraint) 以維持生成影像與真實解剖之對位。模型效能以 AUC、FID、SSIM、PSNR 作為指標, 以 Grad-CAM 與 SHAP 評估病灶遮罩之重疊比例, 並且以對抗生成網路(generative adversarial network) 作為生成對照。

結果: DRNovosight Plus 於預測抗血管新生藥物治療後之生成影像分類之 AUC 達 0.89, 展現了其應用於臨床的潛力。影像保真度方面, FID 為 32.1、SSIM 為 0.77、PSNR 為 22.9 dB, 顯示 DRNovosight Plus 所生成影像之品質與細節保留度表現俱佳。Grad-CAM 與 SHAP 與病灶遮罩之重疊比例達 84% (對抗生成網路則為 57%), 表示生成後之變化區域主要集中於臨床病灶與血管相關位置, 顯示 DRNovosight Plus 偏離真實解剖基

準之風險較對抗生成網路低。整體結果顯示, 視網膜預訓練模型與結構提示之導入可在不犧牲生成穩定性的前提下, 同步提升辨識性能與影像保真度。

結論: 本研究建立之 DRNovosight Plus, 能呈現患者於抗血管新生藥物注射後之可能的眼底變化, 並兼顧影像品質與解剖一致性。透過該模型, 可協助眼科醫師向患者解釋接受治療後的效益。本研究以結構證據支持生成可信度, 未來該模型將進一步整合眼球光學電腦斷層掃描(OCT) 圖片與患者的糖化血色素數據, 以提升其預測準確性與臨床實用度。

成人雙眼弓蟲性眼炎以脈絡膜增厚樣病變表現: 一個診斷延誤的偽裝者

第一作者: Shu-chun KUO

共同作者: Huai-wen HSU, Chia-yi LEE, Chenghao SUNG

目的: 弓蟲性眼炎(ocular toxocariasis, OT) 為犬貓體內 Toxocara 屬幼蟲感染所致的人畜共通寄生蟲病, 成人罕見。由於臨床表現多樣, 常被誤診為其他脈絡膜或葡萄膜疾病。本研究報告一例 50 歲免疫功能正常男性, 初期以雙眼視力模糊及脈絡膜增厚樣病變表現, 最終確診為雙眼弓蟲性眼炎之病例, 藉此提醒臨床醫師對成人新發視力下降應納入人畜共通感染之考量。

方法: 病人為中華民國臺南市居住男性, 主訴半年來雙眼視力逐漸模糊, 左眼先發後波及右眼, 合併頭痛與噁心。既往有糖尿病與脈絡膜血管瘤樣病變(PCV) 病史。外院初步診斷為 Vogt-Koyanagi-Harada 症候群(VKH), 接受類固醇與 Ozurdex 治療反應不佳。入院檢查顯示雙眼前房細胞、黃斑水腫、視乳頭充血及多處黃白色斑塊。光學同調斷層(OCT) 呈現界限清楚之次網膜高反射結節及漿液性網膜下液; 螢光血管攝影顯示脈絡膜充盈延遲及 RPE 層滲漏。常規免疫學與感染檢查均陰性, 惟血液及房水 Toxocara IgG 抗體呈陽性, 確立弓蟲性眼炎診斷。治療初期使用甲苯咪唑合併口服類固醇與硫唑嘌呤, 待取得進口藥後改用阿苯達唑。

因病情持續惡化，雙眼後續施行玻璃體切除合併網膜切開引流、羊膜移植及 SF6 填塞。

結果：術後分析顯示網膜下液 Toxocara IgG 陽性。病理檢體未見幼蟲，但符合慢性肉芽腫性發炎表現。病程中雙眼視力持續下降，最終右眼 BCVA 0.01，左眼 0.5。此病例呈現典型「假脈絡膜病變」(pachychoroid-like) 外觀，早期與 PCV 及 VKH 極易混淆，致診斷延誤。文獻回顧指出，成人 OT 雖少見，但可因與犬貓接觸或環境暴露而感染，常呈慢性雙側表現，且抗體檢測為重要診斷依據。

結論：本病例顯示，弓蟲性眼炎可於成人中以非典型脈絡膜增厚樣病變表現，易誤為 PCV 或 VKH 等免疫性疾病而延誤治療。對於有犬貓接觸史或環境暴露史且以不明原因視力模糊、網膜下液及黃白斑塊為特徵的病人，應高度懷疑弓蟲感染，及早進行血清或房水 Toxocara 抗體檢測。合併抗寄生蟲藥物與免疫調節治療可控制發炎，但預後與診斷時機密切相關。本例提醒臨床醫師在 pachychoroid 樣表現下仍須警覺潛在的人畜共通感染。

近視性脈絡膜新生血管治療之長期療效及相關影響因子

第一作者：Yuchieh WU

共同作者：Shihjen CHEN, Yubai CHOU, Dekuang HWANG, Taichi LIN

目的：高度近視常導致多種威脅視力之併發症，包括近視性黃斑部病變、青光眼、白內障、視網膜剝離及高度近視性脈絡膜新生血管 (myopic choroidal neovascularization, mCNV)。其中，mCNV 既為致盲性併發症，亦為可治療疾病。本研究旨在評估抗血管內皮生長因子 (anti-vascular endothelial growth factor, anti-VEGF) 治療 mCNV 之長期視力與解剖學結果，並探討與療效相關之影響因子。

方法：本回溯性研究於臺北榮民總醫院進行，納入 2016 年至 2022 年間經健保核准接受玻璃體內注射治療之 mCNV，且追蹤期至少三年之患者。主要觀察指標為基準至三年之最佳矯正視力 (BCVA) 變化、復發率及失明率；同時分析年齡、基準視力、中央黃斑厚度 (CMT)、脈絡膜厚度、近視性黃斑病變分級、是否合併視網膜下液 (SRF)、視網膜內液 (IRF)、出血、視網膜下高反射物質 (SHRM) 及注射次數等因子與結果之關聯。排除追蹤不足三

年、嚴重青光眼、合併其他視網膜血管疾病或顯著黃斑前膜者。

結果：共納入 118 位患者 125 眼，平均年齡 55 歲，女性佔 75.2%。治療藥物包括 bevacizumab (30.4%)、aflibercept (40.8%) 及 ranibizumab (28.8%)。平均眼軸長 29.27 mm，脈絡膜厚度 86.9 μm ，黃斑病變平均分級 1.82 級。基準 OCT 顯示 SRF 佔 32%、IRF 佔 17%、SHRM 佔 7%、出血佔 35%。平均視力由 logMAR 0.57 $\pm$ 0.29 改善至注射後 1 個月 0.43 $\pm$ 0.30，6 個月達高峰 0.33 $\pm$ 0.27，隨後逐漸下降，1、2、3 年分別為 0.34、0.36 與 0.43，但三年視力仍較基準有顯著統計學意義之改善 ($p < 0.05$)。平均 CMT 由 302.2 μm 降至 264.5 μm 。注射次數以第一年最多 (平均 2.68 次)，其後逐年減少；三年間 CNV 復發率為 29%。進一步分析顯示，年齡較高、基線視力較佳及黃斑病變分級較高者，視力改善幅度較小；黃斑病變分級越高者，失明風險亦顯著增加。基線脈絡膜較厚者傾向需更多次注射以維持穩定。

結論：抗 VEGF 治療可於三年內提供顯著且持久之視覺與解剖學改善。雖視力於初期改善後略有下降，但整體仍優於治療前，顯示其長期療效。疾病活動多集中於首年，符合過去文獻之結果。黃斑病變分級與脈絡膜特性為預後關鍵，早期治療與密切追蹤可望提升長期視覺預後並降低永久性視力喪失風險。

以眼性斜頸為初始表現的眼附屬器淋巴瘤合併單一上直肌侵犯：病例報告

第一作者：Shang-te MA

目的：發表一位以斜視與斜頸為初始表現之眼窩淋巴瘤病人，雖然眼窩淋巴瘤侵犯眼外肌並不罕見，但斜視為初始表現之病人卻很容易疏忽。

方法：病例報告。

結果：一名 63 歲男性，病史僅有高血壓，因持續 2 年的雙眼複視逐漸加劇前來就診。症狀在將頭部向右側傾斜時可獲得緩解。患者否認有視力模糊、眼痛、頭痛或體重減輕。檢查顯示雙眼視力皆為 16/20，眼壓正常。正位檢查可見左眼上斜視與外斜視。眼內結構與眼底檢查皆正常。血液學檢查、血清生化、甲狀腺功能與自體免疫抗體檢查結果亦皆正常。Hess 視野檢查顯示左眼上偏斜，伴隨左上直肌與左下斜肌過度作用，以及左下直肌作用不

足。同時，在裂隙燈檢查下於左眼上方球結膜發現一處 12 × 15 mm 鮭魚色樣病灶。眼眶磁共振造影（MRI）顯示左眼眶僅有上直肌腫脹，視神經路徑並無其他佔位病灶。與患者討論後，進行了上直肌與結膜病灶切片檢查，結果診斷為結外邊緣區淋巴瘤（Extranodal marginal zone lymphoma, EMZL）。最終分期為 Ann Arbor stage 1E。

結論：本病例強調，當臨床上遇到非典型的眼外肌增大時，醫師應警覺其他可能造成單一肌肉浸潤的病因。完整的全身性評估結合多專科團隊合作，對於及時診斷與妥善治療至關重要。

溫敏抗氧化碳點水凝膠眼藥：針對乾眼病的高效奈米治療策略

第一作者：Yue WU

共同作者：Xin CHEN, Jinhai HUANG, Mei YANG, Xingtao ZHOU

目的：乾眼病（dry eye disease, DED）是一種以淚膜不穩定與慢性炎症為特徵的常見眼表疾病。其病程中氧化壓力與炎症反應相互促進，導致角膜上皮損傷與淚液分泌功能下降。本研究旨在開發一種基於氮摻雜碳點（N-doped carbon dots, CDs）的溫敏水凝膠（F-CD hydrogel），以協同抗氧化、抗發炎與抗凋亡機制達成眼表修復與乾眼治療。

方法：CDs 由檸檬酸與聯氨水合物經水熱法製備（平均粒徑約 3–6 nm），並嵌入 Pluronic F127 形成溫敏水凝膠。系統性表徵其理化性質、抗氧化活性及生物相容性。體外使用 HCEC 細胞模型評估其 ROS 清除、線粒體保護及抗炎作用；並通過 Western blot、qPCR 及 RNA-seq 分析 NLRP3 炎症小體及氧化應激相關基因。進一步於苯扎氯銨誘導的乾眼小鼠模型中，驗證其治療效果與安全性。

結果：F-CD 顯示出顯著的自由基清除能力（ $\cdot\text{OH}$ 、 $\text{O}_2\cdot^-$ 、DPPH），能有效降低細胞內 ROS 水平並恢復氧化還原平衡，抑制 NLRP3/Caspase-1 活化，減少炎症因子 IL-1 β 與 TNF- α 的表達。F-CD 水凝膠於 37 °C 可快速凝膠化，顯著延長眼表滯留時間（> 90 min）。在體內，F-CD 眼藥水能修復角膜上皮、促進杯狀細胞分泌並恢復淚液穩定性，未見明顯毒性。

結論：本研究提出一種基於氮摻雜碳點的無金屬抗氧化水凝膠眼藥，可協同抑制氧化壓力與炎症反應，

實現乾眼病的高效、安全與長效治療，具顯著臨床轉譯潛力。

IP3R 介導視神經損傷後突觸信號失調

第一作者：Yuxuan QIU

共同作者：Yiqing LI, Jiahui TANG, Qi ZHANG, Yehong ZHUO

目的：成年哺乳動物的視神經在損傷後難以再生。我們前期工作首次揭示：無長突細胞（ACs）通過釋放鋅離子（ Zn^{2+} ）和多巴胺，跨突觸調控視神經損傷後視網膜神經節細胞（RGCs）的存活和軸突再生（PNAS, 2017; Sci Adv, 2024）。然而，RGCs 軸突損傷如何觸發 ACs 中 Zn^{2+} 升高的上游分子機制尚屬未知。本研究旨在闡明：1) IP3R 在視神經鉗夾（ONC）損傷信號從 RGCs 向 ACs 傳遞中的作用；2) 抑制 IP3R 能否促進 RGCs 存活與軸突再生。

方法：1. 利用 ONC 模型，通過免疫螢光評估未損傷視神經以及 ONC 後 1 天、3 天、5 天中 IP3R 的表達。2. ONC 後玻璃體腔注射 IP3R 抑制劑（2-APB）。分別在損傷後 1 天通過金屬自顯影法（AMG）評估視網膜中的 Zn^{2+} 水準。3. ONC 後玻璃體腔注射 2-APB，兩周後使用 RBPMS/Tuj1 染色和 CTB 標記評估 RGC 存活和軸突再生。4. 敲低 IP3R 後行 ONC 術，2 周後使用 CTB 標記（對照組：n = 5，敲低組：n = 5）評估 RGC 軸突再生。

結果：1. ONC 後第 1–5 天，近端視神經中的 IP3R 水準顯著升高。2. AMG 提示抑制 IP3R 顯著降低了 ONC 後 1 天內叢狀層（IPL）的 Zn^{2+} 積累。3. 2-APB 處理顯著提高了 RGC 存活率，但未顯著增強軸突再生（距離損傷點 0.25 mm 處 p = 0.0533）。4. 敲低 IP3R 顯著抑制 RGCs 軸突再生（距離損傷點 0.25 mm, 0.5 mm 處 p 值分別為 < 0.0001, 0.0006）。

結論：ONC 後近端視神經中的 IP3R 顯著上調。抑制 IP3R 可減輕 IPL 中 Zn^{2+} 的升高，表明 IP3R 在從 RGC 軸突向 ACs 傳遞損傷信號中起關鍵作用。儘管 2-APB 處理部分促進了 RGC 存活，但並未顯著增強軸突再生，而敲低 IP3R 抑制軸突再生，提示 IP3R 對 RGC 存活與再生的複雜調控作用。這些發現揭示了 ONC 後 IP3R 介導的損傷信號傳遞機制，為視神經再生提供了新的分子靶點。
